The materials published in this Readings Book may be reproduced for instructional and non-commercial use. Any use for commercial purposes must have the prior approval of the Executive Board of the EuroMed Research Business Institute (EMRBI).
All full papers and abstracts submitted to the EMRBI Conference are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the specific areas.

Published by: EuroMed Press
FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted over 270 people from over 50 different countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.
ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 10th Annual Conference of the EuroMed Academy of Business. Special thanks go to the Conference Co-Chairs Dr. Stefano Fontana, Dr. Silvia Solimene and Dr Daniela Couccia and the Sapienza University of Rome, in Rome, for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

A SUGGESTED NEW METHOD OF INNOVATION: INTRODUCING THE INTEGRATED QUALITY FUNCTION DEPLOYMENT FOR PRODUCTS & SERVICES

Abu-Assab, Samah

Dept. of Business Administration and Marketing, Birzeit University, BZU, Ramallah, Palestine

ABSTRACT

The main purpose of the paper is to present a new method of innovation to help organizations to become more competitive in their markets by better capturing the voice of customers and better implementing it to create new products or improve existing ones. The new method is called integrated QFD which is an integration between the quality function deployment method and the compositional preference measurement method of conjuncture compensated self-explicated method. The paper explains each method and the way they are combined and used.

The method is first introduced in Abu-Assab (2012) under the category of research methods for the particular group of elderly people, and here it is extended to be used as a tool for innovation and to suit consumers in general. The method is a modification of previous methods from Pullman et al. (2002) and from Baier (1998).

Keywords: Quality function deployment, innovation, Self-explicated method, House of quality, Integrated QFD, Conjuncture-compensatory self-explicated method, competitiveness, preference measurement, voice of customers.

INTRODUCTION

The economy of the 21st century is based mainly on information, knowledge and innovation. Lots of competitors and similar products which makes no choice for the companies but to invest in their employees and always seek to be innovative and differentiable.

For example, it is emphasized that in order for organizations to have competitive advantage, they have to effective management for today and simultaneously working on future innovation.

So to innovate, organizations need tools and methods to implement to stay ahead in their domain. In this article, the author suggested a method of innovation for organizations to help them create new products or/and improve on the existing products they have.
The suggested method “Integrated QFD” is based on the integration of the conjuncture-compensatory self-explicated CC-SE method into the quality function deployment (QFD) (see Abu-Assab, 2012). In the coming sections, the two methods are explained and then the suggested method is presented.

QUALITY FUNCTION DEPLOYMENT (QFD)

For the suggested new innovation method, the quality function deployment is the main method used, therefore, the method will be described in this section to help readers in understanding it. The method was first suggested by the author for complex products to help organizations capture the needs of the elderly people in particular, and thus enhance the organizations in producing more adequate products that fits to the real demand of elderly people. The method was first introduced in 2012 as a market research method for organizations and in order to improve their ability to capture the voice of their elderly customers. In this research, the author introduce the method as an innovation method to help companies become more competitive and customer oriented, in general.

Introduction and Definition

QFD focuses on the voice of the customer (VOC) and translates it into engineering quality or engineering characteristics. QFD is shaped from the combination, integration, and development of many concepts, starting with the quality assurance items (Oshiumi, 1966), the quality deployment (Akao 1972) and continuing with the quality chart (Takayanagi, 1972), value engineering which defines a function of a product, to the narrowly defined QFD, and to the quality charts (Akao and Mazur, 2003).

Quality function Deployment is the translation of the Japanese words “hinshitsu kino tenkai”. In its literal sense, it means deploying the attributes/features of a product/service accepted by customers throughout the relevant department of a company (Akao and Mazur, 2003)

One of the key definitions of QFD by Akao (1990) “A method for developing a design quality aimed at satisfying the consumer and then translating the consumer’s demand into design targets and major quality assurance points to be used throughout the production phase.” (also refer to Abu-Assab, 2012; see also Abu-Assab, 2011; Abu-Assab et al., 2010).

QFD enables the companies to focus on the customer and brings better communication between different departments in the company to achieve the optimum customer satisfaction. Additionally, it enables the companies to make the necessary trade-offs between the customer requirements and their abilities and capacities to produce the optimum product (Bouchereau and Rowlands, 2000). As a result, the organization can increase its competitiveness abilities.
The House of Quality

According to Akao (1997), the House of Quality (HoQ) was given this name because of its “triangular top shape” which looks like a roof (Akao and Mazur, 2003). The main purpose of the HoQ is to transform the “Customer Requirements” (CRs) into “Engineering Characteristics” (ECs) and assign target values for the product (van de Poel, 2007). Clausing (1994) described the HoQ as a matrix that provides a conceptual map for the product design process. In this sense, it is a construct for gathering and understanding the CRs as well as finding and prioritizing the ECs. The cooperation among the marketing, the engineering, and the manufacturing departments of a company is necessary for building the HoQ. This cooperation leads to a greater new or improved product success and more profits for the company (Griffin and Hauser, 1993).

The main steps of the house of quality are according to Griffin and Hauser (1993), (1) Collecting the CRs, (2) rating the importances of the CRs, (3) the customer rating of competitive products, (4) determining the ECs, (5) rating of the relationship matrix, (6) rating of the correlation matrix, (7) calculating the importances/priorities of the ECs, and (8) determining the target engineering as seen in Figure 1.

Values for ECs.

Step 1 in the HoQ begins with the collection of the CRs. CRs are listed in the left side of the matrix (see Figure 1). Those CRs are the description of customers’ needs, wishes, and expectations in their own words (refer to Terninko 1997). Typically, the customer needs are also called “customer attributes” and “customer requirements” and they are usually structured in a hierarchy of primary, secondary, and tertiary demands. CRs are usually gathered in focus groups, face-to-face interviews, customer surveys
and trials (Saatweber 2007), analyzing competitors, and listening to customers. However, a major problem related to the CR issue is the correct translation of the words and inferences of customers by the cross-functional expert team (Hauser and Clausing 1988).

In step 2, rating the importance of the CRs, the expert team members rate the CRs based on their direct experience or, e.g., through questionnaires. This step is very critical in the HoQ, because of the various interpretation or calculations of the importance of the CRs which can lead to different results. Many methods are used in the literature to rate the CRs: some researchers use statistical techniques while others use revealed preference techniques. In the former technique, the customers state their preferences for existing and hypothetical products whereas for the latter, customers are judged by both their actions and their words (Cohen, 1995).

Further in step 3, competitive products are rated by customers. In order for companies to match or exceed their competitors, they have to know where they stand in relation to them first (Hauser and Clausing, 1988). The part dealing with benchmarking is located on the right side of the CRs which gathered the customers’ evaluations and assessments of the “company’s product” and the “competitors’ products”. This step helps the company identify areas of strengths and weaknesses. It should be seen as an essential step for the company to improve itself against its competitors.

In step 4, determining the engineering characteristics, an interdisciplinary expert team from various departments of the company is formed, usually from the marketing, sales, R&D, engineering, and production departments, to translate the VOC into ECs. It should be noted that any EC may affect more than one CR. Another important issue is that it is expected that the ECs describe the CRs in measurable terms and thus affect the customer perceptions (refer to Hauser and Clausing, 1988; Abu-Assab, 2012).

Afterwards, in step 5, rating the relationship matrix, the interactions or dependences between CRs and ECs are estimated by the cross-functional expert team. According to Franceschini and Rossetto (1995) a consensus is required here. Symbols or measuring systems are often used to rate the strength of the relationship between the CRs and ECs. The two most known measuring systems used in this step are the 1-3-9 and the 1-3-5 ordinal scales (for a description of scales refer to Franceschini and Rossetto, 1995).

Subsequently, in step 6, rating the correlation matrix (roof of the house), the dependency within the ECs is assessed. The expert team assesses the effect of each EC on the other ECs (refer to Saatweber, 2007). Sometimes, the expert team has to take the right decisions between possible conflicts within ECs. This happens when the increase of an EC affects at least one other EC negatively. This results in a conflict concerning the product’s design. Objective measures and comparisons (e.g. with the competitors) as well as cost-benefit comparisons help engineers, marketers, and managers of the expert team to decide about the correlations of the ECs process.
In step 7, the importance of the ECs and relative importance of ECs are calculated according to the equations shown in Table 1.

\[
\begin{align*}
A_{ij} &= \sum_{i=1}^{m} w_i \ast f_{ij} \\
R_{ij} &= A_{ij} / \sum_{k=1}^{n} A_{ik}
\end{align*}
\]

- \(A_{ij}\) Absolute importance of EC\(_j\) \((j=1, \ldots, n)\)
- \(R_{ij}\) Relative importance of EC\(_j\)
- \(w_i\) Relative importance of CR\(_i\) \((i=1, \ldots, m)\)
- \(A_{ij}\) Absolute importance of EC\(_j\)
- \(f_{ij}\) Relationship coefficient between EC\(_j\) and CR\(_i\)

Table 1: The absolute and relative importance of ECs in the HoQ (adapted from Kim et al. 2003; see also Abu-Assab, 2012).

Mathematically expressed, in the relationship matrix (Table 1) a cell \((i, j)\), where the \(i^{th}\) defines the row and the \(j^{th}\) defines a column is, given a value according to the scale used corresponding to the strength of the relationship between the CR\(_i\) and EC\(_j\) which is called the relationship coefficient and designates a weak, medium, or strong relationship \(f_{ij}\).

In the last step, step 8, to determine the target values for the ECs, it is essential for the multidisciplinary team to consider the customer satisfaction values and to be careful not to emphasize tolerances (Hauser and Clausing, 1988). The setting of target EC levels is accomplished in a subjective, ad hoc manner, e.g., by expert team consensus (Kim et al., 2003).

The house is as a common place for the various functional teams of a company, which enables them to communicate together and understand the priorities and goals of one another (Hauser and Clausing, 1988). In short, The house of quality aggregates a lot of information in one table.

In the next section, the second used method in the new suggested method is introduced namely the self-explicated method.

**METHOD OF PREFERENCE MEASUREMENT: THE SELF-EXPLICATED METHOD**

In this section, the self-explicated method is introduced. The self-explicated method is a known method of preference measurement together with the conjoint analysis method.

*Definition of The Self-Explicated Method*
The compositional self-explicated (SE) method is one of the three main approaches used in marketing to measure the preference structures of respondents (Green and Srinivasan, 1990). Its main underlying idea is to ask respondents directly about their preferences of a product and is based on an additive model (Hensel-Börner, 2000).

**Two-Stage Self-Explicated Method**

The two-stage SE method consists of a conjunctive and a compensatory stage (Srinivasan 1988; Green et al. 1988). The SE method is differently implemented by various researchers (Green and Srinivasan, 1990). In this section, the conjunctive-compensatory SE approach suggested by Srinivasan (1988) is described and adapted in this research.

Srinivasan (1988) suggested an SE approach called “Conjunctive-Compensatory SE” (CC-SE) that incorporates conjunctive and compensatory stages. The idea in the conjunctive stage is to ask respondents to identify one or two (if any) “totally unacceptable levels” of each attribute. And idea in the compensatory stage is to rate the attributes and levels on a 0-100 or 0-10 scale with the least preferred yet acceptable level assigned 0 and the most preferred level assigned 100 or 10, respectively (Bucklin and Srinivasan, 1991). In doing so, the respondents are explicitly asked to rate the attributes and their levels to elicit the part-worths of the levels and subsequently to obtain the overall utility for the choice alternatives based on the multi-attribute preference model, in which a product is considered as a bundle of attributes (Wilkie and Pessemier, 1973). The model is shown in Table 1 (see Baier and Brusch, 2009a):

\[
y_j = \mu + \sum_{k=1}^{K} \sum_{l=1}^{L_j} \beta_{kl} \cdot x_{jkl}
\]

Such that:

\[
y_j \quad = \text{overall utility of alternative j}
\]

\[
\mu \quad = \text{average preference value of all alternative}
\]

\[
\beta_{kl} \quad = \text{utility of level l of attribute k}
\]

\[
x_{jkl} = 1 \quad \text{When the level l of attribute k in the choice alternative}
\]

\[
= 0 \quad \text{otherwise}
\]

**Table 2: Model of (adapted from Kim et al. 2003; see also Abu-Assab, 2012).**

This formula represents an additive utility model originating from the compositional model identified by Wilkie and Pessemier (1973) based on the main assumption that the total utility value of an attribute is the sum of the utility value of each of its levels (Hensel-Börner, 2000). Figure 2 presents the main steps of the procedure of the CC-SE method (Srinivasan, 1988).
Two concepts should be explained to understand the steps of the SE method. In step 1, the respondents should understand that when a product has a “totally unacceptable” level that means that this product will be rejected regardless of the other levels. Moreover, in step 3, a critical attribute is the most valuable attribute to the respondent, which is used as an anchor to estimate the importance ratings of the other attributes (see discussion in Srinivasan, 1988).

The main steps of the SE methods are:

1. Inform respondents about all attributes and their levels and identify “totally unacceptable” levels
2. Determine the “most preferred” and the “least preferred” level for each attribute, excluding the “totally unacceptable” levels
3. Identify the “critical attribute” and set its importance to 100 and elicit the importance ratings (0-100) for other attributes using the critical attribute as an anchor
4. Rate the desirability ratings of the different acceptable levels within the attribute and for each attribute on the scale with the least preferred (but acceptable level) = 0 and most preferred level = 100
5. Calculate the part-wor ths for acceptable attribute levels
6. Set the part-wor ths to fall in the range from 0-100 (To make the part-wor ths more comparable and readable)

Additionally, in step 5, the part-wor ths of the levels are calculated as follows (Dorsch and Teas, 1992):

\[ PW_{kl} = \frac{\alpha_{kl}x_{kl}}{100} \]

Such that:

- \( PW_{kl} \) = Part-wor th of level l of attribute k
- \( \alpha_{kl} \) = Self-explicated desirability rating of level l of attribute k
- \( x_{kl} \) = Self-explicated importance rating of attribute k

The new suggested method is introduced in the coming section.

A New suggested Method of Innovation: Integrated QFD

In this section, the new suggested method of innovation “Integrated QFD” is introduced and explained. This new method was already suggested by the researcher in her work (Abu-Assab, 2012). However, the method was suggested as a new research method for complex products and particularly for elderly people. In this work, the researcher reintroduce the method as a method of innovation and for customers of all ages. The method serves like any other innovation method in enhancing the ability of
The new method is a modification of the Pullman’s et al. (2002) method and Baier’s conjointQFD method (Baier, 1998). The two methods are described in details in the previous work of Abu-Assab (2012).

The new method is a combination of the two previously introduced methods in this paper: The two-stages conjuncture-compensatory self-explicated (CC-SE) method proposed by Srinivasan (1988) is suggested to be used to the QFD house of Quality mainly to make the method easier and lower the cognitive burden on respondents in comparison to the other combined methods.

The use of CC-SE method conforms to the consumer behaviour research that empirically recognises the heterogeneity in the choice process across individuals (see Srinivasan, 1988). The approach models the customer choices in two stages: conjunctive and compensatory. Individuals can purely choose in a conjunctive way in which they eliminate all the levels that are totally unacceptable, thus excluding them from further processing or they choose to different degrees in a compensatory way in which they trades off the remaining levels and attributes; Against this background, the author assumes that the CC-SE method would be more suitable to elicit the preferences of the customers of all ages as well as elderly especially for products with many attributes.

The major three phases conducted in the integrated QFD innovative method are:

*Selection and Evaluation of CRs*

The respondents (customers) and the expert team is built from experts including a number of customers who are considered expert in the selected product of study. In this phase, first the CRs are identified by conducting face-to-face interviews with customers (e.g. 17-20 face-to-face interviews can be a sufficient number to collect the CRs according to Griffin and Hauser 1993). The identification process of the CRs is conducted in the same way as described by Pullman’s conjointQFD. That is to say, three members of the expert team separately identify primary and secondary CRs and then conclude their work with a final list of primary and secondary CRs (see Pullman et al., 2002). Then a number of respondents are asked to evaluate the primary and secondary CRs by a one-phase SE method in which the respondents are directly asked to rate their preferences of the CRs on a 1-10 Likert scale. The CRs are then rescaled so that the sum of secondary needs is equal to their corresponding primary CR in the same manner as done in Pullman et al.’s (2002). Additionally, a check is done to make sure that the importance or preferences of CRs ranking correspond to the evaluation given by respondents, otherwise they are then corrected according to their evaluation. Afterwards, respondents are asked to
evaluate a number of competitive products of the selected product on a 1-10 Likert scale for the benchmarking part in the HoQ.

Selection and Assessment of ECs

In this phase, the expert team determine for each CR one or more ECs. Then for each ECs, two or three levels are assigned “convenient option”, “inconvenient option”, and “between option”. Additionally, the influences of ECs on each CR are determined as in the traditional HoQ. Afterwards, the relationship matrix is evaluated using the CC-SE method. For each CR, which is assigned more than one EC, a CC-SE questionnaire is made. The questionnaire is done by elderly respondents. By using the CC-SE method the relationship matrix is quantitatively assessed thus overcoming this problematic issue of the HoQ.

Estimation of the Importance of the ECs

From the CC-SE method, three HoQ can be constructed, namely a HoQ for (1) the conjuncture stage on the aggregated level, (2) the compensatory stage on the aggregated level, (3) the compensatory stage on the individual level.

For the aggregated level, the importance of the ECs are calculated in the conventional way, each EC importance is calculated by summing its influences over the CRs multiplied by the weight of each corresponding CR. On the individual level, the importance of the ECs are calculated for each respondent in the conventional way and then the average of the importance of ECs are presented in the HoQ for of all respondents is presented in the HoQ on the individual level.

An additional CC-SE interview is conducted to test the validity in which all the ECs are included in the interview to investigate the respondents’ preferences for the ECs. The “within approach” convergent validity is calculated on each of the three results.

The new method was implemented on the product of smart homes for the target group elderly people and was proven valid (refer to Abu-Assab, 2012; see also Abu-Assab and Szuppa, 2005).

In this paper, the concept is introduced of the new innovation method. Further, the author will be using this method on different industries and different target groups of customers.

CONCLUSION

In this conceptual paper, a new innovation method was suggested for new and improved product development for different types of customers which is based on the new research method that was suggested in Abu-Assab (2012). The method was implemented on the smart home product and proved
to give good results. Here, the author extends the use of method on products and different categories of customers.

The method should positively contribute to the field of new product development and/or improved products which in return should promote the competitiveness of the organizations and its capabilities to innovate successful products wanted and needed by buyers.

In further research, the author will be implementing the method on different products from different industries and for various targeted groups to test the method.

PERCEIVED VALUE OF BRANDS: THE EFFECTS OF BRAND ATTRACTIVENESS AND BRAND TRUSTWORTHINESS

Akturan, Ulun

Department of Business Administration, Galatasaray University, Istanbul, Turkey

ABSTRACT

The aim of this study is to explore the relationship among brand attractiveness, brand trustworthiness, and perceived value. Data were collected from 458 respondents via face-to-face interview. And the hypothesis tested via Structural Equation Modeling (SEM). As a result, it was found that brand attractiveness affects all four of the perceived value dimensions, and trustworthiness affects only three of them—functional, emotional and monetary value—but it has no influence on the social value.

Keywords: Brand attractiveness, brand trustworthiness, perceived value, SEM

INTRODUCTION

Business is about creating value. In today’s business environment, companies are focusing on creating and delivering superior value to customers in order to drive their satisfaction, loyalty, and profitability (Kumar and Reinartz, 2016). The value perception of consumers is a key element in marketing (Morar, 2013), and the marketing literature extensively investigates the perceived value (Sánchez-Fernández and Iniesta-Bonillo, 2007).

Previous research conceptualized value as a trade-off between “get” and “give” elements (Kumar and Reinartz, 2016; Zeithaml, 1988). In other words, consumers’ value assessment is based on perceived attributes and costs. Perceived attributes are benefits that the consumers can get by having those brands, and costs may be monetary—such as price—, or nonmonetary—such as time, effort, and perceived risks. The extant literature defines “perceived quality” as the main benefit, and “price” as the main cost, on that ground, perceived value is interpreted as “value-for-money” (Sweeney and Soutar, 2001). However, defining value as value-for-money is a uni-dimensional approach and there were attempts to redefine value as a multi-dimensional concept (Sheth et al. 1991; Sweeney and Soutar, 2001).

But, what affects the value perception of consumers? One of the main indicators is perceived quality—since it is a base for “get” elements— it affects value positively (Sweeney, 1997). In addition to quality perceived risk also has an impact on consumers evaluations, because it represents a cost as a sacrifice.
Creating and delivering value is a crucial factor for companies to succeed. It is also main activity of marketing, since the marketing is defined as “the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large” (AMA, 2013).

There are mainly two approaches to conceptualize perceived value, uni-dimensional approach and multi-dimensional approach (Sánchez-Fernández and Iniesta-Bonillo, 2007). From a uni-dimensional point of view, perceived value is conceptualized as a single overall concept that can be measured on the basis of quality-price relationship. One of the earliest attempts to conceptualize perceived value defines it as a function of acquisition utility and transaction utility (Thaler, 1985). Acquisition utility “is based primarily on non-monetary costs involved in a purchase and encompasses the subjective benefits derived from a purchase” (Jayanti and Ghosh, 1996, p. 8). However, transaction utility depends on the “perceived merits of the deal” (Thaler, 1985, p. 205). In this model, Thaler (1985) replaced the utility function in economics with the value function in prospect theory (Monroe and Chapman, 1987).

However, it is not that simple to measure value perception (Zeithaml, 1988). First, value perception is subjective and has different meanings for consumers. Second, consumers do not carefully calculate the give and get components as opposed to the assumptions of utility models. On that ground perceived value is “the consumer’s overall assessment of the utility of a product based on perceptions of what is received and what is given” (Zeithaml, 1988 p. 14). Monroe and Chapman (1987) conceptualized perceived value as a function of perceived quality constituting the numerator while the price as a sacrifice constituting the denominator (PV= PQ/P).

From a multi-dimensional point of view, perceived value has an affective dimension as well as a functional dimension (Morar, 2013). Holbrook (1994) developed a complementary view on value and postulated that consumption experiences most likely involve more than one type of value.
simultaneously. Because people do not desire products but they want to satisfy experiences, then customer value simply is an “interactive relativistic preference experience” Holbrook (1994 p.27). In other words, customer value involves an interaction between an object (e.g., a product) and a subject (e.g., a consumer). “This object–subject interaction is relativistic in at least three senses (comparative, personal, situational) –“first, involving a comparison among objects; second, varying from one person to another; and, third, depending on the situation in which the evaluation occurs” (Holbrook, 2006 p.715).

Sheth et al (1991) define multiple value dimensions for different choice and decision levels such as buy level, product level, and brand level. They suggested five value dimensions (social, emotional, functional, epistemic, and conditional) in relation to the perceived utility of those levels. Sweeney and Soutar (2001) developed a four-dimensional perceived value model (price/value for money, performance/utility, functional and emotional value).

(1) Functional value (price/value for money) is the utility derived from a product due to the reduction of its perceived short-term and longer-term costs (in this study, this dimension is called monetary value).

(2) Functional value (performance/quality) is the utility derived from the perceived quality and expected performance of a product.

(3) Emotional value is the utility derived from the feelings or effective states that a product generates.

(4) Social value is the utility derived from a product’s ability to enhance social self-concept.

In this research perceived value is defined as a multi-dimensional construct formed by functional value, monetary value, social value and emotional value.

Brand Attractiveness

Brand attractiveness is the “extent to which a brand is attractive, favorable, and distinctive” (Sophonsiri and Polyorat, 2009 p.54). It is the sum of the positive evaluations of the brand’s associations and attributions (Elbedweihy et al. 2016). Brand attractiveness is important for brand success (Kim et al., 2001) since it affects market share positively (Gonzalez-Benito et al., 2008). Also, perceived brand attractiveness influence the relationship between consumers and brands. The quality of the relationship between consumers and brands appears to be dependent on the brand’s perceived attractiveness (Hayes et al., 2006). On that ground, it has a direct, positive influence on consumer–company identification (Curra’s-Pe’rez et al. 2009).

Consumers evaluate a product category on the basis of the factors that go beyond the brand level. Boyd and Mason (1999) name those factors as “extrabrand attributes” (EBAs), such as the number of
competing firms, firm reputation, the existence of uniform standards of technology, the availability of local product support and repair services, and the actual users. Those EBAs constitute the assessment of brand attractiveness, which turns into the focal point whether to adopt or not. Therefore, attractiveness has an important influence on consumer attitudes and intentions (Boyd and Mason 1999). Brand attractiveness is not merely a function of attributes, but when the brand associations match the consumer’s sense of self, a brand is perceived as attractive (Bhattacharya and Sen, 2003). Moreover, value congruence is positively related to brand attractiveness (Elbedweihy et al. 2016). For example, a consumer who cares about animal rights will be drawn more to a brand that have respect for animal rights in their manufacturing and operation process (Bhattacharya and Sen, 2003). In addition, customer-to-customer similarity is positively related to brand attractiveness (Elbedweihy et al. 2016). In that sense, a brand is attractive when customers perceived other users to be similar to themselves.

Brand attractiveness is important in evaluating the attributes of a brand. It, even, uniforms an association related to the brand or the product category, and perceived value is the assessment of brand related attributes and costs, hereby it is hypothesized that:

H1: Brand attractiveness positively affects (a) functional value, (b) emotional value, (c) monetary value, and (d) social value.

**Brand Trustworthiness**

Brand trust is an important antecedent of brand loyalty (Chaudhuri and Holbrook, 2001; Delgado-Ballester and Munuera-Aleman, 1999), and a leading indicator of brand equity (Ambler, 1997). The long-term relationship between consumers and brands is based on trust (Morgan and Hunt, 1994). The relationship between trust and volume sales is not a linear, symmetric relationship. Trust builds slowly with sales when consumers are fully satisfied, since it is an affective form of memory (Ambler, 1997).

Trust is possible only after a satisfactory degree of trustworthiness is achieved (Lee and Turban, 2001; McKnight et al., 2002b). Trustworthiness can be defined as beliefs of ability, integrity, and benevolence (Gefen 2002). In order trust to be developed, consumers determine if a business is trustworthy (McKnight et al., 2002). Trustworthiness and trust are not the same concept, but they are related as trustworthiness precedes trust (Serva et al., 1990). In other words, “trust is an act of a trustor, whereas trustworthiness is a characteristic of someone or something that is the object of trust” (Corritore et al. 2003 p. 741). Since trustworthiness leads to overall trust, which is assessed as a determinant of brand equity and perceived quality, it is hypothesized that;
H1: Brand trustworthiness positively affects (a) functional value, (b) emotional value, (c) monetary value, and (d) social value.

Figure 1: Model of Hypothesized Relationships

RESEARCH METHODOLOGY

Measurement and Sampling

Data were collected via survey method from the university students. And the product category was chosen as sneakers, which is suitable with the sample. A total of 458 valid and complete responses were included in the final analysis. The socio-demographics of the sample is as follows: Gender (53.3% female, 46.7% male), Age group 21-23 (64.4%), Income level: 1500 Euro (34.9%). Because it is a student sample, sneakers were chosen as a subject to study.

In order to measure the variables, established scales were used. Perceived value was adopted from Sweeney and Soutar (2001), brand attractiveness was adopted from Wang and Yang (2010), and trustworthiness was adopted from Erdem and Swait (2004). Scales were translated and back-translated to ensure the consistency.
RESEARCH FINDINGS

The Reliability Analysis

Prior to test the hypothesis, the reliability of the scales was evaluated via Cronbach’s Alpha coefficient and the exploratory factor analysis was run to check the validity. Table 1 summarizes the Cronbach’s Alpha values and the explained variance of the constructs.

Table 1: The Results of Validity and Reliability Analyses

<table>

As given in Table 1, all the constructs are reliable, and explain at least 59.5% of variance. Then, the research hypothesis tested via SEM.

Structural Model Testing

The overall fit measures of the structural model indicate an adequate fit of the model to the data (Chi-square/df=3.382; CFI=.891; TLI=.877; IFI=.892; GFI=.861; RMSEA=.072). The results provide strong support for the conceptual model displayed in Figure 1, and Table 2 presents a summary of the hypotheses tests. As a result, all the hypotheses were supported except H2d, which is testing the relationship between trustworthiness and social value.

Functional value $R^2 = .616$, Emotional value $R^2 = .603$, Monetary value $R^2 = .302$, Social value $R^2 = .196$
R² values represent the explanatory power of the dependent variables and the overall adequacy of the model. It displays the explained percentage of endogenous latent construct by exogenous latent variables (Sirohi et al., 1998). For functional value R² value is .616, for emotional value it is .603, for monetary value it is .302 and, for social value it is .196. Brand attractiveness and trustworthiness explains nearly 60% variance of functional and emotional value. However, their exploratory power is low for monetary value, and social value.

CONCLUSION AND DISCUSSION

Extant marketing literature has investigated the concept of creating and delivering value to the customers. In order to drive satisfaction, loyalty and profitability, companies should focus on value creation (Kumar and Reinartz, 2016). This study seeks to find answers the affects of brand attractiveness and trustworthiness on perceived value.

Perceived value is the trade-off between the benefits that consumers expect or experience, and the undesired consequences (Gutman, 1982). The central aspect is that, consumers choose actions that, ceteris paribus, maximize the desired consequences and minimize concurrent undesired consequences (Kumar and Reinartz, 2016). Benefits are derived from the attributes of the offerings, while undesired consequences are the sacrifices or costs- either monetary or nonmonetary, such as price, time, effort and risk. Consumers are not able to perceive the entire objective attributes clearly (Kumar and Reinartz, 2016), but form a composite perception. Brand attractiveness and brand trustworthiness can also be assessed as brand attributes. Therefore, it was hypothesized that brand attractiveness and trustworthiness positively affects perceived value.

As a result, it was found that brand attractiveness affects all of the perceived value dimensions- functional, emotional, monetary and social value. And when the standardized regression coefficients checked, it is seen that brand attractiveness dominantly affects emotional value (.668). In addition to brand attractiveness, trustworthiness also affects three of the perceived value dimensions- functional value, emotional value, and monetary value, but it has no influence on social value. And trustworthiness has a major impact on functional value (.631).

The study contributes to the literature by defining the brand attractiveness and trustworthiness as determinants of perceived value. When consumers perceive the brand is elegant, beautiful and attractive, they perceive it is well made, has a consistent quality, offers value for money, give them pleasure, make them feel good, and help them to feel acceptable. Moreover, when they think that the brand delivers what it promises and has believable claims, they perceive the brand generates functional, emotional and monetary value.
As is the case with any research, the study has several limitations that may generate further research avenues. The findings may be limited to the sample and the brand investigated in this research. Because a student sample was used, the findings should be verified for other samples. Besides, one product category and one brand were investigated in the study. Therefore, other product categories should be tested for generalizability.

ADVANCING THE PRIVATE HEALTHCARE MANAGEMENT SYSTEM IN LEBANON AND THE MIDDLE EAST - INTRODUCING NEW MEDICAL BENEFITS BY THIRD PARTY ADMINISTRATORS

ABSTRACT

The definition of healthcare in the Middle East has recently been changing in accordance with the international healthcare advancements by incorporating new medical benefits and assessing the cost-benefit of these added services. Most of those added services were used to be viewed as being too expensive to be covered, irrelevant to core medical practices or simply secondary medical services that can be ignored. Changes in approaches to health issues such as mental disorders and sexually transmitted diseases and in particular the decrease in the taboo surrounding HIV infection, infertility and obesity has allowed the Ministry of Public Health (MOPH) with the support of Third Party Administrators (TPA) to tackle those issues in the Middle East. TPAs have played a crucial role in this aspect by highlighting the fact that those mentioned medical conditions do not have a high financial burden and covering them would in fact greatly help patients in need. In order to elaborate this point, this paper will look at certain healthcare trends and medical benefits newly added by TPAs in the region.

Keywords: Healthcare Management, Health Benefits, Middle East, Lebanon, Ministry of Public Health (MOPH), GlobeMed, Insurance Policies, National Social Security Fund (NSSF), Insurance Regulatory and Development Authority (IRDA)

INTRODUCTION

Large increases in health-care costs can make it difficult to balance a budget, but at the same time, health-care benefits are pivotal in maintaining an up-to-date healthcare level. Governments in the Middle East with the help of Third Party Administrators (TPAs) need to closely monitor health-care costs and choose approaches that make use of the jurisdictions, purchasing power, shared costs, and ultimately health promotion.
This paper will be based on analyzing the added benefits newly covered by a major Third Party Administrator in Lebanon and the Middle East - GlobeMed Lebanon (formerly known as MedNet Liban till September 2012).

Policies determine what is covered, what is excluded and what is subject to financial limitations. Over the years, the policies have been revised several times in order to add new benefits as the healthcare needs arise. Major updates have been implemented in several medical fields ranging from congenital disorders, to infertility and organ transplantation. In fact, while all the healthcare industry is covering “sickness treatment”, some Third Party Administrators are shifting their interest to “sickness prevention”, promoting prevention and wellness-education and even extending the scope of coverage to encapsulate palliative care.

In this paper, we visit the newly added benefits and asses the impact they had on the beneficiaries especially since they were previously exclusions that were recently transferred to covered conditions or procedures.

As previously stated, the policy is constantly changing to accommodate emerging needs; many benefits were added to various programs, but we will limit our review to subjects that we consider resulted in major changes and healthcare impact.

The benefits that will be visited are listed below; these were added gradually as of year 2012.

1. Transplantation, added in May 2012
2. Psychiatric and mental disorders, added in May 2012
3. Infertility, added in May 2012
4. Pet scan and VCT 64, added in May 2012
5. Morbid Obesity Surgery, added in October 2014
6. HIV and other Sexually Transmitted Diseases, added in May 2015

Other added benefits of importance also include video capsule endoscopy, OCT (Optical coherence tomography), non-post-traumatic prosthesis, and many others.

The general aim of this paper is to augment the Lebanese Healthcare Management Association’s goals that revolve around assessing and advancing healthcare solutions through the widening of the scope of healthcare services that need to be covered by Third Party Administrators. These services would be proven in this paper to have bearable financial costs while at the same time immensely advancing the healthcare level in Lebanon and the Middle East.

The objectives of this paper would therefore be:

1. To shed light on several healthcare services that have been newly introduced into the general healthcare practices in the Middle East but which needed the support of private Third Party Administrators in order to include them in the applied policies.
2. To highlight the impact of covering HIV and other sexually transmitted diseases that were once thought to be completely out of the scope of health coverage schemes. The same applies to organ transplantation, psychiatric disorders, infertility, Pet-Scans and bariatric surgeries.

3. To delve into each of the six most significant healthcare services and elucidate the cost-benefit and advantages of including those services into the common mainstream healthcare system.

4. To present an example which can serve future healthcare assessment projects in being able to persuade healthcare Third Party Administrators to adopt and cover potential healthcare services.

LITERATURE REVIEW

When trying to understand the different types of healthcare coverage programs and policies, it is important to know the definition of policy exclusions and restrictions which were the subject of criticism in several papers. By this token, healthcare plans should be assessed from different perspectives. Even though we are tackling the newly covered benefits in this paper, it is important to note that policy exclusions and restrictions are important as well. Exclusions arise when one is not covered at all for certain services. Restrictions however arise when one agrees to receive only limited benefits for certain services. This might have the benefit of paying a lower premium in return. In her paper, ‘What Does That Means? Understanding Health Insurance Coverage’, Mila Araujo has defined what a lifetime maximum, out-of-pocket expenses and limitations on pre-existing conditions are. “A pre-existing condition is a medical condition that the insured had before the insurance policy began. Some plans will cover pre-existing conditions while others may completely exclude them. Pre-existing conditions may sometimes be subject to a waiting period before they are covered, other times they are excluded completely” (Araujo, 2016). This would constitute a win-win situation in certain instances when certain pre-existing conditions might not pose a health threat for the policy holders and excluding them might save those holders money by paying lower premiums and removing or lowering the financial limitation on other diseases that might otherwise pose a higher threat. Moreover, experimental and investigational therapies are still not covered by most coverage schemes in the Middle East because of the mere fact that they are still unproven therapies that might be detrimental to one’s health. However, in several instances, rising premiums have been paired with increasing exclusions. This is the case with some healthcare coverage programs in Australia. “With insurance premiums rising faster than inflation … policies are being stripped of cover deemed unnecessary, or laden with fees and charges that members pay only when treated. Former health official Shaun Gath is warning that this trend will force insurers to increase the price of entry-level products, potentially deterring customers. The Australian Competition and Consumer Commission
(ACCC) has also raised concerns over the increasing number of policies, changes to benefits and the rise of exclusions, restrictions, excess and co-payments. ‘This complexity makes it harder for consumers to understand and respond effectively when insurers change their benefits, and makes consideration of reforms to improve benefit change notifications in this industry even more important,’ the ACCC states in its latest report to the Senate” (Parnell, 2017).

When the civil war ended in 1992, the health sector in Lebanon faced several problems: the weakened Ministry of Public Health (MOPH), rapid cost escalation in health expenditure, particularly MOPH expenditures, unrestricted growth of the private sector and a weakened primary health care system. In response to these problems, the government adopted a health sector strategy in 1993. Important elements of this strategy included strengthening the role of the MOPH and containing the rapid growth in health expenditure. While the long-term objective of the health sector strategy is to improve the allocation and use of resources in the public and private sectors, the short-to-medium term objectives have focused on improving the managerial and administrative functions of the MOPH, including a comprehensive package of curative and preventive services at all primary health care facilities, strengthening of hospital management and implementing service delivery capability and alternative health financing options (Kronfol, 2006). Moreover, a recent endeavor in 2016 was the collaboration between the MOPH and three TPAs in Lebanon whereby those TPAs would be helping the MOPH in both managing and auditing health claims.

With the growth of private voluntary insurance in the unregulated healthcare market, costs of healthcare are likely to go up. Managed care organizations in many developed countries play important role in containing costs. The Insurance Regulatory and Development Authority (IRDA) has paved the way for insurance intermediaries such as third party administrators (TPAs) which are going to play a pivotal role in setting up managed care systems. TPAs have been set-up with the objective of ensuring better services to policyholders and mitigating some of the negative consequences of private health insurance. However, given the demand and supply side complexities of private health insurance and health care markets, insurance intermediaries face challenging tasks to achieve these objectives. Right in the early stages of its development, the IRDA has defined the role of TPAs to manage claims and reimbursements. Their role in controlling costs of health care and ensuring appropriate quality of care remains less defined. In order to mitigate the risks of working capital, insurance companies may be required to keep cash balances with TPAs to meet the reimbursement pressure (Bhat, 2004).
GAP(S)

Mustafa Younis who is a member of the Executive Committee of the International Society for Research of Healthcare Financial Management states that an emergent issue in the Middle East is the long-term policy to deal with access to healthcare and health for the growing aging population. In his speech to Laura Dormer, the commissioning editor of Future Medicine, he states that the government and other healthcare organizations are increasing their focus on preventive healthcare as a means of cost containment and outcomes improvement. They have used the media and other educational outreach to promote immunizations and other forms of prevention. However, they continue to face the major obstacles of low literacy rates and political instability in the region, which can limit the success of these efforts (Younis, 2013).

The Middle East is further challenged by high health care costs on a per capita basis, significant variation in the quality of care provided across sectors, and large gaps in services. Boston Consultancy Group was asked to assess and benchmark performance, develop recommendations, and create a roadmap for change and their recommendations included increasing preventive care and integrating the public and private healthcare sector. “Creating value for patients is both the ultimate goal and an increasingly critical competitive advantage for health care payers and providers worldwide. Payer organizations are being challenged to manage funding gaps and improve the care of members within a changing regulatory environment. Health care providers must transform their business models to deliver cost-competitive services that improve patient outcomes and deliver sustainable growth for the organization” (Farber, 2017).

In the United States, the new healthcare reform law (the Patient Protection and Affordable Care Act or “PPACA”) required healthcare payers and insurance companies to cover additional preventive care services and eliminate member cost-sharing (copayments, deductibles, or coinsurance) for certain in-network preventive care services (Laxmaiah). The question that arises here is why the Middle East is still lagging behind on this front? It is clear that healthcare reform needs to kick in. This reform can only be done through collaborations between Third Party Administrators and the Ministry of Health and by extending the horizons of the existing healthcare benefits. Although many benefits have been introduced, still much reform is needed to be done.

METHODOLOGY

This paper is based on the statistics, real-life medical examples and assessments – hence, it is a quantitative research using a deductive approach - conducted on data from a leading private healthcare Third Party Administrator in the Middle East, GlobeMed Lebanon. The ontology is that of
a positivist and the epistemology is positivism; this leads to a positivist paradigm. In essence, we will focus on the Lebanese market and numbers pertaining to the Lebanese adherents – which is the sample of study. As for the methods to be used, this research will utilize the IBM Cognos Analytics software which is a business intelligence and performance management tool in order to personally extract and analyze all the needed data. Besides Cognos Analytics, we will take advantage of a healthcare platform, ‘i-care 2’, which is utilized by GlobeMed Lebanon and which has access to all the medical records including adherents’ profiles, electronic medical records and healthcare provider data. In this manner, all the needed quantitative data relevant to our study are extracted and linked to other financial and medical data in order to draw conclusions.

**HYPOTHESES TESTED**

*H1:* The addition and implementation of new healthcare benefits by TPAs is cost-efficient.

*H2:* The addition and implementation of new healthcare benefits by TPAs would lead to a win-win scenario between the guarantors and adherents.

**DATA GATHERING AND ANALYSIS**

1. **Transplantation:**

   While transplantation is described for kidney, liver, heart, pancreas, lung, cornea, skin, and bone marrow, our review will be limited to bone-marrow and kidney transplants because of the scarcity of cases.

   In the following section, we will study 8 bone marrow and 7 kidney transplantations.

1.1 **Bone-Marrow Transplantation (BMT):**

   Bone marrow transplantation, or stem cell transplantation, is the process of taking healthy stem cells from the blood or bone marrow and transferring them later on into a malfunctioning bone-marrow.

   In the experience of GlobeMed Lebanon, since it started covering bone-marrow transplantation in May 2012 for its Perpetual and Mutually Upgraded Plus programs, only 8 patients needed this newly introduced benefit out of the 30 identified patients in the whole population including the groups that have policies that are the same as NSSF benefits.

   The only two providers where bone-marrow transplantation (BMT) was done for GlobeMed Lebanon patients’ were the American University of Beirut Medical Center and the Makassed General Hospital. The outcome is not as impressive as in the kidney transplantation (presented later), but the number of cases reviewed is minimal and does not permit to make conclusions.
Only one woman who was 65 years old died during the same hospitalization of the bone-marrow transplantation. She had T-cell lymphoma diagnosed in February 2014, underwent the autologous bone-marrow transplantation in May 2016, and died of sepsis around one month later while still in hospital.

Another woman who was 65 years old, first diagnosed with Multiple Myeloma in September 2015, had 24 sessions of chemotherapy, followed by successful autologous bone-marrow transplantation. However, she died one year later of aspergillosis pneumonia.

The six remaining patients are still alive but with variable outcomes: stroke, relapse and chemotherapy four years later but with no direct complications. By reviewing the expenses related to this new benefit, the average cost of the procedure was 35,000 USD. The total cost incurred for the 8 patients related to their diseases was 809,640 USD; but it is important to note that regular chemotherapy cycles before the BMT are not included in the financial limitation.

It is worth noting that in the Lebanese market, transplantation is not yet included in most of the policies. But since its introduction under GlobeMed Lebanon's policies in 2012, the experience is considered encouraging, and out of the 94 cases with diagnosis listed in the indications of BMT, eight could benefit from it under their insurance coverage in Lebanon.

Although the network covered under GlobeMed Lebanon includes the MENA region and France, there are no reimbursement claims from abroad and all the cases were done in Lebanon.

1.2 Kidney Transplantation:

It is well known that end-stage renal disease may lead to death; only dialysis and kidney transplantation are available to treat this condition.

In Lebanon, there are 2 major payers: the public sector and the private sector. Regarding the public sector, the NSSF and MOPH are paying directly the fees of the surgery to the hospital. They do cover also the cost of immunosuppressive drugs needed to maintain the life of the transplanted kidney.

In the private sector, most of the policies are still excluding kidney transplantation. GlobeMed Lebanon added the transplantation to its covered benefits in May 2012, subject to a life-time financial limitation.

Between 2012 and June 2015, GlobeMed Lebanon covered 7 cases of kidney transplantations. While the total financial limitation for the 7 cases was 780,000 USD, the cost of the procedures was only 180,260 USD, and the real spent amount was 107,586 USD since some patients had co-insurance.
While the number of cases is not the most significant factor under study here, it should be noted that the average cost over the years strongly depends on the admission class of the patients. The good news is that 100% of the kidney transplantations procedures covered by GML were successful.

2. Psychiatric and Mental Disorders

While reviewing the number of patients who benefited from this newly added benefit, we found 21 patients from 2012 through 2015, 17 of them being female and 4 being male.

As can be seen in the figure above, the total cost incurred is not major and the maximum length of stay was 11 days for a case of major depressive disorder. The ages of hospitalized patient ranged between 21 and 88 years.

3. Infertility

GlobeMed Lebanon has extended its coverage of infertility in 2012 for the following coverage plans: Mutual Upgraded Plus, Perpetual Program, Perpetual SP Limited Network. This coverage for infertility covers laparoscopy and hysteroscopy procedures for females whereas for males it covers varicocele repair procedures. However, the newly added infertility benefit does not cover in-vitro fertilization or intra-uterine insemination procedures.

3.1 Males: Varicocelectomy

Varicoceles are enlarged varicose veins that occur in the scrotum. Between 2012 and end 2015, GlobeMed Lebanon covered 337 varicocele surgeries, out of which 57 fall under the newly added
benefits. The age of the beneficiaries ranged between 12 and 51 years. Most of them had one surgical intervention with no further complications. All the hospitals can provide this type of surgery, so claims occurred in 67 hospitals within the GML Network.

Going back to 2010 and 2011, we noted that GML was rejecting around 80 requests of varicocele repairs per year. GlobeMed Lebanon’s male population counts for around 105,000 adherents, around 60,000 of them being between 12 and 51 years of age. Since coverage of infertility is not yet comprehensive, no one can estimate, from the number of varicocele cases covered, the rate of infertility in the subject male population.

3.2 Females: Laparoscopy and Hysteroscopy

The most common procedures associated with infertility in women are laparoscopy and hysteroscopy. Both procedures can be performed for several medical conditions other than infertility and are inherently covered, such as pelvic pain, hemorrhage, etc...

If we limit our review to the cases with a final diagnosis of infertility, we have 10 cases between 2012 and the end of 2015, with a mean age of 36 years and an average cost of 1,401 USD. Most of the laparoscopies done for infertility of tubal origin have an average cost of 2,522 USD while most of the hysteroscopies are done for endometrial hyperplasia with an average cost of 603 USD.

If we take into consideration all cases of hysteroscopies and laparoscopies in those years, for all ages including post-menopausal women, the below table will describe the situation. As can be seen, the numbers are quiet more than if infertility is taken alone which means that such procedures done for infertility alone are cheaper possibly due to lower expenses in accompanying costs.
Figure 4: Laparoscopy and Hysteroscopy, all causes (not only infertility)

Our data shows that the number of claims for such procedures is gradually increasing over the years. Moreover, the age range of women undergoing the aforementioned procedures is mostly between ages 32 – 44 years and the total cost of those procedures over the years (2012 – 2015) for the newly covered plans sum up to nearly $298,180 in those 4 years. However, the average cost per claim is relatively stable and the increase in total cost is mainly related to the increase of accepted claims over the years.

<table>

</table>
| Total| 493                       | $298,180.10     | Average                | $603.4

Table 1: Average cost per claim

Now, let’s look at the rejected cases of infertility before the year 2012 (before implementing the novel coverage) as compared to that rejection as of year 2012 onwards:

Our data shows that there were 36 rejected cases of infertility during the years 2012 till 2015, 15 of which were in 2010 and 16 being in 2011. So, 15.5 claims per year were rejected in those two years and this average rate of rejection decreased to 9 claims per year as of year 2012 onwards. Based on the fact that the average cost per claim was around 603 USD, then around 5,500 USD per year were related to rejected claims of infertility as of year 2012 onwards and around $9,400 per year is related to rejected claims before that. Therefore, the rate of approval of infertility cases increased by more than 72%.

4. PET-Scan and VCT-64

4.1 PET-Scan:

A minimally invasive diagnostic imaging procedure, PET uses a radioactive tracer to evaluate glucose metabolism in tumors and in normal tissue. TPAs in Lebanon have started covering PET-Scans for oncology cases only. Studying the covered PET-Scans up until 2015, GlobeMed Lebanon covered them...
on out-patient basis, and the average cost of the test varied between 1,000 USD and 1,088 USD.

Figure 5: Number and Total cost of Pet Scan from 2011 to 2015

GlobeMed Lebanon had 1,139 adherents in 2015 diagnosed with cancer and covered 189 PET-Scans, sometimes twice and more for the same patient during the same year. Although GML is sure the PET-Scanning is providing better cancer staging and follow-up, it does not have enough data to evaluate the impact of introducing PET-Scan to its policies.

4.2 VCT-64 (Coro-Scan):
The heart is known to be a “noble organ”. Preserving it is a major concern to any human being. GlobeMed Lebanon decided to cover this test even though it is not yet recognized by the NSSF. As can be seen in the table below, the average and total cost of VCT-64 has been increasing over the years and this is related to the increasing number of patients undergoing this imaging technique. This is based on 2 factors: the increase of awareness to the benefits of this imaging technique and an increase in the awareness in recognizing the availability of it.

However, it should be noted that the coroscan did not replace the traditional cardiac catheterization which is done on an in-hospital basis.

5. Morbid Obesity Surgery (Bariatric Surgery)

Obesity is a world-wide epidemic and is associated with multiple serious co-morbidities, both physical and psychological.

Body Mass Index (BMI) is a simple index of weight for height that is commonly used to classify overweight and obesity in adults. It is defined as a person’s weight in kilograms divided by the square of his height in meter.

For adults, WHO defines overweight and obesity as follows:

- Overweight is BMI greater than or equal to 25.
- Obesity is a BMI greater than or equal to 30.

Since starting covering bariatric surgeries for morbidly obese adherents in October 2014, GML has approved and covered nearly 220 cases of such surgeries.

Furthermore, the increase in medical expenses and hospitalization fees has rendered those surgeries more expensive. This can be clearly noted in the graph below which shows the increasing trend in the average cost of the procedure in Lebanon.

![Figure 7: Average cost of morbid obesity surgery over the years in GML population](image)

6. HIV Tests:

The number of patients undergoing HIV tests is not huge but nonetheless significant. Knowing that HIV screening and testing helps in early detection, treatment and consequently a decrease in the number of patients reaching the AIDS stage, covering this test can have a great positive impact on our patients’ health status and on decreasing the outbreak of this global disease.

We have not detected a significant difference in ordering this test between males and females (394 for females versus 362 for males). Moreover, the total cost of doing this test over the past 6 years for our population of adherents amounts to 16,686 USD knowing that a single admission for any of our
patients can cost approximately this much if he/she presents with serious infections and immune-compromise.

Figure 8: Trend of Total Number of Claims for HIV Tests over the years

As can be seen above the total number of claims dramatically increased in 2015 since GML started covering HIV testing in its policies as contrasted to the years before whereby coverage was just based on NSSF approval.

Because of the fact that antiretroviral treatment is given for free to infected patients and the fact that we are pushing forwards for early detection, the number of HIV infected patients who have an undetectable viral load is nearly 80% and the goal is to reach 90% according to Dr. Jaques Mokhbat, a prominent leading infectious disease physician who is striving for HIV advancement in Lebanon.

GML data shows that nearly 60% of the tests done for STD’s other than HIV are mainly for anogenital (venereal) warts caused by human papillomavirus (HPV). However, the number of tests ordered is not very significant as it is small and not statistically important.

**DISCUSSION**

In USA, Medicare started covering kidney transplantation in 1972, with deductible and co pay, based on a study proving cost saving compared to maintaining patient on hemodialysis (Levinsky). In Lebanon, the rising coverage of organ transplantation has helped in improving the health status of some patients especially those with end-stage-renal disease. However, the figures are still shy due to the various financial, technological and medical hurdles that still need to be solved. This does not mean that there is no future for such surgeries/ on the contrary, the future is bright in Lebanon and the Middle East for such surgeries especially kidney and bone-marrow transplantations.

As most people know, mental health care services are not covered by health insurance packages and health plans to the same degree as are physical healthcare services. Not only such medical services are excluded, but even when covered they are often subject to higher co-pays and are capped at a maximum number of covered treatments in a lifetime. Less well known is the fact that those with severe mental illness (SMI) are less likely to have health insurance coverage of any kind (McLaughlin, 2004).
What emerges is a complex circle of correlation that suggests various paths of causation. Lower levels of employment, educational attainment, and income are positively correlated with both mental illness and the lack of health insurance coverage; lower levels of insurance coverage are negatively correlated with utilization of primary care; late detection and treatment of mental illness is positively correlated with psychiatric and physical co-morbidities; and so on (Levy and Meltzer 2004). The findings of the research done by Wang point out a serious problem in the health care system and underscore the belief of many that mental illness may be one of the more important areas in which the lack of insurance coverage leads to serious deleterious health consequences which impact both the individual and society (Wang et al. 2004). In Lebanon, NGOs like IDRAAC (Institute for Development, Research, Advocacy and Applied Care) is striving to spread more awareness about such psychiatric illnesses and the fact that TPAs have started covering them rendered the patients less afraid to disclose about such an illness and feel motivated about the mere fact that insurance companies are standing by their side.

Infertility is considered one of the main public health issues, as it affects about 15% of the couples of reproductive age (World Health Organization). The male factor is involved in 40% - 50% of infertility cases (Speroff L). The most common type of male infertility is idiopathic infertility, which is characterized by the presence of one or more abnormal semen parameters with no identifiable cause (Baker HW). Another common cause of male infertility is varicocele, which in a European study was found to affect 16.6% of men referred for infertility (Nieschlag E). The Lebanese public as well as third party administrators have seen no reason not to cover surgical and medical treatments for infertility. The previous idea was that health insurance companies should only cover medical case that cause debilitation or deteriorating health. However, as these companies have shifted their visions to encapsulate a more comprehensive medical approach that takes care of healthcare itself, the definition of what to cover has in turn changed. Managing infertility is started to be seen not as a ‘luxury’ treatment but a medical necessity.

Regarding infertility in females, studies have shown that surgical treatment of severe endometriosis does improve the chances for pregnancy as compared to no treatment (Richard Sherbahn). TPAs in Lebanon have started to cover cases of moderate and severe endometriosis which can help women in overcoming their infertility problem. The only way to be sure whether a woman has endometriosis is to perform a surgical procedure called laparoscopy that allows the physician to look inside the abdominal cavity with a narrow scope.

Endometrial polyps are localized hyperplastic overgrowths of endometrium that contain both endometrial glands and stroma. Up to 25% of women with unexplained infertility have endometrial polyps on hysteroscopy (Rackow). Since those polyps can bleed and in turn have serious
complications, visualizing them via hysteroscopy and treating them either by excision or laparoscopy have saved us from many other attributable hospital admissions for anemia, unexplained abdominal pain, adhesions and possible malignancies. The approach therefore is not only to cover the disease that is directly related to the symptoms but also to prevent the possibility of having future preventable diseases and unnecessary hospital admissions.

Regarding breast cancer, PET-Scanning has efficacy superior to that of conventional imaging for the detection of locoregional and metastatic spread in the appropriate patient population, and has better diagnostic performance for detection of skeletal metastasis compared to routine bone scanning (Osborne JR, Miyake KK, Jin S). Pet-Scan allows more accurate staging of the tumor in patients and consequently has resulted in a change of treatment in 10%-15% of them (Gallamini A). Clinicians can detect much earlier the effectiveness of a given antineoplastic treatment, as compared to the traditional radiological detection of tumor shrinkage, which usually takes time and occurs much later and by this Pet-Scan has increased the general survival rates in cancer patients by 25% (Pellegrini C). This is a main reason for the increasing utility of Pet-Scans in breast cancers. Therefore we should expect an increase in the demand on PET-Scan in breast cancer patients. The numbers in Lebanon have indeed shown that such exams are on the rise and therefore the need to cover them has become a necessity. Also under the umbrella of radiologic exams, we have seen that the use of 64-slice MDCT (multidetector computed tomography) results in excellent diagnostic accuracy and in an increased negative predictive value for detecting significant coronary stenoses in per-segment analysis. Patients with a high probability of coronary artery disease do not benefit from this type of non-invasive approach (Sirol). However, other patients with mild to moderate risk for cardiovascular diseases would surely benefit. In a study done by the Institute for Diagnostic and Interventional Radiology in Frankfurt, 218 patients with Coronary Artery Disease were studied (n = 218) and atherosclerotic plaques were found at transverse scanning with a sensitivity of 65.6% (143 of 218 plaques) (Vogl). This sensitivity increased in patients with an intermediate to moderate risk since this techniques works best for those patients and not for the ones who are known to have atherosclerotic heart disease or who are high-risk cardiac patients. By this token, third party administrators have realized that utilizing this exam to screen low to moderate-risk patients would in fact help those patients avoid that complications of the more invasive cardiac catheterization and would motivate more patients to perform this exam given the fact that it is patient-friendly, fast and safe.

On another front, covering bariatric (weight-decreasing) surgeries is on the rise in Lebanon and the Arab world. As per the American Society for Metabolic and Bariatric Surgery, based on data analyzed from 235 hospitals between 2005 and 2007, related to 66,339 bariatric surgeries performed, 83% of
patients were female with mean age 43 years. In GlobeMed Lebanon 57% of the patients were female, with an average age of 37 years.

Out of the 220 claims of bariatric surgery, we had a total of 19 complications (8.5%) that followed the surgery and occurred during the same hospital stay. The complication rate in Lebanon is lower than the international rate (13% for Sleeve and Banding and 21% for Bypass as shown by the various different research conducted by Blachar A, Carucci LR, Chang SH, Heneghan HM, Himpens J, Livingston EH, Masoomi H, Suter M, Topart P, Triantafyllidis G). These complications include postoperative haemorrhage and hematoma (5 cases), prolonged ileus (2 cases), hypotension and tachycardia (2 cases), ulcer and necrosis (1 case), vomiting and intestinal obstruction (4 cases), accidental puncture and laceration during procedure (1 case), fever (1 case), dysphagia (1 case), respiratory distress (2 cases), respiratory distress (2 cases).

Of the three most popular bariatric surgeries (Lap Band, sleeve gastrectomy, gastric bypass), gastric bypass is the most expensive. Duodenal switch surgery and some revision procedures are usually the most expensive of all bariatric procedures. The gastric banding used to be the most popular; however, currently, sleeve gastrectomy is the most common followed by gastric bypass. Due, to the prominence and popularity of those latter two procedures, the average cost of the bariatric surgery has increased over the years. Furthermore, the increase in medical expenses and hospitalization fees has rendered those surgeries more expensive.

Finally, over the past decade, antiretroviral therapy has become more potent, better tolerated, and less complex. According to an article published in Oxford Journal, today, most human immunodeficiency virus (HIV)–infected individuals receiving combination antiretroviral therapy achieve an undetectable plasma HIV-RNA level. Nevertheless, deficits in the spectrum of engagement in HIV care including late HIV diagnosis, suboptimal linkage to and retention in HIV care, insufficient use of antiretroviral therapy, and suboptimal adherence to therapy, pose significant barriers to achieving optimal treatment outcomes (Gardner EM, 2011). In Lebanon, the Ministry of Public Health is dispensing free medical treatment (antiretroviral medications) for hall HIV-positive patients. Several efforts are also being made in order to decrease the social stigma and stereotypes that surround those patients. Many social enterprises are also starting to devise new and innovative plans in the Middle East to help the communities get more aware of the dangers of HIV, prevention techniques as well as facilitating the delivery of medical management to all infected patients irrespective of sexual preferences or race. Therefore, third party administrators have found themselves in a critical position to cover those patients especially since helping them at an early stage would result in a win-win situation on the long-run, both for insurance companies and patients.

Table 4: Total cost in year 2015

(Note: relative percentages were calculated based whether each service is considered an in-patient or an out-patient claim).

The opportunity cost of not covering those services:

- **Bone Marrow Transplant**: Aplastic anemia, Leukemia, Lymphoma, Multiple Myeloma, Thalassemia... can all be cured by this procedure and therefore the cost saving would be significant.

- **Kidney Transplant**: Chronic Dialysis and most of the complications related to Chronic Renal Failure can be avoided.

- **Psychiatry**: decrease the stigma related to this medical condition, mitigate discrimination, boost patient’s credibility in the healthcare sector and avoid claims related to idiopathic claims that do not disclose psychiatric reasons as the underlying disease.

- **Varicocele (Infertility)**: An untreated varicocele or uterine polyps/adhesions are not life-threatening, however, they can lead to damage or complete atrophy of the testicles, ovaries and/or irreversible damage to the uterus and ultimately complete infertility. Covering such claims would render the healthcare services more immersive and comprehensive, decrease the stigma related to being infertile, boost the adherents trust in Third Party Administrators and help in avoiding unnecessary systematic complications.

- **Laparoscopy (Infertility)**

- **Hysterectomy (infertility)**

- **Pet-Scan**: There are tremendous benefits of having a combined PET/CT scan including earlier diagnosis, accurate staging and localization and precise treatment and
monitoring. The cost-saving therefore is significant.

Coroscan (VCT-64)  
Early detection of coronary artery diseases and avoiding strokes.

Bariatric Surgeries  
Provide patients with long term weight-loss and help increase the quality of health. Help improve or resolve many obesity-related conditions, such as type 2 diabetes, high blood pressure, heart disease, and more.

HIV  
Help patients in containing their infection and not reach the AIDS stage

Table 5: Opportunity Cost Description

The hypotheses tested that the addition and implementation of new healthcare benefits by TPAs is cost-efficient and would lead to a win-win scenario between the guarantors and adherents is therefore valid.

CONCLUSION

There has always been a question of whether extending a TPA’s coverage would be increasing the burdens on its shoulders. It turns out that on the contrary, the adherents (patients) get to feel protected and taken care of by nondiscriminatory and well-thought-of actions which would enhance clients’ loyalty while at the same time being viable for those Third Party Administrators. Many efforts are done to shift the TPA role into “sickness prevention”, promoting prevention and wellness education and even extending the scope of coverage to palliative care. This is done by extrapolating the basic function of merely acting as an intermediary between the insurer and the insured by taking a further step to assess the feasibility and benefit of extending the coverage in a win-win situation whereby the adherents have better access and coverage to broader healthcare services which are deemed financially feasible.

INTERLINKING EMOTIONAL INTELLIGENCE AND CUSTOMER RELATIONSHIP MARKETING IN THE LEBANESE RETAIL BANKING SECTOR

Al Khoury, Grace; Thrassou, Alkis; Kaufmann, Hans Rudiger

School of Business, University of Nicosia, Nicosia, Cyprus

ABSTRACT

Emotional intelligence has been a topic of controversy over the years pertaining to its level of significance in the business world as well as how it can be defined and understood as a concept. Through a number of researches done by pioneers in the field of emotional intelligence, it is shown that EI have shown a significant effect on the retail banking sector; hence, the aim of this research is to link emotional intelligence theory with frontline employee behavior in the context of customer relationship marketing; and to empirically test these on the Lebanese retail banking sector, drawing also practicable managerial implications through a combination of existing models, theoretical research and secondary data. A conceptual framework of emotional intelligence was developed. The value of this research stems from its contribution regarding shedding the light on the importance of EI, the interlinkage between EI and CRM and the creation of a customized conceptual framework that fit the LRBS; as well as setting of the foundation for future research that will refine, test and finalise this conceptual framework.

Keywords: Emotional intelligence (EI), Customer Relationship Marketing (CRM), Service Encounter, Lebanese Retail Banking Sector (LRBS), Lebanon.

1. INTRODUCTION

Studying the concept of emotional intelligence in the Lebanese culture is of great interest since emotional intelligence helps in enhancing customer relationship marketing of organizations that are in the service field such as banks (the industry, focus of this research). It is thus crucial for banks to understand their customers’ communication needs and perceptions, and to utilise this knowledge in the emotional intelligence context towards more effective customer relationship marketing techniques.

This research is a continuation on the work of Al Khoury et al., 2016 and Al Khoury et al., 2017, to refine the past papers’ model, to expand on it, to shape gaps and concepts better as well as to specify methodology better. A greater literature review is constructed through adding new concepts, such as:
CRM, Exhibited Behavioural Attributes of EI, Customer Evaluation and Service Recovery, to serve the creation of the new conceptual framework.

In the context above, the aim of the research is to link emotional intelligence theory with frontline employee behavior in the context of customer relationship marketing; and to empirically test these on the Lebanese retail banking sector, drawing also practicable managerial implications.

Towards this aim, seven objectives have been set:

1. To construct the theoretical foundation of the research and particularly in relationship to emotional intelligence, customer relationship marketing and service encounters.

2. To identify and evaluate emotional intelligence related employee behavioural attributes in the customer relationship marketing context, from the customer perspective.

3. To describe customer evaluation of exhibited emotional intelligence behavioural attributes.

4. To identify customer positive and negative actions in response to exhibited emotional intelligence behavioural attributes.

5. To prescribe how emotional intelligence can improve the service experience.

6. To interrelate bank employees’ responses with exhibited emotional intelligence behavioural attributes.

7. To develop a framework that will practicably link emotional intelligence theory with frontline employee behavior in the context of Lebanese banking customer relationship marketing.

2. THEORETICAL FOUNDATION

2.1 Emotional Intelligence

Over the years, the concept and definition of emotional intelligence has evolved since the 19th century. Gabriel (2000) stated that in 1990, Peter Salovey and John Mayer discovered a universal pattern to study emotions. Their research findings showed that individuals are able to identify and recognize emotions through faces, certain designs and colours. The term “Emotional Intelligence” became more solid and structured in 1995 and 1998, where people became aware of this terminology when Daniel Goleman wrote in “Emotional Intelligence: why it can matter more than IQ”. Theorists such as Thorndike, Wechsler and Gardner were the first to generate awareness of the concept of EI and facilitated the emergence of the current well known pioneers in the field of EI such as Peter Salovey and John Mayer, Daniel Goleman and Reuven Bar-On.
Emotional intelligence, simply, is the individual’s ability to monitor, recognize and understand his/her own emotions and feelings as well as others and the skill to use this ability in managing one’s behavior and relationships.

According to Mayer and Salovey (1997), the major areas of skills are: perception and expression of emotion, assimilating emotion in thought, understanding and analyzing emotion, and reflective regulation of emotion. Bar-On (1997) stated the following major of skills: intrapersonal skills, interpersonal skills, adaptability scales, stress-management scales, and general mood. The third most known and commonly used EI model is that of Goleman (1995a) where he listed the following skills: knowing one’s emotions, management emotions, motivating oneself, recognizing emotions in others, and handling relationships.

Intelligence quotient (IQ) and emotional intelligence (EI) are two completely different concepts and are independent of each other. It is possible for an individual of high level of IQ to have a low level of EI or vice versa. People assume that IQ is highly correlated with the achievements; to our surprise, it is not. Whereas EI is considered to be of high importance and highly correlated with success, experts stress that IQ contributes only about 20% of one’s success and achievements. A study examining Harvard graduates showed that the entrance exam grade, which is highly linked to IQ, had a poor and even a negative correlation with one’s success in his/her career life. It is well known that in order to run successful businesses it is not enough to use just the smarts. It is crucial to have a personal and a long-term relationship based on trust and technical know-how with the clients/customers especially in the services sector which includes banking. In business it is crucial to have self-awareness and self-confidence, and emotional intelligence is the key building block of these two components. Emotional intelligence is made up of five competencies as Goleman states: 1. Self-awareness: knowing one’s feelings, 2. Self-regulation: managing those feelings and emotions, 3. Motivation: stimulating oneself, 4. Empathy: identifying and knowing others’, 5. Social skills: managing relationships.

The following skills cannot be studied, measured and analyzed from a customer’s perspective rather than from the employees’ perspective. As a result, there is a need to translate these skills into exhibited behavioural attributes. A further research was made to construct a transitional phase in the model, which is the exhibited behavioural attributes, that enables the future implementation of the model. The key of the transition of emotions into behavior is attitude. (McShane and Von Glinow, 2009, p.100)

2.2 Exhibited Behavioural Attributes of Emotional Intelligence

McShane and Von Glinow (2009) discussed the effect of emotions on the workplace and how emotions can be translated into attitude and then behavior. Since emotional intelligence is the study of
emotions, generally speaking, there is need for the knowledge on the different types of emotion based on the levels of activation and evaluation.

The “Circumplex Model of Emotions” is the building block for understanding emotions which will be translated into behavioural attributes as a result of more detailed and interrelated models.

Emotional intelligence, generally speaking, is a psychological intelligence that deals with ones’ emotions and feelings; hence, how is it possible to control, motivate, and express these emotions if the individual is not aware of the emotions and the outcomes, consequently. The model shows two extreme emotions: positive and negative; however, the level of activation is the variable that results in different outcomes. Showing negative emotions at the workplace will result in poor performance; as a result, managers try to ensure that their employees come with positive vibes to work to increase the profitability of the organization.

Having the knowledge at this level of the different emotions, level of activation and the outcomes, a new “Model of Emotions, Attitudes, and Behavior” is introduced to summarize the role of emotions, attitudes and behavior, through both cognitive and emotional processes. The stimulus-response (S-R) model represents the difference between attitudes and emotions; attitude is a set of judgments that includes logical reasoning, whereas emotions are experiences that operate without one’s awareness. This dual cognitive-emotional attitude model is made up of cognitive, logical reasoning part, which creates the attitude, which is made up of three interrelated factors: 1. Beliefs, 2. Feelings and 3. Behavioural intentions. The model also consists of an emotional process where we have emotional episodes. These episodes affect one’s feelings which will have an influence on the end result, the behavior. Some episodes will lead to different emotions, but even low-intensity emotions will result in some automatic facial expressions that will be noticed by the customers. Hence, organizations tend to expose their employees to emotional episodes leading to positive feelings in order to shape employees’ attitude and behavior. The MARS model is an elaborated and advanced continuation of the S-R model and is made up of four factors: motivation, ability, role perceptions, and situational factors. This model shows a noticeable link between emotional intelligence skills and the factors that affect one’s behavior.

The “MARS – Model of Individual Behavior and Results” model consists of four elements which are influenced by individual characteristics. 1. Motivation: affects direction (which path to choose), intensity (how much effort is the individual going to dedicate for each target) and persistence (how much time will the individual continue to put effort to reach that goal). 2. Ability: is made up of aptitudes (are the natural talents/skills which help employees to attain the needed tasks at work and hence perform better), and learned capabilities (are the physical and mental capabilities that individuals
currently have and might fade with time if not practiced). The mix of these two concepts is usually used in the business world under the umbrella of competencies. Competencies are commonly described as personal traits such as: “knowledge, skills, aptitudes, personality, self-concept, values” (McShane, Von Glinow, p.36). Having these competencies will result in a better performance. 3. Role perceptions: are crucial for employees to know clearly their job description. Knowing what is needed and expected from them will set the direction and coordination with other employees/suppliers/stakeholders to reach their goal. There is a need for knowledge regarding the specific tasks, prioritizing their tasks and perform as expected, and finally understand which is the most preferable procedure/behavior by the organization to choose to complete the tasks assigned. 4. Situational factors: are external, non-controllable factors that affect employee’s behavior and performance. However, some situational factors such as: “time, people, budget, and physical work facilities” (McShane, Von Glinow, p.37) can be controlled and leaders make sure to plan for such factors so that their employees are able to perform at their best.

By mixing emotional intelligence skills and both S-R and MARS models of behavior, the following exhibited behavioural attributes of emotional intelligence are suggested:

- **Expression of Emotions**: Translation of anger, frustration, stress, work-overload etc. by employees in their interaction.

- **Managing Emotions**: Control, regulation, or otherwise channelling negative emotions into positive outcome.

- **Constructive Communication**: Communicating, connecting, providing needed/relevant information (technical know-how), tackle problems, reach solutions, persuade and motivate customers to invest/take risks.

- **Adaptation**: Adapting to changing environments, sudden obstacles/errors, anger bursts and unusual needs/requests.

Retail bank employees who have the above suggested exhibited behavioural attributes of emotional intelligence will result in a positive outcome and hence will be able to implement the customer relationship marketing skills to succeed at the workplace.

**2.3 Customer Relationship Marketing**

Marketeters in the new millennium are of two groups, those who practice customer relationship marketing (CRM) and those who do not, yet. However, those who do not practice CRM will not survive the new millennium and will not have enough profit to survive in the market. Generally speaking, marketing had gone through three waves, since world war two, before reaching CRM: 1.
Mass marketing, 2. Targeted marketing, and 3. Global marketing. All three waves share a core concept, which is the main focus/goal on maximizing sales. Since it is possible for sales to increase without increasing profits, marketers shifted their attention to the quality of share so that they ensure profitable growth. Marketers aim to increase both sales and profits, simultaneously, through creating and reinforcing the bonding with the customers and hence build customer relationships. CRM is the fourth significant post-war wave that came after global marketing (which is still used to date).

The four pillars of CRM, in short, are the ability to: 1. Identify, 2. Attract, 3. Defend and 4. Strengthen ‘brand loyalty’; and if the heart of CRM is brand loyalty, then ‘Value of a Customer’ (VOAC) is its brain. CRM is all about creating relationships with customers, retaining them, and trying to move them up the loyalty ladder. CRM is not about the sales, rather than enduring profitable growth through focusing on the customers and creating a loyalty bond between the organization and its clients/customers. Selling, which was the end goal of traditional marketing, is the first stage of CRM to turn customers into loyalists. Only customer-relationship marketing can endure profitable growth.

2.4 Service Encounters

On the other hand, employees might face failure in performing/implementing the suggested behavioural attributes of emotional intelligence. The failure in service performance means that the customer’s expectations were not met therefore customers will be dissatisfied leading to a negative outcome by having negative customer reactions/feedbacks. Data from TRAP Worldwide Inc. (2007) shows that: 1% to 5% complains to management or company headquarters, 45% complain to a frontline employee and 50% encounter a problem but do not complain. Zeithaml, Bitner and Gremler (2013) presented the “Customer Complaint Actions Following Service Failure” model in their book.

When failing to satisfy customer needs, negative emotions will emerge which will lead to either not complaining and choosing to either exit/switch or stay; or to act upon these negative emotions and file a complain to the provider, spread negative word-of-mouth using social media or other tools, which is extremely harmful for the organization due to the ease of access to social media without putting any financial effort and the time factor, where the complaint can be spread to the community in a matter or seconds. The customer might also consider a third-party action that would take action on his/her behalf which also harms the organization and cause propaganda. The end result will be either exiting or switch the organization or to stay, based on how the dissatisfaction was handled by the organization/employees. In order to minimize the loss of customers as a result of service failure, customers expect the organization to not only response, but also to show remorse for the inconvenience and disappointment of the service. The organization is expected to show that they
hold the responsibility and offer help as soon as failure occurs. The “Service Recovery Strategies” model presents the strategies that should be implemented once the organization faces a service failure.

Following the model of service failure which was discussed above, the model is adopted to ‘fix’ the dissatisfaction from the customer perspective as well as fixing the problem itself to ensure that it would happen again. Organizations and employees seek continuous improvement through learning from previous mistakes and planning for the future through training sessions and gaining experience through time. The implementation of these service recovery strategies/techniques will result in the shift of the negative outcomes which lead to negative customer feedback/reaction into a positive outcome. As a result, the failure will be recovered and employees will be able to implement the relationship marketing skills to ensure and boost their success. The concept of consumer behavior is embedded in the process of having a positive and negative outcome as well as in the corrective actions using service marketing techniques since without having the knowledge of customers’ behavior, it will be impossible for employees to uncover the needs and wants of their customers to satisfy and fulfill their expectations.

2.5 Focusing on the Lebanese market

Jamali, Sidani and Abu-Zaki (2008) stated the following results after conducting their research using the Emotional Quotient Inventory (EQ-I) technique to measure emotional intelligence and a final sample of 225 individuals working in different sectors such as banks, publishing organizations, internet companies, auditing firms, universities, government organizations, and other sectors from Beirut, Lebanon. Results showed that the entire sample scored moderate levels of emotional intelligence and that males scored higher on self-regulation and self-motivation whereas females scored higher on self-awareness, empathy and social skills. There was no significant change in EI scores between genders except for self-regulation where males scored higher. Senior managers scored higher than staff or lower-level employees on self-awareness, self-regulation and self-motivation whereas middle managers scored lower than senior managers and staff on empathy. Differences in educational background, as there are three categories: high school, college and graduate degree, had no significance in emotional intelligence scores when testing for self-awareness, self-regulation, self-motivation, empathy and social skills. Moreover, difference in age had no significance in emotional intelligence score, except for self-motivation where the group ranging from 35 to 44 scored the highest and the group aging under 25 scored the lowest. Carrying emotional intelligence assessments at work can assist employees to detect their strengths and areas of development, and by implementing this technique in a safe and supportive environment, it can trigger and improve self-motivation.

Moreover, a research was conducted by Hejase, Al-Sayed, Haddad and Hamdar in 2012 to explore how emotional intelligence is applied in Lebanon. In the first part of their study, researchers
highlighted the importance of emotional intelligence in business through existing frameworks. In order to explore emotional intelligence applications in Lebanon, both industry and service sectors were targeted. The sample included employees and managers of different backgrounds and gender. The final sample size was 110 individuals, and ten managers divided evenly between the service and industry sector. Results showed no significant distribution difference between genders in both sectors.

To summarize the awareness of emotional intelligence: 2/3 of the respondents in both sectors are not fully aware of the concept of emotional intelligence and have no deep knowledge on this concept. When identifying the sources that exposed emotional intelligence to the respondents in both sectors, none stated that they learned about it from their work setting. The sources were either from their education, media, or other mixed sources. The majority in both sectors agreed that EI has positive effects on an organization’s profit and disagreed with the statement that adopting EI principles incurs a lot of costs in such a way that there is no point in investing in it. They also agreed that EI programs result in favourable results in employees’ retention and disagreed that employees are required to work individually and not in teams when practicing EI principles.

2.6 Research Gap

The link between the concept of emotional intelligence and other domains such as healthcare, banking and education has taken interest over the years. A research paper written by Tudor (2015) has studied the link between EI and these different domains. The researcher stated that banks can utilize the concept of emotional intelligence when it comes to customer-banker relationship and in the day-to-day interactions. Other recent research papers conducted by Danquah (2014) and Kappagoda (2013) have showed the importance of EI in the banking sector. Tudor (2015) has suggested to further research the link between EI and one of the domains that she has researched; one of these domains is the banking sector. Hence, it is stated that the link between emotional intelligence and customer-banker relationship should be researched and studied thoroughly.

Kearney et al. (2017) studied emotional intelligence in front-line/back-office employee relationships and stated: “The present study is premised on the assumption that employee emotional intelligence (at the front line and in the back office) positively affects customer attitudes and drives customer-related organisational outcomes. We did not demonstrate this link empirically though. Further studies might use dyadic data and thereby link emotional intelligence at the individual employee level to the customer level” (p. 193).

Researchers have already suggested a research gap in the term of lack of empirical research linking emotional intelligence, its exhibited behavioural attributes of employees and customer relationship marketing from the customer perspective; and some researchers, in fact, have explicitly or implicitly called for such work to be done (Tudor 2015; Danquah, 2014; Kappagoda (2013); Kearney et
al., 2017; Wisker and Poulis, 2015; Hejase et al., 2012; Jamali, Sidani and Abu-Zaki, 2008; Suliman and Al-Shaikh, 2007; El-Chaarani, 2013; Geha, 2015). Wisker and Poulis (2015) suggested having a further research to study the effect of EI on marketing/sales performance, and identifying which of EI constructs affect the workplace performance. They have also suggested including variables such as personal characteristics, firm structure and industry characteristics when linking emotional intelligence to marketing/sales performance. This paper has included the exhibited behavioral attributes which relies on personal characteristics.

From a specifically Lebanese perspective, Hejase et al. (2012) added that although EI is perceived to be effective in organizations and will help in creating better outcomes, the majority of people are not willing to engage emotions and emotional intelligence in the workplace since they believe that emotions in business will lead to irrationality and unexplained behaviours and decisions. in the same vein, studies conducted by Jamali, Sidani and Abu-Zaki (2008) and Suliman and Al-Shaikh (2007) within Middle Eastern countries, including Lebanon, suggest that even though emotions cannot be separated from a person when conducting business and is part of the individuals’ personality whether the organization accepts that or not, many are still caught with the traditional saying of “leaving emotions at home before coming to the job”.

El-Chaarani (2013) has also studied the concept of emotional intelligence in Lebanese family firms. Although the concept of EI was explored in a completely different field than the one researched in this paper, El-Chaarani suggested to consider exploring this topic qualitatively and from a different angle from that of the research (family firms) since it will positively contribute to the field of EI. El-Chaarani added that other elements/variables should be taken into consideration, such as demographic characteristics and analyze how culture and education (through EI) can influence the job performance. Hence, El-Chaarani highlights the link between culture, emotional intelligence and job performance, which is affected by the customer relationship marketing.

Hejase et al. (2012) suggested to study cross-multiple relationships between different concepts such as EI and other concepts – to marketing, such as customer relationship marketing – and/or to management for example to discover a possible theoretical link that businesses can benefit from as they implement EI in their organizations.

Geha (2015) has stated: “Emotional intelligence training may be one way to bring opposing elements together. This is especially important to the Lebanese community with its diverse backgrounds, religions, political groups and people. It is my opinion that emotional intelligence skills should be introduced at all levels and to all people within Lebanon.” (p. 23)
3. CONCEPTUAL FRAMEWORK OF EMOTIONAL INTELLIGENCE

![Conceptual Framework Diagram]

**Figure 1: Framework of emotional intelligence for the Lebanese retail banking sector**

**Discussion of the Conceptual Framework**

This framework links customer relationship marketing and emotional intelligence skills by adding a twist by translating emotional intelligence skills into exhibited behavioural attributes based on the stimulus-response and MARS model of individual behavior so that it is possible for the Lebanese retail bank customers to evaluate whether these skills are being implemented properly. Customers’ evaluation of bank employees’ exhibited emotional intelligence behavioural attributes will result in either a negative or positive customer reaction. Here comes the role of employee bank response, which consists of the design of concrete response mechanism which are: responding quickly, providing appropriate communication, treating customers fairly, cultivating relationships with customers, guarantying the service offering, encouraging and tracking complaints, learning from recovery experiences, learning from lost customers, and making the service fail-safe, and linking them with the exhibited emotional intelligence behavioural attributes. The following step will result in
preventing negative customers’ reaction and enhance / reinforce positive customers’ reaction. As a result, this process shows how emotional intelligence is incorporated in a successful customer relationship marketing in retail banks (which is the aim of this research paper). Being able to control and manage one’s emotions and others will help in creating relationships with customers, which is the main goal of customer relationship marketing. In order to translate emotional intelligence skills into exhibited behavioural attributes, and in order to study customers’ negative and positive feedbacks, the concept of organizational behavioural is indirectly used since employees and bank managers need to study, understand and analyze their customers so that they can act and react. Having no knowledge of their customers, will hinder their success by not knowing which strategy to implement and this case is crucial when facing negative outcomes.

This framework of emotional intelligence summarizes the link between emotional intelligence and customer relationship marketing which will serve as a base line model for the empirical work that will follow the proposed framework. This section answers and summarizes research questions one till eight.

4. RESEARCH PHILOSOPHY

The ‘ontology’ and ‘epistemology’ of the research will adapt the classical interpretive/constructivist ontology and the interpretivism/constructivism epistemology; since they are interrelated. The reason behind choosing the following ontology and epistemology is the nature of the subject researched. Since one of the major concepts discussed is ‘emotional intelligence’, which is a psychological subject, a researcher needs to implement techniques that will reveal deep and valuable data, usually through interviews, observations, focus groups etc. The researcher, in this case, will take part in the interviews and hence it will mark as a subjective research.

As for the paradigm, it is expected, based on the ontology and epistemology chosen, that the research will implement the ‘interpretivist paradigm’ as well as the ‘constructivist paradigm’; the research paradigm, which is interpretivist/constructivist, is also labelled ‘anti-positivist’ (Hatch and Cunliffe, 2006) and ‘post-positivist’ (Blaikie, 1993). Another terminology used for an interpretivist phenomenology is Heideggers’ ‘hermeneutic (interpretivist) phenomenology’; which is originated from Husserls’ ‘descriptive phenomenology’. Saunders, Lewis and Thronhill (2007) stated that such a paradigm focuses on studying and analyzing ‘social actors’ and understand how they perceive the world. Hence, an interpretivist/constructivist paradigm is highly contextual and results cannot be generalized.

Research Methodology and Methods
Given that the phenomenological paradigm adapted is subjective in nature, it is best to use the qualitative approach to gather data. An exploratory case study is chosen to uncover significant variables and analyze the topic of study in the Lebanese context.

The researcher will implement two approaches, 1. Deductive – in order to extract the major emotional intelligence skills and exhibited behavioural attributes based on the literature review (secondary data); and 2. Inductive – to uncover the results of having positive and negative outcomes of implementing the suggested exhibited behavioural attributes from the consumer’s perspective (primary data).

The concepts of ‘reliability’ and ‘validity’ are interrelated since validity relies on reliability. These concepts differ from a qualitative to a quantitative research. In a qualitative research reliability is measured by ‘quality’ of the study although the concept of reliability is commonly used in quantitative research. These concepts aim at differentiating a ‘good’ from a ‘bad’ research and should be judged based on the research paradigm adapted. Data gathered from Lebanese retail bank customers requires validity and reliability; which made it the main reason to conduct this study from the customers’ perspective rather than the bank employees’.

Having in-depth, open-ended, semi-structural interviews helps in collecting more valuable data, understanding the situation realistically and maybe uncovering some hidden gaps that are not stated in existing research papers. This technique gives the interviewer the advantage of being able to remodel and restructure the questions when needed and also gives the interviewee the ability to better understand the aim of the study by familiarizing the latter with the concept of emotional intelligence.

However, before conducting interviews will Lebanese retail bank customers, a pilot test consisting of two to three questions will be implemented to make sure that the research is on the right path and hence the interviews will lead to valid and reliable results. Conducting a ‘pilot study’ before the main interviews is crucial to guarantee the success of the data gathering process. This study is considered a trial in preparation for the major study. A pilot study does not ensure the success of the research; however, it does increase the likelihood.

Interviews will be audio-recorded, transcribed and reviewed. At the end of each interview, critical incidents studies method will be implemented to uncover stories holding relatable variables that were not taken into consideration when studying the relationship between the customer and bank employees from the customer relations marketing perspective. There will be, in total, 30 interviews. However, in case the research did not reach maturity after carrying out 30 interviews, additional interviews are a must till reaching maturity. The distribution of interviews process is based on the percentages of distributions of Lebanese retail banks, geographically.
A purposeful sampling will be used in order to gather reliable data for this research; hence, the purposeful sample in this research is the Lebanese retail banking customers who are in direct contact with customer service bank employees. Being into a service domain such as banking means relying heavily on personal interaction between bank employees and their clients which makes it easier for bank customers to evaluate the suggested behavioural attributes of emotional intelligence; hence, results gathered from interviews and critical incident studies are expected to be reliable.

Data gathered from interviews will be analyzed using the ‘qualitative content analysis’ which shares some steps with the traditional ‘quantitative content analysis’ procedure, in addition to the NVivo software - which is specialized in analyzing in-depth interviews through highlighting the most important messages/factors/findings after linking and relating/combining the gathered information and consequently the final framework will be constructed. As data is gathered and analyzed, it will uncover any possible effect of the Lebanese culture on emotional intelligence.

Throughout the research, the researcher might suggest that there is a need for additional implementation of qualitative research techniques such as focus groups. The following suggestion depends on the reliability, quality and completeness of the data gathered through the interviews.

5. CONCLUSIONS AND IMPLICATIONS

The importance of emotional intelligence in organizations lays in its significant overall performance improvement through generating more sales and profits as well as satisfying clients and customers. Existing EI models created by Goleman, Bar-On and Mayer & Salovey, were adapted to set the overall EI skills which were translated into exhibited behavioural attributes using a number of models. These behavioural attributes are to be tested and evaluated by Lebanese retail bank customers. Both negative and positive customer outcomes are treated using service encounter models: Customer Complaint Actions Following Service Failure and Service Recovery Strategies. The conceptual framework created aims incorporate EI skills with effective implementation of CRM skills; laying the groundwork for further refinement, testing and elaboration through research and analyses.

Theoretical Implications

Creating a framework that studies emotional intelligence from the customer’s perspective through the utilisation of suggested exhibited behavioural attributes and linking it to relationship marketing skills and service marketing in the Lebanese context was never done before. This research seeks to satisfy the aims and objectives that are set, and to study empirically the Lebanese market to create a preliminary framework of emotional intelligence that is customized for the Lebanese retail banks.

Managerial Implications
The theoretical understanding of the role of emotional intelligence in the sector has significant practical implications as well. The research, in fact, through its framework, shall prescribe actions at all organisational levels towards the utilisation of the knowledge gained for managerial implementation in the contexts of human resource management, customer relationship marketing and service design. Ultimately, the findings of the research shall contribute to the banks' improvement in the aforementioned contexts with direct and explicit benefits in terms of profitability and growth.

SOCIAL ENTERPRISES AS DRIVERS OF LOCAL DEVELOPMENT: A FRAMEWORK

Andreottola, Francesco¹; Massaro, Maria Rita²

¹National Research Council of Italy, Institute for Research on Innovation and Services for Development (IRISS-NCR), Naples, Italy
²Dept. of Business Systems and Operations, University of Bedfordshire Business School, Luton, UK

ABSTRACT

The social enterprises (SE) are taking hold as key players in the processes of local development producing social, economic and environmental effects (Borzaga, Tortia, 2009; Borzaga, Galera, 2014; Eversole, 2013). Since SEs may assume a range of different organisational forms and despite the fact they are commonly spread across many countries, there is not any agreement on a unique and common definition yet (Doherty et al., 2014; Phillips et al., 2015; Picciotti, 2013). Certainly, SE’s objective is to pursue a social goal, but they can also act as drivers of local development, supporting the local community growth and its economic development.

Empirical research shows that across Europe SEs not only increase the community wellbeing, providing product and services, fostering cohesion and collaboration among community members and institutions, but they also act as drivers of local and regional economic development (Birkhölzer; 2009; Eversole, 2013).

This paper aim is to provide an ideal-type model of SE which can help in drawing its boundaries; secondly, a new framework on how SEs produce local development through social, economic and environmental outputs is proposed.

Keywords: social enterprise, local development, social development, economic development, environmental development

INTRODUCTION

The expression ‘social enterprise’ (SE) was introduced in Italy during the late ‘80s to mean a new form of company run by volunteers; differently from the non-profit organization focused on the promotion of human rights, the aim of a SE was to provide social services to the local communities or promoting equality and opportunities. Subsequently, the concept of SE was developed during the ‘90s and spread across Europe and United States and, more recently, even across Asia and Latin America while gaining relevance among academics and practitioners. The growing interest in SEs depends on many factors; firstly, SEs operates not for profit, but for promoting social change and growth and posing new
priorities within the debate on the social and economic development; secondly, with government and local public institutions experiencing the decrease of financial resources to be dedicated to social services, the SEs address the people’s needs, reorganising proactively the existing welfare systems. Thirdly, the SEs are a trigger to re-think the efficiency and efficacy of public sector and to urge companies to consider the social responsibility. Against the scientific growing interest (Doherty, Haugh, Lyon, 2014; Phillips, Lee, Ghobadian, O’Regan, James, 2015) there is still a lack of a unique and common definition of what the SE is; a variety organisations, institutions and firms with different legal and organisational forms seem to be included in the definition of SE; as such there is a compelling need to seek a consistent and shared definition which could encompass all the varieties of existing SEs. The following section 2 attempts to isolate the SEs’ main features drawing an SE ideal-type; in section 3 a new framework on the relation among SE and local development is proposed.

**SES: DEFINITION AND FEATURES**

The SE has a hybrid structure as it combines a variety of elements featuring different types of companies; however, SE construct does not fit in any of the traditional existing corporate forms. At the heart of SE construct there is its ‘social mission’. In the literature on social entrepreneurship two main approaches can be distinguished: the first emerged from the American studies and the second from the European researchers (Perrini, 2007; Defourny, Nyssens, 2010). The American works, which have been emphasizing the role of the social entrepreneurship since the middle of the 90s (Borzaga, Tortia, 2009), focus more on the nature and the characteristics of the ‘social entrepreneur’ than showing interest in deepening the understanding of the SE nature. In fact, within this stream, some works look into the capacity of the non-profit organisations (NPO) to acquire financial resources while other studies investigate the role of the social entrepreneur as a ‘social innovator’ and promoter of the social change. Hence, any organisation led by a social innovator and creating social value is a social enterprise (Picciotti, 2013). In this context, the SE can assume any organizational form among profit, not-for-profit or hybrid, the choice depends on the business model and the social aim to reach: the entrepreneur’s ability to create the best hybrid structure boosters the organizational efficacy and efficiency. As a consequence, the SE become an innovation lab where new organizational behaviours, new cognitive and managerial models take place and guide the identification and satisfaction of the community’s needs using a mix of public and private local financial resources (Bulsei, 2015).

On the other hand, due to the different cultural context and to the different economic situation in which the ‘social cooperative’ were born and largely developed, the European literature focused prevalently on the nature of SE.
The European approach is summarized by the Research Network “Emergence of Social Entrepreneurship in Europe (EMES)” (Borzaga and Defourny, 2008) while the GES model proposed here (Table 1) is derived from existing research (Galera and Borzaga, 2009; Galera and Borzaga 2012) on the SE and takes also in consideration the OCSE and EU’s definitions of SE. This model plots out the SE main features and helps in drawing its boundaries. The SE can be observed and evaluated through its governance, entrepreneurial and social dimensions (GES). The GES model depicts an ideal type, as such it does not represent an existing SE but stresses all the features common to the most. Each SE dimension can be evaluated not only by the presence or absence of the following characteristics, but even on their intensity.

Table 1 GES framework: defining the nature of SE

THE SES AND LOCAL DEVELOPMENT

After the 2007 economic turmoil, the demand for social goods and services has grown while the offering from public institutions has decreased, due to the lack of financial resources; in this gap, there are unexploited opportunities for private investments. Several empirical studies suggest that SE can play a key role to cope with the challenges of the local development: they have been successful especially in those sectors in which were missing the support of public institutions. Actually the social entrepreneurship has been able to develop unconventional strategies to address the needs of underdeveloped areas; for example, Borzaga and Galera (2014) describe the significant role SEs had in Africa providing new micro-credit services, contributing to the construction of infrastructures through the deployment of local resources; even in Europe SE are an important engine for the economic development of local communities: the UE Third System and Employment reports there are 8.88 millions of employees in this sector, confirming that SEs are not a marginal phenomenon, but on the
contrary, is a well-established reality. According to Eversole (2013), the SE has an intrinsic natural tendency for the local development as these institutions naturally foster the community development. «The observation that social enterprises are hybrid organisations that blur sectoral boundaries is established in the literature. What is new is the observation that social enterprises are working in this way as an intentional strategy for achieving local development outcomes» (Eversole, 2013: 576).

According to the theory of the endogenous economic growth (Aghion and Howitt, 1998), the driving forces of the local development lie in internal local resources as human capital, culture and traditions, artisanal artefacts or networking capabilities of local institutions; hence, the SE represents a well-fitted gear of the system as its primary aim is not the exclusive production of goods or return on investments, but the development of social capital, human relationships, network and overall the community wellbeing; furthermore the set of resources used by SEs are prevalently those found in the local context; “In this sense, social enterprises can represent an important instrument for an endogenously driven process of development» (Borzaga and Tortia, 2009: 209).

Obviously, SEs cannot entirely drive by themselves the community full development; although, compared with the profit-oriented companies, the SE benefits from the community higher trust and support; its potential can be expressed only if reinforced by adequate policies such as dedicated financial funds, training programme for social entrepreneurs and managers, research on innovative governance and new business models.

Adopting the endogenous growth theory perspective, the links between SE and the local development can be represents as shown in Figure 1.

Figure 1. SE and local growth

The SE produces social, economic and environmental outputs; in turn, these outputs creates direct and indirect effects on the local development.

The directs and indirect benefits are:

- **job creation**: SEs do not replace existing job positions with new roles, but address unmet social needs creating additional jobs especially for those who normally are denied access to work;
- **poverty reduction**: SEs often offer jobs to the low-income population and deliver goods and services at more affordable prices, or for free;

- **community wellbeing**: SEs contribute to uplift the local population standard of living and, despite employees perceive lower salaries, this is compensated by higher personal satisfaction and wellbeing in the working environment;

- **social capital**: social entrepreneurial activities create social value and social capital building relationship based on trust among individuals and organisations, promoting a cooperation culture among institutions; these links facilitate the exchange of tacit knowledge and reducing the asymmetric information problems.

- **social cohesion**: through the social capital, the terms for individuals and groups to take part in society are improved, hence stronger ties, sense of belonging and inclusion of poor and marginalized people helps people in cooperating to set and achieve community goals.

**LIMITATIONS AND FURTHER RESEARCH**

SEs are a potential engine of the local development; they can play a key role in the most marginalized and poorest regions which are perceived as unprofitable markets by profit-oriented enterprises and cannot be supported by the governments and local authorities due to their lack of resources.

Basing on the previous literature, this work pinpointed the SE’s main features depicting its ideal-type through the GES model. Subsequently, a new framework which points out the effects that SE has on local development was presented (section 3). The main limitations of the framework is in the fact that was drawn upon the existing qualitative research mainly consisting of case studies, while quantitative research on the topic is still scant. Hence the need for deepening the understanding of this phenomenon and the call for more quantitative research in the field of SE. In details, further evidence is needed on the followings:

- Are the SEs able to be financially self-sufficient on the long term, without dropping their social aim?
- Are SEs efficient and efficacious in the use of public financial and local resources?
- What are the contextual factors which foster the social entrepreneurship?
- What can be valid and reliable measurement of their social and environmental impact?
- Is the economic crisis or a profounder shift in the economy in determining the flourishing of SEs?

THE IMPACT OF PUBLIC RESEARCH ON INDUSTRY INNOVATION: A TECHNOLOGY-LEVEL PERSPECTIVE IN THE GREEN ENERGY FIELD

Ardito, Lorenzo; Petruzzelli, Antonio Messeni; Albino, Vito
Politecnico di Bari, Bari, Italy

ABSTRACT
This paper examines the degree to which companies successfully build on technologies developed by public research organizations (PROs) by analysing the influence of their technology attributes. Specifically, four technology attributes have been considered as (i) the level of establishment, (ii) the scope of application, (iii) the scientific nature, and (iv) the technological breadth. We develop hypotheses, and the green energy field is in the focus of this study this phenomenon. Accordingly, 4,363 patents registered by PROs in the period 1976-2011 and classified into the technology fields “Alternative energy production” and “Energy conservation” were collected. Results of the Tobit regression reveal that the level of establishment has a positive influence on subsequent industry innovation efforts; only when the level of establishment becomes excessively high this effect turns negative. Furthermore, the scope of application and the technological breadth positively impact the spread of public environmental technologies among companies, whereas the scientific nature has a negative effect.

Highlights:
- The role of public research as a mean to boost industry innovation efforts is analysed
- Attributes of technologies developed by public research organizations are considered
- The attributes of public technologies impact subsequent industry innovation efforts

Keywords: Green energy technologies, Industry innovation, Public research, Technology attributes, R&D policy.

1. INTRODUCTION
Studies rooted in the neoclassical economic theory highlighted that private R&D efforts are subject to market failures, which are reflected in three main issues: increasing returns, knowledge leakage, and uncertainty of results (e.g., Arrow, 1962; Czarnitzki and Lopes-Bento, 2013). These issues make the private value of R&D lower than the social one. Thus, less incentive exist for firms to invest
in technology development, hence leading to a suboptimal level of industry innovation efforts (Arrow, 1962; Czarnitzki and Lopes-Bento, 2013).

Governments have attempted to correct for market failures by funding public research organizations (PROs) (e.g., universities, public research centres, governmental organizations) aimed at conducting the initial R&D efforts that may expand the pool of technological knowledge available to firms who can draw on this for subsequent innovation activities (Cohen et al., 2002; Martin and Tang, 2007). However, according to the evolutionary approach to the economics of publicly funded research, making available new technologies does not imply that outcomes of public research will boost further innovation efforts by the industry. Notably, firms are not always willing and/or able to build on public research because of its weaker connection to market needs or the lack of firms’ absorptive capacity (Cohen and Levinthal, 1990; Salter and Martin, 2001). In fact, it has been argued that research outcomes of PROs fall short of the full impact they could have, so governments still seek to improve the effectiveness with which they invest public money to produce research externalities towards the industry sector (Beise and Stahl, 1999; Bornmann and Marx, 2014). This means that the question of when R&D efforts of PROs impact industry innovation activities by rendering outcomes as the basis for the innovation activities of many companies has not completely been answered (Alkemade et al., 2011; Coccia and Rolfo, 2008; Cohen et al., 2002). The present paper addresses this topic. Thus, differently from most of the prior research, we do not focus on the public incentives that may stimulate private R&D (R&D tax credits, R&D subsidies, etc.) (e.g., Czarnitzki and Lopes-Bento, 2013). Rather, we aim to assess when multiple companies build upon the technological knowledge underlying technologies created by PROs, hence stimulating industry innovation. Accordingly, to the best of our knowledge, this has remained an underdeveloped area of research.

In detail, since the evolutionary economic theory recognized that not all the technical solutions developed by the public sector automatically affect the industry sector, we attempt to understand which types of technology more likely set the basis for firms’ innovation activities. Notably, technologies are not all equal, and, depending on their attributes, they may be more (or less) attractive to firms (Chen et al., 2011; Shane, 2001). According to the foregoing discussion, the main research question of this study is: do technology attributes explain the degree to which public research has an impact on industry innovation? We investigate this issue into the green energy field since it has been found that government technologies in this domain does not always have a stronger impact than non-government ones (Popp, 2006). Moreover, it is one of the most pollutant sectors, but with the highest chances of improvement (Hoppmann et al., 2013). As a consequence, the current political debate strongly relates to how public environmental research may further sustain the development and
implementation of green technologies by the industry, particularly referring to the energy sector (e.g., Hoppmann et al., 2013; OECD, 2012).

We develop hypotheses and, to test them, we relied on 4,363 patents registered by PROs during the period 1976-2011 and classified into the “Alternative energy production” and “Energy conservation” technology fields, according to the International Patent Classification (IPC) Green Inventory (Albino et al., 2014). After reviewing existing literature on technology attributes (e.g., Chen et al., 2011; Messeni Petruzzelli, Natalicchio, et al., 2015; Messeni Petruzzelli, Rotolo, et al., 2015; Nerkar and Shane, 2007; Shane, 2001; Sohn et al., 2013), four characteristics have been considered in this study, namely (i) the level of establishment (Ardito, Messeni Petruzzelli and Panniello, 2016), (ii) the scope of application (Novelli, 2015), (iii) the scientific nature (Narin et al., 1997), and (iv) the technological breadth (Messeni Petruzzelli, Rotolo, et al., 2015). Results of the Tobit regression reveal that the level of establishment of public environmental technologies has an inverted U-shaped effect on the degree to which the industry sector builds on those solutions. Instead, the scope of application and technological breadth positively impact the spread of public environmental technologies among companies, whereas the scientific nature has a negative effect.

These results allow us to contribute to current debate on when publicly funded research can stimulate additional R&D efforts by industry (Coccia and Rolfo, 2008; OECD, 2006), with a specific focus on the outcomes of public environmental research, which is more and more important to promote economic growth and address environmental issues at the same time (Alkemade et al., 2011). Furthermore, we also provide an alternative perspective to evaluate the impact of public research to society, which is a difficult undertaking for governments, but it is needed to better design funding policies (Bornmann and Marx, 2014).

The reminder of the paper is structured as follows. Section 2 presents the theory and hypotheses. Section 3 explains the methodological approach. Section 4 shows the results. Finally, Section 5 provides discussion, implications, limitations, and future research directions.

2. THEORY AND HYPOTHESES

2.1. Public research in the green energy field

Nowadays, one of the most relevant objectives for many governments (e.g., European Union and the U.S.) is reducing human-induced climate change, while avoiding to shrink economic growth (EC/EACI, 2011; OECD, 2012). To achieve this win-win effect, the development of technical solutions that favour wealth creation and concurrently address environmental issues has become of foremost importance (Alkemade et al., 2011; Mowery et al., 2010; Rogge and Reichardt, 2016). Green energy technologies (i.e., alternative energy production and energy conservation solutions) are at the core of
this debate. Indeed, the energy sector contributes to the economic development, and it may provide extremely positive environmental benefits if innovative low-carbon energy technologies are created and diffused (Albino et al., 2014). However, as in the case of innovation in general, market failures often limit companies in the green energy sector to capture the full value of their environmental innovation activities (Mowery et al., 2010). Specifically, these are subject to the so-named double externality problem (Hoppmann et al., 2013). That is, those innovation efforts lead to two types of positive externalities as knowledge creation and environmental benefits; nonetheless, neither the former nor the latter is well captured by market prices (Rennings, 2000). As a result, private R&D efforts for developing green energy solutions are at a suboptimal level, and governments have to compensate for this misalignment (Foray et al., 2012). Accordingly, PROs spending on more eco-friendly energy technologies has drastically risen in the last years to correct for such problem (Albino et al., 2014; Hargadon, 2010). Yet, relevant improvements in the energy system have not been displayed since bringing green energy technologies to mainstream markets, hence realizing substantial changes in the energy system, requires additional innovation efforts by industry (Balachandra et al., 2010; Sagar and van der Zwaan, 2006). According to the foregoing discussion, we address our research question with a focus on the green energy field.

2.2. Technology attributes

Herein we argue that the attributes of the technologies created by PROs can predict when public research will set the basis for firms’ innovation efforts, especially when they operate in technology-intensive industries such as the energy sector. Indeed, technology attributes reflect the opportunities and underlying knowledge base characterizing technical solutions (Shane, 2001). Hence, technology attributes may explain whether and to what extent firms are able and/or willing to rely upon certain types of technology since they come with some expectations for companies regarding the possibility to build on them to drive future innovation activities (Ardito et al., 2015; Nerkar and Shane, 2007; Shane, 2001). Relatedly, it has been proved that technology characteristics are relevant to explain the likelihood of firm formation (Shane, 2001), technology acquisition (Messeni Petruzzelli, Natalicchio, et al., 2015; Sohn et al., 2013), and the commercialization of university (Nerkar and Shane, 2007) and environmental technologies (Chen et al., 2011). Furthermore, some studies revealed that technology attributes affect the technological impact of patents (e.g., Fischer and Leidinger, 2014; Messeni Petruzzielli, Rotolo, et al., 2015; Nemet and Johnson, 2012; Sterzi, 2013) - i.e., the impact of a patent for developing novel patents (e.g., Ahuja and Lampert, 2001) - also in the case of green technologies (Nemet, 2012). In line with this reasoning, we analyse the role of technology attributes in elucidating the impact of public environmental research on industry innovation.
After reviewing extant literature, we identified four attributes that have been more extensively studied to examine innovation phenomena, namely (i) the level of establishment (Ardito, Messeni Petruzzelli and Panniello, 2016), (ii) the scope of application (Novelli, 2015), (iii) the scientific nature (Narin et al., 1997; Novelli, 2015), and (iv) the technological breadth (Messeni Petruzzelli, Rotolo, et al., 2015).

2.2.1. The level of establishment

Technologies are different with regard to the level of common understanding in the economy (i.e., the level of establishment). That is, certain technologies are more known and their underlying knowledge has been more exploited, which means that they can be considered more established as opposed to nascent (Ahuja and Lampert, 2001; Alnuaimi and George, 2016).

Prior research suggests that established technologies may positively impact subsequent innovation efforts since they provide advantages in terms of organizational learning, recombination opportunities, and market acceptance (Ardito, Messeni Petruzzelli and Panniello, 2016). Indeed, first, established technologies are more codified than novel ones, hence requiring an inferior level of absorptive capacity (Dosi and Nelson, 2010; Heeley and Jacobson, 2008). Thus, it is easier and more cost effective for firms that have not developed the inventions to build on them with fewer risks. Second, a better understanding of a given technology provides firms with more chances to come up with useful recombination opportunities, which then may act as a catalyst for future technological developments (Fleming, 2001; Savino et al., 2015). Third, customers are usually less reluctant towards a technology that they feel to be more familiar (Story et al., 2014). Thereby, the exploitation of established technologies is more legitimated by the operating market.

However, after a certain level of establishment (i.e. when technologies are widely known and adopted), established technologies become commodities and do not represent a valuable resource upon which companies may drive future innovative trajectories (James et al., 2013). Furthermore, a very-well established solution has probably been recombined many times, and the most profitable combinations have been exploited already, so that the costs of searching for new recombination opportunities surpass the benefits of finding additional valuable combinations (Ardito, Messeni Petruzzelli and Panniello, 2016). Finally, when the level of establishment starts to become too high the benefits deriving from market legitimization are outweighed by the impossibility to meet changing customers’ demands and stimulate entrepreneurial possibilities (Alnuaimi and George, 2016).

The above arguments suggest that firms might be interested in established technologies, but only up to a certain level of establishment. Thereby, PROs that aim to provide research externalities toward the industry may have greater chances to attract many companies if they continue with the
initial improvement of a certain technology, hence making it more readily available, instead of only providing complete new solutions. This may be particularly relevant in the green energy sector since companies search for a compromise between avoiding radically new innovative activities, due to the double externality problem, and relying on solutions that cannot represent a source of competitive advantage (Hoppmann et al., 2013). Therefore, we expect that:

**H1.** The level of establishment of public technologies has a curvilinear (inverted U) effect on industry innovation.

2.2.2. *The scope of application*

The scope of application refers to the extent of different domains a technology relates to, which means that a higher scope reflects a broader set of potential applications (Gambardella et al., 2007; Lerner, 1994). Recent research revealed that non-innovating companies more likely build on technologies with a broad scope compared to innovating ones (Novelli, 2015). Indeed, innovating firms usually fail to protect and exploit broad inventions because they do not have the complementary assets and internal capabilities required to pursue developments across all potential domains in a timely manner (Gambardella and Giarratana, 2013; Rosenberg and Trajtenberg, 2004). Conversely, given the high visibility of broad technologies, many non-innovating companies may come across them during search processes and focus on the domain to which they are more expert or need a specific contribution to solve an ongoing issue (Lee and Lee, 2010; Messeni Petruzzelli, Natalicchio, et al., 2015), hence developing follow-up inventions that substitute the original ones. This implies that if PROs are able to develop technical solutions with a high scope of application, the likelihood that more companies will build on them grow because those solutions cross the search processes of many firms (Novelli, 2015). Moreover, to build on broad solutions, non-innovating firms usually do not have to compete with the innovating organization if it is a PRO and, since they will likely belong to diverse domains, they do not necessarily compete against each other as well, thus increasing the attractiveness of broad solutions. This phenomenon may be accentuated in the (green) energy sector because it relates to multiple domains (e.g., building, transportation, and energy production) (OECD, 2012). Thereby, a number of different companies exist that can come across a green energy solution with a broad scope of application. Thus:

**H2.** The scope of application of public technologies has positive effect on industry innovation.

2.2.3. *The scientific nature*
Technologies may differ with regard to the scientific knowledge that has been used for their development; the more the scientific knowledge used the stronger the scientific nature of the technologies (Fischer and Leidinger, 2014). Although the conventional wisdom states that PROs mainly develop more basic and science-based solutions, the changing orientation of PROs towards more applied research has made them not only reliant on basic science (Burhan et al.; Geuna and Rossi, 2011), so the level of scientific knowledge underlying their technologies may vary.

It has been argued that science is an enabler of innovation, in that it opens up novel and useful recombination opportunities that may lead to valuable technological discoveries (Fleming and Sorenson, 2004). This was a major justification for the need of public research (Mansfield, 1991). However, when the goal is to provide research externalities to the industry sector it should be mentioned that firms consider science-based technologies as extremely uncertain (Murray and Stern, 2007). Furthermore, solutions forged in basic science are not ready-made inputs for companies. Indeed, the comprehension of their underlying rationale is more complex than the understanding of solutions not grounded in a scientific knowledge base (Messeni Petruzzelli, Natalicchio, et al., 2015). This issue is further exacerbated by the fact that to understand the scientific logic used in technology development it is necessary to have a link with the scientific communities where more basic solutions are developed, but this link is often difficult to build between PROs and companies given their distance in terms of cognitive capabilities, research objectives, and modus operandi (Brooks, 1994; Bruneel et al., 2010; Gittelman, 2006). Building on these arguments, Gittelman (2016:1584) highlighted that the rise of basic science in medical research was a setback for drug discovery, hence revealing that “a moving frontier in scientific knowledge does not translate to a corresponding advance in technological innovation”. These arguments may also pertain to the green energy field. For instance, in the wind power domain, prior research revealed the failure of the “Big Science” approach over a less science based approach in both the U.S. and Europe (Hendry and Harborne, 2011). Therefore, we contend that:

H3. The scientific nature of public technologies has a negative effect on industry innovation.

2.2.4. The technological breadth

The technological breadth represents the degree to which the knowledge base of a technology is diversified, thus reflecting a wider search process during its development (Messeni Petruzzelli, Rotolo, et al., 2015). Inventions resulting from broad searches are more likely understood by companies operating in different industries (Banerjee and Cole, 2010). This implies that more companies may build on those solutions. Moreover, the diverse companies that attempt to build on
technologies with a high technological breadth may benefit from a large pool of potential links and associations between various knowledge domains, which leads to more opportunities for knowledge recombination (Maggitti et al., 2013) and, hence, more chances to contribute to technological progress (Fleming, 2001; Messeni Petruzzelli, Rotolo, et al., 2015). These recombination opportunities are particularly relevant to let firms build on green energy technologies. Indeed, Nemet (2012) and Benson and Magee (2014) found that green energy technologies based on multiple knowledge domains more likely set the basis for future technological developments; additionally, Ardito, Messeni Petruzzelli and Albino (2016) showed that those technologies also have a higher breadth of impact. Eventually, we may expect that PROs combining more knowledge domains during their R&D (environmental) processes will come up with inventions of a higher impact on industry innovation. Stated more formally:

**H4.** The technological breadth of public technologies has a positive effect on industry innovation.

### 3. DATA AND METHODOLOGY

#### 3.1. Industry setting

As discussed in Section 2, the green energy field is in the focus of our study. Besides the fact that both public and private involvement is relevant (Alkemade et al., 2011; OECD, 2012), additional reasons make this setting as suitable to test the proposed hypotheses. First, despite PROs are usually set to provide scientific knowledge, in this context, their role as technology provider has gained increased importance (Albino et al., 2014; Oltra et al., 2012). Thereby, it is reasonable to adopt a technology perspective in this research. Second, the development of (green) energy technologies involves technological knowledge that spans a long time period and multiple technological areas; furthermore it may origin from both basic and applied research (Benson and Magee, 2014; Guan and Yan, 2016; Nemet, 2012). This provides us with further confidence about the relevance of the analysed technology attributes. Third, patents are widely used to identify and examine green energy technologies (Guan and Yan, 2016; Nemet, 2012; Veugelers, 2012). Moreover, with patent data, it is possible to identify several attributes of patented inventions and the degree to which they have had an impact on subsequent technological developments by means of citations (Kaplan and Vakili, 2015; Messeni Petruzzelli, Rotolo, et al., 2015; Nerkar and Shane, 2007). Finally, many governments have changed the intellectual property policy to increase incentives to patent public research (e.g., the Bayh-Dole Act). Consequently, the rate of PROs patenting has increased (Sterzi, 2013), especially in
the green energy field (Albino et al., 2014; Hargadon, 2010). Thereby, patents can be considered as a reliable information source to conduct our research.

3.2. Data collection

The first objective of the data collection process was to detect technologies developed by PROs in the green energy field. To this aim, patents registered at the USPTO were employed. Specifically, first, the IPC codes pertaining to the “Alternative energy production” and “Energy conservation” technology fields, as defined by the IPC Green Inventory, were identified (e.g., Albino et al., 2014; Ardito, Messeni Petruzzelli and Albino, 2016). Second, we queried the USPTO database in order to collect all the patents (and related bibliographic information) associated with the identified IPC codes. Third, we excluded all the patents that matched our search criteria but were not registered by a research organization or were applied for after 2011. This second choice was made since our dependent variable is based on a patent’s forward citations (see Section 3.3.1), so more recent patents may not have had enough time to be cited (e.g., Katila, 2002), thus leading to a biased measure. Finally, we investigated websites, reports, and other additional sources that may let us distinguish between patents registered by private and public research organizations. As a result, this procedure yielded a final sample of 4,363 patents developed only by PROs during the period 1976-2011. Our sample includes patents of PROs established in diverse countries such as the U.S. Department of Energy, the French Commissariat à l’énergie atomique et aux énergies, the National Research Council of Canada, the Indian Council of Scientific and Industrial Research, and the Taiwanese National Tsing Hua University, which are also among the most patent intensive public organizations.

3.3. Variables

3.3.1. Dependent variable

Cited patents can be considered as the basis of subsequent innovation efforts. Indeed, these are inventions whose technological relevance has been recognized by innovating organizations, which then based part of their innovation activities on those solutions (Kaplan and Vakili, 2015; Messeni Petruzzelli, Rotolo, et al., 2015). Thus, forward citations have been widely considered as a proxy for the impact of patents on subsequent technological developments. In other words, “external citations indicate that other players have internalized part of the knowledge underlying the original invention and succeeded in building on it” (Novelli, 2015:494). In line with this reasoning, we analysed the citations received by the patents in our sample, specifically assessing whether they have been

---

1 See http://www.wipo.int/classifications/ipc/en/est/.
referenced by patents developed by companies. With this procedure, we can analyse if PROs patents have had an impact on industry innovation efforts. More in detail, for each patent in our sample, we identified the citing patents and to whom they belong. Once identified the owners of the citing patents, we distinguished between those registered by companies and those registered by other types of assignee. Finally, after checking for company names, we measured our dependent variable ((IndustryImpact)) as follow:

$$IndustryImpact = 1 - \sum_{F} \left( \frac{C_{FP}}{C_{P}} \right)^2,$$

where $C_{FP}$ indicates the number of times the firm $F$ has cited the focal patent $P$, while $C_{P}$ is the total number of citations to patent $P$ coming from patents owned by firms. This is a Herfindahl-type index based on the generality index proposed by Trajtenberg et al. (1997). Differently, from the generality index, this measure does not account for the diverse technological classes of the citing patents; rather, it considers the diverse firms owing the citing patents. In other words, this index measures the degree of different firms possessing patents that cite a PRO patent. The rationale behind this index is that the greater the variety of firms owing citing patents, the higher the impact of the PRO patent on industry innovation efforts.

Of course, we may have computed this variable as the simple count of diverse firms that own, at least, one patent citing a PRO one. However, in this way, the actual degree to which the PRO patent affects the industry sector would be missed. For instance, suppose that an invention received 15 citations equally distributed among patents owned by companies A, B, and C, respectively. Moreover, suppose that a second invention still received 15 citations, but 13 of them are from patents owned by company A, one citation is from company B, and one citation is from company C. In this case, the first invention actually had a wider impact on the industry as opposed to the second one, which had an impact mainly on company A. However, if we adopted a count measure for IndustryImpact, its value would be the same for the two inventions (three). Differently, using the Herfindahl index, IndustryImpact would be 0.88 for the first invention and 0.24 for the second invention. This better reflects that the two inventions have impacted industry innovation efforts in a different way, with the first invention reflecting a wider impact.

Furthermore, since this study covers a long time period and there may be a bias towards older patents in terms of forward citations, we are confident that our measure is still reliable for the following reasons. First, the most recent patents in our sample were filed for in 2011, with forward citations collected through the end of 2016. Hence we captured all the citations received, at least, five years after patent application, which is considered the time span when patents gets most of their citations (e.g., Ardito, Messeni Petruzzelli and Albino, 2016; Griliches, 1987; Katila, 2002; Nooteboom...
et al., 2007). Second, we included time period effects in our models to account for systematic intertemporal differences (Capaldo et al., 2017) (see Section 3.3.3).

3.3.2. Independent variables

The first independent variable measures the extent to which a technology is established (Established). It is computed as the natural logarithm of the number of a patent’s backward citations. The logarithmic transformation was adopted to correct for skewness and kurtosis. The rationale behind this measure recalls previous studies arguing that the higher the citations made by a focal patent the higher the level of establishment (e.g. Ahuja and Lampert, 2001; Ardito, Messeni Petruzzelli and Panniello, 2016; Nerkar and Shane, 2007; Ziedonis, 2007). Indeed, based on the fact that a technology is often the result of a cumulative process over a technological trajectory (Dosi, 1982; Dosi and Nelson, 2010), it can be assumed that patents referring to a high number of previous patents reflect inventions with a stronger link to a well-established technological paradigm (Dornbusch and Neuhäusler, 2015; Martinelli, 2012). Conversely, a small number of backward citations signal that the patent is disconnected from previous technical solutions, thus highlighting its novel nature (Ahuja and Lampert, 2001; Ziedonis, 2007). Second, following well-known research, we operationalized the scope of application (Scope) as the number of different three-digit U.S. classes assigned to each patent by the USPTO (Lerner, 1994; Novelli, 2015). Third, to account for the scientific nature of the knowledge underlying a patented invention (Scientific), as made by previous studies, we counted the number of patent references made to non-patent documents (Callaert et al., 2006; Narin et al., 1997). Since also this variable was skewed and kurtotic, logarithmic transformation was also used in this case. Finally, to assess the breadth of the technological base upon which a patent is built (TechBreadth), we adopted the Trajtenberg et al. (1997)’s originality index. It is computed through a Herfindahl index measuring the diversity of technological classes assigned to the patents cited by a focal patent. Specifically,

\[ \text{Technological breadth} = 1 - \sum S_{ij}^2, \]

where \( S_i \) refers to the fraction of patents cited by patent \( i \) that belong to the three digit U.S. class \( j \) out of \( n \) technological categories assigned to the patents by the USPTO.

3.3.3. Control variables

Several control variables were considered to improve the reliability of our analyses. First, we controlled for the duration of the patent examination process (Duration), measured as the difference, in years, between the filing and issue date (Nemet, 2012). Second, a dummy variable assessing whether a
patent has been jointly developed by more organizations was included (value one) \textit{(Joint)} (Messeni Petruzzelli, Rotolo, et al., 2015). Third, we controlled for the number of patent claims \textit{(Claims)} (Novelli, 2015). Fourth, we accounted for the number of inventors that have been involved in the invention process \textit{(TeamSize)} (Messeni Petruzzelli, Rotolo, et al., 2015). Fifth, a patent may attract companies’ attention whether it has also been published in other patent offices and whether the innovating organization has been willing to pay renewal fees. Therefore, we took into account the number of patent offices (besides the USPTO) where the patent has been registered \textit{(PatFamily)} and if the renewal fees of the patent have been paid at least once \textit{(Renewal)} (Fischer and Leidinger, 2014). Sixth, we distinguished PROs between universities, governmental organizations (e.g., the U.S. Department of Energy), and other public research centres (e.g., national research councils), each of which resulted in a dummy variable. Thus, we included two dummies \textit{(dummy PRO)} to control for the different types of PRO. Seventh, we also included dummy variables to control relevant time period effects \textit{(dummy period)}. Following Ardito, Messeni Petruzzelli and Albino (2016), four time periods related to the energy sector were considered: 1976-1987, 1988-1997, 1998-2002, 2003-2011. We omitted the dummy PRO “university” and the dummy period “2003–2011”. Finally, we added a dummy variable assessing if the PRO owning a patent is U.S. based (value one) in order to control for a potential country bias \textit{(dummy U.S.)}.

3.4. \textit{Model specification}

Since our focus is on the technology attributes of an invention, the unit of analysis of this study is the single patent. Regarding the econometric approach, we employ a Tobit regression. This type of regression is suitable when the dependent variable (DV) is limited between a range of values and is not normally distributed (Long, 1997). Indeed, other types of regression (e.g., OLS) cannot account for the nature of this type of DVs and will probably estimate incorrect parameters (Long, 1997; Wiersema and Bowen, 2009; Wooldridge, 2012). \textit{IndustryBreadth} is operationalized through a Herfindahl index, which, by construction, is continuous but limited between zero and one. Thus, our dependent variable falls into the category of limited DVs and, according to previous studies (Ardito, Messeni Petruzzelli and Albino, 2016; Banerjee and Cole, 2010; Köhler et al., 2012), given the double bounded nature of this variable and its non-normal distribution, a Tobit regression is employed.

4. \textbf{RESULTS}

Table 1 and Table 2 show descriptive statics and pairwise correlations, respectively. According to Table 2, correlations are well below the value of 0.70, hence limiting multicollinearity issues (Cohen et al., 2013).

n=4,363
*p<.05

Table 3 presents the results of the Tobit regression. Model 1 is the baseline model, hence including control variables only. Models 2-5 are the partial models, each of which includes one the four independent variables. Model 6 is the full model, where all the variables are present. Since the variance inflation factor (VIF) for this last model is above the limit of 10 (Kennedy, 2003), we discuss results using partial models (Capaldo et al., 2017). Model 1 reveals that PROs patents have a wider impact on the industry sector if the number of claims is high (β=0.008, p<0.01), and if they have been renewed at least once (β=0.226, p<0.01); the opposite effect can be ascribed to the duration of the examination process (β=0.084, p<0.01) and the team size (β=0.011, p<0.05). Model 2 tests H1 and suggests that the level of establishment is curvilinearly (inverted U) related to IndustryImpact, as its linear term is positive and significant (β=0.206, p<0.01), while its squared term is negative and significant (β=0.026, p<0.01). To corroborate this finding, using the coefficient estimates from Model 2, we depicted Established against the predicted level of IndustryImpact (Figure 1). According to Figure 1, the slope at the right side of the curve is not comparably steep to the slope at the left side. This may
hint that despite negative effects of very-well established solutions exist, these are slightly relevant as opposed to the positive ones (see Haans et al., 2016). In line with H2, Model 3 reveals that the scope of application has a positive impact on industry innovation efforts ($\phi=0.015$, $p<0.10$); similarly, Model 4 confirms H3 by revealing the negative influence of the scientific nature of a technology ($\phi=0.069$, $p<0.01$). Finally, Model 5 supports H4 in that the coefficient of TechBreadth is positive and significant ($\phi=0.340$, $p<0.01$).

Global and national business theories and practice: bridging the past with the future
ISSN: 2547-8516
5. DISCUSSION

The present paper aims to understand when the research outcomes of PROs influence industry innovation by analysing technology attributes of PROs developed technical solutions (i.e., the level of establishment, the scope of application, the scientific nature, and the technological breadth). Specifically, we conducted this research in the green energy field. Indeed, as per innovation in general, the role public research to correct for the market failures hampering private environmental R&D efforts is extremely important, yet PROs often fail to achieve this goal (Balachandra et al., 2010). Moreover, boosting the development of green energy solutions by the private sector is pivotal for policymakers in order to simultaneously improve economic growth and environmental benefits (Hoppmann et al., 2013; Rennings, 2000).

On the basis of a sample of 4,363 patents registered by PROs during the period 1976-2011 and classified into the “Alternative energy production” and “Energy conservation” technology fields, results of the Tobit regression reveal that the level of establishment of PROs technologies has a positive influence on subsequent industry innovation efforts; only when the level of establishment becomes excessively high this effect turns negative. Furthermore, both the scope of application and the technological breadth manifest a positive influence on the degree to which many companies will build on PROs research outcomes. Finally, we found a negative relationship between the scientific nature of technologies and the breadth of impact that PROs technical solutions have on subsequent private innovation activities. Considering that “understanding the impact of public research on industrial R&D is central to understanding the innovation process itself” (Cohen et al., 2002:1), these results will provide relevant theoretical and policy implications.
5.1. Theoretical implications

From a theoretical perspective, first, this research investigates a novel and understudied set of antecedents that may explain when outcomes of public R&D efforts provide externalities towards the industry sector, i.e., the technology attributes. To the best of our knowledge, prior research has widely investigated the policy incentives fostering private R&D efforts (e.g., public subsidies) (e.g., Czarnitzki and Lopes-Bento, 2013; OECD, 2006) but negligible efforts have been devoted to examine when the results of public research themselves impact the industry sector. Furthermore, among the few studies examining the results of public research in promoting R&D initiatives related to the private sector (e.g., university-industry-government collaborations and Spin-offs creation) (e.g., Bruneel et al., 2010; Dornbusch and Neuhäusler, 2015), very few of them has narrowed the level of analysis to the technology level (e.g., Shane, 2001), which, instead, has been proved to be pivotal to understand innovation phenomena and the impact of developed technologies (e.g., Ardito et al., 2015; Chen et al., 2011; Nerkar and Shane, 2007). Likewise, studies examining public-private knowledge transfer have mainly focused on firm/university characteristics, modes of knowledge transfer, and proximity dimensions (e.g., geographic) (Agrawal, 2001; Azagra-Caro et al., 2017; Lindelöf and Löfsten, 2004). However, except for Bekkers and Bodas Freitas (2008), knowledge specific characteristics (e.g., codification) have been undervalued; moreover, whether these knowledge characteristics actually help firms to improve their innovation processes has remained unclear. Eventually, these arguments highlight the relevance of our contribution, which refines earlier works on the influence of public research on the industry sector by offering empirical evidence about the role of technology characteristics.

This first contribution goes hand-in-hand with our second contribution. Indeed, we reveal that investigating the role of technology attributes is relevant to assessing the impact of public environmental research on industry innovation efforts, particularly referring to the green energy field. Considering this specific setting is important because extant academic (e.g., Hoppmann et al., 2013) and political debates (OECD, 2012) have devoted particular attention to this sector. Moreover, the role of technology development in the green energy field is central to understand how to promote a shift towards low-carbon societies; thus, some recent studies have recognized factors at the technology level as pivotal to provide information about the development and impact of green energy technologies (Benson and Magee, 2014; Nemet, 2012). Notwithstanding, those studies have not provided insights about the potential influence of technology-level factors, as technology attributes, to explain if green energy technologies developed by PROs may have an impact on subsequent innovation activities by firms.
Third, this study also contributes to the discourse about “where” measuring the influence of a technology. Indeed, a technology may influence the technological landscape of succeeding innovation activities within or beyond a technological, geographic, or institutional domain (e.g., Messeni Petruzzelli, Rotolo, et al., 2015), and our results highlight the types of technology belonging to the public domain that have an impact on the industry domain, as represented by the degree of different companies that build on green energy technologies developed by PROs. In turn, these results may let us add to literature on research evaluation (e.g., Bornmann and Marx, 2014; Lyall et al., 2004). In particular, this literature claims that measuring the societal benefits of public research is still a complex task. However, we believe our approach, which involves the selection of PROs technologies and the adoption of a Herfindahl index measuring the degree of firms building on those solutions, may have provided further insights on how to measure the societal impact of public research.

5.2. **Policy implications**

From a policy perspective, we provide guidance on how governments may allocate public money for developing technologies that will be relevant for industry innovation efforts. Indeed, we advise policymakers that public technologies are not all equal with regard to the attractiveness they might have to companies. Thereby, when it is relevant to produce research externalities towards the industry sector, policymakers should design funding schemes directly devoted to develop certain types of technical solutions instead of others. In turn, it is important that PROs receive clear indications regarding the R&D outcomes they are expected to produce. Specifically, considering the analysed setting, where the objective is to achieve better environmental performance while maintaining high level of economic development and both private and public efforts are needed (Albino et al., 2014), we suggest that policymakers invest in strengthening their networks with corporate executives in order to better understand their technology needs. In this way, environmental and business requirements may be better matched; thus, there will be more chances that governments supply relevant green energy technologies to the industry sector, which will set the basis for their future innovation activities. More in detail, we found that green energy technologies that are more established will likely impact industry innovation efforts; conversely, those characterized by a high scientific nature has the opposite effect. Although it may appear that these results may recommend policymakers to disregard more basic research, we advocate that PROs should not be limited to basic research. In other words, PROs should not only devote R&D efforts on basic research, but also continue the technology development process till a level that may be understandable by companies without necessarily focusing on the basic scientific rationale of the developed technologies. This may also help to overcome the double externality problem facing private innovation activities by reducing
knowledge leakage and uncertainty. Furthermore, the scope of application and the technological breadth was revealed to be relevant attributes that make green energy technologies important to firms. This implies that technologies that can be readily applicable to diverse domains or are grounded on a knowledge base that enables many recombination opportunities will likely spread among multiple companies. Therefore, policymakers are advised that developing more pervasive solutions or solutions that may enable pervasive innovation activities (Ardito, Messeni Petruzzelli and Albino, 2016; Gambardella and Giarratana, 2013) should be developed for sustaining industry innovation efforts.

5.3. **Limitations**

As with all studies, this paper has some limitations that may point out avenues for future research. First, although the use of patents to capture technology development is very-well established, especially in the green energy field (Albino et al., 2014; Hoppmann et al., 2013; Popp, 2006), we may have missed some inventions because PROs may decide not to adopt a patenting strategy in certain cases and inventions are not always patentable. Thus, further confirmation or additional data may be attained through direct interviews with companies and policymakers. In this way, additional characteristics of technologies (e.g., operational complexity and originality) that cannot be captured with patent-based measures may be also scrutinized. Second, in this research we only focused on the role of technology attributes given the poor attention they have received for analysing the impact of public research. However, we acknowledge that organizational- and environmental-level factors might moderate the technology-level relationships between technology attributes of PROs technical solutions and industry innovation efforts, hence calling for multilevel analyses (e.g., Ardito et al., 2015; Hitt et al., 2007). Third, despite the energy sector is particularly relevant for this research and has some common features with high-tech sectors such as biotechnology and aerospace (Ardito, Messeni Petruzzelli and Panniello, 2016), other industries can be investigated to assure generalizability of results.

THE EFFECTS OF PAY DISPERSION BETWEEN EXECUTIVES AND EMPLOYEES OF AN ORGANIZATION ON FIRM PERFORMANCE: EVIDENCE FROM TURKEY

Ataay, Aylin
Galatasaray University, Management Department, Istanbul, Turkey

ABSTRACT
This study examines the performance consequences of pay dispersion in publicly-listed firms in Turkey for the period 2009 to 2013. Our study focuses on vertical pay dispersion, which reflects intra-firm and vertical differences between pay at two important hierarchical levels: top executive level and lower hierarchical level. We intend to present arguments based on equity theory and tournament theory, and will propose two contradictory hypotheses to test them within the context of an emerging market. Results provided in the present study confirm that pay dispersion between executives and employees has a positive impact on a firm’s profitability in Turkey. Our study contributes current empirical evidence by examining vertical pay dispersion in an emerging country context, which may have a different cultural orientation and societal-wide assumptions concerning fairness, power and disparities, relative to its developed country counterparts.

Keywords: Pay dispersion, pay gap, executive pay, firm performance, emerging economy

INTRODUCTION
Top management compensation research focuses on CEO and executive pay level and structure. There is accumulated empirical knowledge on the antecedents and consequences of executive compensation (Devers et al., 2007; van Essen, Otten and Carberry, 2015; Finkelstein, Hambrick and Cannella, 2009). However, academic and popular interest in the pay gap between employees at the highest and lowest ranks of organizations, or “pay dispersion”, is relatively new (Winter-Ebmer and Zweimuller, 1999; Heyman, 2005; Lee, Lev and Yeo, 2008). Existing studies only propose limited insight about the determinants and consequences of pay dispersion. For example, some research has shown that, since employees always compete with one another to
gain promotion to managerial positions, and consequently, higher pay levels, pay dispersion encourages greater efforts and performance on the part of employees (O’Reilly, Main and Crystal, 1988; Ehrenberg and Bognanno, 1990; Becker and Huselid, 1992; Main, O’Reilly and Wade, 1993; Conyon, Peck and Sandler, 2001). Other studies, however, have revealed negative relationships between organizational and individual level outcomes and pay dispersion (Becker and Huselid, 1992; Trevor and Wazeter, 2006; Shaw and Gupta, 2007; Bolino and Turnley, 2008; Dallas, 2011). This study examines the performance consequences of pay dispersion in publicly listed firms in Turkey for the period 2009 to 2013. Our study focuses on vertical pay dispersion, which reflects intra-firm and vertical differences between pay at two important hierarchical levels: the top executive level and lower hierarchical level (Gupta, Conroy and Delery, 2002). We intend to present arguments based on both equity theory and tournament theory, and to propose two contradictory hypotheses that will be tested within an emerging market context. Tournament theory’s core assumption is that employees’ motivation and performance increase alongside pay disparities between organizational levels. Executive pay level motivates all employees to perform well. Equity theory suggests the opposite; the main predictions underlying this theory advocate that since all employees considered pay level as a reference point for assessing the fairness of their pay and rewards, pay differences provoke feelings of inequity, injustice, and jealousy, which reduce employees’ organizational commitment and job satisfaction levels.

The rest of this paper is structured as follow. First, we discuss the theoretical foundation of pay dispersion. Second, we develop our hypotheses. We then present our sample, research model and methods. Finally, we summarize our primary results and conclusions, and discuss the implications of these findings for scholars and professionals.
THEORETICAL DEVELOPMENT AND HYPOTHESIS

Theoretical perspectives for vertical pay dispersion and its implications for firm performance

Scholars have long recognized that the way in which executives, especially CEOs of organizations, are remunerated and rewarded in relation to their colleagues and their employees holds important implications for corporate performance (Cowherd and Levine, 1992; Tosi and Greckhamer, 2004; Connelly et al., 2013). Organizations may adopt a wide variety of compensation systems and practices, highlighting different levels of pay dispersion both among peers (horizontal dispersion) and between different ranks within the company (vertical dispersion). The current study focuses on the dispersion between executives’ pay and workers’ compensation, in other words, vertical dispersion, which has been the subject of academic research for several decades (Connelly et al., 2013). While researchers agree that this dispersion has risen dramatically the causes and in particular, the effects of this pay gap, are not entirely clear. The theoretical framework of this analysis regarding the impact of vertical compensation dispersion to firm performance has two distinct theoretical bases, which will be reflected in the two different hypotheses.

Tournament theory

Tournament theory (Lazear and Rosen, 1981), which is based on economic game theory, is one of the foundations of pay dispersion research (Henderson and Fredrickson, 2001; Connelly, Tihanyi, Crook and Gangloff, 2014). Tournament theory proposes that employees are in competition with one another for higher-ranking positions and salaries; consequently employees’ efforts increase alongside pay imbalances and as a result of the differences between various organizational levels. Tournament theory accepts a higher level of executive pay as a means for motivating individuals at all organizational levels to exert more effort and to perform well.
(Becker and Huselid, 1992), and to try and win promotion to a higher level within the firm. This is not only valid where it concerns the ultimate CEO level, but is also true for employees striving to reach any other managerial position (Cappelli and Cascio, 1991; Henderson and Fredrickson, 2001; Lambert, Larcker and Weigelt, 1993; DeVario, 2006). Several research findings support these predictions and have disclosed that top executives and especially CEOs serve as significant reference points to employees; thus, vertical disparities in pay levels have substantial consequences for employee behavior (Wade, O’Reilly and Pollock, 2006). The pay disparity is also justified as a tool for attracting and retaining top competencies in the higher ranks of the company (Bloom and Michel, 2002).

Although a number of scholars have attempted to understand the implications of a widening pay gap between top managers and employees (Beaumont and Harris, 2003; Wade et al., 2006), their attempts have failed to reach a consensus regarding its implications. One opinion, which primarily relies on tournament theory arguments, advocates the benefits of a large vertical pay disparity and debates that this will provide encouragement for promotions, motivate higher efforts and competition, and increase performance (Baker, Jensen and Murphy, 1988; Ehrenberg and Bognanno, 1990; DeVario, 2006). Several empirical findings support this view and have discovered a positive relationship between firm performance and pay dispersion (Main, O’Reilly and Wade, 1993; Lallemand, Plasman and Rycx, 2004; Heyman, 2005).

Equity Theory

A subsequent line of research based on equity theory suggests, however, the opposite argument for vertical pay dispersion. Equity theory states that people expect pay to be distributed according to their relative contributions, and that each employee constantly compares their own contribution to the organization and the rewards received from the organization, relative to their individual reference group. This reference group does not need to comprise only their peers (Kulik and Ambrose, 1992), but will also include those above and below them in the organizational hierarchy, as well as members of other organizations. Employees perceive their outcomes to be unfair when their ratio of input to outcomes falls out of line with
their reference points. Through this mechanism, the pay gap can generate a feeling of inequity within the organization. Employees may then attempt to correct this feeling of inequity (Cowherd and Levine, 1992). This view advocates that since employees observe pay level as an assessment of the fairness of their compensation system, large pay gaps will stimulate feelings of inequity, injustice, and jealousy, which will have a negative effect on their job satisfaction and organizational commitment level (Finkelstein, Hambrick and Cannella, 2009). Hence, scholars taking this perspective generally affirm that a large vertical pay disparity tends to diminish motivation, effort, and cooperation between peers (Cowherd and Levine, 1992). Vertical pay dispersion can similarly stimulate careless risk-taking, reduce employee safety (Becker and Huselid, 1992), and ultimately lead to a higher employee turnover (Bloom and Michel, 2002; Gupta, Conroy and Delery, 2002). Existing empirical evidence supports this perspective, representing a negative relationship between vertical pay dispersion and organizational outcomes (Bloom, 1999; Siegel and Hambrick, 2005; Grund and Westergaard-Nielsen, 2008; Fredrickson, Davis-Blake and Sanders, 2010).

Contrasting hypotheses

As the research findings presented above suggest, these two theoretical perspectives are often considered as contrasting each other. Both theoretical views provide explanations for describing and interpreting results that positively link pay dispersion to firm performance, or that justify the negative effects of a pay gap on organizational performance. When we compare the results previous studies, we observe that accumulated knowledge on the performance implications of pay dispersion had been derived from a developed country context, primarily from the US, where American stock market regulators mandate the disclosure of the gap between the pay of a company’s CEO and its top executives, and the median income of its employees. However, a limited number of studies have been conducted outside the US that propose workers respond to vertical pay disparities differently in different countries, depending on the societal context in which they live and country level institutions (Greckhamer, 2016). The present study aims to examine the performance implications of vertical pay dispersion in an emerging country context, i.e., Turkey. Two contrasting hypotheses will be tested in Turkey, which has a specific and different governance and company system compared to its Anglo-
Saxon counterparts. The Turkish governance system incorporates characteristics of a family-based system, where financial and capital markets are weak and there is less liquidity for providing external control; ownership is generally highly concentrated, with pyramidal-type ownership structures. A small number of dominant shareholders control these companies, and there is a low level of legal protection available to minority shareholders (Nilsson, 2007; Oba, Tiğrel and Şener, 2012). The primary objectives are to observe whether empirical evidence supports the tournament theory assertion that vertical pay dispersion will be positively associated with firm performance, or the equity theory assumption that executive and employee pay dispersion will be largely decoupled from performance in Turkey.

Formally stated, the two contrasting hypotheses tested in this study are as follow:

**H1:** pay dispersion is positively associated with firm performance in Turkey (tournament theory prediction).

**H2:** pay dispersion is negatively associated with firm performance in Turkey (equity theory prediction).

**METHOD**

**Sample and measures**

Our sample comprises publicly trading companies on the Borsa Istanbul (BIST) in 2009. The data were manually collected for the period 2009 to 2013, for each year. Financial institutions (banks, investment trusts, insurance companies, leasing companies, funds, and factoring companies) were excluded from the sample, because they are regulated according to different accounting rules, and their registration systems are different and therefore, may provide misleading results for the calculation of financial variables. A total of 1278 company-year observations were examined and 117 were excluded from the sample. Since some of these companies delisted from BIST during the study period, or began being traded in the custody market, we could not obtain complete data about their financial figures, and our final sample therefore consisted of 1167 firms. Data were combined from a number of sources, while the majority of our secondary data were taken from KAP (Kamu Aydınlatma Platformu- Public disclosure platform of Turkey, www.kap.org.tr) and the Borsa Istanbul (Istanbul Stock Exchange) database. We supplemented these data with information from the annual financial reports of the included companies. However, if any important data were missing for a specific company, this company was not included into the study.

**Dependent variable.** Our dependent variable is the organization’s financial performance. We used a widely accepted measure for firm performance and operationalized this variable as average return on
assets (ROA), one year after the focal year of analysis. Return on assets, which reflected the profitability of a firm relative to its size, was calculated as the ratio of net income to total assets.

**Independent variable.** Our independent variable is *pay dispersion*. We operationalized this variable as the ratio of the average top management team’s (TMT) total compensation to average employee total compensation. Since Turkish firms are not legally obliged to disclose managerial pay information, most of them prefer not to report detailed compensation figures. The total payments disbursed to the entire top management teams were used as a proxy for TMT pay. This variable was calculated using data that is present in the footnotes of the company’s financial reports, according to the title, “Benefits provided to all top executives”. This variable comprises the top management team’s total annual compensation package, which includes the sum of their annual salaries, cash bonuses, and other long-term remuneration (e.g., David, Kochhar and Levitas, 1998). The ratio of total labor expenses for the firm (excluding TMT pay) to the number of employees was used as a proxy for average employee pay.

**Control variables.** We aimed to control for several other factors that may also have impacted on our dependent variable. First, we controlled for *prior year performance* in the form of return on assets (ROA) one year prior to the focal year of analysis, as prior firm performance is often a strong indicator of future performance, and generally associates with firm resources and pay. *Firm size* was also included in the model. The natural log of assets was employed to operationalize this variable. We also controlled for two industry level factors: *market munificence* and *complexity*. We used Boyd’s (1995) operationalization for these measures. Munificence can be defined as the capacity of an industry to support sustained growth. We calculated munificence as the regression of industry sales over time, divided by mean industry sale. Complexity, however, reflected competition level within the industry. We measured complexity using a Herfindahl index; we also included a set of *year* dummy variables to control for temporal effects. Finally, in testing our models, for the impact of pay dispersion on performance, we controlled for *family ownership concentration*, Turkey’s unique corporate ownership structure, by including a percentage of the largest controlling family shareholdings. Table 1 shows the descriptive statistics for all the variables used in this study.

**EMPIRICAL EVIDENCE**

**Analysis**

We used an ordinary least squares regression model to test the performance implications of the vertical pay gap. A classical OLS model increases the likelihood of heteroskedasticity and autocorrelation. As our data are longitudinal in nature, with repeated measures for each firm across five years, panel data of this nature are frequently estimated using fixed effects or random effects.
models. First, we derived firm fixed-effects into equations to correct for unobserved heterogeneity. The results of the Hausman test show significant ($\chi^2 = 376.54, p < .001$) systematic differences in the coefficients produced by the fixed effects and random effects model; as such so we decided to utilize a fixed-effects model, as opposed to a random effects model.

*Correlation is significant at the 0.05 level (2-tailed)

We examined the impact of pay dispersion on firm performance one year after the focal year (Time t+1), while controlling for the prior year’s performance (Time t-1). The results of the tests for hypotheses 1 and 2, which expects a higher pay dispersion to be positively or negatively related to firm profitability, is shown in Table 2. In model 1, we only included the control variables, and the only significant control variables were firm size and firm leverage, indicating a bigger firm size to be positively associated with performance, whereas firm leverage was negatively related with ROA.

The main effect of our independent variable, i.e., vertical pay dispersion, was tested in model 2. The addition of the main effect of the independent variable (i.e., pay dispersion) in model 2 significantly
increased the explanatory power of this regression model over model 1. Pay dispersion impact on performance was found to be positive and statistically significant. As hypothesis 1 predicted, pay dispersion had a positive and significant effect on a firm’s profitability (beta = .018, p< .000). This finding supports our hypothesis 1, which is based on tournament theory assumptions.

DISCUSSION

Based on tournament theory (Lazear and Rosen, 1981; Henderson and Fredrickson, 2001; Connelly et al. 2014), the empirical evidence provided in the present study confirms that pay dispersion between executives and employees has a positive impact on an organization’s profitability.

In the related literature, it has long been suggested that pay dispersion has important consequences for firm performance; however, a full understanding of its impact remains elusive. Some scholars suggest that pay dispersion positively influences effort and performance, while others, emphasizing equity concerns, draw attention to the potential negative performance implications of pay dispersion. In this study, we first developed and then tested these two theoretical explanations of the performance consequences of pay dispersion on manufacturing firms listed on the Istanbul Stock Exchange. Perhaps most important is our finding that intra-firm, inter-rank pay dispersion has significant and positive implications for a firm’s profitability. Although the empirical findings of studies examining the effects of pay dispersion within organizations have been contradictory, a smaller number of
studies have specifically examined inter-rank pay dispersion between organizational levels, particularly between the highest and lowest levels. Relatively few studies have investigated vertical pay dispersion. Our study contributes current empirical evidence by examining vertical pay dispersion in an emerging country context, which may have a different cultural orientation and society-wide assumptions of fairness, power and disparities, relative to their developed country counterparts (McDaniel and Gibson, 2012).

Although there may be some exceptions, we assume that top executives are generally interested in increasing their salaries. However, although we found a positive relationship between pay dispersion and short-term performance, our study draws attention to the fact that increasing pay dispersion may have potential negative effects on long-term firm performance (Winter-Ebmer and Zweimuller, 1999; Heyman, 2005).

Academic studies are still working to understand the implications of pay dispersion. By attempting to integrate tournament and equity theory approaches to pay dispersion, we hope that our study brings clarity and academic insight to this discussion from an emerging market perspective. We believe that pay dispersion also has important consequences for human resource management functioning, in terms of affecting recruitment, selection, and the retention of both top managers and other employees. We suggest that developing a more complete understanding of how pay dispersion impacts on human resource policies and practices, TMT recruitment and retention, as well as on other stakeholders, will offer interesting and potentially fruitful research opportunities.

THE EFFECTS OF PAY DISPERSION BETWEEN EXECUTIVES AND EMPLOYEES OF AN ORGANIZATION ON FIRM PERFORMANCE:
EVIDENCE FROM TURKEY

Aylin Ataay
Galatasaray University, Management Department, Istanbul, Turkey

ABSTRACT
This study examines the performance consequences of pay dispersion in publicly-listed firms in Turkey for the period 2009 to 2013. Our study focuses on vertical pay dispersion, which reflects intra-firm and vertical differences between pay at two important hierarchical levels: top executive level and lower hierarchical level. We intend to present arguments based on equity theory and tournament theory, and will propose two contradictory hypotheses to test them within the context of an emerging market. Results provided in the present study confirm that pay dispersion between executives and employees has a positive impact on a firm’s profitability in Turkey. Our study contributes current empirical evidence by examining vertical pay dispersion in an emerging country context, which may have a different cultural orientation and societal-wide assumptions concerning fairness, power and disparities, relative to its developed country counterparts.

Keywords: Pay dispersion, vertical pay dispersion, emerging economy, Turkey

INTRODUCTION
Top management compensation research focuses on CEO and executive pay level and structure. There is accumulated empirical knowledge on the antecedents and consequences of executive compensation (Devers et al., 2007; van Essen, Otten and Carberry, 2015; Finkelstein, Hambrick and Cannella, 2009). However, academic and popular interest in the pay gap between employees at the highest and lowest ranks of organizations, or “pay dispersion”, is relatively new (Winter-Ebmer and Zweimuller, 1999; Heyman, 2005; Lee, Lev and Yeo, 2008). Existing studies only propose limited insight about the determinants and consequences of pay dispersion.
For example, some research has shown that, since employees always compete with one another to gain promotion to managerial positions, and consequently, higher pay levels, pay dispersion encourages greater efforts and performance on the part of employees (O’Reilly, Main and Crystal, 1988; Ehrenberg and Bognanno, 1990; Becker and Huselid, 1992; Main, O’Reilly and Wade, 1993; Conyon, Peck and Sandler, 2001). Other studies, however, have revealed negative relationships between organizational and individual level outcomes and pay dispersion (Becker and Huselid, 1992; Trevor and Wazeter, 2006; Shaw and Gupta, 2007; Bolino and Turnley, 2008; Dallas, 2011). This study examines the performance consequences of pay dispersion in publicly listed firms in Turkey for the period 2009 to 2013. Our study focuses on vertical pay dispersion, which reflects intra-firm and vertical differences between pay at two important hierarchical levels: the top executive level and lower hierarchical level (Gupta, Conroy and Delery, 2002). We intend to present arguments based on both equity theory and tournament theory, and to propose two contradictory hypotheses that will be tested within an emerging market context. Tournament theory’s core assumption is that employees’ motivation and performance increase alongside pay disparities between organizational levels. Executive pay level motivates all employees to perform well. Equity theory suggests the opposite; the main predictions underlying this theory advocate that since all employees considered pay level as a reference point for assessing the fairness of their pay and rewards, pay differences provoke feelings of inequity, injustice, and jealousy, which reduce employees’ organizational commitment and job satisfaction levels.

The rest of this paper is structured as follow. First, we discuss the theoretical foundation of pay dispersion. Second, we develop our hypotheses. We then present our sample, research model and methods. Finally, we summarize our primary results and conclusions, and discuss the implications of these findings for scholars and professionals.
THEORETICAL DEVELOPMENT AND HYPOTHESIS

*Theoretical perspectives for vertical pay dispersion and its implications for firm performance*

Scholars have long recognized that the way in which executives, especially CEOs of organizations, are remunerated and rewarded in relation to their colleagues and their employees holds important implications for corporate performance (Cowherd and Levine, 1992; Tosi and Greckhamer, 2004; Connelly et al., 2013). Organizations may adopt a wide variety of compensation systems and practices, highlighting different levels of pay dispersion both among peers (horizontal dispersion) and between different ranks within the company (vertical dispersion). The current study focuses on the dispersion between executives’ pay and workers’ compensation, in other words, vertical dispersion, which has been the subject of academic research for several decades (Connelly et al., 2013). While researchers agree that this dispersion has risen dramatically the causes and in particular, the effects of this pay gap, are not entirely clear. The theoretical framework of this analysis regarding the impact of vertical compensation dispersion to firm performance has two distinct theoretical bases, which will be reflected in the two different hypotheses.

*Tournament theory*

Tournament theory (Lazear and Rosen, 1981), which is based on economic game theory, is one of the foundations of pay dispersion research (Henderson and Fredrickson, 2001; Connelly, Tihanyi, Crook and Gangloff, 2014). Tournament theory proposes that employees are in competition with one another for higher-ranking positions and salaries; consequently employees’ efforts increase alongside pay imbalances and as a result of the differences between various organizational levels. Tournament theory accepts a higher level of executive pay as a means for motivating individuals at all organizational levels to exert more effort and to perform well.
(Becker and Huselid, 1992), and to try and win promotion to a higher level within the firm. This is not only valid where it concerns the ultimate CEO level, but is also true for employees striving to reach any other managerial position (Cappelli and Cascio, 1991; Henderson and Fredrickson, 2001; Lambert, Larcker and Weigelt, 1993; DeVaro, 2006). Several research findings support these predictions and have disclosed that top executives and especially CEOs serve as significant reference points to employees; thus, vertical disparities in pay levels have substantial consequences for employee behavior (Wade, O’Reilly and Pollock, 2006). The pay disparity is also justified as a tool for attracting and retaining top competencies in the higher ranks of the company (Bloom and Michel, 2002).

Although a number of scholars have attempted to understand the implications of a widening pay gap between top managers and employees (Beaumont and Harris, 2003; Wade et al., 2006), their attempts have failed to reach a consensus regarding its implications. One opinion, which primarily relies on tournament theory arguments, advocates the benefits of a large vertical pay disparity and debates that this will provide encouragement for promotions, motivate higher efforts and competition, and increase performance (Baker, Jensen and Murphy, 1988; Ehrenberg and Bognanno, 1990; DeVaro, 2006). Several empirical findings support this view and have discovered a positive relationship between firm performance and pay dispersion (Main, O’Reilly and Wade, 1993; Lallemand, Plasman and Rycx, 2004; Heyman, 2005).

**Equity Theory**

A subsequent line of research based on equity theory suggests, however, the opposite argument for vertical pay dispersion. Equity theory states that people expect pay to be distributed according to their relative contributions, and that each employee constantly compares their own contribution to the organization and the rewards received from the organization, relative to their individual reference group. This reference group does not need to comprise only their peers (Kulik and Ambrose, 1992), but will also include those above and below them in the organizational hierarchy, as well as members of other organizations. Employees perceive their
outcomes to be unfair when their ratio of input to outcomes falls out of line with their reference points. Through this mechanism, the pay gap can generate a feeling of inequity within the organization. Employees may then attempt to correct this feeling of inequity (Cowherd and Levine, 1992). This view advocates that since employees observe pay level as an assessment of the fairness of their compensation system, large pay gaps will stimulate feelings of inequity, injustice, and jealousy, which will have a negative effect on their job satisfaction and organizational commitment level (Finkelstein, Hambrick and Cannella, 2009). Hence, scholars taking this perspective generally affirm that a large vertical pay disparity tends to diminish motivation, effort, and cooperation between peers (Cowherd and Levine, 1992). Vertical pay dispersion can similarly stimulate careless risk-taking, reduce employee safety (Becker and Huselid, 1992), and ultimately lead to a higher employee turnover (Bloom and Michel, 2002; Gupta, Conroy and Delery, 2002). Existing empirical evidence supports this perspective, representing a negative relationship between vertical pay dispersion and organizational outcomes (Bloom, 1999; Siegel and Hambrick, 2005; Grund and Westergaard-Nielsen, 2008; Fredrickson, Davis-Blake and Sanders, 2010).

**Contrasting hypotheses**

As the research findings presented above suggests, these two theoretical perspectives are often considered as contrasting each other. Both theoretical views provide explanations for describing and interpreting results that positively link pay dispersion to firm performance, or that justify the negative effects of a pay gap on organizational performance. When we compare the results previous studies, we observe that accumulated knowledge on the performance implications of pay dispersion had been derived from a developed country context, primarily from the US, where American stock market regulators mandate the disclosure of the gap between the pay of a company’s CEO and its top executives, and the median income of its employees. However, a limited number of studies have been conducted outside the US that propose workers respond to vertical pay disparities differently in different countries, depending on the societal context in which they live and country level institutions (Greckhamer, 2016). The present study aims to examine the performance implications of vertical pay
dispersion in an emerging country context, i.e., Turkey. Two contrasting hypotheses will be tested in Turkey, which has a specific and different governance and company system compared to its Anglo-Saxon counterparts. The Turkish governance system incorporates characteristics of a family-based system, where financial and capital markets are weak and there is less liquidity for providing external control; ownership is generally highly concentrated, with pyramidal-type ownership structures. A small number of dominant shareholders control these companies, and there is a low level of legal protection available to minority shareholders (Nilsson, 2007; Oba, Tiğrel and Şener, 2012). The primary objectives are to observe whether empirical evidence supports the tournament theory assertion that vertical pay dispersion will be positively associated with firm performance, or the equity theory assumption that executive and employee pay dispersion will be largely decoupled from performance in Turkey.

Formally stated, the two contrasting hypotheses tested in this study are as follow:

**H1:** pay dispersion is positively associated with firm performance in Turkey (tournament theory prediction).

**H2:** pay dispersion is negatively associated with firm performance in Turkey (equity theory prediction).

**METHOD**

*Sample and measures*

Our sample comprises publicly trading companies on the Borsa Istanbul (BIST) in 2009. The data were manually collected for the period 2009 to 2013, for each year. Financial institutions (banks, investment trusts, insurance companies, leasing companies, funds, and factoring companies) were excluded from the sample, because they are regulated according to different accounting rules, and their registration systems are different and therefore, may provide misleading results for the calculation of financial variables. A total of 1278 company-year observations were examined and 117 were excluded from the sample. Since some of these companies delisted from BIST during the study period, or began being traded in the custody market, we could not obtain complete data about their financial figures, and our final sample therefore consisted of 1167 firms. Data were combined from a number of sources, while the majority of our secondary data were taken from KAP (Kamu Aydunlatma Platformu- Public disclosure platform of Turkey, www.kap.org.tr) and the Borsa Istanbul (Istanbul Stock Exchange) database. We supplemented these data with information from the annual financial reports of the included companies. However, if any important data were missing for a specific company, this company was not included into the study.
**Dependent variable.** Our dependent variable is the organization’s financial performance. We used a widely accepted measure for firm performance and operationalized this variable as average return on assets (ROA), one year after the focal year of analysis. Return on assets, which reflected the profitability of a firm relative to its size, was calculated as the ratio of net income to total assets.

**Independent variable.** Our independent variable is pay dispersion. We operationalized this variable as the ratio of the average top management team’s (TMT) total compensation to average employee total compensation. Since Turkish firms are not legally obliged to disclose managerial pay information, most of them prefer not to report detailed compensation figures. The total payments disbursed to the entire top management teams were used as a proxy for TMT pay. This variable was calculated using data that is present in the footnotes of the company’s financial reports, according to the title, “Benefits provided to all top executives”. This variable comprises the top management team’s total annual compensation package, which includes the sum of their annual salaries, cash bonuses, and other long-term remuneration (e.g., David, Kochhar and Levitas, 1998). The ratio of total labor expenses for the firm (excluding TMT pay) to the number of employees was used as a proxy for average employee pay.

**Control variables.** We aimed to control for several other factors that may also have impacted on our dependent variable. First, we controlled for prior year performance in the form of return on assets (ROA) one year prior to the focal year of analysis, as prior firm performance is often a strong indicator of future performance, and generally associates with firm resources and pay. Firm size was also included in the model. The natural log of assets was employed to operationalize this variable. We also controlled for two industry level factors: market munificence and complexity. We used Boyd’s (1995) operationalization for these measures. Munificence can be defined as the capacity of an industry to support sustained growth. We calculated munificence as the regression of industry sales over time, divided by mean industry sale. Complexity, however, reflected competition level within the industry. We measured complexity using a Herfindahl index; we also included a set of year dummy variables to control for temporal effects. Finally, in testing our models, for the impact of pay dispersion on performance, we controlled for family ownership concentration, Turkey’s unique corporate ownership structure, by including a percentage of the largest controlling family shareholdings. Table 1 shows the descriptive statistics for all the variables used in this study.

**EMPIRICAL EVIDENCE**

**Analysis**

We used an ordinary least squares regression model to test the performance implications of the
vertical pay gap. A classical OLS model increases the likelihood of heteroskedasticity and autocorrelation. As our data are longitudinal in nature, with repeated measures for each firm across five years, panel data of this nature are frequently estimated using fixed effects or random effects models. First, we derived firm fixed-effects into equations to correct for unobserved heterogeneity. The results of the Hausman test show significant ($\chi^2 = 376.54, p < .001$) systematic differences in the coefficients produced by the fixed effects and random effects model; as such so we decided to utilize a fixed-effects model, as opposed to a random effects model.

*Correlation is significant at the 0.01 level (2-tailed)
*Correlation is significant at the 0.05 level (2-tailed)

We examined the impact of pay dispersion on firm performance one year after the focal year (Time t+1), while controlling for the prior year’s performance (Time t-1). The results of the tests for hypotheses 1 and 2, which expects a higher pay dispersion to be positively or negatively related to firm profitability, is shown in Table 2. In model 1, we only included the control variables, and the only significant control variables were firm size and firm leverage, indicating a bigger firm size to be
positively associated with performance, whereas firm leverage was negatively related with ROA.

The main effect of our independent variable, i.e., vertical pay dispersion, was tested in model 2. The addition of the main effect of the independent variable (i.e., pay dispersion) in model 2 significantly increased the explanatory power of this regression model over model 1. Pay dispersion impact on performance was found to be positive and statistically significant. As hypothesis 1 predicted, pay dispersion had a positive and significant effect on a firm’s profitability (beta = .018, p<.000). This finding supports our hypothesis 1, which is based on tournament theory assumptions.

**DISCUSSION**

Based on tournament theory (Lazear and Rosen, 1981; Henderson and Fredrickson, 2001; Connelly et al. 2014), the empirical evidence provided in the present study confirms that pay dispersion between executives and employees has a positive impact on an organization’s profitability.

In the related literature, it has long been suggested that pay dispersion has important consequences for firm performance; however, a full understanding of its impact remains elusive. Some scholars suggest that pay dispersion positively influences effort and performance, while others, emphasizing equity concerns, draw attention to the potential negative performance implications of pay dispersion. In this study, we first developed and then tested these two theoretical explanations of the performance
consequences of pay dispersion on manufacturing firms listed on the Istanbul Stock Exchange. Perhaps most important is our finding that intra-firm, inter-rank pay dispersion has significant and positive implications for a firm’s profitability. Although the empirical findings of studies examining the effects of pay dispersion within organizations have been contradictory, a smaller number of studies have specifically examined inter-rank pay dispersion between organizational levels, particularly between the highest and lowest levels. Relatively few studies have investigated vertical pay dispersion. Our study contributes current empirical evidence by examining vertical pay dispersion in an emerging country context, which may have a different cultural orientation and society-wide assumptions of fairness, power and disparities, relative to their developed country counterparts (McDaniel and Gibson, 2012).

Although there may be some exceptions, we assume that top executives are generally interested in increasing their salaries. However, although we found a positive relationship between pay dispersion and short-term performance, our study draws attention to the fact that increasing pay dispersion may have potential negative effects on long-term firm performance (Winter-Ebmer and Zweimuller, 1999; Heyman, 2005).

Academic studies are still working to understand the implications of pay dispersion. By attempting to integrate tournament and equity theory approaches to pay dispersion, we hope that our study brings clarity and academic insight to this discussion from an emerging market perspective. We believe that pay dispersion also has important consequences for human resource management functioning, in terms of affecting recruitment, selection, and the retention of both top managers and other employees. We suggest that developing a more complete understanding of how pay dispersion impacts on human resource policies and practices, TMT recruitment and retention, as well as on other stakeholders, will offer interesting and potentially fruitful research opportunities.

INVOLVING CUSTOMERS IN NEW SERVICE DEVELOPMENT: PAST, PRESENT AND FUTURE

Athanasopoulou, P.; Giovanis, A.N.; Karounis, V.; Tsoukatos, E.

ABSTRACT

Research on service innovation suggests that involving customers in new service development (NSD) is a major contributing factor to new service success. The objectives of this paper is to provide an overview of the literature regarding the involvement of customers in the development of new services and to offer guidelines for future research. Results show that past research has considered various antecedents and consequences of customer involvement and has also analysed various dimensions of the nature of involvement such as the intensity and modes of involvement and the communication process used to involve customers. Current research is mainly occupied with determining specific managerial practices that can lead to successful involvement of customers; the role of relationships as well as consumer motives, needs and experiences in the involvement process; the selection of customers for involvement and the effect of virtual environments. Future research should focus both on more in-depth, qualitative studies and more detailed quantitative models; analyse both buyer and seller perspectives; develop customer selection guides; formalize the involvement process; determine the role of relationship concepts in involvement and investigate how social media and brand communities can be effectively used for involving customers.

Keywords: New service development, customer involvement, services, service innovation, co-creation, customer participation, consumer involvement

INTRODUCTION

In today’s highly competitive and rapidly changing environment, developing successful services fast is a strategic imperative for businesses (Kindström and Kowalkowski, 2009). The advent and use of the Internet has also revolutionised and changed dramatically the role that customers can play in service innovation. Customers are knowledgeable and powerful and supply vast amounts of information on social media and virtual communities that can be used by firms for developing new services. On the other hand, research on service innovation suggests that involving customers in the
development of new services is a major contributing factor to the success of new service offerings (e.g. Alam, 2002; Kristensson, Gustafsson, and Archer, 2004; Carbonell, Rodríguez-Escudero, and Pujari, 2009, 2012; Melton and Hartline, 2010, 2015; Dadfar, Brege, and Semnani, 2013; Zhihong, Duffield, and Wilson, 2015). Therefore, the involvement of customers in the development of new services is an issue that has attracted the attention of researchers during the last 15 years. However, relevant literature is still limited, results are fragmented and there is no framework to address fully the management of customer involvement (CI) in the new service development (NSD) process.

The purpose of this study is twofold, to provide an overview of the literature regarding the involvement of customers in the development of new services and to offer guidelines for future research. Results of this review will help researchers identify the critical issues and concepts related to CI in NSD and shape future research in the field. This is a timely contribution since the importance of the role of customers has increased exponentially during the last few years due to the advent of the Internet and therefore, it is important for firms to manage effectively customer contributions to NSD.

The paper is structured as follows. First, we explain the methodology followed; then we present the results of the review; thirdly we identify the emerging, contemporary issues that need attention and finally we conclude with guidelines for future research.

**RESEARCH METHODOLOGY**

This review includes the analysis of peer-reviewed literature on CI in NSD. So, all papers included in this review approached CI from the perspective or “co-creation for others” (Witell, Kristensson, Gustafsson, and Löfgren, 2011), that is participating in developing services that can benefit other customers. In order to select articles for inclusion, a set of selection criteria was set. The first was that only academic papers will be used. Practitioner articles were excluded. Secondly, all papers selected had to do with CI in NSD either directly, when the title or the text included these two constructs (CI referred to also as user involvement or co-creation and NSD referred to also as service innovation), or indirectly, because it was inferred by the content of the paper. Conceptual papers and literature reviews were not included in this study. Finally, only papers that used services as a context of investigation were analysed. Relevant papers in product markets were not included in this review.

In order to identify relevant papers a search was initially made on three major business journal databases, namely EBSCO (Business Source Complete), Emerald, and ScienceDirect, using various keywords that appear in the title, abstract or keywords fields. Keywords used included customer involvement, new service development, service innovation, user involvement, co-creation, and customer participation. Carlborg, Kindström, and Kowalkowski (2014) conclude that the first CI paper in services has been published in 2002 so the search was limited to articles published between 2002
and 2016. This search identified a large number of papers (more than 100). However, many of these papers analysed CI from the perspective of co-production in service delivery and many others involved product markets. So, each paper was evaluated individually to determine whether it should be included in the review. Also, all cross-references identified were analysed. Ultimately, a total of 37 studies (from 2002 to 2016) were selected for examination.

The first phase of analysis involved reading all papers in chronological order and gain a total perspective of the evolution of research in the field. In the second step, we tried to categorize the information contained in the from all papers. Eventually, there were seven categories of information analysed: theoretical positioning (the type of service customers (B2B or B2C); the type of perspective (seller or buyer side); the type of service or services involved, and the country from which the sample was drawn); stages of NSD investigated; antecedents of CI; nature and dimensions of CI; consequences of CI; emerging contemporary issues, and future research challenges. From the reading of all papers it became evident that these categories of information are suitable for presenting in detail the content of all papers.

RESULTS

General Observations

Studies on CI in NSD begin in 2002 (Alam, 2002) but there is an increasing interest in the subject from 2012 onwards. Papers mainly appear in services or new product development journals. Services Journals (Journal of Service Management, Journal of Services Marketing, Journal of Service Research, the Service Industries Journal, International Journal of Quality and Service Sciences and Managing Service Quality) have published more than half of papers (54%) whereas Product Innovation Journals (Journal of Product Innovation Management, Creativity & Innovation Management; Innovation: Management, Policy and Practice, International Journal of Innovation Management, and International Journal of Innovation Science) have published 19% of papers. The rest are split between business-to-business area publications, mainline marketing and management journals and specialized journals that deal with a specific industry (e.g. tourism or banking). This focus on service journals is expected since the subject analyzed deals with the development of new services.

Furthermore, we observe that 18 studies examine the seller side; 12 explore buyers’ perspectives in retail services (financial, hotels, hospitals etc.) and seven (7) studies consider both sides of the dyad, buyer and seller. Only 10 (27%) studies are in business-to-business markets and 27 (73%) in retail markets. Moreover, the majority of studies are done in Europe (59%) and within Europe mainly in Scandinavian countries and Spain. The rest of the studies concern the USA, Asia (mainly Taiwan) or...
Australia. There is one study that covers USA, Europe, and Asia and therefore, is considered global and two studies that are done online and therefore are not bound to any specific country.

Methodology

In terms of methodology the first studies in the area were mainly qualitative (case studies and interviews) and experiments. However, surveys started increasing from 2012 onwards because the field started to mature and new types of qualitative research emerge such as netnography and action research. Overall, 16 studies are qualitative and 19 quantitative.

NSD Stages

It is important to note that the focus on different stages tends to change as the field matures. In the early years up to 2009 most studies focused on the first stages of the NSD process or even only on idea generation. However, from 2010 onwards researchers prefer to analyze CI in the whole NSD process by considering all stages. In total, 18 studies explore all stages of the NSD process and another four investigate CI irrespective of stage.

Antecedents of CI

The study of antecedents of CI is not very extensive. However, the main antecedents analyzed are classified into three categories:

1. Type of customer that should be involved. Various studies investigate the role of different types of customers such as close and lead (Alam, 2011b; Schumacher and Kuester, 2012), ordinary or guided or consulted or pioneering (Magnusson, Matthing, and Kristensson, 2003; Kristensson et al., 2004; Magnusson, 2009).

2. Key customer characteristics for effective involvement. A number of characteristics are investigated including proactiveness (Alam, 2011b); knowledge and experience (Alam, 2011a, b; Schumacher and Kuester, 2012; Sigala, 2012); being in a close, trusting relationship with the provider (Nicolaisen and Scupola, 2011; Alam, 2011b; Carbonell et al., 2012); lead userness (Alam, 2011b; Carbonell et al., 2012); customer motives; desires, and emotions (Engstrom and Elg, 2012), and involvement or dissatisfaction with the service (Schumacher and Quester, 2012).

3. The environment. This is mainly shown in Carbonell’s work (Carbonell et al., 2009; Carbonell and Escudero, 2014, 2015) where the influence of technological turbulence is investigated.

Nature and Dimensions of CI
The concept of CI has not been determined yet and no formal scale exists so researchers try to conceptualize it by using various types of information. The conceptualization of CI is focused on 4 types of dimensions.

1. Intensity of involvement in each NSD stage (Alam, 2002; 2006; Melton and Hartline, 2010; Paasi, 2014). However, there is no agreement on how intensity can be measured and whether involvement should be intense in all stages.

2. Modes of involvement including focus groups; taking part in an NSD team; retreats; phones, faxes and emails, and brainstorming (e.g. Alam, 2002; 2006) as well as web-based tools such as social media or virtual communities (Ryzhkova, 2012; Sigala, 2012).

3. Communication with customers that focuses on communication skills (Athanasopoulou and John, 2004); interaction tactics (Alam, 2011b) and the communication process involved in co-creation (Gustafsson et al., 2012).

4. Managing CI effectively through the NSD process. This area includes studies on how to select the right customers for involvement (Magnusson et al., 2003; Kristensson et al., 2004; and Magnusson, 2009) and in which stages should customers be involved. For example, Melton and Hartline (2015) argue that customers should be involved only in the design stage in the development of radical service innovations. Furthermore, other studies emphasize that the effective management of CI should be characterized by collaborative capabilities; customer orientation; knowledge integration capabilities; effective information recording; reviewing and use; appropriate user motivation and getting users to derive ideas from personal experiences (Kristensson et al., 2008; Orbanini and Parasuraman, 2011; Carbonell and Escudero, 2014; 2015; Zhihong et al., 2015).

Consequences of CI

Another category of variables analyzed by CI researchers involves different types of performance of new services, one financial and three non-financial:

1. Financial performance in terms of sales or profit (Carbonell et al., 2009; Chien and Chen, 2010; Melton and Hartline, 2010; 2015; Weng and Huang, 2012) although most of the time they are not considered alone.

2. Idea quality that is conceptualized with measures such as radicality/innovativeness (Orbanini and Parasuraman, 2011; Melton and Hartline, 2015); novelty/originality (Magnusson et al., 2003; Kristensson et al., 2004; Matthing, Sanden, and Edvardsson, 2004; Magnusson, 2009; Mahr and Lievens, 2012; Carbonell et al., 2012; Carbonell and Escudero, 2014, 2015); perceived value; feasibility or producibility (Magnusson et al., 2003; Kristensson et al., 2004; Matthing et al., 2004;
Magnusson, 2009); knowledge value and relevance (Mahr and Lievens, 2012), volume of ideas (Ordanini and Parasuraman, 2011) and quality of service ideas (Schumacher and Quester, 2012).

3. The quality of the developed service that is measured with concepts such as service quality (Dadfar et al., 2013); service advantage (Carbonell et al., 2012; Carbonell and Escudero, 2014, 2015); superior and differentiated service (Alam, 2002, 2006; Alam and Perry, 2002), and service marketability (Melton and Hartline, 2010).

4. The effectiveness of the development process expressed with many different concepts including process complexity (Melton and Hartline, 2015); speed to market (Alam, 2002, 2006; Alam and Perry, 2002; Athanasopoulou and Johne, 2004; Carbonell et al., 2012; Carbonell and Escudero, 2014;2015); launch preparation (Melton and Hartline, 2010); role flexibility; teamwork, and cross-functional integration (Chien and Chen, 2010), and overall measures of project (Melton and Hartline, 2010) or process efficiency (Chien and Chen, 2010).

5. Customer satisfaction used in two recent studies (Dadfar et al., 2013; Zhihong et al., 2015). This trend is probably due to the increasing importance that relationships play in CI and customer satisfaction is a major dimension of relationship quality.

**Moderating Variables**

The use of moderating variables in CI studies is quite rare. Only Carbonell et al. (2012) and Carbonell and Escudero (2014, 2015) use technological turbulence.

**Emerging Contemporary Issues**

The study of CI in NSD reveals the existence of certain important current issues that surface in related research and are expected to guide future research. These include the following:

1. Effectiveness of CI depends on how well the process is managed. CI should be approached as a management process with specific managerial practices that lead to success. Such practices should cover areas such as selecting the best customers for involvement; communicating effectively throughout the NSD process; motivating customers and integrating the knowledge acquired.

2. The selection of stages for CI is not very important in services. Since services have more ad hoc, parallel processes with fewer stages, differentiating CI by stage is not important. What is critical though is to identify the ways CI can become more effective in each stage. For example, researchers should look into which customer or firm actions should be included in each stage and why.

3. The last few years, research on CI in NSD has emphasized the importance of a close relationship with customers. Therefore, firms should select customers that have a close relationship with the
firm for CI. Also, other relationship constructs such as customer satisfaction (a major dimension of Relationship Quality) and service quality are linked to CI. So, there is a need to explore further the role of relationships in effective CI.

4. Many qualitative studies in CI have shown that it is important to get users to derive ideas from their use experiences because experiences create emotions and make it easier for customers to express their needs. Therefore, it is important to understand and manage effectively customer experiences because they can influence CI in NSD. Further analysis of how firms can manage customer experience in relation to CI for NSD is imperative.

5. Selecting customers for CI in NSD is different from New Product Development. Lead customers may not be as useful here. Also, selection of customers will depend on the type of new service sought (incremental or radical). Research shows that for radical innovation, ordinary users are more useful because they have more radical ideas whereas experienced or skilled users are better for incremental innovation. So, the development of guides of customer selection is an important contemporary issue.

6. Due to the advent of the Internet and its importance in the market, another contemporary issue is the role of virtual environments in CI. Related studies look into the role of virtual customer integration platforms in NSD; the use of web-based tools for CI; the nature of lead user participation in brand communities; CI in online channels such as social media and effective management of consumer-generated content.

Future Research Challenges

Based on the insights of this review we offer a guide for future research.

- In terms of methodology there is a need for more rigorous quantitative studies and more focused and detailed qualitative enquiries that will provide more specific and rich information that will help firms manage the process of CI effectively. Also, the perspectives of both buyers and sellers should be included in future research since the quality of collaboration or relationship is important for new service success.

- More research is needed on the types of customers that are useful for CI. There is a need to develop guides of appropriate customers according to the type of information sought or the type of service developed.

- The nature of CI during NSD needs to be analysed more thoroughly. Specifically, we need answers to the following questions. How do we involve customers (modes) and how intensively?
Which types of customer contributions are sought and under which circumstances? What roles do customers play in CI? Which practices and which customer actions are appropriate for each stage or group of stages of the NSD process? What type of relationship should firms have with customers that get involved in NSD? How should firms communicate with customers and which communication skills should firms have to communicate effectively?

- Measures of new service performance on the project or program level should be analysed further and research should conclude whether it is best to use more financial or non-financial measures and why.

- The use of virtual environments or web-based tools used to transfer customer knowledge to companies should be one the key areas of research in the following years since there is a wealth of customer-supplied information that can only be exploited through online media. The question is how companies can use this data for NSD.

- Finally, future research should address the role of relationships in CI. Specifically, it is important to investigate the role of various relationship concepts (e.g. satisfaction, relationship closeness, relationship quality) in CI and their inter-relationships with service innovation concepts such as effective CI or new service success.

SOCIAL RESPONSIBILITY IN BANKING: A BIBLIOGRAPHIC REVIEW

Bellomo, Mario; La Rosa, Fabio

Economics and Law Faculty, “Kore” University of Enna, Enna, Italy

ABSTRACT

The present paper proposes a review concerning the topic of social responsibility in banks. In the backdrop of economic crisis which is still ongoing, companies are requested to align with the directives and values of social responsibility. The compliance to social responsibility, nevertheless, cannot only be seen as a commandment imposed and far removed from the competitive and business environment, which passively to adapt to, but rather as an opportunity for diversification and competitive advantage. Such problem is exacerbated in a sector such as banking, in which the elements of competitive differentiation are often ephemeral and volatile, since based on price (especially in the context of loans and services) and performance (in the management of deposits).

This paper focuses on three areas, which have been extensively analyzed by the national U.S. and European literature in the banking sector. In particular, the present study examines: the relationship between social responsibility and income or stock performance of banks; the compilation of the bank operator’s rankings, on the basis of results achieved in terms of social responsibility; the impacts of social responsibility in terms of customer satisfaction.

This study proposes to investigate some critical issues, in order to offer interesting ideas for new research into yet unexplored areas.

Keywords: Social responsibility, performance, regulation, legal enforcement, corporate governance

INTRODUCTION

Social Responsibility has been studied by academic research since the 70s and 80s. The notion of CSR being a social obligation was first advocated by Carroll (1979, 1991). Carroll’s CSR pyramid, one of the best-known CSR models, presents company’s social obligations as comprising economic, legal, ethical and philanthropic responsibilities. Carroll (1991) noted that businesses were created as economic entities driven by a profit motive, thus economic performance undergirds the other three CSR components yet only in 2011 Corporate Social Responsibility (henceforth CSR), CSR has been provided with an official definition by the European Commission as “the responsibility of enterprises for their
impacts on society”. Among the various factors related to CSR, performance, rankings based on the degree of attention to social responsibility itself, and customer satisfaction have been studied extensively, from both a theoretical and an empirical standpoint. As regards the performance and customer satisfaction, literature shows that people may not believe in an explicit trade-off between being profitable and meeting legal, ethical, and discretionary responsibilities anymore. Yet, banking industry surveys have highlighted a mismatch between customer satisfaction and massive spending on CSR programs. Indeed, the omission of research on the differential impact of CSR initiatives on customer satisfaction is evident. Given both the increasing investment in CSR strategies, and the fact that customer satisfaction mediates firm market value, more awareness of the hierarchy of customer-preferred CSR initiatives is needed in order to enable banks to adapt their CSR programs, to not only benefit the community, but also to improve customer satisfaction (McDonald and Rundle-Thiele, 2008).

In reference to compilation of rankings based on the CSR-care, literature underlines that these approaches have the advantage of being quite transparent and objective, as they are based on publicly available information on websites of banks and supranational bodies and reporting specialized NGOs. The biggest flaw of these researches is the limited number of banks for which reports are available, since there is a generalized problem of insufficient disclosure in CSR activities (Scholtens, 2009).

**AIMS OF THE PAPER**

This paper proposes a review concerning the topic of social responsibility in banks, focusing the attention in detail on: I) the relationship between attention to social responsibility and incomes or stock performance of banks; II) the compilation of rankings of bank operators, on the basis of results achieved in terms of social responsibility: the effects of cultural, ethnic and gender variables on social responsibility indicators; III) social responsibility and its impacts in terms of customer satisfaction. Furthermore, the paper would like to suggest three other areas almost unexplored and therefore susceptible to further research and insights IV) the effects of cultural, ethnic and gender variables on social responsibility indicators; V) the relationship between attention to social responsibility and degree of self regulation and cooperation; VI) the relationship between attention to social responsibility and legal enforcement on a national scale. The importance of the link between the above areas and CSR, particularly the final three areas, calls for an analysis of the current state of knowledge and a systematization of the existing results as preliminary steps to facilitate future studies. In management research, literature is useful to enable the researcher to map and assess the existing intellectual territory and to develop the existing body of knowledge.
In order to make this bibliography as exhaustive as possible, but also having to take into account the inability to analyze the vast literature on CSR, it was decided to concentrate on the most recent researches by selecting those published since 2000 onwards.

**RELATION BETWEEN CSR AND PERFORMANCE OF BANKS**

Most of the research on CSR has focused on investigating the connection between CSR and corporate financial performance, while little theoretical attention has been paid to understanding whether corporations act in socially responsible ways or not. The theoretical framework proposed by Campbell (2007) is, in our view, a milestone in literature, able to systematize the socially responsible behavior of businesses and the motivations behind these behaviors. This model, with reference to business in general and not only to banking sector, summarizes the previous literature on CSR in eight postulates according to which companies would be induced to implement CSR activities (see also Shleifer, 2004):

- Companies with poor financial performance and / or acting in a poor economic environment will be less likely to act in a socially responsible way. In fact, if the possibility of obtaining short-term profits are low, the lack of resources could jeopardize the creation of shareholder value (Margolis and Walsh, 2001; Orlitzky et al., 2003).

- Companies will be reluctant to act in a socially responsible manner whether they operate in environments which are too competitive or too little competitive (McCraw, 1984; Schneiberg, 1999).

- Companies will be more inclined to act in a socially responsible way if there is a strong regulation and an effective legal protection of investors especially if such-regulation is based on consensus and negotiation between the government, companies and stakeholders (Grant and Downey, 1996; Siggitz, 2003; Grant, 1997).

- Companies will be more likely to act in a socially responsible way if there is an effective and well-organized system of self regulation based on the threat of intervention by the state or by an industrial crisis of vast proportions (Schneiberg, 1999; Streeck and Schmitter 1985).

- Companies will be more inclined to act in a socially responsible way if there are independent organizations such as NGOs, social movements, press or institutional investors able to monitor their behavior, and if necessary able to mobilize to change it (Aguilera and Jackson, 2003; Driver and Thompson, 2002; Mitchell et al., 1997).

- Companies will be more inclined to act in a socially responsible way if they operate in a context where the demand for such behavior by important stakeholders is institutionalized for example in major economic journals, professional and training curricula, and in other contexts which the
participation of managers is required (Aguilera and Jackson, 2003; Dore, 1983; Hall and Soskice, 2001; Whitley, 2004).

- Companies will be more inclined to act in a socially responsible way if they belong to associations of businesses that promote socially responsible behavior (Martin, 2000, 2005, 2006).

- Companies will be more inclined to act in a socially responsible way if they are institutionally engaged in a dialogue with social partners and stakeholders (trade unions, investors, the local community), (e.g., Aguilera and Jackson, 2003; Roe, 2003).

In this context it is worth mentioning the work of Chih and colleagues (2010) which seek to empirically test the Campbell postulates, studying a sample of 520 financial institutions in 34 countries in the period between 2003 and 2005. The authors conclude that there is not any significant relationship between the attention given to CSR and the performance of the financial intermediary. In detail, they encounter a series of other important results, such as: the bigger the company the more socially responsible the actions of the intermediaries, the more intense the competitiveness of the market, the greater the legal protection of investors and finally, the more collaborative and non-confrontational the relations between employers and employees. From the methodological point of view, researchers use the ROA index as independent variables for the studied regression as a proxy for performance, the H statistics index defined by Chih and Cheng (2008), as a proxy of the degree of market competitiveness; the study of the independent variables related to legal enforcement and the degree of cooperation between employers and workers will be dealt with in the last section of this paper.

The dependent variable taken as a proxy of the CSR instead is a dummy variable which takes the value 1 if the intermediary is included in the Dow Jones Sustainability World Index (DJSI World) and 0 otherwise. The curvilinear relation between the degree of competition and the degree of socially responsible behavior proposed by Campbell appears to be confirmed by empirical findings.

Simpson and Kohers (2002) analyzing a sample of 385 US commercial banks in the period between 1993 and 1994 came to the opposite conclusion that is there is a positive and significant relationship between the degree of adherence to CSR and the financial and economic performance of banks. The authors use a measure of the dependent variable CSR derived from the Community Reinvestment Act of 1977 (CRA), which consists of a dummy variable that takes the value 0 if the CRA rating is “improvement needed” and 1 if the CRA rating is “outstanding”. The rating, which can assume four levels, is based on 12 items among which are listed the more significant: 1) ability to communicate with members of the community to ensure credit needs; 2) degree of involvement of the BoD in CSR activities; 3) efforts of marketing to make sure that the types of credit offered are widespread in the community; 4) participation in community development projects. In order to measure the dependent variables
Simpson and Kohers refer to two distinct indicators: the ROA index and the relationship between losses on loans and the total number of loans. The CRA was enacted to force banks to meet the credit needs of low-middle income customers by financing their housing needs and supporting their economic development. Taking for granted the existence and positivity of the relation between CSR and Financial Performance (henceforth FP), these authors state that the only possible direction future research can move is to explain, through a theoretical construct, the above relation and identify the direction of it, particularly whether it is CSR to determine FP or vice versa.

Even, Cornett, Erhemjamts and Tehranian (2016) by examining the relation between CSR and performance of banks, in the context of the ongoing financial crisis, found that banks with high scores in terms of CSR show also high performances: being socially responsible is therefore a rewarding behavior. These researchers, based on their empirical findings, argue that big banks, to a greater extent than smaller one, are dedicated to socially responsible initiatives. After 2009, however, there was less attention towards CSR issues by big banks.

CLASSIFICATIONS OF INTERMEDIARIES ON THE BASIS OF PERFORMANCE IN TERMS OF CSR

The scholars who have dealt with this thematic area have sought to draw up rankings of the degree of attention to CSR on the basis of the different items often using the triple-bottom-line theoretical framework by Elkington (1997), widely employed both in the literature and in the best practices. According to Elkington’s model, the performance assessment must concern not only the economic aspects, but also the environmental and social ones, thus aiming to create autonomously qualitative and multidimensional indicators (Birindelli et al., 2015; Scholtens, 2009). Usually the methodological approach is the Content Analysis Method (Abbott and Monsen, 1979; Beattie and Thomson, 2007).

CSR is regulated by international and national self-regulatory measures, without binding legal force (soft law). Among the most relevant CSR disposals, we mention the OECD Guidelines (OECD 2011), the ISO 26000 Standard (ISO 2010) and the GRI (acronym for Global Reporting Initiative) Guidelines for Sustainable Reporting.

In the last few decades, the relevance the community and institutions attach to CSR has progressively increase but some authors (Karaibrahimoglu, 2010) think there is a dilemma between the enhancement and the weakening of CSR activities during the economic downturns. The contrast concerns, on one hand, the strengthening of the CSR initiatives required by the increasing social and environmental awareness and, on the other, the tendency of the organizations to limit such investments because of the lack of financial resources.
In this area, widely covered by business literature in general, but a little less by the specific literature about banks, the contribution of Scholtens (2009) seems interesting. This author develops a framework which analyzes 32 major European banks in the 2000-2005 period and comes to a classification of their degree of adherence to CSR principles. The CSR indicators derived from the World Commission on Environment and Development (1987) are dummy variables and are divided into four areas, namely: adherence to codes of ethics and use of sustainability reporting; environmental management; financially responsible products and social conduct. This approach, according to the author, turns out to be more immediate and transparent than CSR ratings prepared by specialized institutions such as KLD and EIRIS and allows repeatability and verification of results. It also offers both a classification of individual banking institutions and a classification at country level pointing out that banks in the Netherlands, Belgium, Germany, France and the UK get the highest scores in terms of CSR, while banks in Sweden, Italy and Japan register the most disappointing results. The author also finds a positive association between performance in terms of CSR and, respectively, the size and financial standing of the bank as measured by the capital ratios. Along the lines of Scholtens (2009), studying a sample of 30 European banks, has set himself the goal of submitting a ranking indicating the degree of adherence to the values of CSR based on 48 dummy independent variables considered by the authors the most important drivers of CSR in banks. These items are obtained from literature, accounting and financial reporting and the websites of banks and are grouped into four areas of analysis (disclosure, organization and management, offer of socially responsible instruments, adherence to agreements / international standards / certifications and indices). In any case, they are the product of a subjective evaluation process, based largely on the “perceptions” of the respondents (Hillenbrand and Money, 2007). The dependent variables are represented not only by the intermediary position in the aforementioned ranking but also by the ratio between the added value created by the bank and its total assets. The results that the authors come to are that banks should pay more attention to the disclosure of their activities in the field of CSR, since the scores in this area are relatively worse than those achieved in others. The areas of organization and management and offer of socially responsible instruments, are those in which the analyzed banks get the best results, demonstrating great sensitivity in CSR issues, in line with the success of the tools developed to fight against social exclusion and poverty of the poorest social strata and least developed countries. The interpretation of the results relating to the items included in the area and international agreements looks rather ambiguous. If adherence to those standards expected of financial institutions such as UNEP FI and the UN Global Compact Principles appear widespread, it is more difficult to find adherence to those agreements pertaining to specific subject areas such as combating gender discrimination, money laundering, environment protection and human rights.
Weber and colleagues (2005) use a multi-level analysis that begins with the pre-selection of 171 banks that have joined the UNEP Convention of 2001, after identifying the 22 best organizations in terms of sustainability. The authors only interview 8 of those organizations and conduct an in-depth analysis of production processes trying to assess their ability to integrate sustainability into the business strategy. The analysis is performed for three distinct business areas: a) credit business, including microcredit, loans for environmental and social projects with interest rates lower than standard and residential mortgages aimed at the realization of sustainable housing from an energy and environmental point of view; b) wealth management including asset management and mutual funds investing in sustainable projects; c) investment banking activities promoting the creation of job opportunities for local communities in which the investment is made, the use of renewable resources and projects having a positive impact on local environment. For each area, the authors attempt to identify the leaders in the ability to integrate sustainability into core activities, grouping the banks on three levels depending on the efficiency of the implementation: leaders, mid-level banks, sufficient level banks. The specific identification of the leaders is beyond the scope of this paper, so they will not detected. The focus of this section is on the study of the method used and its theoretical and practical implications. Finally, the authors identify five models of integration of sustainability in the banking sector: integrating sustainability-related events; sustainability as a new banking strategy; sustainability as value drivers; sustainability as a public mission; and sustainability as a requirement by customers. These models can be effectively employed even in other banks to implement sustainability in their business. The authors suggest five models of integration of sustainability in the banking strategy:

- Integration of sustainability through the creation of technical funds for the purposes of environmental protection, through the introduction of an environmental tax or the use of a global conference on sustainability.

- Sustainability as a new banking strategy from a social and ethical perspective, besides the financial one. This strategy is the one adopted by those banks which only undertake sustainable businesses.

- Sustainability as a value driver in the implementation of sustainable products, eco-mortgages and similar products. The difference with respect to the concept of sustainability as a new banking strategy is that these products and services do not constitute the core business and do not represent the main portion of the bank’s revenues. The strategy consists in the use of the concept of sustainability only if it improves profits or the reputation of the bank. Sustainable products coexist with all other standard products and services. The business strategy of the bank as a whole is not pervasively affected by the concept of sustainability.
- Sustainability as a public mission in the event that banks carry out their activities on behalf and in the interest of a public entity as a state, an area (the Swiss cantons) or a local authority.

- Sustainability as a requirement by customers. The bank adjusts its policy to the wishes and needs of customers, by periodically asking them if its actions are consistent with their needs and social sustainability.

The authors conclude by listing some practical suggestions which are able to make the banking sector sustainable in the future: a) bank executives must support integration (top-down process); b) sustainability has to be integrated into operational activities in terms of products, services and processes; c) the integration of sustainability into the core business of banks; d) the integration of sustainability into the overall business strategy of a bank; e) sustainability is not a soft factor, but a measurable business result.

**IMPACT OF CSR ON CUSTOMER SATISFACTION**

This thematic area seems scarcely explored as the literature focuses on non-financial companies without investigating what happens with particular reference to the banking sector. In this thematic area most of the research has made use of the theoretical framework based on hierarchy of customer preferences for CSR initiatives by Bhattacharya and Sen (2004). In spite of the notoriety of this model it must be recognized that a comparative analysis of the efficacy of each of the dimensions has not carried out so far.

Bhattacharya and Sen (2004) CSR framework is made up of three broad parts - the company-specific inputs, the internal and the external outputs from consumers - that benefit the focal company, the consumers themselves, and the social issues. The model reflects two sets of “multiplier” factors that moderate the effects of the CSR initiatives on the internal outcomes and that moderate the effects of the internal outcomes on the external outcomes. These factors are broadly classifiable into three categories pertaining to the company, the consumers, and the competition. Because of the heterogeneity of consumer responses, the problem for managers is to understand when, how and why consumers’ respond to CSR initiatives, and the above research-guided framework is aimed to face this difficult task.

McDonald and colleagues (2008), starting with a thorough literature review on CSR, ask future research to answer the question whether, for the purpose of customer satisfaction, a customer centered policy or a CSR centered policy give better results for banks. To this end, they seek to establish a ranking of both CSR item and those with a more marked customer focused character, which allows for identification of which items are more interesting and should be further explored. In the non-banking
area important research by Luo and Bhattacharya (2006) and Maignan and Ferrell (2001) indicate a positive association between CSR and customer satisfaction, yet the same Luo and Bhattacharya showed that the relation between CSR and customer satisfaction was not always linear, and indeed in the case of companies with limited innovative capacity, it was reversed. McDonald and colleagues (2008) found that surveys conducted by the banks themselves often show that institutions which have made significant investments in socially responsible initiatives have not had a significant return in terms of customer satisfaction. This is confirmed by Pomerong and Dolnicar (2006) who, investigating the CSR initiatives of a specific bank have seen how customers prefer initiatives that benefit them directly, rather than those that benefit their wider community. If it is a fact that customer satisfaction is one of the most important determinants of firm value, banks cannot disregard them in the implementation of socially responsible initiatives.

Ultimately through the use of the multi-dimensional model of CSR Bhattacharya and Sen (2004), McDonald and colleagues (2008) confirm what was argued by the prevailing literature, namely that customer-focused initiatives make it possible to obtain better customer satisfaction than those focusing on CSR, but they also point out that the effects of CSR initiatives in consumer behavior have not yet been sufficiently explored by scientific research. The goal of future research will be to identify a hierarchy of CSR initiatives that would allow banks to focus on those initiatives that give a greater return, even under the profile of customer satisfaction, since according to Auger and colleagues (2006) there is a hierarchy of consumer preferences for ethical and social issues, and therefore not all initiatives in CSR have the same impact in terms of customer satisfaction.

EFFECTS OF VARYING CULTURAL, ETHNIC AND GENDER ON CSR

Among the thematic areas that were not elicited enough by the literature it is that of socio-cultural variables such as gender, ethnicity, professional. The main goal of this section, therefore, is a survey of literature on international, cross-cultural CSR policy in general and cross-cultural CSRO (namely individual orientation towards CSR) in specific. The main theoretical reference model, in this fields are, Carroll’s (1979, 1991) framework of CSR and Schwartz’s (1999, 2006) theory of cultural value orientations. Carroll defines CSR as the result of the combination of four components: a) economic responsibilities namely profitably producing goods and services requested by society; b) legal responsibility: operating within the laws and the social rules established by society; c) ethical responsibilities: acting by conforming to society’s expectations and social rules established, by doing what is right and fair; d) discretionary responsibilities: acting as good citizens contributing to the welfare of the society and the improvement of the quality of life. According to Schwartz cultures could be described in several dimensions and are ordered by importance in relation to one another to form a
system of values viewed as interdependent and non orthogonal dimensions (Schwartz, 1992). Schwartz (1992) distinguished seven types of cultural value orientations comprising three polar cultural value dimensions: a) embeddedness versus autonomy; b) hierarchy versus egalitarianism; c) mastery versus harmony.

Literature about this area confirms significant differences in CSR across cultures even within one single internationally operating organization; meeting such differences does not come at the expense of economic performance levels or legal limitations (Van den Heuvel et al., 2014). The most important question arising from this issue is whether CSR-oriented organizations will survive in the long term in the whirlpool of supercapitalism (Reich, 2007) and hypercompetition (D'Aveni, 1994), which strongly emphasizes shareholder satisfaction.

In this thematic area it is worth quoting the work of van den Heuvel and colleague (2014) that, examining 416 employees of a bank operating internationally, study the orientation and attitude towards CSR depending on one’s country. The context studied was geographically divided into three clusters, each corresponding to one of the business units of the bank: Western Europe, English-speaking countries and South Asia. The dependent variable CSR is defined by four distinct components according to Carroll theoretical framework. The authors administered a questionnaire to employees consisting of 44 items, divided into 11 set, each containing 4 items, one for each of the components of CSR identified above, asking them to distribute 10 points among the various items of these 11 sets.

Univariate and Multivariate Analyses of Variance and T-test on independent groups were carried out to verify the research hypotheses, namely the significance of the difference between the averages of the overall scores obtained in the various transnational clusters. In conclusion, the authors confirm their assumptions about the presence of significant differences within a single organization operating at an international level as regards CSR orientation according to their nationality, gender and professional area; such difference it is not significant only for the first component. For example, the Anglo-Saxon countries and those in South Asia give greater weight to competitiveness, economic performance and to the legal component and more limited weight to the ethical component than in Western Europe ones. Western European countries, however, attaches a greater weight to the discretionary component than the Anglo-Saxon countries. This suggests the difficulty in implementing a uniform CSR strategy for all countries. As for gender influence, men generally classify the four responsibilities in order of importance as follows: economic, legal, ethical, and discretionary, whereas women classify economic responsibilities only third after the legal and ethical ones. As for the functional variable, the authors found that employees belonging to the random cluster, compared to CSR experts, believe legal responsibilities to be far more important, while the latter attach more importance to ethical responsibilities. The authors suggest as an additional line of research the study from a transnational
perspective, but in the context of a variety of organizations instead of only one since the corporate culture tends to prevaricate and to prevail on the cultural national orientation of employees. Further research on the differences in CSR across various cultures should be undertaken, incorporating various populations in different countries, through multi-national banks with branches across different countries since research is often focused on banks located in just one nation.

THE RELATIONSHIP BETWEEN CSR AND RESPECTIVELY LEGAL ENFORCEMENT AND COOPERATION BETWEEN EMPLOYERS AND EMPLOYEES

This thematic area, while being interesting for its practical implications, definitely appears to be the least explored in the literature, therefore also worthy to be further investigated by future research. The theoretical framework for this area is the same Campbell (2007) model analyzed in section about the performance and a useful research starting point can be represented by the work of Chih and colleagues (2010), partially shown in the section devoted to financial performance and the cash flows linked to adoption of CSR measures. In this section, the aspects related to legal enforcement and the cooperative and self-regulating frameworks, will be briefly analyzed. The authors use three indicators as a proxy of legal enforcement including the Shareholders Right Index (La Porta et al., 1998) which can take values between 0 and 6, where 6 indicates the highest level of protection for shareholders and Legal Enforcement Index, which can assume values between 0 and 10 where 10 corresponds to the greatest possible degree of protection of investors prepared by the legal system; a proxy index of cooperation between employers and employees was derived from the Global Competitiveness Report which may assume values from 1 to 7, where 7 indicates the highest possible degree of cooperation; an index measuring the degree of self-regulation and may assume a value of 1 if the intermediary adopts either the Equator principles or the Wolfsburg principles and 0 if the intermediary does not adopt either of the two principles. The dependent variable, featuring also in this case the CSR, is represented by a dummy variable which takes the value 1 if the intermediary is included in the Dow Jones Sustainability World Index (DJSI World) and 0 otherwise. The authors (Chih, Chih and Chen, 2010) conclude that the financial intermediaries operating in countries with strong legal enforcement measures engage in CSR activities with greater determination while financial intermediaries in those countries with effective protection for investors are less involved in CSR activities; self-regulation in the financial sector has a positive impact on CSR; finally, financial intermediaries in countries with more cooperative relations between employers and workers and high quality management schools will be more attentive to CSR.
CONCLUSIONS

In the present article we have tried to address the issue of social responsibility of banks trying to identify, through a review of recent literature, determinants and effects. Moreover, we have tried to suggest some ideas for future research in CSR fields like those of customer satisfaction and legal enforcement which have been poorly explored so far. The conclusion is that compliance with social responsibility, can not only be seen as a commandment imposed from above, far removed from the competitive business environment, but rather as an opportunity for the diversification and competitive advantage (Birindelli et al., 2015). This interpretation is even truer in the banking sector, where competitive differentiators are often ephemeral and volatile, since they are based on the price (under loans and services) and performance (in the management of deposits). Yet it cannot be denied that the values of social responsibility are often invoked by the various subject of the system (governments, companies, NGOs) to defend their interests. In particular, governments invoke social responsibility to demand and justify an extension of its regulatory powers, companies set themselves up as bastions of social responsibility to demand more autonomy from regulatory constraints, while NGOs make use of CSR to increase their lobbying powers and to rake in more resources in the form of donations from governments and enterprises (Michael, 2003).

FOR LOVE AND MONEY! EMPLOYEES, VOLUNTEERS AND ECONOMIC PERFORMANCES IN USA NONPROFIT ART ORGANIZATIONS

Besana, Angela; Esposito, Annamaria

Business, Law, Economics and Consumer Behavior, IULM, Milan, Italy

ABSTRACT

The economic performance of nonprofit art organizations is affected by the labour intensity of employees and volunteers. Marketing and, above all, relationship marketing are very important to engage employees and volunteers, emphasize and strengthen their commitments, and maximize the competitive advantage in a resource-constrained sector. A relationship marketing perspective helps art organization to understand who employees and volunteers are and what drives them, and to create a seamless integration between paid and unpaid workers. This facilitates productive relations among staff and volunteers, and their connections to the organization’s goals.

The aim of the paper is to profile 300 nonprofit art organizations in the USA in terms of the relationship between their ratio of employees to volunteers and their economic performances in 2015. Following k-means cluster analysis, three main clusters are significant. The most crowded cluster (130 organizations) shows the highest program service revenue with the greatest share of employees. Marketing staff are essential in the The Marketing Expert cluster, who reveals an organization focused on internal labour intensity. The two remaining clusters show higher fundraising expenses, contributions and ratio of volunteers than The Marketing Expert. The external labour intensity of volunteers is essential for art organizations in The Fundraiser cluster with the highest gains and solvency.

The paper highlights the joint importance of employees and volunteers in the performance of art organizations, which have so far not been thoroughly investigated using cluster analysis. Relationship marketing plays a pivotal role, which can be further optimized by the managers of these organizations.

Keywords: economic performance, marketing, USA nonprofit art organizations, employee, volunteer, cluster analysis.
INTRODUCTION

Labour intensity is very important in nonprofit organizations, who fulfil missions, which do not only affect economic growth but also build social capital and welfare. Nonprofit art organizations in the USA show high levels of labour intensity (Slavich, Montanari, 2009; Turbide et al., 2009 and 2008), whose pillars are employees with their creative skills on the stage, in museum rooms and marketing offices, and volunteers who, above all, outside of ‘creative rooms’ support friendships, advocacy, marketing and fundraising goals. The *internal labour intensity* of marketing and fundraising staff is signaled through marketing and fundraising commitments and goals, which can be magnified by the *external labour intensity* of volunteers, who either may support more the fundraising side than the marketing side of art organizations or may support the match of both fundraising and marketing. Consequently, the economic performance of these nonprofit organizations is affected.

In this context, relationship marketing (Das, 2009; Morgan, Hunt, 1994; Berry, 1995) is an important strategy to attract, maintain, and enhance long-lasting relationships with paid and unpaid staff over time in nonprofit organizations. The marketing perspective allows non-profit organizations to understand who employees and volunteers are and what drives them, allowing nonprofits to identify the strategies most appropriate to managing them. In addition, relationship marketing helps to meet the needs of stakeholders and to provide them with information directly suited to their interests (Bussel, Forbes, 2002, 2006), and to spread awareness of the social values which lead to the achievement of the mission (Sargeant, 2009; Andreasen, Kotler, Parker, 2003).

Adopting a marketing approach allows nonprofit to generate stakeholders trust and commitment (Hussain, Rawjee, Penceliah 2014), and to exploit strategically the valuable resources and capabilities that are at the nonprofit organization’s disposal, among which are employees and volunteers. Furthermore, according to some scholars (Colbert 2001; Hill, O’Sullivan and O’Sullivan 1995; Radbourne, Fraser 1996) the more the organization learns about and monitors the stakeholder’s needs, preferences, attitudes and concerns, the greater will their satisfaction and commitment level grow. This is especially true for nonprofit art organizations, which are services-oriented organizations, and they are built on relationships (Grönroos, 1994,1996, 2004; Rentschler et al., 2002; Padanyi, Gainer, 2004).

The aim of the paper is to profile 300 nonprofit art organisations in the USA in terms of the relationship between their ratio of employees to volunteers and their economic performance in 2015. Following k-means cluster analysis, three main clusters are significant for volunteering in connection with fundraising (external labour intensity) and employees in connection with marketing and advertising (internal labour intensity).
ECONOMICS OF INTERNAL AND EXTERNAL LABOUR INTENSITY IN NON-PROFIT ART ORGANIZATIONS

Internal labour intensity is depends on creative professionals in non-profit art organizations, whose non progressive production function has been the focus of economic literature for decades (Slavich, Montanari, 2009). The commitment of employees concerns identification with the mission of the organization, long-term relationships and satisfaction. It includes visions and the importance of monitoring for satisfaction. Employees can affect performances and, if they mature with the organization, their advocacy and efforts can impact on both economic and social performances (Hegenbuch, D. J., Little, S. W., Lucas, D. J. 2015). Employees show a labour intensity, which is not subsidiary to the volunteers’ one, though some fungible competences can be interchanged (Handy, F., Mook, L. and Quarter, J. 2007). Deviation is possible, if boards do not invest in intensity and trustworthiness (Van Erde, W., Peper, P. 2008).

The external labour intensity is supported by several stakeholders, among them, volunteers, who are not paid by the organizations, though they show advocacy for and commitment to. Nonprofit art organizations have always relied on voluntary relations, while volunteers have invested time, emotions, advocacy, congruent identities, tangible and intangible resources (Carpenter, Myers, 2010; Einolf, Chambré, 2011; Bussell, Forbes, 2007 and 2002). If motivations can range from tangible to intangible (Meier, Stutzer 2008; Ziemek, 2006; Katz, Rosenberg, 2005), the range of variables of the utility function of volunteers include: empathy for a specific good cause, altruism for any good cause, commitment to the welfare of the whole society, self-identification and self-esteem (Chaddha, Rai, 2016). In volunteers’ opinions relations gratify them for being in a community with other people and ‘empathic souls’.

Employees and volunteers collaborate. From the starting point of their relationship, the selection and governance of volunteers they both need charismatic leaderships and, above all, that the board of nonprofit organization verifies changing viewpoints of volunteers over time (DeVoe, Pfeffer, 2007). Volunteers’ levels of satisfaction can change, as well as their impact on turnovers. Employees and audiences are essential to the functioning and revenues of non-profit art organizations. Volunteers are essential, too (Ewing, Govekar, Govekar, Rishi, 2002).

Employees and volunteers can be the same people and the latest nonprofit literature is paying attention to the allocation of time, rewards and reputation, when staff-giving (as volunteers in another organization) change relations and governance inside of firms (Rodell, Lynch, 2016; Grant, 2012). This may not be the case with art organizations: employees are fully devoted to their art organization and they can work as volunteers within it (for fundraising events and big donors’ events). No literature has been found that looks at art and nonprofit employees working as volunteers in other art and...
nonprofit organizations. Only some USA art organizations support their staff-giving (for networks of theatre seasons and productions). In contemporary nonprofit organizations, some staff-giving can be found. Nevertheless volunteering can suffer for recession and millennials, who do not seem to be particularly interested in volunteering (Ertas, 2016; Collins, Long, 2015).

**THE IMPORTANCE OF RELATIONSHIP MARKETING IN NONPROFIT ART ORGANIZATIONS**

Relationship marketing (Morgan, Hunt, 1994) is represented by all the marketing activities geared to the creation, to the maintenance and management of relational assets consisting of long-run relationships with stakeholders. Furthermore, according to Buttle (1996), relationship marketing is about healthy relationships characterized by concern, trust, commitment and service. It is about a mutual exchange and fulfilment of promises (Grönroos, 1994). *Adopting a marketing perspective* — without forgetting the ethical dimension and the values which distinguish the economic role played by nonprofit — pushes art organizations toward innovative strategies for the realization of their mission (Lovelock, Weinberg, 1984; Andreasen, Kotler, Parker, 2003; Kolb, 2013) and in a more strategic direction (Conway, 1997).

It must be remembered that relationship marketing is not just about relationships with customers. In fact, a relationship marketing approach is crucial in dealing with different groups of stakeholders (Peck, 1996) and with different relationships between these groups (Christopher, Payne, Ballantyne, 1991; Morgan and Hunt, 1994; Doyle, 1995; Gummesson, 1996).

A relationship marketing approach is important especially in art organizations which are, as nonprofit service-oriented institutions, multi-stakeholders and multipurpose. Consequently, nonprofit organizations have many relationships that are vitally important. At the same time, they have a multitude of constituencies and must work out the relationship with each of them (Drucker, 1991; Peck 1996; Bussel, Forbes, 2006, 2007).

In the arts, in addition to the audience and visitors who are essential to the arts organization’s survival (Bussel, Forbes, 2007), there are other stakeholder groups (Andreasen, Kotler, Parker, 2003; Bruce, 1995), amongst them volunteers and employees.

Art nonprofit organizations recruit employees and volunteers and invest time, money and commitment in them (Bussel, Forbes, 2006). To succeed, art organizations must focus on building effective relationships with employees and volunteers, in order to enhance their engagement and ultimately to improve their performance (Kumar, Pansari, 2016; Bussel, Forbes, 2006). To create a seamless integration between paid and unpaid workers, volunteers must be trained, supervised and evaluated as if they were employees.
In order to exploit the relationship marketing potentialities, arts nonprofit organizations must make visible their unique value proposition (Delaney, 2014; Sargeant, 2009; Wymer, Knowles, Gomes, 2006), that is the value that the nonprofit provides to its stakeholders, from the audience to volunteers, from employees to donors and to the community. Often, the unique value proposition is not fully and clearly expressed; nevertheless, its relevance is crucial both for stakeholders, as it allows them to appreciate the distinctive specificities of the organization, and for the organization itself, so that it can explain the value generated by its activities and benefits to those parties willing to offer their resources.

If the unique value proposition is consistent with the mission and it is properly communicated, it can meet stakeholders’ needs and allow the art organization to recruit people as volunteers (Wymer, Knowles, Gomes 2006).

When dealing with actual and potential volunteers, employees, audience and other stakeholders, the value proposition is very important. If the value art organizations are offering is close to the value stakeholders are receiving, there should be the basis for a long-lasting relationship. The challenge is to invest in that relationship to ensure, on an ongoing basis, that all involved parties get what they want and need. In fact, people volunteer for specific benefits and will only continue with this activity if they are satisfied (Bussel, Forbes, 2002). Therefore, it is important, when dealing with volunteers, to understand the motivational mix that drives people to invest their time in volunteering (Voss, Voss, 1997), also considering that motivations change over the volunteer life cycle (Bussel, Forbes, 2003). In art organizations volunteers’ motivations are often very similar to those of visitors and audience members.

Volunteers can help as artists directly performing the mission of the organization or as fundraisers, soliciting grants and contributions of money and goods and services from potential donors. They can also be in charge of some of the general activities relating to the accomplishment of the art organizations’ mission.

On the one hand, for instance, art organizations can offer to participate in the effort to improve lives through art programs, on the other hand, volunteers can provide ushering, ticket taking and other services, administrative support in the office; the organization and execution of fundraising events and the promotion of nonprofit activities to their friends.

Volunteers might be regarded and managed as a source of labor, as a special type of visitor or audience member, and as part of the organization’s public engagement strategy.

Employees and volunteers, working together, can provide funding, audiences, sponsorship, and support as well as act as unpaid advocates for art organizations (Bussel, Forbes, 2003; Raymond, 1992).
THE STUDY

The main objective of the study is to investigate the impact of employees’ and volunteers’ activities on the performances of art organizations in the USA. Specific research objectives are represented by the following research questions:

RQ.1 Are art organizations in the USA affected by labour intensity?
RQ.2 If yes, how does it impact on these art organizations’ performances?

To answer the research questions, a sample of 300 art museums, symphony orchestras and opera houses in the USA which had the highest total income in 2015 is analyzed. The sample was selected from Guidestar.com databases and clustered, thanks to a k-means cluster analysis, to identify profiles with different labour intensity.

METHOD

990 forms from the fiscal year 2015 are here analyzed with the Internal Revenue Service (IRS), categories ‘A69-Symphony Orchestra’, ‘A6A-Opera’ and ‘A51-Art museums’: 100 organizations for each category, from the highest to the lowest total income. These reports can be downloaded from the Guidestar website www.guidestar.org and the main websites of the organizations themselves. The Guidestar website contains 990 forms from nonprofits, such as detailed statements of revenues and expenses and financial statements. The sample adds up to 257 organizations, whose 990 forms were downloadable at www.guidestar.org or at their own websites at the end of 2016.

As reported in the 990 form glossary revenues of a nonprofit organization in the USA may include:

Direct public support: contributions, gifts, grants and bequests received directly from the public. It refers to amounts received from individuals, trusts, corporations, estates, foundations, public charities, or raised by an outside professional fundraiser; Government contributions or grants: payments from the Government to a nonprofit organization to further the organization’s public programs. Direct public support, Government contributions and grants are summed so that the whole extent of Contributions can be estimated. The other revenue categories are: Program service revenues: fees and other monies received by an organization for services rendered.

If contributions and program service revenues constitute more than 80% of the sample, ancillary revenues derive from Investment income and Other revenues. Revenue diversification will be here analyzed as concerns main categories: Contributions with the target of willingness-to-donate and Program Service Revenue with the target of willingness-to-pay.

Expense categories include: Program Service Expense related to marketing and production of the core business; Fundraising expense and Management and general expense, a miscellaneous cost that is not
related to the previous accounting lines. According to IRS standards, if the fundraising expense must be separately reported, the marketing or advertising expense can be included in the Program service expense. The advertising and marketing expense will here be separately counted so that it can be compared with the fundraising expense. The personnel expense will also be calculated here, in order to appreciate the magnitude of the internal labour intensity of employees.

Next to the analysis of revenue and expense categories, the (Net) Gain or Loss of the year as the difference – positive or negative – between revenues and costs, Net Assets and Total assets are here analyzed.

Economica performance is here connected with the ratio of employees and volunteers in these organizations. These data can be found in the first page of 990Forms.

First of all, these data are entered into Excel and indexed to total revenues – for revenue categories – and total expenses – for expense categories -. Gain or loss is also included in the analysis, indexed to total revenues. The ratio of Net Assets/Total Assets is also calculated, in order to appreciate the solvency of the sample. Employees and volunteers are calculated as ratios of the total employees+volunteers.

Secondly, these ratios are clustered, in order to obtain meaningful groups with relevant and separating features.

Cluster analysis is the process of dividing a set of observations into a number of groups. In particular, K-means clustering is an iterative follow-the-leader strategy. First, the number of clusters, k, must be specified. Then a search algorithm finds k points in the data, called seeds, that are not close to each other. Each seed is then treated as a cluster center. The routine goes through the points (rows) and assigns each point to the cluster it is closest to. For each cluster, a new cluster center is formed as the means (centroid) of the points currently in the cluster. This process continues with an alternation between assigning points to clusters and recalculating cluster centers until the clusters become stable. Cluster means show the average performances of significant groups.

**KEY FINDINGS**

Having clustered the above-mentioned ratios with *JUMP Statistics*, three clusters are significant in Table 1. Five outliers will not be considered. Clusters are the sum of 252 organizations.
Table 1. Cluster K-means, 2015’s average economic performances of nonprofit art organizations in the USA (ratios) and shares of employees and volunteers.

All clusters show contributions to be the prevailing source of revenue. Nevertheless, one cluster shows the highest program service revenue (30 percent) together with the highest program service expense (76 percent). This most crowded cluster, The Marketing Expert shows the highest internal labour intensity, with the highest employees’ share, the highest personnel expense, program service expense, advertising expense and the highest program service revenue. With 130 organizations, this cluster is giving evidence of an internal labour intensity. The volunteers’ share is 30 percent, the lowest one of the sample. The fundraising expense is as much as in the Fundraiser with the highest gain and net assets (7 percent).

The Fundraiser with the highest gain and net assets is the least crowded cluster, with 35 organizations.

The highest contributions are together with the second highest employees’ and volunteers’ shares of the sample.

The Fundraiser with 87 organizations shows the highest share of volunteers (82 percent) and the second highest gain and net assets. Here, the fundraising expense is the highest of the sample (10 percent).
High shares of volunteers (in clusters labelled as Fundraiser) positively affect gains and solvency in comparison with the most crowded cluster, the Marketing Expert, where volunteers’ share is only 30 percent.

**DISCUSSION**

The purpose of this article is to understand the impact of employees’ and volunteers’ activities on the performances of U.S. art organizations.

From the literature, it is apparent that nonprofit art organizations rely on paid and unpaid staff and that relationship marketing is acknowledged as a helpful paradigm for enhancing the connection among art nonprofits and their staff, ensuring that they are connected to the organization’s strategic goals.

Volunteers are valuable resources for nonprofit arts organizations and they are actively working, together with employees, to increase and expand engagement with the public, with traditional and nontraditional audiences, with social issues, community needs, as well as other issues related to nonprofit management. Arts nonprofits can see their volunteers not just as a tool that helps them achieve their mission but as part of the mission itself.

To understand if and how art organizations are affected by labour intensity a k-means cluster analysis was conducted, and a profiling of art organizations in the USA detected three different clusters in 2015. The Marketing Expert includes 26 museums and 104 symphony orchestras and opera houses. In relation to the literature, the internal labour intensity is here influencing economic sales, so that marketing officers and fundraisers exploit the best of their relationships with multiple stakeholders.

Among the museums we can find the International Center of Photography in New York, Los Angeles County Museum, Museum of Fine Arts in Boston, National Academy of Design in New York, Phillips Collection, PS1 in New York and other high-lighted museums, whose employees are fully maturating their fundraising skills. Nevertheless, price and product marketing is constantly improving with flexible pricing, edutainment, local quarters and community empowerment. The American Symphony Orchestra, California Symphony Orchestra, Chicago Symphony Orchestra and Sinfonietta, Cincinnati Symphony and Opera, Dallas Symphony Orchestra, Houston Symphony Society, Kansas City Symphony, Seattle Opera, The Atlanta Opera and the Carnegie Hall can be here praised for their fundraising strategies: memberships, funds, endowments, planned giving and calls for bequests. At the same time, they offer rush tickets (for last minute purchases with discounted price), gift certificates and cards and new-to-opera nights for newcomers with exciting pre-performances, lectures, exclusive behind the scene activities, etc. They provide flexible series like a create-your-own-season-package and a neighborhood series with connections to local restaurants and businesses.
The Fundraiser cluster (87 organizations) with the highest share of volunteers and the highest fundraising expense includes 39 museums. Among them, the Dallas Museum of Arts, Detroit Institute of Arts, Columbus Museum of Art, Portland Art Museum and San Diego Museum of Art target the multiple engagement of local and national friends, foundations (corporate, independent and community), sponsors, trusts, planned givers and any other philanthropy. The same and skillful fundraising is present in symphony orchestras and opera houses of this cluster. In relation to the literature, the external labour intensity is playing the pivotal role: a long-lasting relation with volunteers positively affects the motivational mix, engagement, benefits and economic performances. Between these clusters, the Fundraiser with best performances includes 33 museums (out of 35 organizations). MOMA of New York, Whitney Museum, Cleveland Museum of Art, Philadelphia Museums of Art, Denver Art Museum and other ‘giants’ are here included with their mature reputation, the best-trained volunteers and employees, whose skills are constantly monitored, as these organizations are focused on new targets, in order to exploit willingness-to-donate and willingness-to-pay. In relation to the literature, long-lasting and mature relationships induce the best performances. All clusters profit by gains and net assets. Nevertheless, where volunteers are present at the highest ratios, commitments and advocacy result in the best performances. Art organizations in the USA should not underestimate the importance of their internal and, above all, external labour intensity.

MANAGERIAL IMPLICATIONS

Managers of art organizations should consider options to spend for internal and external labour intensity, stimulate and develop relations with different focus on employees and volunteers as valuable media to get in touch communities, sponsors’ local governments’ and other stakeholders’ engagement. Managers must be aware that, in order to be competitive, relations needs to be nurtured, monitored, changed and evolved according to the needs of the organization and multiples stakeholders. As aforementioned, marketing and fundraising have diverse positive effects, if they are carried out with an engagement approach. Engagement and empowerment of who is working ‘for love and money’, they result in the best economic and social (relational) performances. Managers should become aware that the advocacy of volunteers can determine the best economic performance. Nevertheless, marketing, fundraising, volunteers’ training, monitoring all require significant endeavors, in term of funding, timing, community involvement and stakeholders’ engagement. Public-private partnerships are essential for the implementation of the process and in order to ensure its success.
CONCLUSION

Employees’ and volunteers’ advocacy, skills and efforts positively impact and affect performances of art organizations in the USA. The cluster analysis confirms both the high level of staff engagement, for different weights of internal and external labour intensity, and economic results, above all, when fundraising is the leading strategy. Increasing fundraising mean increasing contributions, gains and net assets, thanks to the leading role of volunteers, who are calling for communities, friends, sponsors and multiple stakeholders to get involved.

Employees are essential, too. They express their skills both in marketing and fundraising, they train volunteers and they perfectly match with volunteers’ commitments. Trade-offs between fundraising and marketing are avoided: resources are optimized for both strategies, so that gains and net assets are maximized.

One limitation concerns the short-term nature of analysis, for only one-year of accounting data, 2015. The very next research will engage in a longer-term analysis and a bigger sample than this one, in order to explore the impacts of labour intensity and relationship marketing on the whole nonprofit cultural industry in the USA, from performing to visual arts.

CAN A HIGH WOMEN QUOTA IN SUPERVISORY BOARDS INFLUENCE ENTERPRISE SUCCESS?

Binder, B.C.K.

School of Engineering, Pforzheim University, Pforzheim, Germany

ABSTRACT

Many large companies in Europe include mainly men in supervisory boards and the women quota is often lower than 20%. In Germany an optional women quota of 30% in supervisory boards was proposed for capital market oriented companies in 2016. Some assume that without a gender quota the earnings of enterprises would shrink as male and female members in supervisory teams do not work in such a harmonized and structured way. Others think that a women quota in supervisory boards should be requested by law and should not remain optional. In this context, conducting research and analysing the impact of the women’s presence in supervisory boards on the success of companies appear as a necessary topic. The present article looks at the companies of EURO STOXX 50 in the year 2015 and their success and tries to establish whether this success can be related to the percentage of female members in supervisory positions. It replicates in this way the study of Binder, Alonso-Almeida and Bremser (2016) which analysed the relationship between female’s representation in the management board (executive board) and firm performance (measured by earnings before taxes - EBT) of the EURO STOXX 50 companies in 2014. It is in the same time an extension of the original study as the supervisory board is brought under scrutiny.

Keywords: women on corporate boards, firm performance, key performance indicators, gender quota, earnings before taxes

INTRODUCTION

This article contributes to the literature in the field of Key Performance Indicators (KPIs) as success factors e.g. the Earnings before Taxes (EBT). It offers an insight into the relationship between the economic success of 50 European companies and the gender balance on supervisory boards. For this purpose the article builds upon existing literature in the field of KPIs, diversity management, supervisory boards, and women quota, etc. Thus, the paper can help investors or business owners to gain a thorough understanding of the current business environment. The paper is structured as follows: the next section presents the literature review and introduces the hypothesis. Section three contains the
research methodology. In section four the findings are discussed. Finally, section five develops insights for investors and owners and shows the limitations of the study and offers suggestions for future lines of research.

LITERATURE REVIEW

A controversial issue during the past decades was women’s presence in supervisory boards. Women are still the exception in German supervisory boards but their representation increased gradually (Holst and Kirsch, 2014). It can be seen that more women are integrated in supervisory boards in Northern Europe (e.g. Norway, Iceland, Latvia, Finland and Sweden to mention the top 5 countries with the highest women quota). It depends on the examined countries if a study can find a significant link between firm performance and the women quota in supervisory boards. On the one hand, it was shown e.g. for Denmark that a higher women quota in supervisory boards can determine a better company performance (Lückerath-Rover, 2011) but on the other hand, this finding could not be verified for the same country by other studies (Rose, 2007).

Beaufort and Summers (2013) identified at European level a 1.5% change of women representation in mainly male supervisory boards between 2009 and 2013. If women were already member in a supervisory board, the women quota was likely to increase further. When one woman was a board member, the women quota stood at 3.2%; by already 3 women in the supervisory board, the women quota increased to 3.7%. According to the above study the average women quota in supervisory boards in Europe in 2013 was 7.9%. France stood out as a positive example with a women quota of 28.1% in 2013.

Another result was registered by a Catalyst study which examines the relationship between women on corporate boards and their companies’ financial performance in the United States (Catalyst, 2007). The study “Women matter. Gender diversity, a corporate performance driver” shows that companies with a higher proportion of women in top management perform better (McKinsey, 2007). Other authors signal rather the lack of evidence that female representation in supervisory boards improves profitability (Ferreira, 2014). It is suggested that rather benefits for the society should be measured when women occupy supervisory board positions. In a study with 108 German large corporations which took place between 2009 and 2013, there was not enough evidence to indicate a significant relationship between gender diversity and firms’ financial performance (Dick, 2015).

There are however, institutional factors driving gender quotas in supervisory boards such as e.g. welfare provision for state-owned enterprises, political coalitions and a legacy of initiatives (Terjesen et al., 2015). It is more likely to establish a high gender quota in supervisory board with left-leaning governments. In a survey of 201 Norwegian firms the positive effect of the women quota in supervisory
boards is seen in increased board development activities and in a decreased level of conflict (Nielsen, 2010). Another exhaustive study, in which 2,360 companies from the Morgan Stanley Capital International All Country World Index (MSCI ACWI) were observed over a period of 6 years by the Credit Suisse Research Institute (2012) shows as a result a better mix of leadership skills, a wider pool of talent and a better risk aversion, the higher the women quota in supervisory boards in the companies is (Kersley and O’Sullivan, 2012).

What needs to be acknowledged is the fact that gender balance became a priority and diversifying corporate supervisory boards often represent a target to be achieved. Small improvements can be seen with a law instituted quota for women in supervisory boards (Corkery and Taylor, 2012). In Norway, Italy, France, Spain and starting with 2016 also in Germany optional gender quota exist (Sullivan, 2015). Norway was the first country to legislate board quotas in 2004 and many countries followed with law determined or optional women quotas in supervisory boards, however, less than 10 % of the board members consist of women (Dizik, 2015).

Moreover, men in supervisory boards have often better networks and for this reason the male supervisory board managers often recruit male followers which minimizes the women quota in supervisory boards on the long run (Terjesen et al., 2015). Rosa et al., (1996) analysed the impact of gender on small business performance in the United Kingdom (UK) and concluded that there are “some considerable differences by sex in quantitative economic and financial performance measures” (p. 476).

Another study with reversed causality shows that in over 3,876 public companies the presence of independent female directors is necessary in supervisory boards to contribute best to the firms’ performance (Terjesen et al., 2015). This means that, when no women are included as supervisory board members, the companies’ results are lower (measured by Tobin’s Q and shown by the Return on assets ROA). Finally, another study with reversed causality about 151 of the capital market listed German firms shows that only after a critical mass of about 30% (e.g. 3 women in absolute positions) is attained, then a higher firm performance can be reached (Joecks et al., 2012).

The present research focuses on the companies of the EURO STOXX 50 index, and aims at exploring whether there is a link between the EBT of these successful European companies and the number of women in supervisory boards. It has to be noted that the relationship between the EBT and the women quota in management boards was analysed thoroughly by Binder et al., (2016), however, the focus of this article lies on the supervisory board and especially on the link between firms’ performance measured by EBT and the proportion of women on the supervisory boards. The following hypothesis is formulated and will be tackled in the following sections:
H1: Enterprises which have a higher gender quota in supervisory boards are more successful and achieve a higher EBT.

METHODOLOGY
The EURO STOXX 50 Index was selected to represent the performance of the 50 largest companies among 19 supersectors in the year 2015. There are enterprises of seven Eurozone countries which are integrated in this index. This index has a fixed number of components and is part of the STOXX blue-chip index family. Moreover, EURO STOXX 50 index is one of the most liquid indices for the Eurozone and serves for benchmarking purposes. The index is a financial control index which ensures stable and up-to-date figures. It represents the performance of only the largest and most liquid companies in a sector (STOXX Limited, 2016).

The research was conducted for the first time at the beginning of the year 2016 and it was carried on in the year 2017. The original study published in 2016 tackled the relationship between EBT and the women quota of executive boards, relying on data extracted from the 2014 annual reports of the fifty EURO STOXX companies and financial websites (compare figure 1).
The current study looks at the number of women in supervisory boards as presented in the 2015 annual reports of the fifty EURO STOXX companies, and data regarding the EBT of each of the fifty companies was collected similarly to the research from 2016, via financial websites.

The composition of EURO STOXX index in 2015 changed slightly in comparison to the year before. Two new companies were included in the EURO STOXX index: Fresenius (Germany) and Safran (France) replaced Repsol (Spain) and REWE (Germany), a change which became effective on September
2015 (STOXX Limited, 2015). The composition change of the index takes place once a year, in September, when only the biggest companies are maintained on the basis of their market capitalization and their price index. Out of the 50 EURO STOXX companies four have e.g. the highest index weights: Total (France) with 4.78%, Sanofi-Aventis (France) with 4.39 %, Bayer (Germany) with 4.29 %, and Anheuser-Busch InBev (Belgium) with 4.11 %.

In order to examine how successful these companies are, the EBT was chosen as being a relevant KPI, taking thus into consideration the fact that companies may face different tax rates in different states. In other words, the lack of a harmonized taxation system across the Eurozone will not affect the results of this study, the EBT making possible a comparison of the 50 EURO STOXX companies at European level.

![Figure 2: Number of EURO STOXX companies per country (Source: own representation based on the information from: https://www.stoxx.com/index-details?symbol=SX5E, retrieval date: 03/03/2017)](image)

**FINDINGS**

Figure 2 shows the number of companies that each country has in EURO STOXX 50 index. Most EURO STOXX companies are located in France (20) followed by Germany (14), Spain (5) and Italy (5). The Netherlands has four companies in the EURO STOXX index, while Belgium and Finland have only one big company.

In order to test the raised hypothesis (H1: Enterprises which have a higher gender quota in supervisory boards are more successful and achieve higher EBT), two steps are necessary. In a first step, the EBT
and the EBT / employee of the selected companies should be examined. In a second step, the gender quota per sector and in total should be analyzed for supervisory boards and the findings should be brought together.

Figure 3 shows a top 10 ranking of the EURO STOXX companies according to their achieved EBT in 2015.

![Top 10 EURO STOXX Companies by EBT in 2015](image)

**Figure 3: Top 10 EURO STOXX companies by EBT with figures of 2015 in million EUR (Source: own representation – the EBTs of all the 50 companies were taken from http://www.finanzen.net/ - retrieval date: 03/03/2017)**

On the first place in 2015 was Daimler (Germany) with an EBT of €12.3 million, also the highest value of all companies analysed in this study. Daimler has overtaken Volkswagen (Germany), which was on the first place in 2014 with €10.8 million, but it suffered a serious draw back in 2015 due to the emissions scandal. Daimler is followed in the 2015 EBT-ranking by Anheuser-Busch InBev (Belgium) with €11.5 million and BNP Paribas (France) with €9.8 million.

While in the 2014 EBT-ranking one could find Deutsche Bank (Germany), E-On (Germany), Enel (Italy) or Eni (Italy), in 2015 these four companies are no longer among the biggest companies by EBT. Deutsche Bank e.g. suffered in 2015 claims for compensation and the energy sector went through a critical situation which caused in all cases lower EBTs for these companies.

If by now the focus was on offering a broad insight on the EURO STOXX companies and the KPI EBT, in the following section the emphasis will be on completing this insight by introducing also the information on gender quotas in supervisory boards as found in the annual reports of the EURO
STOXX companies. In this respect, figure 4 shows the percentage of women in supervisory boards in each of the 7 countries.

![Women on the Supervisory Board of the EURO STOXX Companies in 2015](image)

*Figure 4: Number of women on the supervisory board of EURO STOXX companies in 2015 in different countries*  
(Source: own representation – the information with regard to the number of women on the supervisory board was extracted from the 2015 annual reports of the respective companies)

In six out of the seven countries the women quota in supervisory boards in 2015 is higher than 25% in average. In contrast only in two countries the women quota in management boards in the year 2014 was higher than 25%: This shows that there are more women in supervisory boards than in management boards. The highest women quota in supervisory boards has Netherland with 36.6% followed by France with 36.4%. Additionally, it can be seen that the expected women quota of 30 – 40% is not yet achieved by EURO STOXX companies.

Due to the fact that the countries Germany and France have the highest number of companies in EURO STOXX 50 index and the highest EBT per company and per employee these two countries are examined more closely.
Figure 5: Women’s quota on the supervisory board of EURO STOXX companies in 2015 by sectors – a top five
(Source: The information with regard to the number of women on the supervisory board was extracted from the
annual reports of the respective companies end of 2015)

The analysis can be deepened by looking at the women quota in different sectors. Figure 5 displays a top
5 ranking of the sectors according to women’ presence in supervisory board. The highest women quota
in supervisory boards can be seen in the media sector (42.9%). However, this can be misleading as there
is only one company – Vivendi (France) – active in this sector. Vinci (France) and Saint Gobain (France)
follows with a women quota in supervisory boards of 40.0%, but again these are the only two
companies active in the sector ‘Construction & Materials’. The sectors ‘Personal & Household Goods’,
‘Insurance’, and ‘Utilities’ follow with more companies that are located in these sectors to strengthen
the results. In all of these sectors the women quota in supervisory boards is therefore over 35%. If this
value is considered, then this answers the expectations which are entrenched in the law of several
countries or in the corporate codes of different companies as recommendation.

Finally, the next figure presents the first three sectors which have the highest women quota in
supervisory boards per country.
It can be shown that the women quota is high especially in traditional branches such as ‘Personal and Household Goods’ e.g. in the Netherlands. A relative high women quota can be seen e.g. in France in the branches ‘Utilities’, ‘Banks’, and ‘Media’. Lower women quota in supervisory boards can be found in new technology branches such as ‘Telecommunication’ or ‘Industrial Goods and Services’ e.g. in Germany. This result is significant over all countries.

If France and Germany, the countries with the highest number of companies in the EURO STOXX index are compared, further differences can be identified. In France, the sectors with the highest women representation in the supervisory boards are ‘Utilities’, ‘Banks’ and ‘Media’ with a women quota in supervisory boards of 58%, 50% and 43% respectively.

When these sectors with a high women quota in supervisory boards are compared to the companies with the highest EBT per employee, hypothesis 1 can be verified: in the top 10 companies by EBT per employee all enterprises of the 3 sectors with the highest women quota are present (see figure 7).
If one looks e.g. at the sector ‘Banks’ enterprises such as BNP Paribas and GRP Société Générale are included in top 10, and in the ‘Media’ sector the company Vivendi is enclosed in the top 10 best enterprises by EBT per employee. The sector ‘Utilities’ shows a special situation as the enterprise Engie had a negative EBT in 2015 due to high depreciations and cost saving projects. For this reason Engie was not included in the hypothesis’ verification.

In Germany, the highest women quota in supervisory boards is reached in companies from different sectors compared to France: ‘Telecommunications’ (40%), ‘Insurance’ (35%) and ‘Industrial Goods and Services” (33%). The women quota in Germany is in general much lower. Germany has the most successful companies in terms of EBT and EBT per employee but it has a women quota of only 26%.

The sector ‘Automobiles and Parts’ in which Germany makes high profits is not even mentioned under the three most important sectors when the women quota in supervisory boards of the EURO STOXX companies is measured. In spite of this, hypothesis 1 (H1: Enterprises which have a higher gender quota in supervisory teams are more successful and achieve a higher EBT.) can be verified.

In the top 10 best companies by EBT per employee in Germany, one can find e.g. in the sector ‘Telecommunications’ the company Deutsche Telekom. In the ‘Insurance’ sector Münchener Rück, and Allianz are included as best companies by EBT per employee. Siemens can be seen in the sector ‘Industrial Goods and Services’ as the best company by EBT per employee. Moreover, in top 10 companies by EBT per employee all enterprises of the 3 sectors with the highest women quota are included (see figure 8).
To conclude, France has a higher concentration of women in supervisory positions (36%) as well as a higher number of companies in the EURO STOXX index. However, these companies are less successful than the German companies in terms of EBT per employee. The German companies have a better EBT per employee although the women quota is lower when compared with that of French companies (26%). However, the 26% women quota seems to lead to better results by EBT per employee in the top 10 companies compared to other German enterprises.

When the correlation between the EBT and the percentage of women on supervisory board is shown in the case of the French companies, all enterprises except of Engie (which registered a negative EBT) show a positive correlation. A similar result can be seen also in the case of German companies after running a correlation for the EBT and the percentage of women on the supervisory board, all companies show a positive correlation. Finally an increasing women quota in the German companies seems to cause an increasing EBT.

**DISCUSSION OF RESULTS AND CONCLUSION**

As the statistical analysis of the previous section has shown, hypothesis 1 (H1: Enterprises which have a higher gender quota in supervisory teams are more successful and achieve a higher EBT) can be
supported. Nevertheless, these findings should be treated cautiously. They do not imply that women in supervisory positions are more effective than men. With the exception of three companies, the supervisory boards of the other EURO STOXX 50 companies contain mainly male persons. The success of a company is also a result of the entire supervisory board, male and female alike. Moreover, a successful result in the form of EBT or EBT per employee for an enterprise is generated mainly by the management board and not by the supervisory board only.

Furthermore, another type of information should be included in future research, such as women qualification, experience, educational background, etc. All these aspects could provide a more realistic image regarding the role of women in supervisory boards and company performance. Moreover, as presented in the literature review, female participation in supervisory boards shows mixed results with regard to company performance. Therefore, a more holistic approach is needed, researching not only the number of women on board but also considering women participation in total workforce, industry’ sectors, management, subsidiaries, etc.

In the same time EBT as a performance indicator provides only a rough approximation of company success, a combination of indicators could provide better results. Even the consequent measurement of the KPI EBT per employee in all cases as relative figure brings additional insights. A long term research could bring more results and appropriate solutions to improve the situation of women the boards of companies.

ABSTRACT

The conference session is centered on diverse uses of narration (story) for insight and understanding. Each panelist (see short biographical information) recognizes the research-based power of narration for attention to complexities O'Toole and Bennis identified in their Harvard Business Review article “reflecting the complex challenges business leaders face.” The proposal anticipates short (9-12 minutes) well-focused presentations from each of five panelists, with professional visual enrichment. Previous contributions by these panelists for the EMAB conferences in Verona (2015) and in Warsaw (2016) have been highly successful and engaging opportunities. Those presentations, and this one, model an integrated collaborative multi-voice approach that includes hands-on audience participation. Take-away value for participants is enhanced by the interactive design.

For the 2017 conference, the presenters have added to their preparation and the session another voice and yet another perspective, that of a current university student who has experienced a story-based approach in her studies. Narration has strengthened both her present learning and awareness of her own preferred ways of learning to carry forward into career and life. All presenters will link their sharing to the conference theme of bridging past and future.

The goal of the session being prepared for Rome, like the earlier contributions in Verona (curated examples of excellence in teaching and learning) and in Warsaw (cross-cultural skill development) is to provide a platform for thoughtful conversation during the session time as well as throughout the days of the conference. Ongoing networking post-conference is an expectation the presentations will enable.

Keywords: teaching, consulting, learning, learning theory, narration, story, management education
THE POWER OF NARRATION (STORY) FOR LEARNING AND FOR LIFE: BRIDGING PAST AND FUTURE

“Narrative imagining—story—is the fundamental instrument of thought. Rational capacities depend on it. It is our chief means of looking into the future, of predicting, of planning, and of explaining . . . . Most of our experience, our knowledge and our thinking, is organized as stories” (Turner in Pink, 2006, p. 101)

“The human brain has always been highly tuned towards narratives, whether factual or not, to justify ongoing actions . . . . Stories motivate and connect activities to deeply felt values and needs” (Schiller, 2017, p. 2).

This proposal requests a 90-minute session for the 10th Annual EuroMed Academy of Business Conference.

The five individuals who will bring this session to the conference are actively pursuing both consulting and academic careers in three nations. Their professional work is grounded in awareness of the essential nature of learning about learning. They are aware of the critique of both managerial practice (Hamel and others) and management development and education (Mintzberg; O’Toole and Bennis, and others). Individually and at times collectively, they have sought out ideas from a range of disciplines to enrich engagement and interaction as they coach, teach, develop and inspire a variety of others, including mid-career and senior managers and governing boards in public, private, and social organizations across economies.

The conference session will be centered on diverse uses of narration (story) for insight and understanding, drawn from research into learning and communication theory. Each panelist recognizes the power of narration to bring attention to the complexities O’Toole and Bennis identified in their Harvard Business Review article “reflecting the complex challenges business leaders face.” The conference presenters use narration-based approaches to help ensure “learning approaches infused with multidisciplinary, practical, and ethical questions and analyses” (2005, p. 104). Imagination (a term O’Toole and Bennis highlight) and right brain-centered designs are foundational to the ideas these presenters will bring to the conference. Bridging theory and practice, bridge-building through connecting past, present and future, acknowledging the human need for meaning conveyed through story---all these are central to the ways of working that will be shared and discussed in this session. “Stories are the easiest forms to help others understand complexity” (Crossland, 2008, p. 83).

The presenters have a richness of background and experience. They live and work in three different countries (Czech Republic, Italy, United States); together they have taught at six different universities;
studied in multiple disciplines; consulted in organizations diverse in focus, sector and size; researched in the fields of organizational development, leadership, management, education, public services, gender issues, sociology, health care, human resources, cross-cultural competence . . .

They themselves are of four different generations. Together they have more than 126 years of professional experiences.

For this conference, individually and collaboratively, they have identified and will each share one example of best-practice use of narrative to address an individual or organizational goal.

“The story—from Rumplestiltskin to War and Peace—is one of the basic tools invented by the human mind for the purpose of understanding. There have been great societies that did not use the wheel, but there have been no societies that did not tell stories” (Le Guin in Pink, 2006, p. 105).

This proposal anticipates short (9-12 minutes) well-focused presentations from each of these individuals, with professional visual enrichment. Previous contributions by these panelists for the EMAB conferences in Verona (2015) and in Warsaw (2016) have been highly successful and engaging opportunities. Those presentations modeled an integrated and collaborative multi-voice approach that expands a conference panel session to include engaged hands-on audience participation. Take-away value for participants is enhanced by this interactive session design.

For the 2017 conference, the presenters have added to their preparation and the session another voice and yet another perspective, that of a current university student who has experienced a story-based approach to her studies. That approach has strengthened both her present learning and her awareness of her own preferred ways of learning which she will carry forward into career and life. All five presenters will link their session sharing to the conference theme of bridging past and future.

The goal of the session being prepared for Rome, like the earlier contributions in Verona (curated examples of excellence in teaching and learning) and in Warsaw (cross-cultural skill development) is to provide a platform for thoughtful conversation during the session time as well as throughout the days of the conference. Ongoing networking post-conference is an expectation, an expectation the presentations will enable.

Each presenter will provide one consulting or teaching approach--a focused story-based presentation on the use of narrative. Why use narration? Why use story?

The session will share and illustrate these diverse responses to the questions:
Story connects and makes communication possible.
Story can be a vehicle for empowering women.

Story is an appropriate foundation for scholarly research through sociological narration.

Story is an effective learning entry point.

Story is a skillful means to structure curriculum design and delivery.

INFORMATION ON PRESENTERS

Presenter #1 – An executive coach with almost thirty years’ experience in university teaching in management and human resources. She has researched and published in the field of management, including attention to generational differences, cross-cultural approaches, and gender studies. A somatic coach, she has created a diversity-focused consulting and training firm.

Presenter #2 – A sociologist now teaching and researching, her approach lies in linking academic knowledge with research and consulting activities in organizations. Particular interests include the ageing of population and its consequences, sociology of organizations, organizational development, working conditions and quality of life of employees, and psychosocial determinants of health.

Presenter #3 – Her twenty years’ management experience in business, government and nonprofit organizations was followed by an award-winning teaching career characterized by attention to design thinking for strengthening graduate management education. She is passionate about the application of the arts, including literature, drama and poetry, and of learning theory in both managerial and educational settings. Her career has been characterized by frequent international work in leadership, organizational change and organizational development.

Presenter #4 – At the age of twenty-one, she is in her third year of university studies for a degree in nursing. She is passionate about international relief and hopes to continue to lead medical service projects around the world after graduation. An American, she lived in Europe for five years. She has traveled extensively in fourteen European nations and also in Latin America, where she contributed to a health care service project. Travel feeds her with many stories as does her love of theatre as both a performer and a director.

Presenter #5 – She is active in both consulting and teaching to develop individual and organization-based innovative thinking through experiential activities. She has twenty-five years’ career expertise in marketing, business development and strategic planning, principally in health care and community-based organizations.

ABSTRACT

This research tests if the application of proactive measurements during crisis times is best mediated by cost reductions or increased marketing efforts. The research was conducted in 2013 (the fifth consecutive year of falling GDP after the 2008 economic crisis) through a structured questionnaire addressed to owners / managers of Spanish hotels and restaurants in the city of Madrid. Whereas proactive measures undertaken by the hotels and restaurants had a direct and positive impact on income generated, increased marketing measures only partially mediated this result. Cost reductions on the other hand did not show a similar effect. The conclusion highlights that it is recommended for managers and operators for tourism companies to focus on proactive measurements instead of cost reductions in crisis times. Given that the research was undertaken in the capital city of Spain, results may not be applicable to touristic destinations in non-metropolitan areas.

Keywords: Spain, Crisis, Tourism, Hotel, Restaurant, Proactive Strategies, Crisis Management

INTRODUCTION

Recent economic data show that Spain finally has come out of an economic recession that lasted for five consecutive years, from 2009 – 2013 with falling GDP year after year (World Bank). For Spanish companies, 2013 presented the worst crisis year with the numbers of companies declaring bankruptcy reaching an all-time high of 8,724 failing companies, mainly from the construction and services sector (PWC, 2016). Tourism companies that were active in 2013 had until than gone through a series of severe adaption processes in order to survive. Therefore, this research gives insights from these companies that can enable hotels and restaurants from other touristic destinations to improve their own crisis management and to benefit from the lessons learned. Several important touristic destinations are currently facing critical situations, either because of terrorist attacks (i.e. Turkey) or economic problems (i.e. Greece). Additionally, academia will benefit from this research. Previous research has shown that proactive strategies are more effective in crisis situations for the tourism industry than reactive...
strategies (Alonso-Almeida and Bremser, 2013, Alonso-Almeida et al., 2015). With this analysis, the authors analyze which actions can actually mediate the effect of proactive strategies.

**LITERATURE REVIEW**

*Strategy development in crisis times*

There is a large body of research elaborating about the success of different strategies in crisis times focusing on the tourism industry. A general understanding exists, that proactive strategies are more effective than reactive ones (Huhtala et al., 2014, Okumus and Karamustafa, 2005, Okumus and Karamustafa, 2005 among others). Proactive strategies are defined as strategies centering on innovations capabilities, marketing, new product development as well as new product introduction (Brzozowski and Cucculelli, 2016, Alonso-Almeida et al., 2015, Ewah, 2013). These strategies are important in order to stay at the forefront of the market and attract customers.

In crisis times, the relation between proactive strategy and performance is debatable. Whereas some research shows, that reactive (cost reduction) and proactive (marketing oriented) strategies show equal results (Köseoglu et al., 2013), most researchers analyzing the period after 2008 point to the success of proactive strategies (Ngo and O’Cass, 2012, Hilmola et al., 2015, Ramos Conti et al., 2015, Simon-Elorz et al., 2015 among others) for different industries and countries. Therefore, we postulate the following hypothesis:

**H1:** There is a direct and positive relationship between proactive activities and revenues

Performance in this case is measured as total revenues. Compared to other performance measurements commonly employed (EBIT, ROI, Net income, …) it has the advantage that these numbers are well known by the interviewed persons and also available for small businesses that are below the thresholds for publishing detailed financial statements. Especially in the Spanish restaurant business, many smaller establishments prevail. Most Spanish businesses in the hotel and restaurant sector are either owner-managed with no employees or below a threshold of five employees (FEHR, 2013).

The question now remains, if cost cutting or increased marketing efforts can mediate the success of proactive strategies. In their cover story for Harvard Business Review Gulati et al. (2010) conclude that selective cost-cutting with a focus on operational efficiency instead of employee reduction increases the likelihood of post-crisis success. Severe cost cutting will destroy a firm’s productive base and inhibit post-crisis recovery. Su and Tang (2016) point out in a recent article after the economic crisis that cost-cutting and product-innovation show similar results with respect to performance, however, fewer firms apply cost-cuttings. These are mostly younger and smaller ones. If cost-cutting is applied, those companies will later on switch to product innovation. Askenazy et al. (2013) add that salary reductions
flexibilise a firm’s cost base and thus allow companies to come out stronger after a crisis. Cowling et al. (2014) suggests that cost-cutting is the most frequently used strategy in crisis times and allows firms to survive a crisis in order to switch to growth-related strategies afterwards. These articles point to a relation between cost-cutting and innovation or growth strategies. Therefore, the authors postulate: H2: Cost-cutting (COST) positively mediates the relationship between proactive activities and revenues.

On the other hand, Gulati et al. (2010) also point to the evidence of many different crisis times where increased marketing efforts helped firms to come out of a crisis. A research undertaken by Rollins et al. (2014) shows for the US that during the economic crisis of 2008 most companies did cut their marketing spending. However, those companies that actually increased marketing activities in order to overcome the crisis ended up to be more successful. Here, a redirection of marketing spending is visible towards e-marketing in order to attract different customer segments. Earlier Srinivasan et al. (2005) as well as Pearce and Michael (2006) had already pointed out the importance of marketing in recession times. Especially Srinivasan et al. (2005) characterizes proactive strategies that enable firms with a strong marketing advantage before the crisis to build on it and increase their competitive advantage. Therefore, it is postulated:

H3: Marketing efforts (MARKETING) positively mediates the relationship between proactive activities and revenues.

The remainder of the paper is structured as followed. The next section presents the methodology employed; subsequently results are presented and discussed. The last section concludes the research, pointing out some limitations as well as recommendations for research and practice.

DATA AND MEASUREMENTS

Sample and method

Data was collected through face to face interviews with working at restaurants or hotels in the city of Madrid. Table 1 presents the descriptive analysis of the sample (n=339). Mainly, it is composed by hotels (n=178) and restaurants (n=155). Only six responses come from other typology of establishments, which are hostels or bars.

The hospitality industry was selected because of its importance in terms of national GDP. Among the Spanish regions, the capital of Madrid has the highest GDP per capita, and tourism comprises a significant portion of the local labour market (Alonso-Almeida and Bremser, 2013). According to the national federation of the hospitality industry in Spain (FEHR), in 2011 the hospitality sector represented more than 7.2% of the national GDP (FEHR, 2011).
As can be seen in Table 1, more than 85% of the hotels are over 5 years old. On the other hand, the restaurants are equally balanced among different range of ages. However, similar to the hotels, they are mainly over five years old.

Table 1. Descriptive analysis of the sample by age and typology

The questionnaire was structured in three parts and focused on the period of 2011 – 2012. The first part of the questionnaire included two questions about how the establishment had been affected by a set of impacts and how these impacts have modified the expenditure per client, the price and cost per employee. The second part of the questionnaire included one extensive question about the measure deployed by the establishment to counter the financial crisis. Finally, the last section of the questionnaire collected financial data about the evolution of the establishment during the analysed period.

Precisely, Table 2 presents this data by typology of establishment. We can observe that in both cases the main option selected was a decrease between 1-25 %. Only 47 establishments (13.91%) of the sample declared having an increase of income during the analysed period. According to FEHR (2013), in the last years every year more establishments have stopped their activity within the hospitality industry, reaching the peak of closures in 2013 with more than 45,000.

Table 2. Descriptive analysis of the sample by income and establishment type

Measures and Analysis

Based on the above review of the literature several factors were explored in light of testing the stated hypotheses. The respondents were asked to indicate, based on a 5-point Likert scale, their opinions about the different statements. For measuring the earning dimension the ordinal measure, based also on a 5-point Likert scale, presented in Table 2 was used.
The hypotheses were tested using a Partial Least Squares (PLS) approach to SEM (Chin, 1998), using the SmartPLS 2.0 software (Ringle et al., 2005).

The PLS approach’s underlying mathematical algorithm makes it suitable for this research, which is characterised by a non-normal distribution. This suitability is attributed to the iterative PLS algorithm (Henseler et al., 2009), which transforms non-normal data in accord with the central limit theorem (Hair et al., 2012). The PLS results are thus robust when using skewed data (Wilden et al., 2013). PLS is referred to as a ‘soft modelling’ technique because it does not require that restrictive assumptions be made regarding measurement (Sosik et al., 2009); data normality (Fornell & Larcker, 1981) or known distribution (Falk & Miller, 1992); or sample size (Reinartz et al., 2009), unlike other methods. Consequently, we employed PLS because of its overall suitability to our modelling requirements.

RESULTS

The results section is structured into two parts that follow the analysis process. First, the measurements and the structural model were assessed. Second, an analytical approach was applied to test the mediation hypotheses. In addition, we assessed the variance accounted for (VAF) to ascertain whether the mediating effect, in each case, is either full or partial. The operationalisation of the items is presented in Table 3 (sample size, mean and standard deviation).

Table 4. Validation of the measurement model: convergent validity and reliability

Research model assessment

Assessment of the measurement model

Because all first-order latent variables are reflective, they were assessed with reference to the reliability and validity attributes of the item scales used. First, individual item reliability was proven to be optimal for most of the measurements because the item standardised loadings were equal to at least 0.707 (Carmines & Zeller, 1979). The items under the suggested optimal threshold were extracted to optimise the model; nine items were dropped. Table 4 shows only those items that passed.

Second, internal consistency reliability was examined through composite reliability (Werts et al., 1974), which fulfils the same task as Cronbach’s alpha (Furrer et al., 2012). However, composite reliability is more suitable for PLS because it does not assume that each indicator makes an equal contribution to the
construct (Chin, 1998). All of the latent constructs exceeded the benchmark of 0.7, as suggested by Nunnally (1978) for exploratory research, which confers reliability to the measures (Table 4).

Third, convergent validity demonstrates the unidimensionality of our constructs. The variance in the indicators accounted for this unidimensionality in terms of variance extracted (AVE) and exceeded the 0.5 threshold (Fornell & Larcker, 1981), ensuring that each set of indicators represents the same underlying construct (Henseler et al., 2009) (Table 4).

Finally, discriminant validity, which verifies that each factor represents a separate dimension, was analysed using linear correlations or standardised covariances between first-order factors that examined whether the inter-factor correlations were less than the square root of the average variance extracted (AVE) (Fornell & Larcker, 1981) (Table 5).

$$\begin{array}{|c|c|c|c|c|}
\hline
\text{PRO} & 0.734 \\
\text{COS} & 0.152 & 0.714 \\
\text{MKT} & 0.218 & 0.179 & 0.883 \\
\hline
\end{array}$$

\textbf{Note:} Diagonal represents the square root of average variance extracted. The correlations are represented below the diagonal.

Table 5. Validation of the measurement model: discriminant validity

Assessment of the structural model

Structural model evaluation in PLS relies on the measures that indicate the model’s predictive power (Tenenhaus et al., 2005). The central criterion in this respect is the coefficient of determination ($R^2$). Table 6 shows that the $R^2$ values for the three endogenous variables in the model well exceeded the minimum value of 0.1 recommended by Falk & Miller (1992).

Additionally, the Stone-Geisser $Q^2$ statistic (Geisser, 1974) was greater than zero for the four constructs, suggesting that the model has predictive relevance.

$$\begin{array}{|c|c|c|c|c|}
\hline
\text{Dimensions/ Hypotheses} & \text{Path coefficient} & \text{Bootstrapping} & \\
& & & \text{Standard error} & \text{t-value} \\
\hline
\text{Cost (Q2= 0.012)} & & & \\

Table 6. Structural model assessment
Once the model has been assessed and validated, the analysis is extended to examine the mediating effect of both internal processes along the customer perspective in the model.

Mediating effects

The mediation hypotheses (H2 and H3) were tested based on the analytical approach described by Castro and Roldán, 2013 and Picón et al., 2014. Figure 1A shows the total effect (c) of proactive activities on income. Fig. 1B.1 expresses the total effect of proactive activities on income as the sum of the direct (c1) and indirect effect (a1*b1) due to the mediation effect of cost. Finally, Fig. 1B.2 shows the total effect as the sum of the direct effect (c2) and the indirect effect caused through marketing (d2*e2).

A. Model with total effect

B.1. Model with a COST mediated effect

B.2. Model with a MKT mediated effect

Figure 1. Mediation model

The application of bootstrapping allows for the testing of the mediation hypotheses (Preacher and Hayes, 2008). In the analysis, 5,000 resamples were generated to provide 95% confidence intervals (percentile) for the mediators. As shown in Figure 2A and Table 7, proactive activities has a significant total effect on income (c = 0.167; t-value = 2.939). When adding the mediator effect of costs (Fig. 2B), proactive activities decreases its influence and maintains no significant direct effect on income (H1: c1 = 0.086; t = 0.840) and there is significance relevance in the chain proactive – costs – income. On the other hand, when the mediation effect is produced by marketing, the influence of proactive activities on
income also decreases (c2=0.097;  t-value= 1.400) but there is significance relevance in the chain proactive activities – marketing – income. Therefore, these results reject H2 but supports H3.

A. Model with total effect

B.1. Model with a COST mediated effect

B.2. Model with a MKT mediated effect

Figure 2. Structural model: Mediation

In addition, in Table 7, the value of variance accounted for (VAF) indicates the relative size of the mediating effect when it is significant (H3). Different authors (among others Shrout and Bolger, 2002; Hair et al., 2014) pointed out that VAF is a good criteria: no mediation (< 20%), the partial mediation (from 20% to 80%) and full mediation (>80%). Hair et al. (2013) showed that the VAF determined the size of the indirect effect in relation to the total effect, and was explained how much of the target construct’s variance was explained by the indirect relationship via the mediator variable. According with VAF value of H3 (VAF=23%) marketing partially mediates the effect of proactive activities on income.

VAF>0.80 full mediation, 0.20 ≤ VAF ≤ 0.80 partial mediation, VAF < 0.20 no mediation

CONCLUSION

The results found are in line with existing research. It has been shown, that proactive strategies have a direct impact upon performance, measured in this case as income. Interesting to look at, are the mediating effect. Marketing activities partially mediate the effect on income whereas costs do not. That marketing activities show a partial mediation is not surprising since they draw on the newly empowered employees and benefit from anti-crisis plans and measures that streamline marketing efforts into promising market segments or international markets. For practitioners this implies that measures strengthening employee empowerment should go hand in hand with other activities that rely on empowered employees. Thus, the newly empowered will be motivated to pursue the firm’s strategy.

Cost-cutting effects show no mediation on income. This could also be expected. Cost-Cutting focusing on outsourcing and dismissals or layoffs have a negative influence on employee motivation and therefore are therefore contrary and difficult to communicate measurements if the company on the other hand also wants to increase employee empowerment. Care should be taken from the part of practitioners not to decide for the easiest measures in times of crisis (cost savings are often considered to be easy and ready at hand) but instead to carefully find a balance between the different necessary actions undertaken.

Researchers can base future research on these findings. It would be interesting also to see moderator effects of cost or marketing activities. Caution has to be taken when applying the research to other industries or destinations. Since the sample was small and covered only one region, results are not easily transferable to other cities, countries or regions.

FEATURES AND BUSINESS OPPORTUNITIES OF PIEDMONT AGRITOURISMS

Broccardo, Laura; Culasso, Francesca; Giacosa, Elisa; Truant, Elisa
Dept. of Management, University of Turin, Italy

ABSTRACT

Agritourism has considerably achieved a greater importance in the last decade, underling a continuous growing, also for the Italian economy, with an annual rate greater than 4%. Despite this relevance, the definition is not everywhere aligned, depending on the geographic areas in which agritourisms are located. The research focuses on agritourisms of Piedmont region, one of the North Italian regions characterized by a significant concentration of agritourism farms, providing accommodation, food and agricultural experiences.

The research, conducted by an empirical analysis, aims to analyze the state of the art of agritourism management depicting the main features of agritourims, with a particular emphasis on type of services offered, dimensional features, type of customers, type of manages that run such business, key financial data.

Final results show that the agritourism analyzed can be classified within the Phillip et al. (2010) framework as Working Farm, Indirect Contact (WFIC). The work shares understanding of agritourism key features as a starting point to continue the scientific and educational development of this business.

Keywords: Italian agritourism, hospitality model, management features, new opportunities.

INTRODUCTION

In Italy, the phenomenon of agritourism began to spread in the mid-60s and there were first attempts to regulate the sector in the ’80s with the Law 730/1985, later repealed by Law 96/2006. The Law 96/2006 specifies the definition and establishes characteristics of agritourisms. In particular, an agritourism is the activity done by a farmer when offers tourists, in the own funds, food and accommodation, using their products and sometimes organizing recreational and cultural activities. This definition explicitly requires that farmers cultivate lands, make forestry or farm animals, since agritourisms are ancillary to agriculture and complementary to traditional production. Indeed, the Law 96/2006 aims to support agriculture through the promotion of appropriate forms of tourism in the countryside, through which protecting, qualifying and enhancing the specific resources of each territory and promoting the
maintenance of human activities in rural areas, with a differentiation of farm incomes and the promotion of rural culture and food education.

Each Italian Region also approves specific regulations with the aim of governing the creation and the management of these structures. For example, the Piedmont Regional Law 2/2015 regulates the agritourism activities in this local territory.

Italian and Regional Laws then assign an important task to farms, since they should be able to convey to the tourists everything that characterizes a territory: culture, history, traditions, landscape, environment, food and wine, cuisine. However, they should also transmit the rural values such as the respect for nature, the hospitality, the love of the countryside, the pleasure of consuming healthy and genuine products of the territory, the cycle of time and the seasonality.

Basing on this evidence the main purpose of this research is to investigate the features of agritourism in Piedmont, a relevant region in Italy for agritourism business.

An overview of the main literature on agritourism is presented in the next section, and then the methodology design including the research questions is described, followed by findings, discussion and conclusion of the work.

LITERATURE REVIEW

The agribusiness sector is one of the most representative economic activity in terms of employment and companies revenues in Italy. For instance, in Piedmont area on 2010 (Istat - VI agricultural Census data) there were 67.148 agribusiness firms (4,1% of the Italian firms in the sector) with 1.010.780 ha of UAA (Utilised Agricultural Area). This extension - near to 8% of Italian agricultural surface – is also due to an increasing number of fusions producing a larger average size of the firms (15,14 ha per firm in Piedmont against 7,96 ha per firm in Italy).

The agribusiness context is composed by several segments such as food and wine, which are the most representative economic activities in many countries in terms of employment and companies revenues (Bigliardi and Galati, 2013; Giacosa et al., 2014a; Menrad, 2004; Vrontis et al., 2016).

Agribusiness is mainly characterized by micro, small and medium enterprises, which are frequently rooted in the territory in which they are located. In this context, the agribusiness represents a set of values, symbols, and traditions (Giacosa et al., 2014b). In addition, family firms are common in this context, due to both the tradition of some long-standing family companies across generations and the entrepreneurship of producers (Contò and Lopez, 2008). However, due to limited financial resources and a consolidated mind of set, these enterprises tend to be closed to the internationalization process (e.g. they do not sell their products abroad), thus reducing their business opportunities.

In agribusiness sector, agritourism represents a significant subset.
Agritourism definition and typologies are not everywhere valid and universal, since they usually depend on the geographic areas in which they are located (Gil Arroyo et al., 2013), considering both the natural, economic and socio-demographic characteristics of a Country, but also the different influence that is associated with the presence or the lack of legal framework and policies correlated with the business model of agritourism. In U.S., for example, there is a lack of laws through which regulate the development and the marketing of these kinds of business activities (Carpio et al., 2008; McGehee, 2007), while in Europe agritourism definitions are legally formulated and correlated to particular incentives and/or subsidies (Hegarty and Przezborska, 2005; Kizos and Iosifides, 2007; Sonnino, 2004).

The lack of an unambiguous definition around the world and the presence of cognitive differences about the meaning and features of agritourisms create many problems especially in the academic literature. Indeed, the absence of a unique definition does not favour the development of a homogeneous field of studies on the sector and does not promote the dissemination of specific research in the field (Phillip et al., 2010).

In particular, the inconsistencies in defining agritourisms in literature are correlated to four particular issues (Gil Arroyo et al., 2013).

The first one refers to the identification of an appropriate setting that usually includes farms, but sometimes also ranches, nurseries and other off-farms facilities (the EU defines the term “farm” as an agricultural holding under a unique management that consists of both agricultural production and of non-agricultural activities.

Another issue is the typology of experience done by customers in an agritourism, debating whether farming should be working or also non-working (in EU, the definition of agritourism typically includes the meaning of entrepreneurial diversification of working farms activities).

In addition, another possible matter is related to the kind of activities that an agritourism should do, debating whether including only hospitality correlated services (i.e., lodging, food services and event programming) or also educational/recreational activities.

Last issue is about the meaning of the term “tourism” in the concept of “agritourism”, debating whether considering it as a minimum number of overnight staying or a minimum distance from the customer’s house.

In order to solve these issues, Phillip et al. (2010) proposed a multiple-definition of agritourisms, classifying them in five groups, on the basis of the offered activities: i) Non-Working Farm (NWF), where non-working farms serve only for scenery goals; ii) Working Farm, Passive Contact (WFPC), where there is not a strong interaction between customers and working-farms; iii) Working Farm, Indirect Contact (WFIC), where the interaction between customers and working-farms is strong, but
only focused on the exchange of agricultural products; iv) Working Farm, Direct Contact, Staged (WFDCS), where the interaction between customers and working-farms is strong and it is focused both on the exchange of agricultural products and on the experience of agricultural operations, that are staged or linked to predetermined tours; and v) Working Farm, Direct Contact, Authentic (WFDCA), in which customers are directly involved in agricultural operations, exchanging their labour for food and accommodations.

Basing on the literature definition of agritourism this paper aims to analyse the key features in Piedmont agritourism with a particular focus on services offered, dimensional features, customers, ownership and management, key financial data.

**METHODOLOGY DESIGN**

The research focuses on agritourisms located in Piedmont region. This business is particular interesting for the Italian economy due to its continue growth, with an annual rate greater than 4% (Istat source). In the North of Italy there is the main concentration of agritourism farms, providing accommodation (41%); in addition, the 45% of agritourisms providing food services are located I the Italian northern regions.

The choice of the Piedmont Region is also driven by the relevance of this geographical area, as Piedmont is one of pre-eminent regions in terms of agri-tourist supply and which has a strong attraction for tourists such as natural resources, countryside and food and wine. Moreover, the landscape of Langhe-Roero and Monferrato become a World Heritage Site of UNESCO.

The research was conducted through an empirical analysis, using the questionnaire method (Corbetta, 1999) sent by e-mail to all the agritourisms located in Piedmont region. More specifically, the data, both qualitative and quantitative, were collected via an on-line questionnaire using the database provided by the same Region.

The questionnaire was created in June 2016 and sent by e-mail, together with a letter of presentation and a compilation guide, to the selected companies in the months of July, August and September 2016. The compilation period was about 3 months, with several requests made by telephone in order to solicit the answers. The sample is composed by 111 agritourisms that correspond to a response rate of 11%.

In order to verify the coherence of answers, some “test questions” were included in the questionnaire. The questionnaire was chosen because it is a method that allows researchers to obtain a significant amount of data that can be used for statistical investigation. In accordance with the main literature on these topics (Chenhall, 2003), the evidence was studied using descriptive statistics. Descriptive analyses were conducted to develop a socio-demographic profile (e.g., age, gender) of managers involved in
agritourisms as well as to describe their type of engagement. Descriptive statistics were also conducted to identify characteristics of agritourism.

Basing on the methodology followed by different studies on this topic (Arroyo et al. 2013), the research investigates the key features of Piedmont agritourism with a particular emphasis on type of services offered, dimensional features, type of customers, type of manages that run such business, key financial data.

In accordance with the research purpose, the following research question was formulated: “What are the main dimensional and organizational features of Piedmont agritourisms?”

**FINDINGS**

*The management features*

The analysis focuses on the features of family members that run such business. The next graph shows the number of family components involved in agritourism activities.

![Figure 1. Number of family members involved in agritourism activities.](image)

From the previous figure it emerges that the great majority of the sample (53%) manages the agritourism only with family members, without involving external workers. The number of generations involved in running the agritourisms are following described.
Figure 2. Number of generations.

The previous figure shows that the majority of agritourisms are managed by the first or the second generation of entrepreneurs.

The financial features

This section provides financial data of the analysed agritourisms.

Figure 3. Average turnover over the last 3 years.

The previous figure shows that the agritourisms have generally small dimension as the declared turnover is lower than 1000,000 euros.
Figure 4. Annual average costs related to turnover.

As regards the cost composition in relation to turnover, it emerges that the 31% shows annual costs between 50 and 60% of turnover, while the 27% has annual costs less than 50% of turnover or between 60% and 70% of total turnover.

State of the art and new opportunities

According to the purpose of the research we firstly investigated the type of services offered by the agritourisms of the sample.

Figure 5. Type of agritourism services offered.

Basing on the previous graph, the types of services more widespread are those linked to the accommodation, sales of own agricultural products and Catering & Restaurants, while camping activities are the less widespread.

The next figure focuses on the customers with a particular attention on the customers’ origins: Italian and foreign.
Figure 6. Nationality of customers.

The previous figure shows the different classes – Italian and foreign- of customers declared by the sample. For example, the 16% of the sample works with 60% of Italian customers and 50% of foreign customers and the 4% of the total sample works with the 20% of Italian clients and 90% of the foreign ones. The next graph shows the customers composition differentiated between young (18-35), families and over 65 years old.

Figure 7. Customer composition by typology.

Analysing the previous graph, it emerges that around the 30% of the sample works with the 30% of young customers, while the 25% of the sample works with the 40% of families and the 28% of the sample works with the 20% of customers over 65 years.

**DISCUSSION AND CONCLUSION**

As underlined by the literature, about management features it emerges that the great majority of the sample manages the agritourism only with family members, without involving external workers, confirming that family firms are prevalent in this field (Contò and Lopez, 2008).
Furthermore, the research highlights that the majority of agritourisms are managed by the first or the second generation of entrepreneurs, underlining as the agritourisms phenomenon is quite recent.

Referring to the dimensional features, financial data endorse the small size of Piedmont agritourism, characterized by a turnover lower than 1,000,000 euros (Giacosa et al, 2014). However, the sample shows a good level of profitability due to the limited weight of the cost structure.

Referring to the state of the art and new opportunities, the agritourism services offered are those linked to the accommodation, sales of own agricultural products and Catering & Restaurants, while camping activities are the less widespread. Basing on this evidence and referring to the Philip et al (2010) framework the great majority of agritourism analysed can be classified within the third category of working farm, indirect contact (WFIC). In this group the interaction between agritourism and customer is mainly limited to the sale of agricultural products. In addition, we observed other two aspects about agritourism customers. The first one underlines a good balance of the customers’ origin, both at national and foreign level, and the second one shed the light on the good balance also of the customer typology, identified as young customers, families and customers over 65 years.

Although the study focuses on a relevant Italian territory, caution is advised to extrapolate results beyond this region or the Italian territory due to the different regional or national legislation.

Despite the limitations of this study, due to a regional focus, results from this study carry some relevant implications for the theory and practice of agritourism. Indeed the work shares understanding of agritourism key features as a starting point to continue the scientific and educational development of this business.

This study also provides further insights on the types of experiences visitors (state of the art and new opportunities) seek, and consequently agritourism can address their offer on new customers demand, developing the range of new agricultural services. Basing on these evidences future studies should deeply analyze the key factors belonging to the agritourism business model, also enriching the sample, comparing different relevant Italian regions.

ABSTRACT

Drawing on existing research dealing with time in brand and brand management, this paper aims at providing a comprehensive and coherent framework of some time-related concepts, with a special emphasis on what happens when a brand reaches the senescence stage. In addition, it strives to consider what happens when a brand becomes long-lived enough, looking at the brand’s customer base. While undoubtedly time affects customers’ age and generations, the demand side of the brand-customer relationship is actually under-researched. Finally, a research agenda is developed, in order to improve what is currently known about such an important but neglected topic as the effects that the passing of time has both on the brand and on the consumers it addresses to.

Keywords: Brand longevity, brand survival, brand life-cycle, brand senescence, brand decline, brand death, target age, target generation, time-framed brand.

INTRODUCTION

Time represents a relevant dimension that affects marketing management, from product life-cycle, to logistics management, from improving and providing an effective customer service to time to market for succeeding and gaining a competitive advantage. This dimension can also be considered when focusing on brand strategy.

Whatever facet of a brand one considers, the passing of time exerts an influence. To name just a few, brand identity is not identical forever, brand personality modifies from time to time, brand equity changes over time. The elements of the brand identity change: think of the visual identity first; as far as the brand is seen having a human-like personality, it can naturally modify itself; brand equity rankings issued by various organizations show different results year after year.

In the academic literature, several time-related concepts linked to bands can already be found: brand senescence (Ewing, 2009), brand revitalization and brand death (Thomas and Kohli, 2009), brand survival (Wilcox et al., 2008), brand heritage (Urde, 2007) and so on. One way or another, all of them
essentially focus on a particular stage of the life-cycle and look just at the supply side of the brand-audience relationship, i.e. the company’s perspective.

Although the dimension of time is for sure an extremely important matter in everyday business, however two topics are still lacking of analysis from an academic perspective. The first one is the development of a comprehensive framework of the concepts related to time in brand and brand management. The second under-researched topic has to do with the effects the passing of time has on the audience the brand speaks to.

This paper has two main aims: the first is providing scholars with a comprehensive framework of the time-related concepts in brand and brand management; the second is suggesting a research agenda to start taking into account the temporal dimension of the audience of the brand, particularly related to the age and generations of the audience in relation to the age of the brand and its longevity.

The contribution of the article will be twofold: first, having a clearer list of the time-related concepts and of the mutual relationships existing among them; second, having some thoughtful directions for future research in the field of brand longevity that can take in due account the effects of the passing of time on the brand’s customer base.

The remainder of the paper is organized as follows: first a literature background about brand and its relationships with time and time-related concepts will be illustrated. After this, a comprehensive framework putting together brand’s time-related concepts will be introduced. Finally, a discussion about the main directions for a research agenda about the topic will be suggested.

LITERATURE BACKGROUND ON TIME-RELATED BRAND CONCEPTS

As pointed out before, time represents a crucial element that might affect the management of several marketing dimensions. First of all, the management of brand in time is a crucial part of a long distance brand strategy. Previous literature has considered time applied to brand and brand strategy in several manners. Companies can decide to focus on different strategies to survive across the years. For instance, brand managers must maintain consistency to create strong, specific and easy to recognise images associated with their brands (Delgado-Ballester et al. 2012; Keller et al. 2001; Park et al. 1986); yet, at the same time, they must opt for maintaining brand relevance, which may require to be updated (Aaker, 2012; Holt and Cameron, 2010; Kapferer, 2014). Creating higher acquisition and retention rates leads to increased willingness to pay higher margins by customers (Stahl et al., 2012).

Brand relevance across time is a key issue in order to retain customers considered by previous research after 2005. However, depending on authors, context, and time when their studies were undertaken, the factors indicated as crucial for maintenance of brand relevance change. For instance, Bennett & Rundel-Thiele (2005) introduced the Brand Loyalty Life Cycle Model. When analysing brand
equity components, they observed that generally, over the years, customers’ attachment to brands decreases. The authors suggest that brand loyalty declines for two main reasons: firstly, the quality levels of branded products have risen to a standard where they no longer clearly differentiate the competing brands within the category, secondly: the perception of brands has a different meaning for new consumers than for long-time heavy users. Based on this study, brand relevance is an important longevity factor.

Another time related theme that previous literature considers is brand survival and its predictors. When studying brand survival in the wine industry, Wilcox et al. (2008) listed from Aaker Brand Equity Model (Aaker, 1991) two components: brand awareness and perceived quality. Their results suggest that brand awareness can be a good predictor of brand ability to survive in time. Referring to the brand equity framework, Thomas & Kohli (2009) claim that most brands with high levels of awareness or positive brand image are candidates for revival. They emphasise that branding is an exercise in patience. Most brands take a long time to build, and a long time to die. This process is a challenge in a corporate system, which usually rewards managers based on short-term performance. In their opinion, the brand revitalization process can be kick-started by addressing the causes of the decline; understanding why it may have failed to maintain its relevance; adjusting this, if necessary; and re-educating the market about new identity.

Referring to the holistic approach of brand management, another stream of research related to time is related to brand evolution. A close attention should be paid to the research by Merrilees (2005) who stresses the importance of brand evolution as a necessary component of a successful marketing strategy. Merrilees has also introduced the idea of three key constructs as a framework for analysing rebranding decisions: brand vision, brand orientation, and brand strategy implementation. Based on that, we can conclude that brand managers should continuously reassess brand vision relevance and company’s brand orientation level and the ability to successfully implement its strategy in relation to the market. The opinion that brands need to be revised and reassessed is discussed by Tjiptono et al. (2006), who even state that brand is a specific asset which can be ‘temporarily dead’ and then reintroduced to the market. Tjiptono lays out four brand-specific characteristics: brand origin and brand ownership, brand architecture, brand scope, and brand size which are responsible for brand longevity defined as a continued presence of a brand in the relevant market. The bottom line is that a brand strategy should be continuously reassessed.

Focused on the last step of a brand life cycle, Ewing et al. (2009) point out that brands should be immortal and only managerial incompetence results in brand death. They refer to Groucutt (2006, p. 106) who argues that brand life expectancy can be increased by innovation and repositioning. Ewing et al. (2009) have introduced a model of Brand Senescence, where the key point is to help managers to
recognise the moment when a brand starts to become irrelevant and needs to be innovated to survive. The model is composed of the following factors: constitutive utility (wellbeing and reflexive effects) and symbolic utility (symbol boredom and status relevance/irrelevance). The essence of this model is that successful brand attracts aspirational interest from non-owners who hold that successful brand in high esteem. As more non-owners achieve their goal and become associated with the brand they aspire to, the value for previous owners decreases. In the long run, the brand ultimately declines and runs out of aspirational consumers. Thus, the Brand Senescence model suggests that the key factor for a brand to be immortal is the ability to inspire people and be aspirational.

Another interesting research aspect of brand longevity related to Brand Life Cycle is explored by Butterfield (2007). This article draws the attention to the fact that brands and products have the same lifecycle. The key actions which help to renew brand’s lifetime are adaptation and rejuvenation driven by innovation and re-positioning of the brand. Likewise, Bivainiene (2010) discussed the theoretical concept of the Brand Life Cycle Model. She highlighted that brand identity, and consequently brand image, is a key factor related to the brand life cycle, because it influences brand association by customers. Her model proposition is based on three principles: brand identity related to personal values and emotions gives the benefit of self-expression which reflects customer’s image, brand identity as a root of customer-brand relationship, and brand identity as a reflection of brand coherence which reacts to changes adequately. In the context of brand life, the brand image is analysed as a result of consumers’ opinions and actions. Not only, the brand image is the result of the relationship it has with the consumer, and the way she/he perceives and recognizes herself/himself with brand’s values, cognitive characteristics and emotions (Kaufmann et al., 2012). Referring to brand consistency across time as a part of the literature review, it is worth having a closer look at studies of Rindell (2013). Rindell investigated the influence of inputs from consumers’ past experiences of a company on their current image-construction processes. She found out that consumer images generated by relevant past experiences are a direct and influential input into real-time corporate image formation. Based on their qualitative researches she also introduced two concepts: “image heritage” and “image-in-use” - respectively, distinguishing consumers’ past-based images from those they construct in real time. Image heritage is moderated by three principal variables: timespan of awareness, content of earlier experiences, and key temporal focus. Referring to “image heritage” Rindell & Iglesias (2014) conducted an online qualitative survey with regard to brand image construction processes over time. Their results suggest that time and context dimensions of brand experiences are strongly related to further brand images. In essence, past images from past experiences influence how present experiences are interpreted into current images and future expectations. In connection with our study it means that managers should, in systematic way, identify these specific memorable moments (time
and context) which are most crucial for the consumers’ brand image construction processes and transfer these findings onto brand management processes. This will allow them to follow the customer’s lifetime and make brands always relevant. The idea of the influence of “image heritage” on strategy brand management was continued by Rindell et al. (2015). The findings of their researches suggest that key challenge for making brand always relevant across time is to find the right balance between company’s and customer’s and other stakeholders’ brand image heritage.

According to the importance of the concept of “Brand heritage”, Urde et al. (2007) and later on Balmer and Burghausen (2015) pointed out that brand heritage is a denotation of longevity. As Urde claimed, longevity does not necessarily result in a brand heritage, it can, however, be its key element. This can be especially true for family-owned brands. Moreover, even timeless can be considered as an important brand attribute: “The problem is that the quality of timelessness takes years to develop, even decades. You cannot just decree it. A brand has to pay its dues - it has to come to stand for something in the eyes of the world” (Wetlaufer, 2001, p. 122). Therefore, brand heritage as source of longevity is important for companies with a long tradition, where company heritage and brand heritage are very closely related.

Beverland et al. (2015) examined existing theories on brand consistency and relevance and concluded that although these theories present some guidelines to help brand managers resolve the competing imperatives of brand consistency and relevance, following them would assure sustainable performance of a brand rather than brand development. In consequence, they introduced their own concept of Brand Ambidexterity, where brands managers need to find the appropriate balance between consistency and relevance based on the idea of service-dominant logic (Merz et al., 2009) and through the methodology of design thinking (Brown, 2009; Dorst, 2011) which can stimulate brand innovation. In their opinion, the combination of these two approaches is the best way to succeed in search for the right balance across years. Service Dominant Logic is about customer centricity as a fundamental company’s mindset (Lusch & Vargo, 2014). Design Thinking Methodology focuses on how things (e.g. products and brands) ought to be to achieve novelty and workable solutions (Cross, 2011; Kimbell, 2011). Beverland et al. (2015) suggested that brand managers become more like designers when adopting a design thinking approach to brand management and that Brand Ambidexterity concept helps brand managers possess a capability of building two things: consistency and relevance of brands.

Urde (2016) introduced the Brand Core concept and how it has been evolving over time. This paper defined a set of core brand values supporting a brand promise defined as a sum of inner meanings of a brand, to communicate its value proposition and to clarify its position (de Chernantony, 2009). The Brand Core is based on three management perspectives: PATHOS - appealing to emotions and the
will of customers, ETHOS – appealing to brand personality, and LOGOS – appealing to reason and understanding of customers. These three perspectives give a fundamental meaning to the brand promise, and vice versa, as a point of reference in long-term management. The presented framework is intended to be an aid for the strategic brand management, to explore the core of the brand (universal criteria) and for its consistent management (continuity criteria) and communication over time (dynamic criteria). Urde (2016) suggests that management must measure the essential brand core elements over time. By tracking the internal foundation and commitment of the brand – combined with external appreciation and perceptions of the brand promise and the core values – management can continuously evaluate the strength and performance of the brand core. Such a managerial tool serves as an early warning system and an essential guide in strategic brand management.

A PROPOSED FRAMEWORK OF TIME-RELATED BRAND CONCEPTS.

Past research has undoubtedly examined many time-related concepts in brand and brand management. Quite often, however, each concept is considered in relative isolation from the other ones, so that the knowledge available is somehow disconnected. In the following figure, we try to put such concepts together in order to create a single coherent framework.

Fig. 1 – Time-related brand concepts

![Fig. 1 - Time-related brand concepts](image)

According to a general life-cycle model, sooner or later at a certain stage brand senescence will occur. Depending on which brand strategy marketers implement different scenarios will happen. In the worst case, brand decline will follow and, unless marketers are able to put the brand back on a revitalization track, it will likely results in brand death. On the other side, after senescence brand can be revitalized and consequently it will survive, thus resulting in brand longevity. It is very likely that
such brand will be able to benefit from a certain amount of heritage, since some time will be obviously elapsed.

TOWARDS A RESEARCH AGENDA ON BRAND AND TIME-RELATED CONCEPTS

The extant literature on time-related concepts applied to branding research raises some questions. With few exceptions, published research in this domain focuses primarily on a specific period of time (often the decline phase) or focuses on just one dimension or element regarding branding strategy (brand meaning, brand design, brand core etc.). In addition, no research summarizes existing works on overall time-related concepts of brand. The academic debate remains open about which brand strategies are better to follow in order to guarantee brand survival and longevity.

In light of the quoted works, being relevant and always up to date seems for a brand to be a better strategy than only to be consistent. On the other side, brand heritage, as an outcome of longevity, may be a strong element lending weight and making a brand stand out in the market. Managers responsible for brands with a background abundant with traditions should, as much as others, follow Brand Life Cycle in order to maintain Brand Core Relevance. Strategies for finding and implementing the appropriate balance between consistency and relevance vary, and depend on several aspects, namely: the market, industry and product category as well as the already discussed brand heritage.

For the above reasons, some of still open and unanswered questions that future research can address may be the following:

- what are the main drivers for brand longevity maintenance? Some empirical research is needed for providing best practices of brand survival and longevity (Tjiptono et al., 2006; Wilcox et al., 2008);
- is it better to be a timeless brand that relies on tradition and heritage (Urde et al., 2007) or being a “up to date” brand that continuously rejuvenates itself and to survive (Thomas and Kohli, 2009)?

Beyond the above questions, further aspects are still missing. Actually, no one can hardly deny that reaching a certain extent in longevity is for any brand both difficult and fruitful. Consequently, a good number of papers deal with the issue of getting old enough, since longevity is reckoned as a positive result to obtain. Longevity means heritage and heritage is in turn a good driver of brand equity (Rindell et al., 2015).

But, to the best of our knowledge, no research has ever considered the effects of brand longevity on the brand’s customer base and its implications on brand management. In other words, the demand side of the relationship with the brand has been totally neglected.

When time goes by, in fact, it is highly presumable that customers of different ages will be part of the same customer base. In addition, the more the brand is long-lived the more various the ages will be.
Therefore brand managers will be confronted with the necessity of managing a brand that speaks to a differently aged audience.

So, it seems quite interesting to investigate what happens in the brand’s customer base when the brand’s life spans over a certain number of years.

To analyze the issue of the temporal heterogeneity of the customer base, we need to introduce three concepts:

*Calendar time*: the year or, for the sake of simplicity, the decade we are referring to: 1970, 1980, 1990, etc.;

*Target age of consumers*: the typical age of customers the brand is addressing; let’s say teenagers, people in their twenties, thirties and so on;

Based on these premises, some open research questions are:

- As a brand reaches a certain longevity, are managers aware of the different clusters of consumers based on their age and/or generation?
- How is it possible to distinguish among customers, according to their generation?
- Do all the long-lived brands have the same composition in terms of age and generation of the customer base?
- In case a brand’s customer base is made of different ages and/or generations, do these different groups of customers share the same brand image or not?
- In case of multiple generations in the customer base, how can marketers manage the coexistence of such generations, in terms for instance of brand identity?
- Is it possible to predict brand survival in the future observing the time-related dimensions of the brand’s customer base?

Based on these questions, further research is needed in order to better explore this phenomenon. In addition, beyond conceptual research, additional empirical research about this topic is called for. Qualitative studies could better delve into the subject, for instance better defining the antecedents and consequences of brand longevity across time. Later on, quantitative studies could validate the results from the qualitative studies, testing hypotheses about the existence of some relationships among brand longevity and customer’s base age and generation.

HOW FOUNDERS VIEW THE DEVELOPMENT OF CUSTOMER- AND BRAND-ORIENTED CAPABILITIES OF THEIR YOUNG FIRM

Buttenberg, Katharina
Department of Global Economics, University of Latvia, Riga, Latvia

ABSTRACT

With a recently increased interest in entrepreneurship, the founding and growth of new firms is more than ever an important factor for economic growth. Entrepreneurs and founders are facing many challenges. Strategic and functional marketing capabilities are a key driver to provide strong sustainable economic value. Therefore, founders need to acquire and develop these capabilities in the early beginning of the firm.

Purpose: This paper aims to shed light on the specific characteristics of customer- and brand-oriented marketing capabilities for young firms and how their impact on business performance is analyzed.

Design / methodology / approach: Adopting a case study methodology through in-depth interviews with founders and CEOs, 14 young firms in Germany and the USA were analyzed.

Findings: The paper gives an overview of the specific requirements for customer-and brand-oriented marketing capabilities in young firms as drivers of business performance and proposes a framework for the assessment these capabilities.

Practical implications: The proposed framework and learnings offer founders, managers of nascent firms and start-up investors orientation on how to strategically evaluate marketing capabilities and take strategic choices on their acquisition and development.

Research limitations: The findings in this paper are qualitative and need to be quantified in a next step.

Originality/Value: The research investigates marketing capabilities that are specific to new firms in order to support their strategic decision-making on customer- and brand-oriented marketing capabilities.

Keywords: young firm, start-up, brand-orientation, customer-orientation, marketing capabilities, business performance, marketing, branding, life-cycle, resource-based theory.
INTRODUCTION

Scholars of the Resource-Based Theory (RBT) of the firm consider the development of resources and capabilities as main factor for the competitive advantage of a firm. In opposition to other theories, entrepreneurs can influence the success of their organization by aggregating or creating a unique set of assets, differentiating their firm from other competitive organizations. Marketing and especially the development of marketing capabilities have been found to be one of the main frameworks to analyze and explain competitive advantages and even forecast performance outcomes in the RBT framework (e.g. Kozlenkova et al., 2014, p. 1). From the business-side as well as in academic research, there is a growing interest in the measurement of the contribution of the marketing-discipline on performance and first research has already indicated a positive impact of marketing capabilities on business performance. There are two main types of capabilities – customer-oriented and brand-oriented capabilities, which drive brand equity and organizational performance. The two concepts of marketing capabilities are based on two different views of the firm – the “outside-in” and the “inside-out” view of the firm, which both need to be considered when building successful brands (e.g. Urde et al., 2013, pp. 14–15). Customer-oriented marketing capabilities such as customer relationship management, market sensing capabilities or product development capabilities have been proven to contribute to business performance. The same holds true for brand-oriented capabilities such as branding, pricing or functional brand implementation and marketing communication. Analysis comparing customer-oriented and brand-oriented marketing capabilities has provided differing results. Higher levels of customer- and brand-oriented marketing capabilities have been found to result in higher financial performance (e.g. Vorhies et al., 2011, p. 752) Even though the overall effect of these marketing capabilities on profit growth rates is positive, there have been findings on some different directions in the effects of revenue growth and margin growth rate (Morgan, Slotegraaf et al., 2009, pp. 289–290). Later research confirms that the combination of customer- and brand-oriented capabilities is beneficial to business performance and improves the outcome and even future earnings of the firm (e.g. Angulo-Ruiz et al., 2014, p. 395). These previous findings prompt strong causal relationship between marketing capabilities – customer- and brand-oriented – and business performance. Hence, customer- and brand-oriented resources and capabilities need to be acquired and developed over time to support firms in their different stages of the life cycle to provide as competitive advantage (e.g. Sirmon et al., 2010, p. 1387) and contribute to firm performance.
OBJECTIVE OF THE STUDY

The goal of this research is to gain insight from young firms on the marketing-capabilities they had developed, their strategic view on marketing capabilities in their current stage of the life cycle and their judgment on the impact of their marketing capabilities on their business performance. Authors define the components of constructs measuring marketing capabilities in different ways. Marketing capabilities have been previously described as capabilities involved with the creation and management of brands, the management and development of customer relationships and the building of marketing innovation and knowledge on a strategic as well as a functional level. Based on an in-depth literature review of marketing capabilities in the RBT literature, the author has developed a general classification of marketing capabilities into a marketing capabilities matrix. The first dimension of these marketing capabilities is customer- and brand-orientation. In the second dimension, these capabilities are broken down in strategic and functional marketing capabilities (Buttenberg, 2015, p. 36). This research is a supplement to the previously identified concepts, allowing the researcher to further structure the findings generated for the marketing matrix. The results of the qualitative analysis provide information for the selection of the items to be included in the latent constructs of customer-based and brand-based marketing capabilities as well as business performance for future research.

ENTREPRENEURIAL CHALLENGES IN YOUNG FIRMS

Depending on their stage in the life cycle, firms are facing different challenges also in terms of development of firm value. Especially for young firms, where structures are still small, environmental conditions are a greater threat to the survival than they are to older and bigger firms. Young firms most likely have less resources available than larger firms and they are less structured and strategically planned (Gilmore, et al., 1999, p. 29). There is also a greater risk of failure for firms, when they are young of age and still small (Thornhill & Amit, 2003, p. 497). Capabilities might not be fully developed and market-based information will still be limited (Sinkula, 1994, p. 36). But – due to its small size and its newness – it is easy for young firms to act highly entrepreneurial, to innovate and quickly react to environmental changes (Weerawardena, 2003, p. 18). In the modern entrepreneurship literature, entrepreneurs are forming opportunities themselves, it is an important topic for CEOs and managers especially of young firms to acquire and develop capabilities that support business performance. In addition to entrepreneurial orientation, well-developed marketing skills can support innovation in these turbulent environments and contribute to the development of strategic orientations (Miller, Droge, & Toulouse, 1988, pp. 550–551). In the last decades, the discipline of marketing has been striving to become more accountable for business performance. Recent literature and analysis has shifted the
previous sole focus of functional marketing activities to a focus on the brand as the center of marketing and models have been conceptualized to assess the return on marketing investment. Unfortunately, empirical analysis focused on the development of marketing-capabilities in young firms is rare. This is surprising, since under the light of the creation of sustained competitive advantages, marketing capabilities deserve close attention. They can provide multiple benefits to young firms, not only in terms of financial performance and market effectiveness, but also argue for shareholder value (Srivastava et al., 1998, pp. 8 pp.), or for attracting and maintaining employees, a very scarce resource in young firms (Lievens, 2007, pp. 62). The few papers identified which analyze marketing capabilities in young firms mainly focus on brand-oriented marketing capabilities and are aimed at exploring the developments of marketing and brands in new firms. Especially the qualitative papers are concerned with founders or CEOs of new firms and analyze their perception of relevance of marketing, how they create the brand and make first branding decisions and measure their marketing activities. In regards to branding, there are two authors who have specifically engaged with the topic of the development of a brand in new firms. While Rode and Vallaster analyzed the status of branding with companies at the age between two and four years, Bresciani and Eppler focused more on the relevance of the brand, the attitude towards branding and the brand building process itself of companies with and age up to five years. Findings were that most companies at the age of up to four years had not decided on their final brand including strategic branding elements such as positioning, values etc. as well as their final functional elements such as name and logo (Rode & Vallaster, 2005, pp. 125–128). Of the slightly older companies (up to five years of age), most had already defined their strategic elements, but the functional elements were still unclear. (Bresciani & Eppler, 2010, pp. 359–361) Regarding marketing-communication, both studies confirmed the financial constraints. They also highlighted a lack of professionalism in communication and the lack of identifying suitable target audiences.

CUSTOMER- AND BRAND ORIENTED MARKETING CAPABILITIES

The discipline of Marketing itself is a core and long-developed discipline, which has evolved quite considerably in the last decades. Strategic and functional marketing capabilities are a key driver to provide strong sustainable economic value (e.g. Rust, Ambler, et al., 2004, p. 77), which is typically half of the market capitalization of a mature firm. Contemporary theories of marketing have raised the purpose of marketing from mere communicative support for sales and product presentation towards a more integrated, strategic role as value-driver with focus on shareholder returns (e.g. Day & Fahey, 1988, pp. 46). Also the focus of marketing has changed from a sole focus on how the brand is communicated to the inclusion of an outside-in view, traditionally based in customer behavior theory and customer satisfaction theories. Customer- and brand-oriented marketing capabilities are
representing different views on the firm – the outside-in and the inside-out view. These views also hold different implications and are based on different organizational assumptions. The customer-oriented approach is highlighting the outside-in view of the consumer on the firm. The theoretical base for customer-orientation roots in customer-behavior- and customer-satisfaction theories. Culturally, organizations which are very consumer-oriented set high importance on the fulfillment of customer needs, also on the individual level of the employee (Saxe & Weitz, 1982, p. 343). Consumer-oriented organizations display market-oriented behaviors such as a strong focus on individual customer needs and adherence to its changes. They also strategically segment their customers to better focus on specific characteristics of separate groups (Urde et al., 2013, pp. 14 pp). Especially capabilities in regards to the management of the customer relationship or market sensing capabilities as well as more functional capabilities such as the generation of customer feedback on products and product development capabilities have been proven to be connected to firm performance and profitability by a wide stream of research. The concept of brand-orientation is putting the brand as strategic hub in the center of its’ focus. High brand-orientation stands for a marketing strategy and marketing activities centered on the brand. Successful brands create awareness for the firm and evoke positive associations, support of a positive brand image and differentiate the brand towards competitors (Aaker, 1991, pp. 15 pp). Culturally, brand-oriented organizations share a strong brand-philosophy throughout the whole organization, framing how they operate from the inside-out. Capabilities such as branding capability, pricing or brand performance as well as more functional brand-oriented capabilities like the definition of the brand name and logo, market planning, marketing communication or marketing implementation fall in this group. Especially in the birth phase of a young firm, where resources are scarce and the organization is not structured, firms need to focus on the important capabilities to acquire and develop. Marketing capabilities can significantly support firm value. They are amongst the key capabilities firms have to develop to gain insights on customers, build customer relationships and leverage them for their success and create their own brand and brand elements, communicate it and position the firm against competitors. Even though several authors have already engaged in the analysis of marketing in the context of the Resource-Based Theory and have proven a significant impact of these capabilities on business performance, there are only few authors who have analyzed them in the context of small firms.

**METHODOLOGY**

As previously mentioned the constructs of marketing capabilities vary between authors and how they classify and compose the single components of these constructs in different ways. Since the topic of marketing capabilities in young firms is a quite untouched subject of research, the author wanted to
ensure that all relevant components of customer-oriented and brand-oriented capabilities and business performance indicators for young firms are considered. Because the research question posed by the author is also still a much undefined topic and previous research is limited, the author identified it as appropriate approach to analyze her research question. To assess the characteristics of marketing capabilities as well as business performance in young firms, the author decided to use semi-structured expert interviews as most appropriate research instrument. As the goal of this research is to gain insight from young firms on the marketing-capabilities, the author has based the surveys on the previously identified capabilities, which are a supplement to concepts of customer- and brand-oriented marketing capabilities identified in the literature review, allowing the researcher to further structure the findings previously generated and specify them to the requirements of young firms. To better understand the specific marketing capabilities needed and developed by young firms, qualitative in-depth interviews were conducted. The author adopts the principles of the key informant technique identifying interview-partners (Gläser & Laudel, 2006). Based on this technique, the ideal informant should have a role in community in which he has permanent access to the information sought, he should have transformed this information into knowledge and should be willing to share this knowledge (Tremblay, 1957, p. 692). Since the goal of the author is to analyze firm-level performance, the author focuses on the founders of single-business firms with an age of maximum ten years. The interview partners all hold CEO positions and are owners of their firm at the time of the interview. To avoid any bias in the firms selected due to the focus on a specific market, industry, product or country, a broad variation of firms was selected. The products and services produced by the firms vary from marketplaces and services to technical devices. Also, the company size varies very much, but the majority of the companies have only a low number of employees at the time of the interviews. To avoid national differences, the companies are chosen from two countries, Germany and the USA, the two strongest economies for innovation following the small economies of Switzerland and Singapore (Weissenberger-Eibl, et al., 2013, p. 21). This broad variety enables the author to recognize general marketing capabilities for young firms and identify performance indicators applicable to various markets. Table 1 provides an overview on the firms.
Table 1 Profiles of CEOs interviewed and their firms

For the interviews, the questions and an interview-guide are prepared according to the guidelines for such qualitative interviews with knowledge carriers. The questionnaire was split in different sections covering questions about the founders who were selected as respondents, their firms and their current stage of development as well as their marketing capabilities and their measures for the success of these capabilities and the business. To enhance descriptive validity, the interviews with the founders were taped and transcribed by the author for further analysis. In regards to interpretative validity, the author adjusts the language and usage of the terms for the constructs based on the language used by the respondents during the interviews, as recommended by experts. To ensure that the meaning of the expressions is interpreted correctly and to avoid any misunderstandings, the author asks the interviewees to explain the terms and then used them in the rest of the interview in the meaning they have defined (e.g. Polkinghorne, 2005, p. 139). The main structure of the survey and the sections are listed in Table 2.
Table 2: Sections of qualitative questionnaire

The questions generated by the author are pre-tested for logical consistency and unambiguity with seven managers holding leadership positions in startup-accelerators, venture capital firms and entrepreneurial consulting in the startup-environment as well as two academic marketing experts. In preparation for the interview, the author researched the financial background data if available on the firm and the founder or CEO who would be the interview partner. For cost and time reasons, the interviews are mostly held via skype. The consent of the participant and the technical setup provided, the interviews are video conferences and taped so the author is able to transcribe them for further analysis.

RESULTS

The interviews varied very much depending on the level of knowledge and affinity towards marketing of the respondents. The values and perceptions of the founders are significantly shaping the organizational development and strategy of the firm. The founding team, their values and personalities have a major impact on decisions regarding marketing capabilities. Decisions on which capabilities to
focus on and which marketing activities to pursue are significantly influenced by the founders’ competitive orientation, risk-taking and innovation-capabilities. All founders interviewed confirmed the importance of marketing capabilities. However, they were in different stages in the development of these capabilities. Every firm had already created a brand, even if it was only preliminary and had developed first marketing capabilities. Below, the developments are described in detail.

**Customer-oriented marketing capabilities**

Every founder who has been interviewed holds a perception of their customers and their needs. However, not all hold the same level of detail and some are only based on assumptions. Firms of which the founders had been previously working in the industry or had in-depth experience in the field the firm is operating in are defining their products for a clearly segmented and defined customer-base or in case of firm L several customer-personas. Given the often limited resources and budget, it was even recommended to focus on a very small and specific target audience in the beginning, because it is linear and homogenous in their interests and therefore easier to identify and market to. The founder of firm D indicated that the customer-base of his company changed over time and described that they had different requirements to his service and subsequently the marketing capabilities. Same was confirmed by several founders, who explained that they were adapting the product based on customer feedback. This finding confirms previous findings on small firms, which have been found to build their innovation capabilities directly through feedback from consumers because they more directly interact with them than bigger firms (Merrilees et al., 2011, p. 374). These learnings clearly indicate that in terms of strategic customer-oriented marketing capabilities, young firms start by identifying a customer need, very often in their immediate environment and then develop it through further customer feedback, very often in direct interaction with customers. The firms also use this direct interaction to build trust and relationships with potential customers and existing customers. Even though customer feedback has been indicated as important factor for the founders, the generation of feedback is mainly qualitative and unstructured. Sources are direct selling activities, contact with customers who bought or used the product or service or social media feedback from internet platforms such as Facebook. Only three firms (D, F and K) had systematic structures or regular cycles of generating user feedback for example through focus groups or customer surveys. To the contrary, two firms (G, J) even reported difficulty in generating quantitative direct feedback from customers for example through surveys. These sources are also suggested by literature for young firms. However, the use of sources like government agencies, trade associations, or similar associations as indicated by literature (e.g. Alvarez & Barney, 2010, p. 563), was not applied by the interview partners. However, whenever possible, all firms tracked user behavior to generate knowledge to further develop their products and services. Since the product is still
in the product or service prototyping phase or produced / provided in small quantities, the firms are still very flexible in adjusting their differentiation towards competitors, even re-defining the market they were operating in. For example, the service of firm F was first conceptualized for the market of consumer electronics instead of baby products. The firms are still very focused on the development and specification of their product / service. Even firms that were older like A (founded in 2008) and E (founded in 2011) were still optimizing their service and product and worked on customizability and differentiation towards competitors based on customer feedback. Based on these findings, it is clear that functional customer-oriented marketing capabilities are still in development. However, as previously mentioned, there is not so much need for systematic interaction with customers or CRM because there is a lot of direct interaction with the target audience, topic of the interaction mainly being the product / service.

When looking at the development of measurable indicators for customer-oriented marketing capabilities on the strategic and functional level, the following definitions can be derived:

**Strategic Customer-Oriented Marketing Capabilities:** The anticipation of customer needs and requirements are seen as clear advantage and the development of customer responsiveness is an objective. This goes in line with findings of previous research (e.g. Hooley et al., 2005, p. 26) and therefore needs to also be included as item in the assessment of these capabilities for young firms. To cover the strong customer-oriented mindset and strategic generation input of customer feedback throughout the organization, it is most appropriate to adapt a reduced version of the customer-oriented selling construct of the Selling Orientation - Customer Orientation Scale from Saxe and Weitz to cover these strategic customer-oriented marketing capabilities. It includes and summarizes all relevant components applied by the other customer-oriented strategic constructs (Saxe & Weitz, 1982, pp. 345–346). It has been widely used and adapted in literature for the analysis of strategic customer-orientation in marketing (e.g. Homburg, Wieseke, & Bornemann, 2009; Ramaswami et al., 2009; Bagozzi et al., 2012). This construct reflects the previously described direct contact with the customer and the capabilities required in the early stages of young firms. The benefit of this construct is that the items are focusing on the direct interaction between the firm and the customer and it also includes components that are measuring the relationship between the customer and the firm. Both are important for young firms to be successful and the main characteristics of customer-oriented marketing capabilities at that age.

**Functional Customer-Oriented Marketing Capabilities:** The main part of functional customer-orientation for young firms is the ability to understand the needs of the customers and to adjust and customize the products based on the needs. This goes in line with the findings in literature on the general functional customer-oriented marketing capabilities. (e.g. Hooley et al., 2005, p. 20; Song et al.,
It was also found that the development of high quality products can contribute to a positive reputation-development especially for new firms (Petkova, Rindova, & Gupta, 2008, p. 328). These product-related factors have also been described by the interviewed founders as the main items of functional customer-orientation. The firms are still developing their products and services and are seeking for customer-input to develop them and product-related capabilities are highly relevant to them. There is still no clear definition of customer needs and the firms have to react quickly to the changing market environment. Therefore, product management and differentiation capabilities such as the capability of the firm to provide a valuable, unique, in-imitable and un-substitutable product or service to the customer and to use the feedback generated to improve the product as well as the ability to develop the product faster than competitors, are key functional capabilities in customer-orientation for young firms in this phase and have to be included in the assessment. These factors can be evaluated through the scale for product uniqueness developed by Steensma and Corley (Steensma & Corley, 2000, p. 1067). The author has identified this scale as one of the most suitable scales for young firms to assess the functional components of the customer-oriented marketing capabilities in her empirical research. This concise scale not only provides measures on the customer-oriented marketing capabilities of product management, but it also puts them into competitive perspective.

**Brand-oriented marketing capabilities**

The topic of brand and branding was perceived very differently by the different founders. The term brand and brand-oriented capabilities were described and explained very differently by the several the founders. According to their records, they had all created a brand that was clearly differentiated based on the market characteristics of their product or service and the identified potentials. The level and depth of this strategic brand-orientation varied very much between the firms: Some founders defined brand as name and color of the logo (founder I), others defined it as key differentiator (founder D) and some as personality (founder L). Even though they were very articulate about their product / service and its' benefits, the majority of the respondents could not clearly describe the values their firm was standing for and how the differentiate in their positioning against competitors. This goes in line with the findings of other research in the field of startups and branding, which also highlighted this lack of clarity (Rode & Vallaster, 2005, pp. 125–126). The creation of the strategic and functional brand was described as an iterative process. Founder N mentioned that even though the theoretical steps were clear to her, she wasn’t able to plan the process, because according to her experience, it develops over time and in cycles of evolution. Some founders approached these strategic brand-oriented activities very consciously and integrated it in their business strategy whereas others relied more on their
intuition. Especially experienced founders, who had been previously working in the industry or founded firms before, are using their strategic brand-knowledge to differentiate the brand and conduct marketing tests. Based on the learnings gathered, adjust their brand strategy. Four of the fourteen brands had already undergone re-branding. Founder D even stated that he is redefining and readjusting his brand strategy on a regular basis. The marketing capability of pricing was mentioned by some of the founders as differentiator and they tested different pricing- and payment-models. Firm H even defined their new pricing model as one of their key differentiators, offering their services on a subscription-basis in comparison to the single-payment models used by competitors. Also specific channel strategies were integrated in the branding strategy. Firm G for example leverages their B2B customers as multipliers for their service and their brand. The founder of firm E also stated that since he did not have a product to show yet, the capability of branding, including strong values, a clear brand personality, the understanding of the competitive environment and a clear concept for a pricing and channel strategy is helping to sell the idea of the product to investors and other stakeholders such as strategic business partners. In terms of functional brand-oriented marketing capabilities, the name was described as the most important element of the brand. Other functional brand elements such as design varied based on the product or service. Founder B stated that a professional logo and website can make the company look professional, representative and bigger. This was also confirmed by the reports of founder K, who also mentioned strong branding guidelines and consistency in communication as main factor of success. However, the creation of the name is the central and main element of the functional brand. Important criteria for a successful brand name were a descriptive character, distinctiveness, memorability and a clear indication of the benefit of the product / service. These criteria were also identified by other researchers (e.g. Aaker, 1991, p. 196). Founder A and founder K stated that their name represented their services functionality and was well-understood, which helped a lot in becoming successful. This feedback is similar to findings in previous studies (e.g. Kohli & La Bahn, 1997, p. 69). The name of the service and website of firm F is close to the name of one of its’ competitors and it is pronounced in the same way. He reported this to be a disadvantage, because customers confuse his service and the service of the competitor. Also, promotion through recommendation via word of mouth is not easy if the name is not clearly spelled. Another important factor that was described by almost all founders when choosing a name is the availability of the web address of the name to ensure that marketing activities promoting the brand did not lead people to find the wrong page in the internet. This has also been identified as important factor in other research (Bresciani & Eppler, 2010, p. 359). The emotional value of a brand was described by founder L, who said that they changed their name to evoke different emotional reactions and perceive the brand as more personal and less functional. The ideal brand name for founder G was to have name which could
also be used as verb (e.g. google is used as googling). The identification of the right name is an iterative but non-structured process spent significant time in finding a name.

When looking at the development of measurable indicators for brand-oriented marketing capabilities on the strategic and functional level, the following definitions can be derived:

**Strategic Brand-Oriented Marketing Capabilities:** For the development of the strategic brand-oriented marketing capabilities, it is crucial to understand the market conditions as well as the potential for differentiation of the own brand. Therefore, founders who had previous experience in the industry of their startup, described this knowledge as clear advantage. Many pathbreaking decisions regarding the strategic setup of the brand are made in the early stages of the firm: how does the firm want to present itself, which values it stands for, what the personality is and what benefits it wants to communicate. Brand-orientation plays a key role in shaping the business model. Very often at this stage, a rather narrow interpretation of branding as just being the brand name and logo is exhibited (e.g. Wong & Merrilees, 2005, p. 157). However, it is of essence, that in the early stage of development, the firm exhibits strategic capabilities such as an understanding of the market and its’ characteristics, determines differentiation characteristics for the service or product, develops a pricing strategy and a communication channel strategy in order to be successful. Based on these findings for young firms, the author decided to draw from the “Marketing Proficiency” indicator created by Song and Montoya-Weiss (Song & Montoya-Weiss, 2001, p. 79). It summarizes an elaborate set of capabilities, which cover the main factors of strategic brand management also for young firms and therefore the author sees it as adequate measure use to assess brand-oriented strategic marketing capabilities.

**Functional brand-oriented marketing capabilities:** In terms of functional brand-oriented marketing capabilities, the name of the product or service is the most important element of the brand at this stage of the firm. Other brand elements such as design varied very much in development amongst the different young firms. Other functional brand-oriented marketing capabilities mentioned by authors in the previous literature reviews, such as marketing programs, advertising initiatives and the selection of appropriate marketing channels, were not (yet) seen as important factors. Young firm are still in the process of developing functional brand-oriented marketing capabilities. In most cases, brand guidelines are not developed and marketing planning and communication are not developed yet. Also financial constraints are limiting marketing activities and subsequently the development of capabilities in this field (e.g. Bresciani & Eppler, 2010, pp. 359–361). The brand name is the first functional element of a brand that most firms develop. It is also the most important element of the brand and the most difficult to change. Based on these findings, the author has identified naming-related criteria as best indicators for the assessment of functional brand-oriented marketing capabilities. As base for the scale, the items used are based on the indicators defined by Aaker about successful brand naming (Aaker, 1991, p. 196).
The scale has been enhanced by the inclusion of the requirement regarding the availability of the web-address (URL) which have also been confirmed by the founders in the interviews and the potential of the name to be “verbalized” (e.g. google => googling). The identification of the right name is an iterative but non-structured process spent significant time in finding a name. Due to its’ significant importance, the author decided to put a focus on naming for the analysis of functional brand-oriented marketing capabilities.

Business performance

The indicators for business performance mentioned in the interviews varied by founder based on the stage of the firm and the complexity of the market environment. The youngest firms, which were still in the stage of conceptualizing their products or services, measured their performance in terms of the relationships they were establishing with opinion leaders. For the firms that were already in the development of their product, market adoption was stated as crucial topic. Therefore, another popular measure, which was used by the majority of the founders interviewed, was the number of customers using the service and returning customers. For some firms in the early stages, the usage of the product or service is more important than financial performance and it is offered to potential customers without payment or at a reduced price. This indicator of usage or trial as indicator for business performance is common and rather specific for young firms and not as common in other research assessing performance in relation with capabilities. Based on these findings, the author decided to include the usage of the product or service and the purchase of the product or service in the construct of business performance. Finally, most firms reported to use revenue, profit and indicators for market adoption to measure business success. Since numbers are still small, they often look at growth rates more than actual numbers and are also focusing on returns. Regarding the specific measurement of the impact of the brand and marketing activities, most founders reported that the effort for measuring the success was too high at this stage of the organization. Therefore, most firms also indicated that they turned to business performance indicators to measure the performance of their marketing efforts.

When looking at the development of measurable indicators for business performance, the author has decided to measure organizational effectiveness based on business performance. The assessment of business performance is therefore composed of two sets of items, financial performance and product market performance.

Financial performance: As identified in qualitative research, there is no specific differentiation for the measurement of financial indicators for young firms. The author therefore turned to the widely used and renowned financial performance scale from Gupta and Govindarajan (Gupta & Govindarajan, 1984,
p. 34), which includes a broad spectrum of financial measures and covers the most relevant performance measures and has been preferably adapted in SME-research. The indicators covered include all measures mentioned in the interviews and range from sales levels to the ability to fund business growth from profits.

**Product market performance:** The number of customers engaging with the product or service is seen by many start-ups as early indicator for future performance. Getting customers to test the product or service and use it is very important for young firms to generate first trial and confirm customers into paying customers. Therefore, the author has decided to include market effectiveness measures based on the concept of Vorhies and Morgan (Vorhies & Morgan, 2005, p. 92) and the measures used by managers to assess marketing-related activities (Mintz & Currim, 2013, p. 20) as indicators for product market performance. These measures for business performance include number of customers using the products without payment and the number of returning customers without payment. Finally, the number of buyers as well as repeat buyers are also included in this indicator.

Another observation to be mentioned for the assessment of the development of marketing capabilities is the role of the founders in the development of the firm. Their values and perceptions are significantly shaping the priorities and the strategic setup of the firm. The decision, which capabilities to focus on and which marketing capabilities to acquire and develop, is significantly influenced by the founders’ competitive orientation, risk-taking and innovation-capabilities (e.g. Covin & Slevin, 1989). Therefore, when modeling customer- and brand-oriented marketing capabilities for young firms, it is important to consider this factor of strategic posture in the assessment. There is a substantial body of research, dedicated towards the characteristics of strategic posture. The concept of strategic posture by Covin and Selvin is a commonly used measure for the competitive orientation of the firm (Covin & Slevin, 1989, p. 75). It is defined by the way management addresses innovation, their motivation to take risks for their business and how proactive they are in addressing development. To ensure that this special situation of founders and young firms is reflected, the author recommends to introduce the concept in the assessment of business performance, which moderates the relationship between marketing capabilities and business performance.

**DISCUSSION**

Depending on the stage of development in the life cycle, firms are confronted with different requirements and challenges in regards to the development of their capabilities. Young firms are facing special challenges in the establishing of capabilities while they are still developing their strategy and their organization. Marketing capabilities are amongst the key capabilities to drive business performance and need to be developed already early in the beginnings of the firm. The effect of
management attitude and the underlying strategic assumptions about the market on the development and the focus of marketing capabilities cannot be underestimated. The results of the interviews show that founders are well aware of the importance of marketing capabilities. However, the knowledge about and professionalization of these capabilities varies in between firms. The development of customer-oriented marketing capabilities is very often based on the experience of the founders in the industry. Feedback is mainly gathered through personal interaction with customers and there is no systematic process for input. There is a very strong focus on product-development, which is also reflected in the focus of functional customer-orientation. Based on these findings, it can be clearly stated, that customer-oriented marketing capabilities are acquired and developed differently in young firms in comparison to older firms. Also the focus of brand-oriented marketing capabilities in young firms is slightly different. Since the functional brand is not yet defined, naming and the creation of corporate design are most prevalent. The identification of the right name is an iterative but non-structured process spent significant time in finding a name. The development of other brand elements and brand guidelines varied very much between the firms. One more thing to highlight is that besides the criteria of name clarity and distinctiveness, the suitability for internet-usage (e.g. no other users of the keyword) needs to be considered. The concept of a brand itself and the level and depth of strategic brand-orientation varied very much between the firms. Depending on their brand-orientation and knowledge, the brands were at different stages of development. Brand differentiation and testing is highly relevant at that stage to generate valuable learnings for the next stage of development. As previously described, managers of young firms have to be innovative and open to innovation, proactive and embrace risk-taking to ensure the success of their firm. This also holds true for marketing capabilities. The development of customer- and brand-oriented marketing capabilities is an iterative process and the capabilities need to be constantly assessed and adapted to the new challenges of the firm.

CONCLUSIONS

This paper makes a contribution to the understanding of the development of marketing capabilities in young firms. It adds to existing knowledge by further exploring the concept of life cycle development in regards to the Resource-Based Theory and its’ definition of capabilities. Limitations of the study include the focus on only the development of marketing capabilities. Other capabilities which are closely connected to marketing capabilities such as research and development or innovation are not considered. Also, the focus of the research is on the internal view of the firm and the external environment and the market are not considered. The use of a qualitative method represents another limitation, which does not allow for generalization. In a next step, these findings need to be
quantified. The novelty of this research lies in the analysis of marketing capabilities which are specifically important for young firms and how founders develop these capabilities. It adds to existing literature by investigating if the customer- and brand-oriented marketing capabilities deemed necessary, also apply to the specific situations of firms in the early stages of development. Since marketing capabilities are a key driver to provide strong sustainable economic value, it is important for young firms to develop them early on to support them in their different stages as competitive advantage.

TOWARDS A LIFE-CYCLE MODEL OF INTER-FIRM NETWORKS:
PHYSIOLOGICAL AND PATHOLOGICAL PATH OF EVOLUTION

Cantele, Silvia; Vernizzi, Silvia
Department of Business Administration, University of Verona, Italy

ABSTRACT

This paper presents a model of network life-cycle based on the literature on network and alliance evolution. Though networks are considered strategically relevant to firms’ success, in particular in a context of small businesses, many evidences report the high failure rate of inter-firm cooperation strategies. The literature on whole network has been mainly devoted to study network structure, governance and outcomes, while longitudinal studies on network evolution and critical factors leading to untimely termination are scant. Starting from this premises, this paper describe the first step in a more comprehensive research project aimed at defining the critical issues that occur in each stage of a network life-cycle, by matching different literature stream (network evolution and life-cycle, network termination) with subsequent empirical investigation on business network contract drafted following the specific regulation introduced in Italy since 2009.

By analysing the first stream of literature, we propose here a life-cycle model made of the following stages: formation, operation, performance evaluation, consolidation and decline; these stages belong to what we called “physiological life-cycle”, while each stage could result in a “pathological path” determined by some specific critical factors which can undermine the successful evolution of the network. The whole research project presents theoretical contribution to this specific stream of research, and also relevant managerial implications by describing and testing the main issues that a network manager should be ready to face in the dynamics of networks operations.

Keywords: networks, inter-firm network, business network, network life-cycle, network evolution, network termination, strategic alliances, business network contract. Abstracts should contain no more than 250 words. Write concisely and clearly. The abstract should reflect only what appears in the original paper.

Keywords: networks, inter-firm network, business network, network life-cycle, network evolution, network termination, strategic alliances, business network contract.
INTRODUCTION

Networks relationships are often strategic for the success of firms, especially in a context of small businesses, usually facing resources and knowledge constraints. The literature on networks is vast and focused on different topics, like for example the structure of the relationships, the governance of the networks and the prospected outcomes for member firms (Provan et al. 2007). In this paper the perspective chosen is that of inter-firm networks, namely networks created among firms, and the level of analysis is the network itself. The idea is that a formalized network is an institution separated from its partners and which has its own life and evolution in a context that can be conceptually isolated, even if it experiences influences from the macro-level (the environment) and the micro-level (the single partner firms). The paper is part of a more comprehensive research stream starting from the emergence of a new form of organisation, the “business network contract”, created in Italy by a specific regulation since 2009.

Previous studies conducted on this topic revealed the strategic factors affecting the success of this kind of networks (Cantele and Vernizzi, 2014; Cantele et al. 2016) and the impact of network relationships on firm performance (Cantele and Vernizzi, 2015; 2016).

The Italian experience appears to be successful if we consider the increasing number of contracts drafted since the beginning: at the end of 2011 contracts were 214 with 1.065 firms engaged; in April 2017 the contracts drafted were 3.588, with 18.079 firms involved.

But different studies assert that cooperation strategies like alliances have a high rate of failure, so that the shared idea of their critical relevance is challenged by the evidence of the difficulties in carrying on the relationships with effective outcomes (the “alliance paradox”, Kale and Singh, 2009). Consequently, studies on inter-firm networks are increasingly expected to describe their path of evolution, through longitudinal studies (Provan et al. 2007) which can capture the dynamics of networks and the risk they face in the different stages of their life; the main implicit risk is that of ending the cooperation without reaching the strategic purposes for which the network was created.

This paper is aimed at defining a theoretical framework based on that part of literature on networks and strategic alliance dedicated to life-cycle models and evolutionary path; the idea is that networks and strategic alliance undergo a certain evolution through stages similar to life-cycle, a model already used at product, firm or industry level. Instead of describing the antecedents or success factors broadly studied in the literature (Christoffersen, 2013), the focus is on critical factors which can prevent the network from its physiological path of evolution, leading to untimely termination or stagnation of the relationships.

The first part of this project is presented here, with an analysis of the (scant) literature on network life-cycle or network evolution, and with a first theoretical contribution in terms of stages definition and a
preliminary recognition of the main aspects considered critical as they can prevent the positive network dynamics.

**NETWORK LIFE-CYCLE MODELS**

The literature on networks has considered different forms of evolution and change, useful to better understand network forms of cooperation in a dynamic perspective. Some authors describe the evolution of networks (or similar inter-organisational forms of cooperation, like strategic alliances) in terms of stages in a life-cycle model. The life-cycle model was first introduced to describe the development and growth of organizations over time by Alfred Chandler in 1962. If we consider networks as higher-level institutions separated by the firms they connect, it is possible to hypothesize similar stages in their life.

Wegner et al. 2015 analysed 28 small firm networks (SFN) in Brazil and proposed a life-cycle model based on three main stages: birth and formalization, development and consolidation, decline and eventual closure; they analysed the literature and interviewed some experts in order to arrive to a shared vision of stages in the life-cycle; they also define some dimensions that are relevant to understand in which stage is the network placed: engagement/commitment, governance, information exchange, management, process and routines, service portfolio offered by the network and trust. Among critical factors which lead to termination, from the qualitative analysis they deduce the work overload on a small number of members in charge of organizing activities, the lack of commitment from many participants (which reduced remaining members’ motivation), the differing business profiles amongst network members, the insignificant outcomes from the collaborative strategies, the dependency of the SFN on the public program and the lack of continuity of consulting support offered by it. As implications they suggest higher managerial efforts, the creation of a managerial structure (like the network manager), the cooperation with other networks in order to reach scale gains and cost sharing and also a larger size in networks, as the smallest were usually weak.

Ahlström-Söderling 2003 presented a longitudinal case study of a small firms’ network in the wood-manufacturing industry in Sweden; they describe the evolution of the network in terms of “living” system, which encompasses three main phases: formative, normative and integrative. The normative phase can be divided in two parts, so that four stages can emerge, with reference to two relevant dimensions of relationship orientation and task orientation. The first stage (formative) is characterised by high levels of relationship and task orientation: in this phase the entrepreneurs are connected with strong ties in order to define the way by which their vision could be implemented. The first half of the second stage (normative) is characterized by high task orientation but lower relationships: here the network strive for maximisation/optimisation through increased standardisation and formalisation. In
the second half of the second stage (normative) the focus is more on internal efficiency in the network, rather than on products and market; this phase is characterized by low task and relationship orientation. Finally, in the fourth stage (integrative) the relationship orientation is increasing (while task orientation remains low); in the network a new organization emerges, with a renovated style of leadership and new firms emerging: this lead to a renewal in the project, which defines the start of a new cycle.

Kale & Singh 2009 analysed the strategic alliances, which are described as increasingly relevant to competitive success but paradoxically difficult to conduct in a successful manner, without coming to end before reaching their aims. The life-cycle of strategic alliances is made of three main stages: formation and partner selection, governance and design, post formation alliance management. Each of these stages has some critical factors which characterise the phase and which can lead to unsuccessful outcomes if they are not conveniently managed. In the formation stage the partner selection is critical: partners have to be complementary in terms of non-overlapping resources; they must be compatible in terms of working styles and culture, and must be committed to supply the resources in the alliance but also to make short-term sacrifices to reach long-term alliance objectives. In the second stage the governance of the alliance should be designed, with equity ownership or with contractual provisions which clearly define mutual rights and obligations; but the governance is also made of some soft components referred as relational governance, such as trust and reputation. Finally, in the alliance management it is important to establish coordination mechanism, such as programming, hierarchy and feedback; in this phase the major stress is placed on the development of trust, which many studies indicate as critical success factor, as it helps partners to work more cooperatively. If these are the drivers of strategic alliance success through their different stages, it is important to work on some building-blocks of alliance capabilities in firms; from this point of view the main suggestions of the authors are referred to prior alliance experience, the creation of a dedicated alliance function, the implementation of firm-level processes to accumulate and leverage alliance management, know-how and skills within the firms.

Kumar 2014 presented a life-cycle model of strategic alliance based on three main stages: formation, operation and outcome. At the formation stage, the allying firms are engaged in the task of negotiating the contract. At the operation stage, the partners begin to implement the negotiated agreement. The outcome stage gives the partners the opportunity to assess alliance performance. Each of these stages is characterized by a peculiar kind of ambiguity, and consequently requires a convenient management of ambiguities, in order to avoid critical factors leading to alliance termination. In the formation stage the main risk is related to partner ambiguity, which refers to the suitability and appropriateness of partners, in terms of complementarity, compatibility and commitment. In the operation phase the
ambiguity usually refers to process discrepancies, which means that the partners do not interact effectively with each other, due to different factors like opportunistic behaviour, cultural clashes, fairness concerns and inadequate managerial mechanisms. In the outcome stage the evaluative ambiguity refers to the decision to persist with the alliance when it is experiencing an unfavourable outcome discrepancy (the alliance is not meeting its expected goals); in this case the discrepancy in outcomes could stem from environmental volatility or from problems in the alliance, and could also reflect unrealistic or divergent expectations for the alliance. The author suggest precise managerial implications to cope with these ambiguities and their peculiar outbreak which could compromise the evolution of the alliance through its life-cycle stages.

Jap & Anderson 2007 considered inter-organisational relationships and used two different theoretical framework to describe the life-cycle and the development of relationship; the stages in life-cycle are five or six: the awareness (1) of the possibilities another organization presents, the exploration (2), the expansion (build-up)(3), the maturity (4), the decline (5) and eventual dissolution (6). The hypothesis relate to the idea that some properties of relationships are low in exploration, higher in expansion, highest in maturity and lowest in decline; these properties relate to goal congruence, information exchange norms, relationship harmony, overall dependence of the parties from the relationship, idiosyncratic time investments by one side, idiosyncratic adaptation investments of existing routines by one side, bilateral idiosyncratic investments, the organization’s trust in other organizations, the organization’s willingness to take risk, the organization’s outcome given comparison level of alternatives, the inverse of the number of seriously considered alternative partners. From the quantitative analysis, they found that usually the properties do not reach the zenith in maturity phase, as in this phase the levels are similar to build-up or lower; some properties also follow a different pattern: information exchange norms and goal congruence reach the maximum level in the expansion phase rather than in maturity, while the lowest properties are usually found in decline.

This first part of literature analysis is based on the idea that networks evolve through some pre-defined stages, similarly to what happens in biological life-cycles; if each stage is characterised by some peculiar aspects, the risk of not-evolving to the subsequent stage is dependent on the respective factors, while the effects of regression at any stage is stagnation and probable dissolution of the network.

NETWORK EVOLUTION WITHIN ITS EXTERNAL ENVIRONMENT

Another part of the literature is dedicated to network evolution, and aims to describe the possible patterns of change, without recurring to pre-defined and consecutive stages like in a life-cycle model; in this studies the evolution of network is usually described with reference to the industry (Valdaliso et al. 2016), the environment (Koka et al. 2006), the relationship with other networks (Lin et al. 2010) or the
technology life-cycle (Codini 2015; Suire & Vicente 2014), or is referred to relationships entailed by the firm along its life-cycle (Hite & Hesterly 2001; Strobl & Kronenberg 2016).

Valdaliso et al. 2016 examined six clusters in the Basque region by tracing their possible evolutions with reference to that of the industry they belong to. The industry evolve through a life-cycle model which is made of three main stages: an embryonic stage with small output, a growing stage and a mature stage, with decline in the number of companies and employees. By combining the industry evolution and cluster evolution, four scenario are defined: adaptation/renewal when both industry and cluster are developing; sustainment and maturity when both are not changing noticeably, transformation when industry is not evolving while the cluster do, and lock in and decline in case of cluster not evolving in a context of industry development. The contribution of the article lies in having shown that clusters do not necessary evolve in line with their industry, and the driving factors behind cluster evolutions are cluster knowledge base, social capital and public policies.

Koka et al. 2006 proposed a framework of four patterns of network change, depending on some environmental characteristics; the two environmental dimensions analysed are uncertainty and munificence; environmental uncertainty has been defined as the inability of a firm’s managers to "accurately assess the external environment of the organization or the future changes that might occur in that environment" (Dickson & Weaver, 1997: 405), while munificence refers to the extent to which resources available to a firm are plentiful or scarce, after taking into account the number of firms competing for those resources (Anderson & Tushman, 2001), and is an index of the capacity (Dess & Beard, 1984) of the environment to support the firm and its strategies. Four environmental scenario are possible by considering the matching of increase or decrease in the two considered dimensions (uncertainty and munificence). The evolution of networks could be defined with reference to tie creation or deletion, and portfolio size and range, and is labelled consistently with each scenario: network shrinking (decrease in uncertainty and munificence), network churning (increase in uncertainty and decrease in munificence), network strengthening (decrease in uncertainty and increase in munificence) and network expansion (increase in uncertainty and in munificence). The patterns of change are not only dependent on environmental evolution, as their scope is moderated by the strategic orientation of the firm.

Lin et al. 2010 recalled the patterns of network change (Koka et al. 2006), but introduced a third dimension of change determined by the relationship with another network, such as internetwork co-evolution (the simultaneous changes and developments in networks (the selection, retention and variation of network actors) caused by the interactions between networks that are linked by technology and institutional ties. It is necessary to consider all the levels involved when studying networks: the macro-level is referred to network-environment relationships, the meso-level to the single network,
while the micro-level is referred to each firm participating in the network. The idea is that changes occur both top-down (mainly through institutional ties) and bottom-up (mainly through technology ties).

Different authors analysed the impact of technology on networks and clusters; Suire & Vicente 2014 studied the clusters and their resilience, such as the ability to develop by disconnecting their life-cycle from those of the technology they produce, while Codini 2015 analysed the evolution of network relationships during the different stages of technology life-cycle, in terms of different categories of stakeholders which reveals fundamental in passing through these stages.

When networks are considered as the combination of different relationship which a firm entails in its operating activity, it is possible to analyse how this relationships evolve along the whole firm life-cycle on in specific stages of it.

Hite & Hesterly 2001 analysed the evolution of networks (relationships with different actors created to obtain legitimacy and consensus) within the first stages of a firm (emergence and early-growth) and found that the networks tend to evolve from “identity-based”, where some type of personal or social identification with the other actor motivates or influences economic actions (Granovetter, 1992; Uzzi, 1996) to a “calculative network” (Williamson, 1993) to refer to egocentric networks where the focal actor’s ties are primarily motivated by expected economic benefits. This evolution is leaded by three main evolutions; the first is from embedded ties (relationships characterized by trust and reciprocity) to arm’s-length ties (relationships based on impersonal ties, motivated by self-interest); the second is form cohesion to bridging structural holes, which means passing from dense mutual network to network useful to connect firms which would not be connected otherwise); the third transformation is from path dependence to intentionally managed network, which outlines the change from pre-existent social networks of the entrepreneurs to new relationships in which the firms try to gain the new resources needed to operate.

When the single firm is the level of analysis, it is also possible to study how the network of relationships evolve in the whole life-cycle model of the firm; Strobl & Kronenberg 2016 presented the case of Alpine hospitality entrepreneurs and found which relationships proved to be more relevant across the stages of existence/survival, success, take-off and resource maturity.

In a completely different context, Roloff 2008 described the life-cycle model of a multi-stakeholder network, where stakeholders are defined “as groups or individuals who can affect or are affected by the solution to the problem addressed by the network” (Roloff 2005: 12). Even if this kind of organisation (like for example the UN Global Compact) is completely different from a business networks, the stages described are useful in an approach where network is in general a group of relationships among different people or organisations. The model describe how this group organise the
decision-making process in order to solve the “common problem” addressed by the network; the stages are seven: the initiation phase, the deliberation (composed by acquaintance, first agreement and second agreement), the action (composed by implementation and consolidation) and finally institutionalisation/extinction.

PROPOSED MODEL OF NETWORK LIFE-CYCLE

The literature on networks, strategic alliances and similar forms of inter-organisational cooperation has proposed different life-cycle models, based on the identification of a number of stages ranging from three to seven.

Table 1. Different stages of life-cycle models presented by the literature
Table 1 synthesized the analysed models, which differ with reference to the number of stages and the definition of them. Some proposals start the analysis of stages by considering also the preliminary activities carried out before the formalisation of the network (e.g. Spekman et al. 1998 and Roloff 2008); as for the final stages, some models distinguish between decline and dissolution, or present a final “stabilized” structure stemming from the experience gained through the life-cycle (e.g. institutionalisation, stabilisation). When strategic alliances are considered, a finale phase dedicated to performance evaluation/outcome definition is considered; from this point of view, a network among organisations aiming at common purposes is considered successful when it attains its objectives; this is therefore a necessary step towards further actions like termination of the alliance rather than the re-statement of new strategic purposes. The central parts of the models are composed by a varied number of phases, from two until three: after a first stage of “formation” in which the network is not already going at operating speed, the second stage is of development/growth, while the third usually refers to maturity/consolidation.

By matching the different models found in the literature, we propose a model of network life-cycle referred to the case of business network contract; in this case the preliminary part of the network is already defined by the drafting of the contract, even if some changes can occur, for example in the participants firm, (when a partner is going out or some others are joining the network) or in the design and governance of the network, as the contract can contain only a general agreement without defining process peculiarities. The proposed model will be empirically tested on case studies of networks encompassing the different stages of the model in a second part of the overall research project. The purpose of the future research is to describe the model in its phases but also to define the critical aspects which prevent the evolution of the network through the different stages and lead to termination without a successful attainment of proposed aims.

The proposed stages are:

1. Formation: in this stage the partners negotiate more in details the purpose of the network, the governance structure, the management and organisation of activities, the game rules and the task attributed to each, but also the services offered by the network;

2. Operation: in this stage the activities and initiatives are implemented, the organisation and management tested and the first preliminary results recognised; this is also the stage in which the relational capabilities are put into action and the first problems or conflicts have to be solved within the network;
3. Performance evaluation: after a suitable period of activities the output and outcomes of activities are evaluated by the network members, in order to come to the crucial decision which lead to the definition of the fourth stage;

4. Decline or consolidation: if the performance evaluation is positive and the experience of relationships and problem-solving is good, the network is destined to consolidate; in this case new strategic purposes are defined or the same are re-proposed for future periods; if something goes wrong it is highly probable that the network will decline and be closed.

**Figure 1: the proposed model of network life-cycle**

Figure 1 illustrates the proposed model, in which the physiological life-cycle is described as the “normal” evolution through the stages of formation, operation, performance evaluation, consolidation and decline. The pathological paths are deviations from the expected evolution, occurring when critical factors peculiar to each phase cannot be solved timely in a reasonable way, leading to untimely termination, without reaching the planned strategic purposes of the network.

**CONCLUSION**

This paper is a first step in a more comprehensive research framework, aimed at describing the risks of failure in inter-organisational cooperation in the context of an evolutionary model of relationship. In this paper we analysed and selected the relevant literature on network evolution, starting from a lifecycle model which - usually referred to single organisations - is here applied to second-level
institutions (like networks, alliances, and other forms of inter-organisational structures). The defined stages in the proposed life-cycle model will be further analysed in a second part of the research project, by introducing in each stage the critical factors highlighted in previous literature on network/alliance termination.

In fact, research on success factors is vast in the field of networks and/or alliances, while several evidences suggests that all the kinds of inter-firm cooperation are often not successful as they were hoped to be, with high failure rates of alliances described in several studies, leading to the so called “alliance paradox” (Kale and Singh, 2009).

When the success of inter-firm cooperation has to be evaluated, it is necessary to define what is performance at network level (for a classification see Christoffersen et al. 2014); from a generic definition of performance, we can assume that a network is performing when it reaches its strategic objectives. This usually requires an evolutionary path through which the network is formed, developed and consolidated to its tasks (the physiological life-cycle in figure 1); this means that when unfavourable circumstances occur (the critical factors in the pathological paths in figure 1), the evolution of the network through the proposed stages is put at risk, with higher probability of termination before reaching the original purposes of the strategic cooperation.

From this point of view, unsuccessful outcomes can stem from early-stage termination (occurred during the life-cycle stages prior to physiological decline), or from a situation of stasis, in which the network exists but is not active at all.

Some critical factors have already been studied in those articles dedicated to the management of networks or strategic alliances, sometimes with reference to the issue of stability (Jiang et al. 2008), to the management of ambiguity (Kumar, 2014) or giving emphasis to the evolution of collaborative practices among networks (Verschoore et al. 2015).

The analysis and collection of these critical factors will be done in a second step of research by the match of the literature on network life-cycle/evolution - here presented - with the literature on network termination; each identified critical factor would then be put in the specific stages of life-cycle/evolution model; this theoretical contribution would be further enriched by empirical investigation with longitudinal analysis of network cases positioned at different stages of their life-cycle and thus experiencing different critical factors. Our research has also some relevant managerial implications, as it aims to describe the pathological paths which the network managers have to avoid to assure a long-live and above all successful existence of the network.

ABSTRACT

For a long time, managerial and organizational studies have debated the topic of value co-creation, underlining the need to involve all actors in shared pathways to “collect and use” their information. In recent years, thanks to advancements in knowledge offered by information and communication technologies (ICTs) and computer science related to Big Data, new opportunities have emerged with reference to the “use” of information to improve the quality and effectiveness of organizational strategies. Reflecting on these opportunities, this paper aims to analyze the topic of Big Data in the light of service logic and systems thinking, underlining the implications for organizations’ strategies and survival. The principal aim is to define some essential key points for organizations interested in the “use” of Big Data, offering them the opportunity to improve the positive effects of efficient, effective and sustainable use of information and thus build value co-creation strategies in the emerging knowledge economy.

Keywords: Big Data, Value co-creation, Service Logic, Systems Thinking

INTRODUCTION

Over time, society has progressively shifted from a tangible and linear structure to a more indefinable and articulated configuration (Stacey et al., 2000; McElroy, 2003; Stacey, 2007; Rotmans and Loorbach, 2009). Traditional managerial and organizational approaches have been gradually acknowledged as inadequate to support the understanding and managing of emerging phenomenon. Therefore, new skills and capabilities are needed to face the challenges imposed by the knowledge economy (Teece et al., 1997; Hefley and Murphy, 2008; Schmenner et al., 2009; Barile et al., 2014, 2015a).

According to Kessels (2004), in emerging social and economic configurations “the application of knowledge adds more value than the traditional economic factors like capital, raw materials and labour” (p. 165). Recognizing the relevance of this perspective, the real problem concerns how to
determine the ways in which knowledge affects an organization’s ability to generate value (Matusik and Hill, 1998; Tsai, 2001; Carlucci et al., 2004; Del Giudice et al., 2016).

With the aim of investigating this issue, several researchers have analysed the ways in which knowledge is shared among different entities (Gruber, 1995; Nonaka et al., 2000; Barile et al., 2015b; Saviano et al., 2016), the dimensions and processes able to support or hinder knowledge sharing (Haldin-Herrgard, 2000; Caloghirou et al., 2004; Evangelista et al., 2016) and the role of technologies in supporting knowledge sharing (Alavi and Leidner, 2001; Earö, 2001; Ipe, 2003). All these contributions have offered relevant advancements in knowledge and stimuli in terms of reflections in the field of knowledge management, but the basic assumptions on which they are based are changing as a consequence of the emerging topic of Big Data (Zikopoulos and Eaton, 2011; McAfee et al., 2012; Provost and Fawcett, 2013).

As posited by Davenport et al. (2012), Big Data support the learning of organizations that are “beginning to understand their business environments at a more granular level, are creating new products and services, and are responding more quickly to change as it occurs” (p. 43). In this vein, they offer the opportunity to combine more different sources in common and shared pathways useful for supporting several organizational activities (Hampton et al., 2013; Callebaut, 2012; Chen and Zhang, 2014).

Analysing the role of Big Data, it can be argued that they support alignment between organizations’ strategies and environmental trends by offering organizations the opportunity to develop in-depth understanding of the elements that affect social and economic dynamics (Chen et al., 2012; Snijders et al., 2012). Thus, Big Data appear to constitute a considerable opportunity for organizations, but – widening the perspective – some drawbacks, for instance ethical issues, can be identified if they are not correctly used (Gantz and Reinsel, 2012; Fan and Bifet, 2013; European Commision, 2016). In this vein, several research questions can be defined with reference to the advantages of investing in the management of big data and there are some doubts in terms of the capabilities of organizations to use Big Data effectively to improve the quality of their strategies.

In line with this, the increasing attention paid by organizations to Big Data could be a hazard if they are not aware of how they can be used and what is needed to exploit them. To enhance the existing literature on these topics, the rest of paper is structured as follows: in the next section, a possible theoretical and conceptual framework to broaden knowledge of the ways in which Big Data could affect organizations’ performance and strategies is proposed. A conceptual model designed to enrich the state of the art of the role of Big Data in the knowledge economy is then defined in light of service logic and systems thinking. In the fourth section, the theoretical and practical implications of the
Reflections herein are analysed and finally some conclusions and future directions for research are proposed.

THEORETICAL AND CONCEPTUAL FRAMEWORK

A service view of Big Data

As underlined by several researchers and practitioners, we are living in a service economy (Gallouj, 2002; Lusch et al., 2007; Vargo and Lusch, 2008; Buera and Kaboski, 2012; Metcalfe, and Miles, 2012). According to Barrett et al. (2015), “the complexity of intra-organizational structures and interorganizational value networks create new demands for professional coordination services internal to the firm (e.g., supply chain management) or outsourced to specialized firms (e.g., supply chain mediation, third and fourth party logistics, professional service firms)” (p. 135). This increasing attention focused on the service domain has progressively required a radical change in perspective, supporting the emergence of a new service-dominant paradigm in which all social and economic activities can be analysed in terms of the services exchanged; these are obtained through interplay between resources, and the competences and knowledge of all actors involved (Barile et al., 2012; Golinelli et al., 2012; Lusch and Vargo, 2014; Polese et al., 2016).

According to Vargo et al. (2008), in this emerging scenario, organizations should move beyond the traditional “industrial view”, which is based on transactional approaches, instead building shared pathways with all the actors involved in their ecosystem to co-create value. To implement this approach, organizations should build collaborative pathways based on resource sharing and reciprocal understanding (Barile and Saviano, 2010).

In this line, the relevant change is a shift from a vision based on hierarchical and mono-directional relations between organizations and markets to one based on collaboration and bi-directional relations, as shown in Figure 1.
According to the representation shown in the Figure 1, the emerging social and economic configurations require that organizations constantly adapt their strategies and behaviours on the basis of information provided by the business environment. Business environment involves all important partners, significantly affecting the success of a firm: customers, suppliers, shareholders, employees, sub-contractors, regulators potential local and global partners, etc (Perko et al., 2015). In past years, this process required direct interaction between organizations and markets to acquire the information needed to improve the general quality of the strategies adopted (Henderson and Venkatraman, 1993; Reich and Benbasat, 2000). Today, thanks to the opportunities provided by Big Data, a new general pathway can be defined as shown in Figure 2.
Specifically, Big Data offer organizations a synthesis of the “relevant” information offered by the business environment, combining different sources of information to support the definition of strategies and behaviours aligned with the “average trends” of the business environment expectations. By this means, Big Data reduce the efforts required of organizations for the acquisition and use of data related to market trends, but at the same time they also reduce organizations’ ability to build direct relationships with the actors involved in their ecosystem. Thus, in a service economy Big Data reduce organizations’ ability to personalize their value propositions because they address organizations’ strategies in light of the average trends of market. Therefore, it is possible to state that:

Big Data improve the quality of organizations’ strategies in a service economy only in the case that there is strong similarity between the actors involved in the ecosystem.

A systems view of Big Data

The knowledge economy can be considered to be the results of a networked environment in which all actors exchange information with the principal aim of ensuring survival over time. According to this definition, the knowledge economy can be viewed as a system in which all the parts interact through the exchange and sharing of information. These processes support the actors’ ability to improve the quality, efficiency, effectiveness and sustainability of their pathways and strategies on the basis on the information provided by the external environment (Di Nauta et al., 2015).

This synthetic description offers a general picture of the ways in which the actors define their pathways, highlighting the existence of a strong interrelation among all the actors involved in the same environment. With reference to this, a relevant issue emerges with reference to the variables and dimensions able to affect the exchange and sharing of information between the actors involved in the same pathway (Lee, 2001; Tsai, 2002; Blumenberg et al., 2009; Ekinci and Baykasoglu, 2016). To address this issue, an interesting contribution is offered by systems thinking as a general interpretative framework in which the relevance of interaction among the parts to ensure the survival of the whole is underlined (Beer, 1979; Checkland, 1981; Emery, 1981; Capra, 1996; Jackson, 2003; Golinelli, 2010; Barile, 2013; Barile et al., 2016).

Among the research streams rooted in systems thinking, interesting contributions to broadening perspectives in the study of Big Data can be derived from the viable systems approach (VSA). According to the VSA, every kind of social and economic configuration aimed at ensuring survival in a specific context can be considered a system and can be represented in terms of information units, interpretation schemes and categorical values (Barile, 2009; Saviano et al., 2014). More specifically, information units comprise the information on which systems’ strategies and decisions are based, interpretation schemes are the ways in which the available information is organized and filtered to
support systems’ strategies and decisions and categorical values are the strong beliefs that underlie systems’ decisions and behaviours.

Adopting the interpretative lens offered by the VSA, it can be argued that in the knowledge economy every interaction among different systems is based on information sharing, information coding and information filtering as shown in Figure 3.

![Diagram of information interaction process](Source: Authors’ elaboration)

Enriching this modelling with previous contributions provided by studies on the topic of Big Data, it can be observed that Big Data reduce the effort required for information sharing and coding by offering organizations opportunities to pay particular attention to the selection of information considered relevant and aligned in light of prevalent strong beliefs. Therefore, it is possible to state that:

*Big Data reduce the effort required of systems’ for information sharing and coding and they offer systems the opportunity to pay greater attention to the information filtering process.*

**BIG DATA AS A VALUE DRIVER**

In the last few years, the topic of Big Data has attracted increasing attention from several researchers and practitioners in a multi- and trans-disciplinary debate principally oriented to investigating the ways in which it is possible to acquire, code and use large amounts of data to improve the efficiency, effectiveness and sustainability of organizations’ strategies (Dumbill, 2013; Swan, 2013). According to this perspective, several contributions have analysed the ways in which big data can be managed with the support offered by information and communication technologies (Chen and Zhang, 2014; Di Fatta et al., 2016) and increasing attention has been paid to the opportunities for organizations to use “more information” in the planning and implementation of their strategies (Sagiroglu and Sinanc, 2013).
Despite the relevance of this approach, it seems to be strictly related to a quantitative view in which the focus is only on the amount of information that organizations can use to achieve their aims (Caputo et al., 2016c). With the aim of enriching this perspective by highlighting the “qualitative” contribution of Big Data to organizations’ strategies, this paper adopts the interpretative lens provided by service logic and systems thinking to show the lights and shadows of Big Data.

In line with the interpretative contributions provided by service logic and systems thinking, Big Data can be considered the source of a radical change in ways of managing the interactions between organizations and environment, reducing the effort of acquiring and coding information. Reflecting on this opportunity, it is necessary to specify that the acquisition and codification of information represent only two steps in the interaction processes between organizations and environment. In this line, Big Data can offer organizations useful support in the management of interactions with the environment, but they cannot be considered the only driver.

![Diagram](image_url)

**LEGENDA:**

- **ACTORS**
- **ACTORS SELECTED TO BECOME PARTNERS**

**Figure 4.** A representation of the role of Big Data in supporting organization’s selection of possible partners for suitable value co-creation strategies (Source: Authors’ elaboration)
By reducing the time and resources required for the acquisition and codification of information, Big Data offer organizations the opportunity to pay greater attention to the “qualitative dimensions” of strategies. Exploiting Big Data, organizations can focus more intently on the identification of actors aligned with their own strong beliefs and involve them in building effective strategies based on collaboration and value co-creation, as shown in Figure 4.

However, Big Data can be considered a value driver for organizations only in the case that the advantages offered in terms of more available information are used effectively to filter the environment with the aim of identifying possible partners inspired and affected by similar or complementary strong beliefs and thus enabling them to develop joint strategies for value co-creation (Caputo, 2016; Caputo et al., 2016b).

THEORETICAL AND PRACTICAL IMPLICATIONS

Over time, the attention paid to information flows and processes has been progressively influenced by the increasing relevance of quantitative approaches (Bhatt, 2001). In this vein, Big Data can be considered the last representation of organizations’ willingness to obtain more information to better define their strategies (Wu et al., 2014).

Despite the relevance of this approach, as underlined in the previous pages it cannot be considered exhaustive in terms of understanding and managing social dynamics. A more extensive approach is required to capture all the opportunities offered by the knowledge economy also in the light of a qualitative approach.

By following this pathway, this paper highlights the opportunities offered by Big Data for improving organizations’ ability to identify compatible actors and develop joint strategies. Focusing on the reflections provided in the previous pages, several implications can be derived both from theoretical and practical perspectives.

More specifically, from the theoretical point of view, it is necessary to undertake the following:

- expand studies on Big Data by introducing specific references to the ways in which information is filtered on the basis of organizations’ strong beliefs;
- enrich the existing managerial and organizational literature in light of the opportunities offered by Big Data to gain an understanding of the market and build stronger relationships with the actors involved in the same ecosystem;
- develop a multi- and trans-disciplinary conceptual framework able to link the advancements in knowledge offered by information and communication technologies with the organizations’ need to enrich the quantitative perspective with a more qualitative view.

At same time, from a practical point of view, it is necessary to:
- investigate the ways in which organizations use Big Data to define their strategies and behaviours;
- analyse organizations’ perceptions of the role and contributions of Big Data in building value co-creation strategies in the knowledge economy;
- develop cross-cultural studies with the aim of enriching studies on Big Data using culturally based variables and dimensions.

CONCLUSIONS AND FUTURE DIRECTIONS FOR RESEARCH

In the post-modern era, information can be considered the most relevant resource for every kind of organization interested in survival over time (Castells, 2011). The progress and advancements in knowledge derived from information and communication technologies and computer sciences offer organizations the opportunity to overcome the limitations imposed by a scarcity of information. In coming years all actors will be able to access and use amounts of information that today we cannot even imagine. Thus, in the future the real competitive advantages for organizations will not be related to the amount of information available, but to the ways in which this information is subjectively filtered and used to build shared pathways for value co-creation strategies.

Big Data can be considered the last evidence of an evolving knowledge society in which the boundaries imposed by time and space are progressively disappearing and new rules are emerging. In this emerging scenario, the real challenge for organizations concerns the identification of non-imitable pathways rather than the acquisition of more information with respect to competitors. Big Data offer organizations a relevant opportunity by reducing the time and resources required for the acquisition and coding of information. Nowadays, organizations should use this “saving” and the greater availability of information to select possible partners inspired by similar or complementary strong beliefs, leading to the potential to develop shared strategies for value co-creation.

To support this process, further research is required to investigate the psychological and cognitive domains able to affect organizations’ strategies by defining their strong beliefs. Such research could develop instruments, tools and models to support the identification and selection of possible partners for suitable value co-creation strategies.

CAN BRAND ENTERTAINMENT STRENGTHEN A BRAND?

Caratù, Myriam; Sfodera, Fabiola

Department of Communication and Social Research, University “Sapienza”, Rome, Italy

ABSTRACT

The paper is framed in the academic debate regarding evolution and paradigmatic changes of the branding strategies adopted in the new postmodern marketing era. Its purpose is exploring whether or not a branded content, beyond being an engaging touch-point for the customers, can be an Integrated Marketing Communication tool effective in strengthening a brand. The findings, synthesized in a holistic conceptual framework, reveal that a branded content strategy can boost in the audience a positive attitude toward the brand, by operating on Brand Image and Brand Awareness (components of Brand Knowledge that, in turn, influences Brand Equity). This conceptual model, verified through a quali-quantitative research carried on across two countries, represents an attempt to fill a gap in the existing literature about brand entertainment: by assuming that branded content is the natural evolution of the advertising in the new postmodern era, the paper represents the first attempt to frame it in a branding model. Hence, the originality and value of the study, since - unlike what happened with regard to advertising – branded content has never been linked with brand equity. From the managerial point of view, the study helps businessmen in moving forward from the traditional perspective of advertising, while suggesting a new approach in getting useful insights about the branding policy: from a “push” to a “pull” communication.

Keywords: Brand Entertainment, Branded Content, Advertising, Integrated Marketing Communication, Content Marketing, Branding, Brand Equity, Promotion.

1. INTRODUCTION

In recent years, several studies (Boyland, E. J., & Halford, J. C., 2013; Hansen, F., & Christensen, L.B. 2003; Percy, L., 2003) have focused on advertising and its link with branding and brand equity, while proposing even a theoretical frame for embedding advertising in the branding model (De Mooij, M., & Hofstede, G, 2010, Erdem, T., & Sun, B., 2002). Differently, there is a lack of documents aimed at proposing a theoretical framework, in this sense, in the literature regarding branded content - even though the latter represents the natural evolution of advertising in the modern era. In fact, brand(ed) entertainment, quite literally, means ‘entertainment by or in con-junction with a brand’, and since the
origins of TV brands have always been integrated with media products, giving birth to the so-called product placement. However, in the branded entertainment, also called advertainment— as a convergence of advertising and entertainment - the products are no longer just 'placed', but woven into the entertainment content, building a stronger emotional connection with the consumer (Hudson, S., & Hudson, D., 2006): branded entertainment is a sign of the new fast-changing, growing socio-economical environment where the classic advertising is not efficient anymore, because of the obstacle of the so-called ‘marketing clutter’, which prevents people from accepting in their life any other promotional messages, since their threshold of attention is now full and - in a sense - trained to push away the thousands of messages that bombard our lives everyday, everywhere. In this totally branded media world, moreover, people react in discordant ways: for some, seeing brands everywhere is a source of irritation, while other derive amusement from spotting them (Lehu, J.M., 2007). Hereafter, entertainment and irritation are factors that directly contribute to the attitude of the audience towards a brand (Aldas-Manzano J. et al., 2013). This is the reason why marketing communication has changed its features, today: within the so-called “long-tail economy” (Anderson, C., 2007) and the structure of the new media environment (abundance of media, audience fragmentation and polarization, product-portfolio of the firms, overall power shift on communication) the customers’ audience is spawn between many and diversified media, especially the new digital ones, and the traditional communication is no more effective in creating brand loyalty and fight that “continuous partial attention” (Stone, L., 1998) that the consumers have developed towards the pounding media pressure present in their lives. No wonder if the advertising of the the last twenty years make of interactivity, emotional touch-points and user-generated contents the “must” of the new marketing communication, which, over time, has come to value the importance of engaging the consumers - more and more pro-sumers (Toffler, A., 1980), as in producers of contents themselves. Connecting with the pro-sumers through a communitarian/participative approach is, at the same time, the aim of the marketing communication and a useful tool to position the brand in the competitive scenario and in the consumers’ “mindscape” (mind landscape). Not by chance, in the last years, some scholars (Lundqvist, A. et al. 2013; Woodside, A. G., 2010; Herskovitz, S. and Crystal. M., 2010) have found a creative approach to position the brand in the consumers’ minds: the brand storytelling, which aims at creating a brand positioning based on a fictional story that has a setting, characters, a narrative plot and a well-defined language ascribable to the brand values. The narrative, here, links the brand to the consumers, going deep into their memory, leveraging on the mental associations and connecting to the stories and experiences of the individual, and very often this fiction is based on the storytelling of the brand heritage: this forms interesting solutions in the new digital environment, where the storytelling has become cross medial (trans-media storytelling), since all the elements of the fiction get dispersed systematically across different medium, each giving its own
contribution to the story that at the end results coordinated, in a real optic of Integrated Marketing Communication. What has been just outlined is the context where branded entertainment finds its “raison d’être”: blending Branding, Storytelling and Viral, it can be defined as the production of contents realized by the company/brand itself, which is able to attract the audience on themes pertinent to the brand values and objectives but, nevertheless, not immediately amenable to the brand products and services (Bonsignore, P. and Sassoon J., 2014). It can be proposed also on the traditional media (TV, cinema) but it is important to underline that what is intrinsic to its interactive and participative nature is the connection with the new digital media, not by chance expression of the new active consumer. It can be argued that Branded Entertainment is son of the new market and new economy abovementioned and at the same time a symptom of the shift from the old “push” communication strategy (e.g. marketing/advertising clutter) to the new “pull” one (e.g. audience engagement).

2. LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

The research questions of this study therefore are: the branded content can also be an effective tool of a company’s branding process? Moreover can it influence brand equity? From an initial literature review, has emerged that, nowadays, brand entertainment – alongside with branded content – is an effective touch-point to engage the audience and retain the customers, and a marketing strategy increasingly adopted by brand-holders, even in disparate fields (Hudson, S., & Tung, V., 2016; Lei, S. S. L., Pratt, S., & Wang, D., 2016; Holt, D.; 2016). However, we already mentioned the lack of documents in the literature reviewed – that propose a theoretical framework to explain brand entertainments’ influence on brand equity in a systematic way. So, in order to fill this gap, this study has tried to understand what is the incidence of Branded Content on the brand system through acting on the aspects influencing Brand Equity and to individuate the main factors influencing the branded content marketing strategy, both from the contextual perspective and from the brand holders’ perspective.

2.1 Branded Content and Branding

The already mentioned shift in the marketing perspective (see Introduction) represents also a redirection of focus in the companies’ corporate communication: no more pivoted the product offering itself but instead on the brand system. In fact, if advertainment has grown mainly in reaction to the increasing advertising clutter, escalating advertising costs, and the reduced effectiveness of traditional advertising messages, in the modern fragmented market and related “fragmented marketing” (relational/event/B2B/B2C - marketing etc.), the need for promoting the brand instead than the products themselves becomes fundamental to approach an audience that does not care anymore about the tangible attributes but rather to the intangible ones. Hence, the need no longer for product integration
(that is the logic of the product placement) but rather for brand integration in the media content is a crucial step towards the branded entertainment: this, in fact, marks a shift from the intrusive advertisement pushed at the audiences who are engaged in other content (interruptive/push strategy= intrusion-based marketing= hard-sell approach) to a kind of advertising of such merit or interest that the audience actively seeks it out (interactive/pull strategy= invitation-based marketing=soft-sell approach) (Lotz, D. A. 2007). Moreover, another difference with the old logic of product placement is the advantage, in the branded content, of new technologies (Grainge, P., 2012): according to Valero, D. (2014) the latter is organic (brand and content are at the same level of importance and totally integrated in the creation of the show) and seamless (defragmenting the brand from the story is impossible). Therefore, if irritation in the product placement is neutralized by the degree of integration, and if this can be applied to the branded entertainment in slightly different terms (no longer “less irritation” but rather “more involvement”), we could state that, the thinner is the aforesaid “line”, the bigger will be the audience engagement. The level of integration in different advertainment typologies is indeed proportional to the degree of integration: less in the product placement, more in the product integration, even more in the branded content (Russell, C.A. 2007). Hence, hypothesis 1: the more is the level of integration between the brand and the media content, the more likely will be a positive attitude towards the brand. For what concerns instead the format used for proposing a branded content - especially on the TV, it is important to mention that there are several mainly common formats - according to some researches appeared the Italian Cultural Observatory on Brand Activity. For instance, the TV-movie and the Collection (that recalls the form if the sit-com), TV Series and Serialized Series and, finally, Reality/Talent Show. The choice of the media then, as well as the one of the formats where to convey the branded content message, is relevant in engaging the target audience in terms of: opportunity to see (which has a direct effect on brand awareness) and customer retention (that influences brand loyalty). It also has an indirect effect on the brand image, since the brand personality must have congruence with the media and format chosen (Repetto, M., 2006): for instance, is rather unlikely that a brand involved in a Reality TV/Talent Show will reach the target aged 50-60, and even if it happened, there is a high probability that it will not be perceived positively, given the idiosyncrasy of the above-mentioned target towards this form of entertainment. Hypothesis 2: the type of media and format chosen for branded content has an indirect effect on brand image. However, the choice of media and format needs to be contextualized in different media cultures, and consequentially it undergoes different audio-visual policies: for instance, Kevill, S. and Connock, A. (2013) underline that in the UK branded content suffers of more restrictions than in other countries, (e.g. US and Italy). This is explained through the analysis of the regulatory frame, looser for what regards the advertising in the US, and much more liberal about product placement and branded content. It can be argued that: (hypothesis 3) the less the regulatory
restrictions, the more is the insinuation of sponsoring third-parties in the media contents. Besides the media culture, however, there is another culture to consider: the brand culture. The literature review in fact indicates that a branded content, essentially, is about that very emotional engagement that a product can give only if associated to a set of values and beliefs, which are enclosed in the so-called brand culture, appropriately narrated through the brand storytelling – as already mentioned (see Introduction). Herskovitz, S. and Crystal. M., 2010 explain how brand storytelling can be a catalyst of the process of brand learning for the customer, which allows landing faster to the step of the “call-to-action” of the AIDA Model (Lewis, St Elmo E. 1898), that means purchase intention. Besides the storytelling, there is also another factor to take into account – when thinking about an effective branded content: the communicational pact embedded in the branded content. In this sense, the managerial literature (Branded Content LAB 2013) suggests that a high level of brand storytelling is an optimal tool for branded content to raise brand awareness and reach a good purchase intention, but only if associated to an explicit valorisation of the communicational pact with the audience. In this research, in fact, are outlined four different valorisations of the latter - according to its different degree of innovation, involvement and storytelling: the first is the explicit valorisation of the communicational pact (even though there is no effective centrality of the product, this form results very strong about the purchase motivation, thanks to high levels of involvement and innovation); the second is the ludic valorization, which is not finalized to the commercial purpose (it takes advantage of the mechanism of empathy generated by the pure fun, but it does not grant any return on investments either on the brand image or on the purchase intention, since the experience is standing alone). Then there is the seductive valorization, in between the involvement and the storytelling: it is weak on innovation, and it does not highlight the concrete aspects of the product/brand. Finally, the instrumental valorization: although being more capable of highlighting the product/brand, this results less functional to the purpose of branded content if compared to the 1st and 3rd valorisations: here, the communicational code is closer to the traditional advertising and therefore less able to boost the specific aspects of the Branded Entertainment. From the studies just mentioned, indeed, it is possible to develop the next two hypotheses: hypothesis 4 (if a brand wants to raise brand awareness in order to reach a good intention-to-buy, this is more likely with an explicit valorisation, combined with a good level of Storytelling) and hypothesis 5 (the more articulated is the “Brand Storytelling”, the more likely the intention-to-buy and purchasing effect will be). The very same research just mentioned (Branded Content Lab 2013) has also defined the three most common marketing approaches of the managers (problematic, critic and editorially-led approach) towards branded content: the first is ruled by the objectives of the reputation and brand building, but less by the ones of customer generation/retention. The second is more focused on commercial objectives, while the latter - used by those managers who normally choose the branded
content marketing as a marketing strategy - pursues the objectives of the *traffic generation* (on the brand website or company blog) and the one of the support to the *commercial action* (customer retention, prospect generation and brand loyalty). Hence, the hypothesis 6: the marketing approach influences the decision to use a branded content and also the choice of its type. The abovementioned ‘critic’ and ‘problematic’ approaches’ clusters of marketing managers struggle - unlike the editorially-led approach cluster- in seeing the branded content as a highly effective marketing strategy, mainly because of difficulties encountered in its assessment and measurement. It can be implied that the type of assessment influences the perception of branded entertainment as a strategy for brand-holders (hypothesis 7).

Finally, in closing the literature review, it is worth to go back to the hypothesis 2, which can be integrated with what found by analysing the regulatory frames analysed in this research (Romani Decree, 2010; Ofcom Broadcasting Code, 2010, Audiovisual & media policy, 2012). The latters, in fact, legislate about other issues – more cultural and ethical than strictly legal - besides the integrity of broadcasters from the presence of advertising and third-parties sponsors in media content: for instance, these laws focus on the protection of the minors, or the banning of product placement relative to tobacco, prescription-only medicines and alcoholic drinks, and also about the independency of the current affairs and news programs, which must be devoid of brand placement in order to maintain its status “super-partes” - as well as the religious programs. According still to Kevill and Connock (2013), this does not necessarily happen in other markets like the US one or the Chinese one, so it is easy to prove that the media culture (not only laws but also shared beliefs and costumes of a society) influences the likelihood of having a branded content marketing strategy, since if there are too many restrictions about the branded content it is likely that marketing managers of some companies (e.g. a tobacco company) will not choose branded content as a tool of their strategy. Hypothesis 8: the type of media ethic and culture is tightly connected to the legal frame and this influences the likelihood of having branded entertainment as a marketing strategy for the brand holders

2.2 The theoretical frame

By accepting the hypotheses just developed, a conceptual framework (Figure 1) has been created in order to demonstrate the relationships between branded content and the brand system. In particular, through *brand storytelling*, the *branded content* (whose creation is influenced both by the contextual frame and the brand-holders’ perspective) influences the *attitude of the audience towards the brand*, acting as a catalyst on *brand building* (or *brand shift*) and *brand knowledge* (composed of *brand awareness* and *brand image*). These three last mentioned factors directly operate on *brand equity*. To achieve this original conceptual model, the study has analysed and tested with positive results several factors, attaining thus some main outcomes: a) the incidence of branded content on three factors influencing brand equity:
brand awareness, brand building and brand image; b) an analysis of the characteristics that branded content needs to have in order to engage the audience (level of integration, brand storytelling, consistency with the format and type of media chosen, type of valorization); c) the main factors influencing the branded content marketing strategy, both from the contextual perspective and from the brand holders’ perspective; d) cross-sectional main differences among the Italian audience and the British one in perceiving branded content. The overall assumption hereby is that, beyond being a mere tool for entertaining the audience and the brands’ customers, branded content boosts in the audience a positive attitude toward the brand, building the brand in the consumers’ minds and therefore affecting positively the brand equity. Here, the definition of ‘brand equity’ and the related theoretical frame taken in consideration, among the various branding models, is the Customer Based Brand Equity model, outlined by Keller, K.L. (1993), according to whom: ‘Customer-based brand equity is defined as the differential effect of brand knowledge on consumer response to the marketing of the brand. (...) Brand knowledge is defined in terms of brand awareness and brand image and is conceptualized according to the characteristics and relationships of brand associations described previously. Consumer response to marketing is defined in terms of consumer perceptions, preferences, and behaviour arising from marketing mix activity (e.g., brand choice, comprehension of copy points from an ad, reactions to a coupon promotion, or evaluations of a proposed brand extension).’

Figure 1. Branded Content: a perspective in the Branding frame
3. THE EXPLORATIVE STUDY

3.1 Methodology

In order to validate the hypotheses and the related conceptual frame just outlined, the authors have carried out an empirical research across two countries (UK, Italy), consisting of: an on-line quantitative questionnaire among a sample audience of 347 individuals (175 Italian 169 British), 11 qualitative semi-structured interviews among international media companies with internal creative divisions for brand entertainment. As far as it concerns the qualitative research, altogether, 11 vis-a-vis interviews were conducted to subjects in high-level corporate roles (e.g., VP, Marketing Director, Director of Ad Sales, Creative Director) of media companies, branded content companies, broadcasters and media agencies. The data for the quantitative research, instead, has been collected through an Internet-mediated questionnaire submitted via Facebook, email and LinkedIn, with a redemption of 99% (344 valid responses). The sampling has been stratified and non probabilistic, with a random selection. Besides the place of residence, the sample has been identified on the basis of other 3 parameters: gender (M/F), profession (professional/self-employed, employee, student/unoccupied) and age/generations - as identified by de Pelsmacker et alii, 2013: baby boomers (age: 46-65) generation X (36-45) and generation Y (20-35). The task was to watch and assess two branded content videos, chosen because of their features dichotomized: a 10' documentary B2C “made in Italy” (“Illy Artists of the Taste”) and a B2B “made in UK” branded content (“Bacardi True Original”, a 2’ video streamed on YouTube and meant for bartenders). Through the questionnaire (4 questions about the individuals socio-demographic profile and 5 questions about the videos’ perception) the sample has expressed its attitude towards branded content, allowing the researchers to evaluate: a) the effects of a branded content on the brand knowledge (brand awareness and brand image) in a sample audience; b) cross-sectional main differences in perception of the branded content among different generational targets and individuals living in different countries’ media contexts.

3.2 Hypotheses testing and main findings

The data obtained from the explorative study have been used to validate the hypotheses developed after the literature review. Following, the results of every hypothesis’ testing:

- H1 (accepted). To test this hypothesis, the first step was to understand which one of the two branded videos taken in consideration in the quantitative questionnaire has shown more integration between the brand and the media content - according to the questionnaire interviewees’ perception who responded to the Q2: “In your opinion, which is the role of the brand(s) in this kind of content? From graph 1 it is possible to notice that the sum of the percentages of people who considered the brand Illy as “part
of the story” and/or “protagonist of the story” is 51, 5 %, while 47,4% with respect to Bacardi where – moreover - many people (29,4%) recognize the branded video as “simple advertising”.

Graph 1. The role of the brand in the content. Source: Own production from primary research data

The next step to test the hypothesis was to see if the brand that has resulted to be the most integrated with the content (Illy) generates the best brand attitude toward the brand: question n°3 (Q3). Every possible response to the question corresponded to a certain brand objective: “It makes me wanting to try the product” → Intention to buy/Prospect Generation; “It suggested new advantageous uses of the product” → Lead Generation and/or Customer Retention; “It makes me wanting to know the brand” → Prospect Generation; “It brought me closer to the brand” → Customer Retention; “It increased my trust in the brand” → Customer loyalty (as defined by Delgado-Ballester, E. and Munuera-Aleman, J.L, 2001); “It changed my attitude toward the brand” → Brand Shift or Brand Building.

Graph 2. Branded content’s effect on attitude towards product and brand (Q3 responses) - Total averages (of both branded contents). Source: Own production from primary research data
As it is possible to see from the graph 2, Illy has more percentages of agreement than Bacardi with the statements/responses regarding the brand: it can be affirmed that it generates the best brand attitude toward the brand, therefore the hypothesis seems to be supported both by secondary and primary research, and then accepted.

- **H2 (accepted).** According to the quantitative data, Illy’s branded content - more than Bacardi’s one - inspires a positive attitude in the people interviewed, because it is a documentary streamed on a big broadcaster, and this format is more adapt to increase trust because it has more time to set a connection with the audience, which is more difficult to reach at the same extent with a branded video of 2’.

- **H3 (accepted).** The qualitative data are consistent with this hypothesis, since the Ofcom Broadcasting Code 2010 and the BBC Editorial Guidelines (documents handled by the director of one of the companies interviewed) suggests that there cannot be logos well visible on the screen, while the EU branded content law (Audio-visual and media policy) allows this.

- **H4 (accepted).** The hypothesis’ statement is consistent with the quantitative data, since both the branded videos s explicit valorisation and a high level of brand storytelling, and as it can be seen from the responses to the Q1 (“Have you recognized the presence of one or more brand(s) in these videos” Yes/No), 98,8% of the interviewed has answered ‘Yes’, while only 1,2% has not recognized brands in these videos. That is the level of brand recognition that, together with the brand recall, constitute the brand awareness, which in turn is a component of the brand knowledge - a parameter affecting directly the brand equity: the level of brand recognition here means that the brand awareness of the audience is significantly high.

- **H5 (rejected).** To test this hypotheses, we took in consideration the Q4 of the qualitative questionnaire: “How much do you agree, on a scale from 1 to 5, with the statement ‘the video made me wanting to try the product’?”. The majority of the interviewees agreed that Illy’s video makes them wanting to try the product (66% against 60% of Bacardi). However, the results to Q5 showed that it was Bacardi to result the branded video with a higher level of Brand Storytelling, denying the hypothesis’ correlation.

- **H6 (accepted).** The hypothesis is consistent with the qualitative because both the branded videos analysed show several characteristics of the second cluster of managers, the ones which pursues the objectives of the traffic generation (on the brand website or company blog) and support to the commercial action (customer retention, prospect generation and brand loyalty) within the dimensions of entertainment and engagement. This is confirmed also by the qualitative data: both Illy and Bacardi fall within the category of editorially-led marketing approach, even though belonging to different sectors, since Illy is addressed to the customers (B2C field), while Bacardi wants to engage the bartenders, both as mavens and fellow businessmen (B2B field).
- H7 (accepted). The hypothesis is consistent with the quantitative data collected from the branded content agency Precious Media and the media agency Repucom: the Valuation Model of the latter and the Master Assessment Method of the first are, in fact, their strengths in presenting the results to their customers, since they use KPIs bounded to the media world, but also are connected to the Return of Marketing Investments, which is the kind of data that brand-holders and managers currently understand and use to evaluate any marketing tool that could be useful for their own brands - branded content included.

- H8 (accepted). The hypothesis is consistent with the qualitative data, since BBC’s representative Philip Almond - Director of Marketing & Audiences at BBC- has confirmed the impossibility of the BBC to make branded content, while instead BBC Worldwide can do that, since operates outside UK.

4. MANAGERIAL IMPLICATIONS AND CONCLUSIONS

From the data analysis of the quantitative research it has emerged that branded content is an effective marketing communication tool, since the sample has responded positively to Q3, and regardless Place of Residence, Age/Generation, Gender and Profession. In fact, the Place of Residence has not resulted to be a significant variable because both people living in UK and in Italy have appreciated the branded content as a tool for getting them closer to the brand and the product (see graph 3), entailing that in Italy and UK the audiences are positioned on a similar level in accepting the branded content.

Graph 3 - Branded content’s effect on attitude towards product and brand (Q3 responses) – Total averages (of both branded contents) per category: Place of Residence. Source: Own production from primary research data

From the managerial point of view, this is important for brand-holders when planning their communication strategy, because they can rely on branded content effectiveness in both the countries.
The same results appear about different generations: the variable age/generation, in fact, has resulted to be not very significant either in the variance of the responses.

Graph 4 – Branded content’s effect on attitude towards product and brand (Q3 responses) – Total averages (of both branded contents) per category: Age/Generation. Source: Own production from primary research data

In definitive, this means that branded content is an effective marketing communication tool well received both by different age ranges (though very dissimilar) and by the British and Italian audiences (despite of the considerable socio-cultural differences that cross the two countries). In addition, the results confute also the assertion (Branded Content LAB 2013) that a B2B content cannot use a same marketing approach both for stakeholders and consumers, since here Bacardi has proven to be effective on a consumers’ sample.

5. LIMITATIONS AND FURTHER RESEARCH

The overall conclusion, hereby, is that our hypotheses are worth to be further investigated in a research or conceptual study, in order to understand how and how much branded content can influence brand equity. However, there are some limits to be considered in reading this overall conclusion: the branded entertainment panorama here analysed only refers to Occidental productions (mainly European, Canadian and American), as all together they constitute the magnitude of worldwide distribution. In addition, there is a possibility that the brands appearing in the TV shows are currently running a marketing campaign, which may influence the effectiveness of the branded content. Moreover, on the ground that the Keller’s brand equity model is a static framework, only short-term memory effects (brand recall) has been investigated for the case studies analysed - thus excluding effectiveness on long-
term memory, which would have required a longitudinal study. For what regards the primary research, further research needs to be considered in order to close some gaps: firstly, from the research does not appear a direct correlation between the branded content strategy and the effect on the brand holders’ sales, due to the fact that the brand holders and the company interviewed preferred not to disclosure the revenues in terms of ROMI (because of privacy issues). Secondly, when analysing the legislative frame in Italy, which allows state-owned broadcasters like RAI to have product placement, an unexpected variable emerged from the words of Eleonora Costa (Head of Marketing at Endemol Italia): the economical one. That is why, in analysing the contextual frame, future research should investigate a broader set of variables – besides the legislative one – that influence the branded content’s creation. Finally, for what regards specifically the quantitative research, further investigation should be made in order to analyse the effect of all the variables on branded content’s perception (also Gender, Profession) that in this study have not been analysed with the same attention paid to the other variables (Place of Residence, Age/Generation).

TECHNOLOGY TRANSFER AS DRIVER OF SMART GROWTH: A QUADRUPLE / QUINTUPLE INNOVATION FRAMEWORK APPROACH

Carayannis, Elias1; Caputo, Francesco2; Del Giudice, Manlio3

1George Washington University School of Business, Washington, DC
2Department of Pharmacy, University of Salerno, Fisciano, Italy
3Department for Research, University of Rome “Link Campus”, Rome, Italy

ABSTRACT

In recent years, increased attention is being given to the concept of knowledge and its management implications for the future of business. Today, these works are also influenced by the recent developments in technology transfer, seen as a ‘pathway’ for accelerating economic system growth and advancement.

Starting from these preliminary reflections, this research consists in a proposed system for classifying international literature on the topic of Knowledge and Technology Transfer (K&T2). The links connecting the various works is re-interpreted - including through several case studies - in the context of the Quadruple / Quintuple Innovation Helix Framework (Carayannis et al., 2015a; 2016b), outlining the possible implications of a change in perspective for traditional models.

The proposed reflections are the first step whereby management studies can be used to define new models and instruments for managing the complex relationship between Knowledge and Technology Transfer in the multi-actor knowledge era. For professional communities, these reflections offer useful indications on how to define management models that can help them to gain a greater understanding of the dynamics of context and, therefore, introduce better means of governance.

A new and different approach to technology transfer is proposed in this paper. Technology transfer is analyzed not only in terms of the practical implications of knowledge management, but also by highlighting the two-way relationship between knowledge and technology, together with the need to develop a common model for the actors involved in the processes of generation and transfer. This model can be used to increase the positive effects of the processes on company dynamics and to address the issues of increased scarcity of resources and greater competitive rivalry.

INTRODUCTION AND SOME PRELIMINARY REFLECTIONS ON EVOLUTION AND CHANGES IN THE KNOWLEDGE ERA

Many changes have occurred to influence the market and its evolution over the past few years. Globalization, changes to consumer behaviour, greater competitiveness and the pressure from scarce resources are only some of the issues that organizations, institutions and, more in general, social actors have had to face over recent times.

In evolving, society has upset the traditional balance among the actors involved in social and economic processes, meaning that it is now necessary to re-think models and instruments which are no longer capable of handling the emerging challenges of context (Carayannis and Stewart 2013; Cecere 2015).

Accordingly, several research streams are being developed to propose more efficient solutions that focus on different aspects, such as customer behaviour (Hallowell 1996; Jensen 2015), effects of rules and protocols (Bettman and Park 1980; Sadiq and Governatori 2015), systems of accountability (Roberts and Scapens 1985; Gray et al. 1996; Bebington et al. 2014), development of core competences (Teece and Pisano 1994; Prahalad and Hamel 2006; Holahan et al. 2014), management and governance of complexity (Espejo 1992; McElroy 2000) and so on.

All these studies have offered interesting contributions to the advancement and understanding of knowledge systems and social phenomena, but their focus is limited and, in some cases, cannot provide a general overview of the processes taking place (Carayannis and Alexander, 1999, Di Nauta et al. 2015, Caputo, 2017).

To overcome these limitations, it is necessary to extrapolate common elements from the recent developments and analyse their properties more thoroughly, with the view of defining a general scheme that can help in the understanding and management of new socio-economic configurations.

By observing the recent pathways from both economic and social point of view, it is possible to note that “perspectives from and about different parts of the world and diverse human, socio-economic, technological, and cultural contexts are interwoven to produce an emerging new worldview on how specialized knowledge, that is embedded in a particular socio-technical context, can serve as the unit of reference for stocks and flows of a hybrid, public/private, tacit/codified, tangible/virtual good that represents the building block of the knowledge economy, society, and polity” (Carayannis and Campbell 2012: 3).

It is clear, at this point, that the key element in the recent developments is knowledge, seen as a “critical factor affecting an organization’s ability to remain competitive in the new global marketplace” (Bollinger and Smith 2001: 8).
Nevertheless, the traditional approach to knowledge is not useful for understanding the new world that is emerging before our eyes and, apparently, it cannot cope with explaining the processes on which the new reality is based. To overcome these limitations, it is necessary to combine studies on knowledge with the ‘strong’ contribution of works on the technology-based approach to management (Del Giudice et al., 2012; Battistella et al. 2015; Di Fatta et al., 2016; Caputo and Walletzky, 2017).

Several solutions have been proposed in these contributions, stressing the potential influence of technology to management processes, in order “to understand knowledge and its uses in various aspects of the business, the motivational and attitudinal factors necessary to get people to create, share, and use knowledge effectively, and the ways to use technology to enhance knowledge activities” (Davenport and Völpel 2001: 2015).

The real advancements of studies on the contribution of technology to the processes of management are, in any case, concerned with clarifying the ways by which knowledge can be encapsulated into a tangible resource (software, processes, databases, etc.) and transferred to other actors (Blackler 1995; Del Giudice et al., 2016).

By offering explanations through technology-based studies, it is possible to understand how a conceptual idea becomes concrete and how it impacts on the general socio-economic environment. However, it is still not possible to understand why some ideas become tangible and can easily be transferred in the form of new technology, while other equally good ideas come across many more hurdles in the process of turning into actual real new technology.

In the following sections, the paper contains a short analysis and classification of the studies covering the relationship between Knowledge and Technology Transfer (section two) with a summary of the methodological approach and the research pathway. A possible conceptual framework built upon the Quadruple Helix model is then proposed, to help the understanding of the elements that impact on a potential Knowledge and Technology Transfer (K&TT) process (section three). The key elements for a new common model of management are then presented (section four) with several final remarks and practical implications (section five).

THE CONTRIBUTION OF LITERATURE IN THE MANAGEMENT AND UNDERSTANDING OF TECHNOLOGY TRANSFER

The growing complexity of the relationships on which civil society and economic activity are found is such that new models of management are needed to propagate behavioural patterns based on the tacit and shared knowledge that is connected by means of organizational routines (Bogenrieder and Nooteboom 2004; Barile et al. 2013; Del Giudice et al. 2013a).
In recent years, the growing attention on this topic has had a positive influence in seeding and creating knowledge and has also underlined the relevance of knowledge-sharing as a critical element in the success of organizations and for the process of co-creating knowledge (Del Giudice and Maggioni 2014; Caputo and Evangelista, 2017).

By recognizing that the new market is configured as a cognitive entity, it is possible to understand how the transfer of critical knowledge from one actor to another can help in managing the barriers to knowledge transfer (Ardichvili et al. 2003; Del Giudice et al. 2017) and of contextualization (Nonaka and Takeuchi 1995).

Starting from these assumptions, it is possible to note how the relationship between knowledge, technology and the process of turning an idea into a physical reality - “tangibilization” - (Hyötyläinen and Möller 2007) has been emphasized in various contributions to literature. The worth of these studies is to have proposed solutions for encapsulating knowledge into a physical medium and, therefore, helping the process of transferring it from one actor to other, as an ongoing operation over time (Newell et al. 2009). In this perspective, it can be underlined that knowledge is made up of several components and that it can be embedded in different devices (Sharif and Ramanathan 1987). Knowledge concerns both the technological and physical characteristics of what is being transferred (the technoware component) and typically resides in the easily transferable physical support.

These different contributions are strongly influenced by the transactional approach, where knowledge is considered a resource that should be “sold” to the market and technology is the instrument that ensures its transfer (Chapman and Buckley 1997).

It is necessary to specify that knowledge transfer can concern different elements, such as technology (Flannery et al. 1994), knowledge (Liyanage et al. 2009) and know-how (Ferdows 2006). For each of them, it is possible to identify several forms of transfer each with their own properties and processes (Davenport and Prusak 2000).

In this articulated scenario, technology transfer is seen as an active process in which technology is transferred between distinct entities (Amesse and Cohendet 2001; Cummings and Teng 2003; Bozeman et al. 2015).

Autio and Laamanen (1995: 652) have defined the transfer of technology as an “intentional, goal-oriented interaction between two or more social entities, during which the pool of technological knowledge remains stable or increases through the transfer of one or more components of technology”.

Technology transfer is, therefore, a process-oriented interaction between two or more entities, with the purpose of improving the transferred technology (Argote and Ingram 2000).
Several authors (Flannery et al. 1994; Gilbert and Cordey-Hayes 1996) have identified the temporal stages involved in a “transfer process” and Szulanski, in 2000, identified the following phases:

- The start-up phase arises from the need for technology and knowledge to be expressed in their relative context. The discovery of a gap between existing technology and knowledge and the contextual need drives the search for external solutions.

- The second phase is implementation. After the decision to transfer knowledge has been made, attention shifts to the exchange of information and resources between companies. The companies form relationships to interact together and simplify the flow of information and resources. In this step, there can be issues relating to an inability of bridging the communication gap between the source and the recipient of the technology.

- Once the recipient has started to use the transferred technology, the ramp-up phase begins. The main interest, in this phase, is to identify and solve unexpected problems connected to the new context in which the technology has been inserted.

- In the final phase, integration, new technology gradually becomes routine and generates know-how. Technology is integrated into the organization, losing its novelty but, if the receiver is unable to change and integrate it, the technology could be abandoned, with the receiver turning back to the previous state. The problems in this case could depend on organizational balance and on the ability of overcoming internal resistance to change.

The transfer process illustrated above underlines the fact that it is not simple to implement technology transfer in practice. The process is possible only if the recipient learns the new techniques and acquires new knowledge, otherwise, the recipient will not be able to take full advantage of the all benefits (Carayannis et al., 2006). Gaining greater understanding of the developments in the approach to Knowledge and Technology Transfer can be useful, especially in connection with the role of the user, who is not simply a recipient but an actor who can collaborate to the creation, design and transfer of knowledge and technology (Stewart 1987; Terrett 1998).

It is clear that, when technology is transferred, the knowledge and the skills needed to use it should also be integrated within the company that will use the technology. The transfer of know-how is the link between knowledge and technology (De Toni et al. 2012).

In this framework, collaboration and integration are essential elements for the aim of producing and transferring knowledge and technology that can support management activity. Although the topic of technology transfer is a highly debated subject, with many studies focusing on particular aspects of technology transfer, there are few comprehensive studies that deal with the parameters and levers that are to be considered when designing and implementing a process of technology transfer.
In the knowledge era, technology transfer between the involved companies can be represented by a two-way arrow. This metaphor implies that the transfer concerns reciprocity and feedback. The process requires interaction among the parties and the relational context is a significant aspect (Carayannis et al. 2016b; in press b).

Organizational culture is increasingly being recognized as a major barrier to technology transfer because it influences, at different levels, the creation, sharing and use of knowledge.

De Long and Fahey (2000: 116) identified four ways in which culture influences behaviour and, specifically, by:
- moulding the assumptions about what knowledge is and which knowledge is worth managing;
- defining the relationship between individual and organizational knowledge, determining who is expected to control any specific knowledge, as well as who must share it and who can hoard it;
- creating the context for social interaction that determines how knowledge will be used in particular situations;
- shaping the processes by which new knowledge -with its accompanying uncertainties- is created, made legitimate and distributed within organizations.

These four points can be used to suggest what actions in particular can be taken by managers to assess the different aspects of culture most likely to influence knowledge-related behaviour. By underlining the central role of users as key actors who can influence all the phases of the processes on which Knowledge and Technology Transfer are based (Seufert et al. 1999), the four points also provide a summary of the more recent approaches to K&T.

Starting from this contribution, the growing feeling is that there is a need to change the approach to Knowledge and Technology Transfer from a transactional approach to a relational approach, where the aim is to involve and exploit the knowledge of the interested actors (Grönroos 1997; Paun 2011; Campanella et al. 2013a, 2013b; Carayannis et al. 2014).

The contributions offered in the literature on the topic of knowledge and technology transfer can by synthesized into three different phases:
- **First phase**, based on ‘selling’ knowledge and technology to users outside the process of generating the knowledge and technology and who even, sometimes, are not able to understand the value of the resources purchased, or manage them appropriately.
- **Second phase**, in which the processes of generation and transfer of knowledge and technology open up to potential users, in order to gain a greater understanding of their needs.
- **Third phase**, where producers and users are part of the same process and their collaboration and integration is essential in achieving the joint aim of producing and transferring knowledge and technology in support of management activity.
Methodology approach and pathway of research

In the current socio-economic environment - in which models and behaviour are driven by globalization, competitiveness and scarcity of resources - knowledge can play a significant role, but it can no longer be held within individual productive units or be managed in a hierarchical manner. Knowledge must, necessarily, be shared at all levels of business systems and outside these systems.

The transfer of knowledge between two specific entities can take place through several ways. These include selling knowledge, opening and integrating knowledge between companies and sharing knowledge.

The paper consists in a qualitative analysis (Maylor and Blackmon 2005; Myers 2013) of the relationship between Knowledge and Technology Transfer, in which it is emphasized that the development of approaches based on collaboration and integration can enable companies to share knowledge and start a seeding process in a virtuous circle of knowledge co-creation.

The specific aim in the paper is to analyse the shift from a transactional to a relational approach, offering a possible conceptual framework that can help researchers and professionals in the understanding and governance of a changing scenario (Barile et al. 2015a).

As result, in our research, we have paid particular attention to the following aspects:

- the importance of knowledge in the emerging socio-economic environment;
- the contribution of technology transfer as a means to combine the competence and capabilities of different actors within the same processes, with the purpose of increasing the opportunities for sharing knowledge/technology;
- the Quadruple Helix model as a framework for stimulating changes to the rules of knowledge co-creation;
- the need for management models that can help in the process of moving from a transactional to a relational approach.

Data acquisition was conducted through a single-method approach using secondary research sources. These sources include, but are not limited to:
- three databases, specifically EBSCO, Google Scholar and Scopus;
- existing literature on Knowledge and Technology Transfer;
- articles and evidence from the companies that have applied the Quadruple Helix model.

The findings of the study are presented and discussed in the following sections.

BUILD UPON THE QUADRUPLE / QUINTUPLE INNOVATION HELIX FRAMEWORKS TO DEFINE A NEW PERSPECTIVE IN THE STUDY OF TECHNOLOGY TRANSFER

The approach to the management, creation and dissemination of knowledge was -for a long time- influenced by a transactional approach in which ‘resource knowledge’ was produced by a specific group of actors or company area and “sold” to the market as way of solving an existing problem (Massingham 2014).

This approach was based on an ability to ‘read’ market progress and -applying a problem-solving logic- propose customized solutions in situations where traditional instruments could not help.

Over time, this logic identified, in the support offered by technology, a tool that could improve the traditional instruments used to study the market, in terms of their rapidity of application and affordability. This was a great opportunity to optimize traditional management instruments and define new business models.

Unfortunately, the expanding market competitiveness, the effects of globalization and the pressure of resource scarcity have together compromised the balance between approach to knowledge management, the contribution of technology and its application to business. More and more often, market dynamics follow a non-linear logic whereby there is the need to improve models and instruments -with the involvement of the various actors- so that they all play an active role in the production of new knowledge and its contextual use in addressing the challenges imposed by market change (Barile 2013; Carayanniset al., 2014; 2016a).

“Knowledge then is not transferred but must be continuously created and recreated through networking as individuals come to share a common understanding or a common frame of reference” (Swan et al. 1999: 263).
There is, to all effects, a shift from a *linear approach* - in which knowledge is generated, layered (“the stratification of knowledge”), transformed into tangible objects (such as technology innovation) and then transferred to the user- to a *cyclic approach*, in which generation of knowledge requires the involvement of the user and, consequently, the contextual elaboration and transfer of technology to back the understanding and management of market dynamics (Carayannis and Grigoroudis, 2014, 2016a; Carayannis et al., 2015b).

This shift is the beginning of a new era in management studies.

![Diagram](image.png)

*Figure 2. From linear approach to cyclic approach in the knowledge and technology transfer process (Source: Our elaboration)*

The new challenge for researchers and professionals is to understand how Knowledge and Technology Transfer is linked and what implications are concerning the new emerging balance.
This challenge must be met with a new approach combining competences, knowledge and capabilities. In addition, researchers are faced with two significant questions: *Who are the actors involved in the K&Tt process?* and *How can the relationships among these actors be understood and managed?* Carayannis and Campbell (2012) offer a contribution along these lines. Building upon the “Triple Helix” model developed by Etzkowitz and Leydesdorff (2000), they include a “fourth helix” alongside the helices of University, Industry and Government. The fourth helix is the “media-based and culture-based public” as well as the “civil society” (Carayannis and Campbell 2012: 13).

The potential contribution of this model lies in the fact that it highlights the opportunities generated by the synergic collaboration among the interested actors. In this perspective, Etzkowitz and Zhou have analyzed the implications of introducing a fourth helix to the original model, emphasizing that “introduction of a fourth helix might cause a triadic model to lose its creative dynamic. Nevertheless, an expanded model is required to incorporate a critical dimension” (2006: 78).

![Figure 3. A representation of the Quadruple Helix model (Source: Adaptation from Carayannis and Campbell, 2012: 14)](image)

In our perspective, the model proposed in Figure 3 shows the actors involved in the knowledge and technology transfer process, underlining, at the same time, the importance of culture as an element with significant influence over the relationships between the involved actors (Carayannis and Campbell, 2009; Barile and Saviano 2014).

According to our view, the concept at the basis of this model is that value co-creation, perceived as “joint problem solving, which involves supplier and customer resources integrated in a collaborative interaction process. Suppliers apply their specialized professional skills, methods and judgment, while
customers contribute resources such as knowledge, in order to create optimal value-in-use” (Aarikka-Stenroos and Jaakkola 2012: 17).

This is a paradigmatic change from the traditional approach to managing business activities since it combines the traditional competitive oriented approach with a collaborative perspective, involving all the interested actors and exploiting their potential, with the function of achieving aims that are not possible through an individual approach (Saviano and Caputo 2013; Iandolo et al. 2013).

However, looking at the model presented in Figure 3 to illustrate technology transfer, it may seem that, to make the transfer easy, it is simply request to link the various actors together and involving them in the same structure. In this perspective, it is hard to explain why some processes fail even though they consist in linking different actors within the same structure. In our view, the reason for this can be explained by including other elements in the Quadruple Helix model (Tab. 1).

Table 1. Examples of failures in K&T the process and the relative explanation under the proposed perspective

From this point of view, the real challenge in terms of managing the co-creation process in the context of knowledge and technology transfer is to find a means of improving the alignment in culture and values between the actors. Only in this way is it possible to imagine an easy approach to co-creating knowledge and, consequently, a greater probability for improving and optimizing technology transfer among the actors (Carayannis and Alexander, 1999; Alvesson 2000; Barile et al. 2014; Polese et al. 2016; Dominici et al. 2017).

The focus should then shift from the technical instruments that support technology transfer to the social aspects that impact on the process of alignment. The reason for this is to back a change in perspective, so that technology and knowledge are not simply resources to sell according to a transactional approach - in a win-lose logic where one actor can evolve only by hurting the others - but it is need to shift toward a relational approach where knowledge and technology are co-created in an open socio-technical system where production and transfer are simultaneous (Golinelli et al. 2012; Calabrese et al. 2017; Tronvoll et al. 2017).
Due to the developments taking place, there is the need for a greater investigation into the role played by the ‘fourth helix’ in the process of co-creation. This process can help us to understand the importance of alignment among the actors in terms of “degree to which an organization’s design, strategy, and culture are cooperating to achieve the same desired goals. It is a measurement of the agreement or relative distance between several ideal and real elements of organizational life” (Sender 1997: 23).

In this perspective, K&Tt processes should be analysed not so much in terms of “managed process of conveying a technology from one party to its adoption by another party” (Souder et al. 1990: 5), but as “intentional, goal-oriented interaction between two or more social entities, during which the pool of technological knowledge remains stable or increases through the transfer of one or more components of technology” (Autio and Laamanen 1995: 647).

The implications of the proposed change are important if analysed with reference to the conceptual framework proposed in the Quadruple Helix model because “Media-based and culture-based public” and “civil society” cannot simply be considered as another dimension in the same process, but as the key indicators for identifying possible pathways of alignment among the three other helices (Carayannis et al., 2017b; in press a).

Figure 4. A re-reading of Quadruple Helix model (Source: Our elaboration from Carayannis and Campbell, 2012: 14)
In other words, media-based and culture-based public, and civil society - taken together, as one- can be seen as the ‘element’ required to connect the actors in the Triple Helix Model, directing their actions and strategies toward common aims. The real advancement in the management of technology transfer in the knowledge era is to recognize the importance of this element in terms of identifying how and if it is possible to replicate the cases of success involving unplanned cultural and social alignment (Table 2).

Table 2. Examples of success in the K&TI process and the relative explanation under the proposed perspective

Therefore, alignment towards the same entity of media-based and culture-based public and civil society is a preliminary condition for every process of Knowledge and Technology Transfer, because transfer of knowledge is only possible between actors who share the same system of meaning (Trompenaars 1995). Consequently, only when all the actors are ‘culturally aligned’ is it possible to consider improving the transfer and, therefore, overcome the traditional logic of competitiveness.

From this perspective, there is the need to shift from models in which technology transfers are seen as cases of linear information transmission to models in which they are seen as processes of interrelating and sense-making (Weick 1990).

THE NEED FOR A COMMON AND SHARED MANAGEMENT MODEL
The need for a management model common to all the different actors involved in the Knowledge and Technology Transfer process is a challenge insomuch as it requires a blend of sometimes very different models, information, aims and perspectives (Edvardsson et al. 2012).

It is possible, in this respect, to follow a pathway set out in a study on Information Asymmetry, which involves the analysis of the relationship whereby the “inability to assess quality represents exposure to two different forms of supplier opportunism, namely, (1) misrepresentation of an outlet’s true characteristics and (2) actual quality cheating” (Mishra et al. 1998: 278).

The general part of this study proposes a system of rules, indications, awards and penalties to discourage opportunistic behaviour and to direct individual behaviour towards a common pathway defined through a top down approach (Healy and Palepu 2001; Bhargava and Chen 2012).

While recognizing the contribution of these studies towards solving other problems connected to the transactional approach, we think that they could be used more effectively to understand problems relating to technology transfer if they are combined with the recent advancements in research on Service Systems and, specifically, with studies on the value co-creation (Edvardsson et al. 2011; Grönroos 2011; Wetter-Edman et al. 2014).

In our perspective, a combination of the two approaches can offer interesting stimuli to the debate on Knowledge and Technology Transfer because, by starting from the differences among the actors involved, it is possible to show that it is impossible to shape the way they behave exclusively through a systems of rules.

By overcoming this information asymmetry, it is first necessary to create an improved and more complex system based on the cognitive alignment between the actors (Del Giudice et al. 2013b; Caputo 2016; Caputo et al. 2016a). A new approach for defining strategies, partnership and alliance is also required to overcome the traditional transactional approach which is no longer suitable for addressing the challenges imposed by the current context (Webster 1992; Gummesson 2002; Soto-Acosta et al. 2010).

The success of a programme for Knowledge and Technology Transfer should be evaluated in terms of a possible alignment between the actors. The reason for this is that only by developing models that can handle the problem of cognitive distance - “defined broadly as the degree of diversity in research methodologies and in the use and interpretation of knowledge, can influence the process of technology transfer” (Muscio and Pozzalli 2013: 489) - is possible to conceive a socio-technical environment in which knowledge and technology are generated in function of the specific contextual evolution and can be easily transferred and, therefore, be understood more readily and managed more effectively (Meroño-Cerdan et al. 2005, Soto-Acosta et al. 2015).
By moving from a top-down alignment imposed from above to a bottom-up cognitive alignment, it becomes possible to avoid any type of opportunistic behaviour and, at the same time, direct all energy, resources and technology along the same pathway, with positive effect on the value of the achieved result (Palacios-Marqués et al. 2015; Caputo et al. 2016b).

Obviously, the proposed change is not simple to implement because it involves altering the traditional and well-consolidated approach to business and to processes of knowledge and technology. It requires investment in developing the social dimension of the transfer process, because the problem of cognitive distance can be overcome only through continuous interaction. In addition, the approach to human resources must be re-thought together with moving from a logic of ‘resource to use’ to a vision of ‘value to improve’.

To enact the proposed change, there is the need to, for example:
- conceive an educational system which does not only teach the principles of competitiveness,
- develop a social system capable of promoting common values and styles of life,
- promote interaction and relationships not only within the boundaries of specific projects and/or directed at specific aims,
- improve the expertise of policy makers, managers and organizations in terms of finding and promoting pathways for cognitive alignment within organizations and with external actors.

The investment is considerable and it requires substantial effort on the part of policy makers, managers and organizations but, in our view, the opportunities are greater than the costs.

**FINAL REMARKS, PRACTICAL IMPLICATIONS AND POSSIBLE FUTURE LINES OF RESEARCH**

The possible implications of shifting from the traditional approach to Knowledge and Technology Transfer to a new vision based on relational logic are significant for both researchers and professionals.

A change in perspective in the models of management and governance represents, in the proposed perspective, a challenge that cannot be ignored. University, Industry, Government and civil society are called to work together to face the challenges of this new era (Carayannis and Rakhmatullin 2014), where knowledge is the key resource for competitive advantage in every type of organization (Porter and Miller 1985). Its effects can emerge and it can become tangible only if the actors are able to find a common point of contact (Coleman 1988).
From this point of view, media-based and culture-based public, and civil society are the elements to be investigated in order to understand the conditions under which Knowledge and Technology Transfer can be easily promoted.

Many aspects should be considered from this point of view, such as the impact of ethical and cultural variables, the desire on the part of the players to act towards a common goal, institutional and governmental influence and so on.

The work proposed in this research is a first conceptual step, which can be used as the basis on which to build instruments and models for measuring the opportunities linked to the cultural and cognitive alignment of actors during the processes of technology transfer. In this light, a new fascinating challenge emerges for both researchers and professionals. This is the need to develop a stronger cross-disciplinary approach based on contamination among the different research streams that have recently been examining the role of culture, information and cognitive aspects within the processes of knowledge and technology transfer. A possible aim to pursue is to define the indicators, tools and benchmarks that can help managers to identify the areas in which interaction and transfer are more easily achieved because they are underpinned by the implicit alignment of the actors.

The paper represents a first possible step in a pathway requiring cross-disciplinary contributions. It is a call to the many different actors, urging them to work together towards defining a more efficient, effective and sustainable model in which government, industry, academia and civil participants can work together with the aim to build a sustainable future (Barile et al. 2017; Carayannis et al., 2017a; Saviano et al. 2017a, 2017b).

Perhaps a new path is opening before our eyes and maybe it is time to follow it together.

RECENT ISSUES ON CORPORATE GOVERNANCE: THE EFFECTS OF THE “PRECAUTIONARY Recapitalisation”

Cardi, Mavie
Economia Aziendale Internazionale, Link Campus University, Rome, Italy

ABSTRACT
The paper concerns recent issues on corporate governance, in terms of impact on the stability and safety of financial system as a whole and, in particular, in the context of “precautionary” recapitalisation.

The research moves from some recent trends of the international discipline, Basel III above all, and Directive No. 2013/36/EU (so called CRD IV), as well as the Draft Guidelines on internal governance, recently published by the European Banking Authority (EBA), that gave new input to banking corporate governance regulation.

The analysis summarizes the objectives of the current regulation and the reasons of the special nature of corporate governance of banks due to the public interest and institutional function performed by financial intermediaries in the economic process, compared to non financial either industrial companies.

A particular case study concerns - in this context - the measures recently introduced by Italian legislation, with regard to the so called precautionary banking recapitalisation and the effects of these measures on corporate governnace.

Keywords: Corporate Governance, Risk Management, Regulatory Framework, Basel III, CRD IV, Italian Precautionary Recapitalisation, Restructuring Plans.

INTRODUCTION
In the recent trends of international discipline, corporate governance has increasingly taken on a role of safeguarding the stability of financial systems.

The inadequacy of the previous regulatory framework in guaranteeing correct mechanisms of prevention of an excessive risk taking has demonstrated the critical importance of corporate governance for the proper functioning of the banking sector and the economy as a whole.

In the light of evidence revealed by the financial crisis, international regulation is going to be implemented orienting corporate governance mainly towards criteria of safeguarding banks’ stability.

This road to reform is still on-going.
In this context, the Italian financial sector has been recently involved in a renewed government intervention, due to the public precautionary recapitalisation introduced by the 2016-2017 Italian laws. These measures will produce implications on corporate governance too, affecting banks’ risk-taking decisions and management.

Indeed, the process of “banking recapitalisation” is assigned to State intervention tools, subject to the EU standards and in compliance with specific conditions related to capital and governance of the bank involved. In particular, this measure is allowed through capital injections only with regard to a capital shortfall under the adverse scenario of a stress test. This means that the bank must be solvent, being necessary that it fulfils the minimum capital requirements (i.e. Pillar 1 requirements).

Precautionary interventions are based on the European regulatory framework represented by the 2014/59/EU Directive (Bank Recovery and Resolution Directive - BRRD) being compliant with EU’s State aid regime.

Nevertheless, in this context all the overall post-crisis process of regulatory revision must be considered.

First of all, we refer to the Capital Requirements Regulation - CRR (575/2013) and Capital Requirements Directive - CRD IV (2013/36/EU), that transposed into European law the international framework (Basel III) developed by the Basel Committee on Banking Supervision (BCBS): an entire framework that is still in progress.

The objective of the CRD IV Directive in the field of corporate governance is to impose principles aimed at guaranteeing the effective supervision by the “management body” - namely by non-executive directors - and together the control by Competent Authorities on the adequacy of the internal governance arrangements.

Furthermore, the strengthening of the regulatory capital framework, both in terms of quality and quantity, indirectly contributes to contain the excessive risk appetite of the management.

In addition, the Guidelines on internal governance issued by EBA, recently subject to consultation process, further enrich the framework in this field. In fact, “the Draft Guidelines have been developed on the basis of Article 74 of Directive CRD IV, which mandates the EBA to further harmonise institutions’ governance arrangements, processes and mechanisms across the EU and Competent Authorities will be expected to implement the Guidelines by mid-2017” (EBA 2016).

Thus, a holistic framework is being developed, at a national and international level, centered on better managing risks and medium term performances.

In fact, the crucial role of general economic interest assigned to banks in the economy, by intermediating funds from savers and depositors to activities that help drive economic growth, underlies the reasons
of the specificity of corporate governance regulation (compared to the regulatory principles of governance of non financial firms).

There are, indeed, at least two key factors distinguishing the governance of banks from that of non financial firms: "the first is that banks have many more stakeholders than non financial firms. The second is that the business of banks is opaque and complex and can shift rather quickly" (Mehran et al., 2011).

Banks’ safety and soundness are key factors for financial stability. A weak corporate governance - if related to Global Systemically Important Banks (G-SIBs) - plays a negative role in the financial system as a whole, having impact on the banking sector and the general economy.

Capital on the one hand and governance on the other hand represent the fundamental safeguards in face of risks and their potential impact on economic balance.

Capital requirements and risk governance are in some way connected to each other by an institutional link for the achievement of the same objectives: safeguard of banks’ stability and of general economic interests.

The aim of this survey is to provide an overview of the main changes that have occurred in international regulation of corporate governance, with particular attention to functions and competences of the management body and, on the other hand, to the tasks of Competent Authorities. The complex regulatory framework imply that banks must pursue the best strategies to comply with it and to deal with the impacts on their business.

THE REGULATORY FRAMEWORK OF CORPORATE GOVERNANCE IN THE BANKING SECTOR

The need to strengthen the corporate governance of banks emerged more vigorously after the financial crisis, which highlighted the presence of weaknesses, especially regarding the specific issue of risk governance. Although, corporate governance in financial institutions was not the main cause of the financial crisis, however, in many instances, boards and senior management of financial firms failed to understand the characteristics of the new, highly complex financial products they were dealing with and were often unaware of the aggregate exposure of their companies, and consequently largely underestimated the risk they were running (de Larosiere Group, 2009).

Indeed, the strengthening of the governance approach was already previously a topic of interest of the international institutions, even though limited to setting out non-binding principles through the issuing of best practices, updated at various times (OECD, 1999; OECD, 2004; BCBS, 1999; BCBS, 2006).

As outlined before, in the years following the crisis, one of the primary objectives of the revision of European rules had been to enhance the way how banks govern themselves and how supervisors oversee this critical area. This was due to the acquired awareness (BCBS, 2015) of negative and
potentially systemic externalities of ineffective schemes of governance. In fact, “controlling excessive risk taking also requires regulation of corporate governance” (Schwarcz, 2017).

This resulted in the centrality of governance profiles not only in the framework of regulation but also of supervision.

At the regulation level, CRD IV Directive provides a first explicit and systematic placement of governance in the context of primary regulation.

The rules that the Directive dedicates to the themes of corporate governance and remunerations, grouped in a specific section (articles 88-95), are aimed at defining the governance arrangements ensuring an effective and prudent management, through reduction in excessive risk taking.

Two of the main key points of the CRD IV regulation are:

- the reinforcing of the collective oversight and risk governance responsibilities of the board;
- the objective to emphasise key components of risk governance such as risk culture, risk appetite and their relationship to a bank’s risk capacity.

Both the aspects, deeply connected to each other, are aimed at safeguarding conditions of stability and solidity in the financial system, through sound and prudent management of financial institutions, considering the role of general economic interest that they play and the resulting systemic risks.

Hence, banks’ activity should be oriented to the correct identification and assessment of risks which characterise it.

A sound corporate governance approach seems to be the prerequisite of an effective achievement of prudential requirements (particularly, stricter capital adequacy) and it has similar importance in terms of stability. In fact, according to Whereas no. 44 of CRD IV “Competent Authorities should be entrusted with ensuring that institutions have a good organisation and adequate own funds, having regard to the risks to which the institutions are or might be exposed”.

Moreover, banks need to look for new management strategies to increase their capitalization in a context of decreasing banking profits (Tutino et al., 2015).

As outlined above, to the “management body” is awarded a central role, with strong emphasis on the competences regarding risk management.

Financial institutions which are significant in terms of their size, internal organisation and the nature and complexity of their activities must set up internal committees (nomination committee, risk committee and remuneration committee), composed of members of the management body who do not have executive function.

This is properly due to the operational focus represented by risk management and thus by the necessity of committees supporting this specific activity. In particular, to the risks committee is assigned the
function of supporting the activities falling in the risk appetite area, while the control committee deals with risk accountability.

The development of the activity is therefore supported by procedures, processes and programmes in which the board plays the leading role.

In fact, the board (also according to its internal structure) deals with the risk appetite formulation (through the RAS – Risk Appetite Statement), related to the aggregate level and types of risk that a bank is willing to assume, decided in advance and within its risk capacity, to achieve its strategic objectives and business plan.

Furthermore, the board takes on a specific responsibility for the sphere of risk accountability, by constantly monitoring the management, with a specific focus on the adequacy of the risk management system. Also the adjustment interventions, in case of deviation from the prearranged objectives, fall into this context.

This close connection between the board and the management is confirmed by the arrangement of the RAF - Risk Appetite Framework. In this document its outlined the overall approach, including policies, processes, controls and systems, through which risk appetite is established, communicated and monitored; types and the levels of risks considered as compatible with the firm’s situation, are also explained. Therefore, RAF must be aligned with the bank’s strategy; the business units will tend to operate within the limits and along the direction outlined.

The implementation of the rules regarding corporate governance has developed parallel to the definition of the objectives to be achieved in terms of interests needing protection.

In this sense, the set of rules introduced by Basel III regarding the capital levels has a further indirect effect on risk management mainly orienting the activity towards medium-long term performance. This is because - other things being equal - the current regulation “by increasing the quantity and improving the quality of regulatory capital, contributes to align the goals of managers with those of shareholders, so reducing the excessive risk appetite of the management and, more generally, the typical agency problems that usually arise between banks’ managers and shareholders” (Vento and La Ganga, 2014).

THE EUROPEAN SUPERVISION OF CORPORATE GOVERNANCE IN THE BANKING SECTOR

The above mentioned regulatory innovations not only outline a new paradigm of corporate governance but also strengthen the forms of public control based on it.

Corporate governance profiles are object of a specific activity of supervision by the competent authorities, within the SREP process (Supervisory Review and Evaluation Process), in line with the crucial role they play within the regulatory framework.
The Guidelines published by EBA “for common procedures and methodologies for the supervisory review and evaluation process (SREP)” (EBA, 2015) confirm the importance attributed to the mechanisms of governance in the processes of supervision. In addition, the ECB has adopted three high-level priorities to guide its supervision throughout 2017. The aim of Single Supervisory Mechanism (SSM) is to ensure that directly supervised banks address key risks effectively: “to enable banks to address these key risks effectively, European banking supervision has streamlined its supervisory priorities. For 2017 three priority areas will guide banking supervision:

1. business models and profitability drivers;
2. credit risk, with a focus on NPLs and concentrations;
3. risk management” (ECB, 2017).

The institutional control is periodical and pervasive and envisage instruments of reaction if any possible weaknesses arise. As regards governance, SREP assessment is qualitative, and embraces different aspects. First, the assessment concerns the functioning and effectiveness of the board and the decision-making process, particularly on key issues such as strategy, risk awareness and management, transparency towards shareholders, availability of adequate information, and so on. Secondly, it concerns the banks’ risk appetite frameworks and the extent to which an appropriate risk culture is effectively ensured throughout the organisation, starting from the board and working down the hierarchical ladder. Third, it concerns the remuneration policies, also in the light of the EBA guidelines, looking specifically at the different components of remuneration and dividend distributions. Finally, it concerns the internal control functions, internal audit, as well as the risk management and compliance function (Angeloni, 2017).

Within the assessment process Supervisory authorities, in fact, formulate a judgment – expressed by a score (from 1 to 4) – on the adequacy of the mechanisms of the corporate governance and internal controls. The assessment influences the overall outcome of SREP and is aimed at assessing the effectiveness of governance arrangements, corporate culture and values, and the ability of members of the management body to perform their duties.

The CRD IV Directive also disciplines the corrective actions that Authorities shall take against possible weaknesses; among the main consequences, they could take decisions directly affecting the governance arrangements, in terms of strengthening the implemented arrangements, processes, mechanisms and strategies.

“By its nature, governance supervision is less subject to precise quantification and measurement, and relies more on subjective supervisory judgement. In relation to this, and more generally, we need to keep in mind that supervision is not an exact science, which can be conducted following a fully codified methodology. Whether it will become so in the future is a question for academics. Since for now it is not, it is essential that legislation and
standards do not try to limit, beyond a certain point, the room for supervisory discretion, lest making the whole supervisory process unworkable and ineffective. This point is particularly important in Europe now, while the legislators are engaged in the first major revision of our banking law since the launch of the banking union” (Angeloni, 2017).

The same Directive assumes (Whereas 54) the need of monitoring by the Competent Authorities of the adequacy of internal arrangements of governance. This is in order to avoid potential harmful effects linked to the presence of ineffective corporate governance arrangements which can lead to moral hazards by the management.

In the same circumstance the opportunity that “Those principles and standards should apply taking into account the nature, scale and complexity of institutions’ activities” is emphasized. In fact, the principle of proportionality has a crucial role in order to obtain an effective regulation as well as for financial supervision, which tend to significantly influence strategies and activities, with the aim of addressing the latter towards “traditional” less risky and more efficient business models.

Furthermore, the complexity, the increasing number and the frequent revisions of the rules imply high costs of compliance, thus creating competitive disadvantages for smaller banks. Regulatory requirements contained in CRR/CRD IV “should be proportional to the size and systemic risk footprint of banks of differing dimension, complexity and business model” (Masera, 2016).

**RECENT REGULATION ON PRECAUTIONARY RECAPITALISATION: THE ITALIAN CASE**

The recent development of Italian banking regulation has enlightened the interest and renewed the debate about the role of public intervention and its desirability in management of banking crisis.

The Decree n. 237/2016 (hereinafter the Decree) was adopted by the Italian Government on 23 December 2016, on the legal assumption of the need of urgent measures for the protection of savings in the banking sector. The Parliament approved it with law n. 15, 17 February 2017.

The new regulation introduces temporary measures (but with implications in the medium-long term) and involves the “State” in the credit process: something already seen in the past and now reproposed (although in a very different context).

The regulation, in fact, provides state intervention instruments, in order to safeguard stability in banking and financial sector.

The most significant measures aim to establish a legal framework for extraordinary public financial support to Italian banks under the conditions and within the limits set by Regulation (EU) No 806/2014 of the European Parliament and of the Council (SRM Regulation) and according to the Italian transposition of the Directive 2014/59/EU (Bank Recovery and Resolution Directive - BRRD). On the basis of
this Directive, in order to remedy a serious disturbance in the economy of a Member State and preserve financial stability, the provision of such public financial support must not be conferred to a bank that is failing or likely to fail.

To this end, a set of specific institutional tools has been developed. The Decree provides for three categories of extraordinary public intervention: a) a State guarantee of banks’ newly issued liabilities; b) a State guarantee of Emergency Liquidity Assistance (hereinafter ELA) operations conducted by Bank of Italy; c) a precautionary recapitalisation.

The arrangement of precautionary interventions opens the way to a new perspective for the Italian banking system not limited to the use of private capital but relying on the process of recapitalisation through public intervention.

The regulation appears to be compliant with the European regulatory framework concerning the conditions necessary for the grant of public financial aid. The reference is to the BRRD Directive and to the regulation establishing the Single Resolution Mechanism (SRM), which provides uniform rules and a uniform procedure for the resolution of credit institutions and investment firms in the framework of the SRM and the Single Resolution Fund.

The European frame defines, in fact, the necessary conditions enabling the grant of extraordinary public aid without involving resolution measures.

In accordance with the European Union’s state aid regime, the liquidity support measures should be precautionary and temporary and granted to banks with positive equity. Under the aforementioned Decree, the Ministry of Economy and Finance (MEF) is authorised until 31 December 2017 to intervene by subscribing to or purchasing shares issued by Italian banks. Such intervention may only be requested by a bank which, based on an adverse scenario under a national, EU or SSM-wide stress test exercise, needs to strengthen its capital.

THE IMPLICATIONS OF PRECAUTIONARY RECAPITALISATION ON CORPORATE GOVERNANCE

The procedure of request for State support implies a particular impact on corporate governance as well as on the setting out of corporate strategies. The bank is required to submit a capital raising plan to the Competent Authority, namely the ECB for significant credit institutions and the Bank of Italy for less significant institutions. The adequacy of the plan is assessed by the Competent Authority.

The banks benefiting from the government aid are thus required to present a restructuring plan submitted to the European Commission in order to be evaluated with regard to compliance with state aid rules. The plan must give reasonable evidence of the perspective profit earning capacity and bank’s
long term sustainability, without requiring additional public intervention. The precautionary recapitalisation is conditional on the Commission’s approval of the restructuring plan.

In the case of provision of collateralisation of the Bank of Italy’s liquidity operations, in order to face severe crises of liquidity, the respect of the restructuring plan is also due to the necessity to limit the overdraft on liquidity provided by the central Bank.

Bank risk mitigation through the massive use of government guarantees, using the instrumentation of guarantees for the liabilities and for ELA, may be measured and compared with patterns evaluating its impact on banks’ risk-taking incentives. In the current academic and political debate, “government guarantees are considered to be an effective tool to prevent the occurrence of panic crises and mitigate their negative effects. However, their provision can distort banks’ risk-taking incentives and induce them to take excessive risk. Because of this moral hazard problem, the provision of guarantees can lead to the perverse outcome of increasing the overall instability in the banking sector and magnify the costs for the government providing them” (Allen et al., 2017).

The request of precautionary recapitalisation clearly results in management and governance implications for the bank.

In particular, the bank is required to undertake some commitments on the basis of EU’s state aids rules and principles, specifically enacted for the banking sector, and aimed at avoiding the waste of resources.

Furthermore, the capital subscription can be subject to the MEF for the revocation or substitution of executive directors or director general of the involved banks or to the limitation of remunerations of the upper bodies.

As to the restructuring plan, to be submitted to the Ministry and to the Competent Authority, the request must be supported by information and documents related to: the amount of the subscribed shares for which the Ministry’s intervention is requested; a list of the bank’s instruments and loans which would be subject to burden-sharing measures, indicating their economic value, arranged by an independent expert; an estimate of the actual value of the bank’s assets and liabilities, for the purposes of assessing compliance with the “no-creditor-worse-off-than-in-insolvency” principle.

The restructuring plan – implying specific management objectives the claiming bank will have to achieve – is notified to the EU Commission. State precautionary intervention will be arranged only if the Commission delivers a positive outcome of the assessment with regard to the compatibility with the internal market.

As it is known, the first beneficiary under the above mentioned framework is intended to be Banca Monte dei Paschi di Siena (MPS), the third-largest Italian banking group, and the Decree contains specific provisions for the application of the measures to MPS.
The 2016 European stress tests conducted by the EBA showed a very severe impact for MPS in the “adverse” scenario, related to CET1 shortfall. The bank was still solvent, respecting the minimum capital requirements and had thus prepared a recapitalisation, by a private capital increase, with the original intention of avoiding the resort to public resources.

Having failed this initiative, the necessity of extraordinary and temporary state financial support became concrete. According to ECB, the mentioned shortfall translates into a capital requirement of EUR 8.8 billion. The ECB’s communication related to the capital shortfall opened the articulated process regulated by the Decree.

As effect, shareholders will be subject post money to the decrease of their stock proportionally to the capital increase.

The contents of the restructuring plan has a significant role in this context. It is aimed at guaranteeing the effectiveness of the business model in the long term, minimising competitive distortion and, consequently, strengthening its resilience against the hypothetical adverse scenario.

Therefore, the bank management will be required to take on non-negotiable commitments, also in terms of business strategies, subject to constant institutional monitoring.

In this context, the theme of corporate governance - specially with regard to the internal governance - is crucial with regard to the measures that the bank - requesting a precautionary recapitalisation - will have to adopt in order to achieve the envisaged enhancement, that is to say central elements of the planning process itself and of the bank’s perspectives.

POLITICAL CORPORATE SOCIAL RESPONSIBILITY IN THE TURKISH BUSINESS CONTEXT

Cemek, Elif

Institution of Social Sciences, Galatasaray University, Turkey, ecemek@gsu.edu.tr

ABSTRACT

This study aims to reveal the factors that cause the businessmen in Turkey to conduct political corporate social responsibility activities. The factors affecting corporations’ political corporate social responsibility practices depend both on the context of the corporations and their institutional environments. Therefore, understanding and assessing the corporations’ political and economic contexts and the national business system, in which they are embedded are of critical importance in order to extract these factors. With this aim, memoirs of businessmen are gathered and scrutinized using thematic analysis. Emerging themes resulting from the analysis include legitimacy, sustainable development, increasing competitiveness, weakness of the state, state repression, protection of commercial interests and religion. In other words, findings of this study show that the public policies of the governments in education, health and political areas, the religious tendencies of the businessmen, weaknesses of the governments, responding to the increasing market competition and protection of the commercial interests are the main drivers for Turkish businessmen to conduct political corporate social responsibility activities.

Keywords: Corporate Social Responsibility, Political Responsibility, Corporate Citizenship

INTRODUCTION AND PROBLEMATISATION

Malpractices of corporations and increasing public consciousness about business-society relationships have generated heated debates pertaining to the causes and origins of corporate social responsibility. This is linked to the political move prevailing across the world that states respond to globalisation pressures by pursuing neoliberal reforms and passing welfare and regulatory functions to the private sector (Bartley, 2003, p. 434; Maignan & Ralston, 2002, p. 510; Campbell, 2007, p. 955). We focus, in this paper, on the conceptual genealogy of the CSR in Turkey by highlighting the significance of the socio-economic and political developments in the global context. Conceptual genealogy, as an epistemological tool, implies the exploration of historical sites of meaning and the reconstruction of institutional settings, power structures, and meaning systems in which concepts originate and evolve.
through time (Djelic and Bothello, 2013). Genealogical perspectives are closely associated with the reflexive turn in social science in general and organisation and management studies in particular (Woolgar, 1988). As argued by Somers (1995), reflexivity is historical in the sense that it entails challenging historicity of preconceptions, assumptions, theoretical and conceptual underpinnings governing the conduct of research.

Departing from the premise of historicity as the key to achieve reflexivity, we stress that CSR discourse and practice in Turkey have developed in connection with the Americanisation process that has been influential historically in diffusing business and management approaches, models and organisational structures across the globe (see Djelic and Amdam, 2007 for the Americanisation process; see Yamak, 2007 for its impact on the development of CSR in Turkey). This approach entails explaining the underlying institutions and institutionalising processes shaping the evolution of the CSR understandings and practices. As pointed out by Kipping and Usdiken (2014), a crucial question for organisation and management scholars engaging with history is how it relates to theory. Our reflexive approach and analysis is underpinned by the institutional theory. Contextual embeddedness of economic, social and political structures, actors, organisations and actions is a core idea of the institutional theory. Institutional determinants of CSR are crucial as the corporations are embedded in a wider set of political and socio-economic institutions that affect their actions (Campbell, 2007).

Institutional theory allows for explaining institutional emergence, resistance as well as change through a number of orienting tools such as ‘institutional logics’, ‘institutional work’ and ‘institutional entrepreneurship’. The notion of institutional work implies processes of institutionalisation and deinstitutionalisation as combination and aggregation of situated practices that are closely intertwined with ‘existing social and technological structures in unintended and unexpected ways’ (Lawrence and Suddaby, 2006, p. 219). This is compatible with the reflexive approach we take in this study that focuses on the historically situated formation of the CSR discourse and practices in Turkey.

We have structured the remainder of the paper as follows. First, we discuss the macro-field of socio-economic and political institutions that have influenced business and society relationships globally and highlight the research problem emerging out of this debate. Second, we outline key dimensions of the institutional theory pertaining to our study. Third, we present the methods that we applied in analysing the extant studies on CSR in Turkey. Fourth, we move onto discussion of our key findings structured by the main dimensions of our theoretical framework. We conclude with a summary of our key findings and contributions.
MACRO-INSTITUTIONAL FOUNDATIONS OF CSR: AMERICANISATION

Historical and sociological analysis of CSR calls for understanding the emergence of corporations, origins of, and changes, in corporate governance and related managerial developments. For the movements of corporate governance and corporate social responsibility, one of the major forces has been the process of Americanisation linked to managerial revolution in the United States. National institutional systems are highly structuring and powerful systems (Djelic and Quack, 2007) that generate and perpetuate a variety of institutional logics. Americanisation should be viewed as a process involving different phases and evolving institutional logics.

In delineating this, Djelic and Amdam (2007), have put forward two approaches. The first is an evolutionary or ‘modernisation’ argument. According to this argument, due to common technological, public and market pressures, transformations go in the same direction and generate partial convergence in time. This argument is associated with the belief in existence of ‘best practices’ in the domains of economics and business studies. The second perspective to explain partial convergence is diffusionist argument. This argument highlights the notion that ideas, practices, discourses and structures come to resemble each other because of the emergence and growing density of channels enabling and facilitating processes of transfer, diffusion, imitation and normative alignment (Powell and DiMaggio, 1983; Scott, 2008; Suddaby, 2010). From this perspective, economic, political and social logics tend to be closely intertwined. This entails an understanding of the context, processes and shortcomings of the unique form of American capitalism and this has manifested itself in a trend in a number of disciplines such as economic sociology, history, management and organisation studies (Djelic, 1998).

CSR needs to be understood within a historical context where the objectives and the process leading to these objectives are openly debated. In a parallel vein, Djelic and Amdam (2007) have argued that Americanisation should not be conceived as with reference to closed historical periods; instead it is an open-ended process. Among the key institutional actors and agentic forces was the technical assistance programme that came together with the Marshall Plan as a part of an overall aid programme, which aimed to restructure European economies and different countries that are subject to communist threat from 1950s to 1970s (Usdiken, 2010). In that sense, the influence of American capitalism was not reduced to economy; it also shaped business education in many countries (Djelic and Amdam, 2007). United States acted as a supplier of models in business education (Locke, 1989; Usdiken, 2010). Business education itself was revised in a way to support free market capitalism in its competition with Soviet Communism. With a specific focus on business education or management consulting, young expert teams from countries all over the world were trained in American institutions and on their return they became professors in the newly founded business schools or
business studies departments in universities in their home countries. With the increasing importance of private actors in the late 1950s and 1960s, private American foundations such as the Ford Foundation sponsored the business training in Europe. In collaboration with the European Productivity Agency (EPA), they played an instrumental role in setting up the INSEAD, which offered the first MBA programme in Europe.

The idea of Americanisation as a process enables us to assert that the United States has been a key spreader of institutional, normative and organisational models in particular since 1945 (Djelic and Amdam, 2007; Kipping and Usdiken, 2009). In parallel with the developments in Europe, within the framework of the aid programmes, American professors served different positions in Turkish universities. Financial support was provided for the development of libraries; and finally, Turkish faculty members (or those aiming to become such) were offered graduate training or short development opportunities abroad (Usdiken & Cetin, 2001). A proliferation of the institutions to learn American way of management took place during the same period. The establishment of the Turkish and Middle Eastern Institute of Public Administration (affiliated to Ankara University) in 1953 was followed by the foundation of the Inter-ministerial Productivity Centre (later National Productivity Centre) and the Institute of Business Economics (affiliated to Istanbul University) in 1954 (Usdiken & Cetin, 2001). While the latter benefited from the financial support of Ford Foundation and consultancy of Harvard Business School, Turkish and Middle Eastern Institute of Public Administration received technical aid of United Nations (Usdiken & Cetin, 2001). Two more institutions of higher education were established in the second half of 1950s: Middle East Technical University (1957) and School of Business Administration and Economics within Robert College (1958). They were visibly designed according to the American model where the instruction was in English and faculty members were “visiting American professors and American-educated adjunct lecturers” (Usdiken & Cetin, 2001:107).

In the following years the collaboration between American institutions and Turkish higher educations further increased. Similar developments were also observed outside the domain of educational institutions. For example Turkish Management Association which received funding from AID and Ford Foundation was established in 1962 with the aim of providing a whole range of extension programmes and consulting services to small and medium sized enterprises” (Usdiken & Cetin, 2001:107).

In translating these developments to the business-society relationships, Spector (2008) argues that the origins of the current social responsibility movement can be traced down to the early years of the cold war. As with his predecessor, Dean David of Harvard Business School was among the first promoters of extended notions of CSR. He launched a call to businessmen in 1946 to use CSR in order to align business interests with the protection of capitalism against communism. As a member of the post war
new elite, David had significant positions in federal commissions, corporate boards and board of trustees of Ford Foundation, which had an important impact on business school curriculum through its grants.

As noted by Campbell (2007), cognitive frames or worldviews of corporate managers determine how they run their firms; and they often learn these mental constructs and develop their cognitive capacity through the messages that are conveyed to them at business schools and through the professional publications that they are exposed to. Hence, it is salient to uncover the institutional determinants and logics of business school curriculum development historically and geographically in order to shed light on formation of CSR cognitions and understandings.

THEORETICAL UNDERPINNINGS: INSTITUTIONAL THEORY

A core dimension of the institutional theory has been to transcend disciplinary boundaries in addressing key questions such as how embeddedness matters, how institutions constrain and structure action, create regularities, stability as well as change and destability, and how they limit and at the same time open up the range of options and opportunities (see Djelic, 2010). The old institutionalism focused specifically on the key mechanisms generating change and adaptation in the interplay between economic actors and broader environments (DiMaggio and Powell, 1991).

The central focus of the neo-institutional thought was on the institutional forces such as rule-like frameworks, rational myths and legitimised and internalised knowledge, which shaped formal organisational structures (Scott, 2008). Meyer and Rowan (1977) defined institutions as broad abstractions, wider cultural and symbolic patterns, rationalised prescriptions that diffuse in the organisational world. Institutionalisation process, in Selznick’s (1957) approach, has become associated with ‘infusing with values’ (ibid, p. 16). This strand of work was fundamentally concerned with social stability, drawing attention to ‘a particular set of social reproductive processes (Jepperson, 1991, p. 144).

The essence of these processes was captured by DiMaggio and Powell (1983) in their foundational work offering a distinction between coercive, normative and mimetic processes of social reproduction. Elaborating on their framework, Scott (1995, 2005, 2008) put forward a theory of institutional order by differentiating three ingredients: regulative, normative and cultural-cognitive elements. Despite this early scholarly attention to micro-level socio-cognitive aspects of institutions, by institutional theorists, organisation studies research of the last two decades has focused primarily on organisation and field-level unit of analysis (Bitektine & Haack, 2015; Powell & Colyvas, 2008; Schneiberg &
Clemens, 2006). These macro-level approaches are beneficial in understanding particular significance of wider socio-economic and political settings i.e. states and national boundaries for the structuration, stabilisation and reproduction of those institutional frames (see Whitley 1999; Djelic, 2010). In this historical neo-institutional perspective, national institutional settings are historical constructs generating deep-rooted systemic patterns of action (Djelic, 2010). This is in line with the trends observed in the institutional theory in the late 1990s whereby the emphasis was diverted to demonstrate how political and institutional forces set the framework for economic action (Powell, 1991, p. 183). This implies a more dynamic approach paying attention to institutional change processes.

A critique of neo-institutionalism was made by DiMaggio (1988) himself, who argued that early understandings and application lacked importance of agency. Agentic and creative ways in which organisations respond to their institutional environments were highlighted in ‘institutional entrepreneurship’ strand of institutional theory, which attempted to uncover organisational efforts to transform institutional fields and alter institutional logics (see Oliver, 1991; Dacin et al. 2002; Suddaby, 2010). The core concept of institutional theory, then, becomes the ‘tendency for social structures and processes to acquire meaning and stability in their own right rather than as instrumental tools for the achievement of specialised ends’ (Lincoln, 1995, p. 1147). As noted by Suddaby (2010, p. 15), organisations often act in ways that defy economic logic or norms of rational behaviour and institutional theory offers a paradigm to account for such organisational responses and logics.

Institutional logics (see Thornton et al., 2012) has become the key meso-level construct in bridging macro-field and micro-individual levels of analysis in institutional theory. Institutional logics are ‘axial systems of meaning’ or ‘ways of ordering time and space’ (Suddaby, 2010, p. 16), building on the cognitive view of institutions taken by neo-institutional theory. As cultural structures that bring order to domains of practice in explaining structure and action (Rao, Monin, & Durand, 2003; Thornton & Ocasio, 2008; Ocasio, Loewenstein, & Nigam, 2015), institutional logics concept allows for illuminating how such logics are formed and influenced at the individual level of analysis. Taking a step further towards illuminating the interface of meso and micro dimensions in organisational research, Ocasio et al. (2015) offer a framework whereby they explain the communication processes shaping structures and processes reproducing and changing institutional logics. According to this framework, defining properties of institutional logics are category conventions, practices and vocabulary dimensions. The core insight of the framework is that collections of category conventions about practices can converge to yield meaningful and durable higher-order principles of institutional logics (ibid, p. 31). This convergence is achieved through four kinds of interrelated communicative functions, namely co-ordinating, sensegiving, translating and theorising. In combination, these
functions form the practices that embody institutional logics as social facts. Cognition is integrated in this approach in a way that aspects of social process that are taken for granted have meanings and this entails a concurrent cognitive process through which these communicative events come to be meaningful to actors in a social collective (ibid).

We extend this framework of institutional logics departing from the premise that a multi-level analytical approach is imperative in developing a conceptual genealogy of CSR. A fuller understanding of the interpretive capacity of organizations as meso-level constructs, and, therefore, that of varying institutional responses to field-level changes at the macro is crucial for the CSR domain. This generates a better appreciation of how contradictions in societal logics influence the diffusion of particular practices with a broader view of stakeholder needs and expectations on organisations. Socially responsible corporate behaviour tends to be more likely to occur if firms engage with institutionalised dialogue with stakeholders including unions, employees, and investors (Campbell, 2007). One implication is the political nature of the organisations as institutions that are the outcome of such engagements and contestation (Meyer and Hollerer, 2014).

**Figure 1. Reproduction of institutional logics framework**

![Diagram of institutional logics framework]

Source: Developed from Ocasio et al. (2015) and Djelic and Bothello (2013; components numbered 1, 2, 3, 4)

In the context of CSR in Turkey, we have observed the co-existence of multiple institutional logics, even competing ones. Transnational influences have been instrumental in conjunction with traditionalism, which has permeated across institutional settings without formalisation. This parallels with the framework offered by Djelic and Bothello (2013), who have differentiated between the paths
of construction, diffusion, moral contestation and eventual institutionalisation. We combine their framework with that of Ocasio et al’s (2015) model on production and reproduction of institutional logics in order to arrive at an analytical framework for deconstructing CSR conceptions and logics on a temporal and spatial basis. The following Figure 1 demonstrates this framework:

Diffusion is an important concept for the purpose of this research. Stratified character of knowledge diffusion regarding CSR can be understood by paying enough attention to the complex and dialectical relationship between social (Macro-meso levels) and individual stocks of knowledge and by not losing the sight of related symbolic and structural power dimensions (see Meyer, 2008). These power dimensions are taken up by Levy and Egan (2003), who argue that agents are often positioned at the cross-currents of plural and resistant ideologies that are nurtured by the contradictions of social and economic systems embedded in the political and cultural contexts. How this context influences the interactions and opens up a space for a heterogeneous understanding of CSR is our concern in the current study. By questioning accepted knowledge about diffusion of CSR knowledge and its institutional development, this research is of value as it generates new knowledge that locates the historical evolution of the concept in the context of transnational, national, political, cultural and ideological changes.

**METHOD**

Two sources of database were used for this study. First, the database of the National Library in Turkey was searched for any publication on CSR. Second, assuming that there may be some deficiencies in the former, 11 major management journals have been screened for CSR articles since their establishment up to 2015. These academic journals are:

- Amme İdaresi Dergisi (Public Administration Review),
- Ankara Üniversitesi Siyasal Bilgiler Fakültesi Dergisi (Ankara University Political Science Faculty Journal),
- Boğaziçi Journal,
- Eskişehir Anadolu Üniversitesi İktisadi ve İdari Bilimler Fakültesi Dergisi (Eskişehir Anadolu University Economics and Administrative Sciences Faculty Journal),
- Eskişehir İktisadi ve Ticari İlimler Akademisi Dergisi (Eskişehir Economics and Commercial Sciences Academy Journal),
- İstanbul Üniversitesi İktisat Fakültesi Mecmuası (Istanbul University Economics Faculty Review),

---

İstanbul Üniversitesi İşletme Fakültesi Dergisi (Istanbul University Business Administration Faculty Journal),
İstanbul Üniversitesi İşletme Fakültesi İktisadi Enstitüsü Yönetim Dergisi (Istanbul University Business Administration Faculty, Institute of Business Economics. Management Journal),
Orta Doğu Teknik Üniversitesi Gelişme Dergisi (Middle East Technical University Studies in Development Journal),
Sevk ve İdare Dergisi (Management Journal),
Yönetim Araştırmaları Dergisi (Journal of Management Research)

Two journals (Eskişehir İktisadi ve Ticari İlimler Akademisi Dergisi, Sevk ve İdare Dergisi) ceased by 2015. These journals are covered during the whole period of their existence. Two criteria were taken into consideration in the selection of the journals: In order to be able to detect early work on CSR in Turkey we selected the oldest journals on business and economics. Furthermore, we also paid attention to have a representative sample of the major publication outlets on management.

FINDINGS

In Turkey, first publications on administration and operation of business firms appeared in 1935 with strong German influence (Usdiken & Cetin, 2001). In late 30’s, there are some initial thoughts in some Turkish management books on how the ideal relationship should be between the workers and the managers (Usdiken, Türkiye’de İş Yapmanın ve İşletmenin Akademikleştirilmesi 1930-1950, 2003). However, they tend to bear significant paternalist tone and do not integrate any responsibility discourse. The first study on CSR was published in 1967 by Atilla Gönenli in the Management Journal. The title of the article was “Is the manager’s sole duty profit making? (Gönenli, 1967). Management Journal was a publication of Turkish Management Association (Sevk ve İdare Derneği) which was established in 1962 by Mobil Oil top executive Robert Kerwin and Turkish businessmen and managers. Robert Kerwin became also American Cultural Attaché and assumed consultant position at Ford Foundation (Sevk ve İdare Dergisi, 1971). Turkish Management Association was also offered funds of Agency for International Development (AID) and Ford Foundation (Usdiken, Transferring American Models for Education in Business and Public Administration to Turkey 1950-1970, 2011). The author of the article, Atilla Gönenli, had his MBA in 1961 from Indiana University in United States.

This article was followed by several others (Tosun, 1971a; 1971b: 1971c; 1971d; 1971e) in 1971 in practitioner journals. Interestingly, except for one, which was anonymous, all of them were written by
Tosun. These studies focused primarily on the responsibilities of the businessmen. Therefore, all of the initial writings on this subject were published in practitioner journals by academics. Tosun wrote on CSR also in academic journals in the early 1970s. He published the first academic article (Tosun, 1972) entitled “Modern tendencies and responsibilities of business life” in the first issue of the Istanbul University Business Administration Faculty Journal. Tosun was the director of the Institute of Business Economics and professor at the Business Administration Faculty of Istanbul University. He had a major role in the diffusion of American type CSR in Turkey. Therefore, he pioneered in importing this concept and published 6 articles in the Management Journal of Business Economics Institute which was established in 1957 in collaboration with Ford Foundation and Harvard Business School. Both Turkish Management Association and Business Economic Institute acted as a bridge in the diffusion of American business ideas and practices in Turkey. Both institutions acted as intermediaries to transform business education and business life and to make them similar to American model. The institutions with whom they collaborated like Harvard Business School had initiatives about protecting the regime from the influence of Soviet communism and this acted as another force behind their presence.

Turkish Management Association also organized a seminar in 1971 and published a special issue on social responsibility in 1973. The special issue on the same subject appeared in 1979 in the Institute of Business Economics’ Management Journal.

During 1960s and 1970s more than 70% of the articles on CSR were published in the journals of these two institutions. This also shows that the diffusion of the ideas was not fast since only 30 % of the studies appeared in different outlets in more than a decade after the introduction of the American CSR concept. In fact the publications covered environmental pollution and business interaction, social costs and social responsibilities which were not in the agenda of the business and which lacked legal infrastructure.

In the eighties the number and the diversity of studies on social responsibility significantly decreased. It may be misleading to explain this fall by the political transformation due to military coup and the adoption of neo liberal economic policies in Turkey. A similar trend is also observed in the US where changes in tax policies and poor economic conditions led to the loosening of the regulations about CSR (Acquier & Aggeri, 2008; Frederick, 1983). Therefore, the decrease may be an outcome of both internal conditions and external trends. Only about 17.8 % of the CSR publications in our sample dates back to 1980s. This percentage remained the same in 1990’s and increased to 22.2 % in the first half of the 2000’s. It worth noting that the academic articles dating back to 1960s and 1970s constitute 4.4% and 37.8% respectively. Therefore the great majority of the publications on CSR appeared in 1960 and 1970s where the efforts of institutions that were funded by the American grants and aid were
significant. The diffusion appears to have been rather slow since many of the articles originated from the same group of organizations during the initial years. Only after 2000s, where the discourse of CSR was embraced by different organisations at the global level and a myriad of reporting methods and regulating bodies surged, the CSR studies gained momentum in Turkey as well.

Another interesting finding is that CSR studies did not take into account traditional CSR type activities stemming from the old traditions like foundations or zekat institution until 2000s. The initial studies provided typical examples from American business context, which were not embedded into the Turkish business context. Except for some studies mentioning only in one or two sentences traditional CSR type of activities in their introduction, no study investigated CSR as situated in Turkey until 2000s.

CSR is not a new idea or practice in emerging economies where similar concepts and practices bearing different names than CSR have been observed (Blowfield & Frynas, 2005). However, companies in emerging countries have been subject to isomorphic pressures which may be portrayed as diffusion of CSR from North that force them to be involved with existing CSR agenda even though they have different CSR priorities and understandings (Preuss & Barkemeyer, 2011). Therefore, after 2000, two streams emerged in the CSR publications. First was composed of studies, which used American constructs without critique and searched for similarities in the Turkish context. Second group included studies that demonstrated an awareness of traditional roots of CSR.

DISCUSSION AND CONCLUSIONS

We aimed to present a conceptual genealogy of the CSR in Turkey through a reflexive approach that accounts for the importance of the spatial and temporal contexts in examining the topic. Our analysis is grounded in institutional theory, which allows for illuminating institutional reproduction processes of construction of the notion of CSR, which is imported from the States, diffusion of the discourse, through Americanisation process, followed by contestation and finally lack of institutionalisation in Turkey.

Our results show that the emergence of the CSR as a management topic in the Turkish academic circles is a product of post WWII era organisations, which enjoyed financial and consultancy support from the American institutions like Harvard Business School and Ford Foundation. The CSR notion that was imported from United States was detached from the Turkish business context. The construction was based on American patterns. The proposed practices and topics failed to find a ground in the institutional context of Turkey. This, in turn, slowed down the diffusion process significantly and in some cases created contestation. The long existing traditions of CSR were neglected during the attempts of constructing Americanised CSR. This gave rise to a situation
whereby companies pursued traditional philanthropy activities without labelling it as CSR. Therefore, CSR presented a duality in both practices and academic writings. After 2000s, institutionalization of American type of CSR gained pace with increasing publications in the international outlets. However, this period is also characterized by the rediscovery and institutionalization of traditional CSR in Turkey.

We make two important contributions to knowledge. First, we offer a reflexive account of the historical and sociological analysis of the CSR discourse in Turkish academic writing by taking into account the significance of the Americanisation process that shaped business and management approaches, models and organisational structures (Djelic and Amdam, 2007). Second, we respond to calls for application of organisational theory in addressing such a research problem by applying institutional theory. Future research should pay specific attention to key parameters of CSR discourse appeared in each historical period and map them onto the main processes of institutional reproduction as unpacked by the institutional theory.

MARKETING AND PR ACTIVITIES OF THE LEADING WORLD UNIVERSITIES: MODERN TOOLS AND DEVELOPMENT TRENDS

Chernysheva, Anna; Kalygina, Valentina; Zobov, Alexander

Faculty of Economics, RUDN University, Moscow, Russia

ABSTRACT

The present article summarizes the main aspects of marketing evolution, which is characterized by the development of both “inward” – throughout the whole system of company’s business-process, and “outwards” – into the social and political society sphere. These processes are described on the example of the research of marketing and PR-activities of the leading world universities. The research was conducted by the Marketing department of RUDN University in the spring of 2016 in the frame of Russian Academic Excellence Project 5-100.

As part of the study the methods and tools of the universities’ promotion were examined and summarized through the corporate websites, social media and traditional media. The conclusions about the running information traffic which is generated by the universities and which is focused on both external and internal target audience were done.

Keywords: Total marketing, PR in higher education, research of PR-activities, marketing in higher education, new media, social media, websites of universities

INTRODUCTION

The Russian system of higher professional education, which boasts Universities with traditions that trail back down through the centuries – as well as reflecting the pride of their own formidable academic reputations – now faces an arduous task: how to keep in step with the current pace of international development while not undermining its own excellent academic antecedents. The launch of the Project 5-100 sent a new satellite into orbit to assist in the process of revamping Russian higher education and make and giving it a contemporary. The goal of Project 5-100 is to maximize the competitive position of a group of leading Russian universities in the global research and education market. "Excellence Initiatives" similar to the Russian Academic Excellence Project 5-100 are now among the in-vogue imperatives of many governments. Their aim is to better the system of higher education and anchor their national Universities to loftier positions in the global ratings. In 2015, the Russian University of Friendship of
Peoples (PFUR – RUDN University) was among the winners in the competition to receive state support in the framework of the 5-100 Project. In the frame of this project the scale researches of marketing and PR-activities of the leading world universities were starting in order to study their experience in the fields of promotion of their brands.

Marketing tools and technologies have become full, mandatory elements for not only proper functioning of commercial enterprises but also for politics, education, medicine, sport, nonprofit organization. They are also extremely important for the Universities. Well-formed marketing policy can help universities boost rankings, manage crises, increase donations, attract promising students, recruit academic stuff, create their brands and etc.

Assessing the development of marketing both the concept and the complex of practice activities it’s necessary mark its total character. Marketing is growing of both “inward” – throughout the whole system of company’s business-process, and “outwards” – into the social and political society sphere. Marketing tools the effectiveness of which has been proven in business are adapting to the features of non-commercial organizations and specific spheres of society. To be fair, it should be mentioned that Philip Kotler, in 1989 (Kotler, 1989) noted the growth of the use of the marketing concept by non-profit organizations to improve their basic indicators. Russian universities have just faced challenges in international competition. Taking into consideration this circumstances the study of the leading world universities’ modern marketing tools directed to the promotion of their brands and eventually to the increasing of their competiveness has a huge practical value for Russian universities. The Benchmarking can be very useful for understanding the modern marketing tools in higher education in order to survive in this competition.

Back in 1963, J. Marston proposed a formula for successful Public Relations Formula – RACE (Research – Action – Communication – Evaluation) (Marston, 1963). We will not go into the depth of this formula, although each of these aspects deserves a separate consideration. But we have just determinate that before anything can be done, it is necessary to conduct detailed studies.

As mentioned above the analysis of the word university’ marketing activity was conducted in the frame of the project 5-100. The first wave of this research was dedicated to the PR activity of the universities through the Internet. And in this Paper we would like to focus on this issue.

S. Catlip, A. Center, G. Broom suggested the following definition: "The PR is a management function that facilitates the establishment or maintenance of mutually beneficial relations between the organization and its public on which its success or failure depends" (Catlip et.al., 1994). So we can assume that the proper use of PR tools will be very helpful for universities for the achieving their goals. Regardless of the university structure, public relations and promotion (also called integrated marketing communication) were being used at colleges and universities long before the terms
"marketing" or "integrated marketing" came into play (Morris and Cejda, 2001).

**RESEARCH AND METHODOLOGY**

The research was conducted by the leading experts of Marketing Department with the participation of the senior students in the frame of TOP-5-100 project.

The study was carried out during the period from April to September 2016.

19 universities with classical method of education were selected. The main criterion for the choice was the high performance rating in QS World University Rankings, because the main objective of RUDN University is to improve its indicators in this Ranking.

![Image of rankings and statistics]

**Figure 1. The main objectives of RUDN university in the 5-100 project.**

*Source: About the project 5-100. [http://www.rudn.ru/5-100r/about](http://www.rudn.ru/5-100r/about)*

But a sample based only on this criterion would imply research of universities that are not competitors of the RUDN University, targeting another core audience. So additional criterions were added:

1. There are universities from all continents must be presented in the sample
2. The universities with the similar with RUDN indicators must be included to the sample.

So the following universities were selected:

<table>
<thead>
<tr>
<th>NN</th>
<th>University</th>
<th>Country</th>
<th>QS World University Rankings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>University of Illinois at Urbana-Champaign</td>
<td>USA</td>
<td>59</td>

<tr>
<td>3</td>
<td>Yale University</td>
<td>USA</td>
<td>15</td>
</tr>
<tr>
<td>4</td>
<td>University of Toronto</td>
<td>Canada</td>
<td>34</td>
</tr>
<tr>
<td>5</td>
<td>Universidade Estadual de Campinas</td>
<td>Brazil</td>
<td>195</td>
</tr>
</tbody>
</table>
Table 1. Target sample of the study

Depending on the nature of the tasks and sources of information, various methods of analyzing are used. According to the degree of formalization, all methods are divided into formalized and expert. The formalized methods include economic-statistical (extrapolation and correlation-regression), as well as structural. In this case, time-series data obtained on the basis of representative statistics are studied.

When it is impossible to obtain sufficient statistical information, expert methods of analysis are used. The expert method is based on the ability of specialists conducting research to find solutions to a specific problem.

Execution of examination consists of the following stages:
1. Preliminary stage
2. Group development
3. Preparation of research and Research
4. Processing and analysis of results

The indicator of the generalized opinion of the experts conducting the study is a simple and weighted average ($\bar{C}_j$ and $C_j$) values of compliance with the eligible selection criteria.

$$\bar{C}_j = \frac{\sum_{i=1}^{m} C_{ij}}{m}$$

(1)
The degree of consensus between the opinions of various experts is also of interest. The coefficient of variation of the estimates $V_j$, the correspondence of the $j$-th criterion to the exposed selection conditions, is calculated in the following sequence. The variance $\sigma^2_j$ and the standard deviation $\sigma_j$ of the estimations, the correspondence of the $j$-th criterion to the exposed selection conditions

$$\sigma^2_j = \frac{\sum_{i=1}^{m} (c_{ij} - C_j)^2}{m}$$  \hspace{1cm} (3)$$

$$\sigma_j = \sqrt{\sigma^2_j}$$  \hspace{1cm} (4)$$

Then, the coefficient of variation $V_j$ of the estimates, of the compliance of the $j$-th criterion with the exposed selection conditions is determined:

$$V_j = \frac{\sigma_j}{C_j} \times 100\%$$  \hspace{1cm} (5)$$

The smaller the coefficient of variation, the higher the degree of consistency of expert opinions. If $V_j < 33\%$, the opinions of experts are considered to be consistent, and the received value is taken as the final group estimate.

When analyzing the obtained average group estimate, it is necessary to determine the size of the area in which the future value of the estimated value will fall with a given probability $P$. This area is determined by the magnitude of the possible limiting error of the mean $\Delta$:

$$C_j - \Delta_j \leq C_j \leq C_j + \Delta_j$$  \hspace{1cm} (6)$$

$$\Delta_j = t \times \mu_j,$$  \hspace{1cm} (7)$$

Where $t$- confidence ration (Student’s T-Test)

$\mu$ - The mean square error of the arithmetic mean
In the process of the study, the criteria selection was recognized as reliable, and the experts' opinions agreed, while the maximum error limit was not more than 5%.

A research hypothesis reflected rather obvious tendency that takes place in modern marketing in general and in marketing in higher education in particular. We mean that all major marketing communications are increasingly shifting to the Internet. Actually from the mid-1990s onwards, the purpose and value of the Internet and then social media gradually engaged the interest of public relations practitioners and evaluators (Watson, 2012) but for the universities this direction has become very important not so long ago, but is becoming more and more important. According to the results of Hanover Research, “perhaps the largest area of innovation and growth in higher education marketing and branding, as well as in recruitment, is in the online and digital space. Although there is still some doubt that institutions are using technology to its full potential, particularly with social media and other emerging platforms, a recent survey by the University of Massachusetts Dartmouth indicated that nearly 100 percent of institutions polled use some form of social media as part of their marketing and overall operations” (Hanover Research, 2014).

That’s why it was decided to analyze the specific practice of the selected universities in so called new media namely websites and social networks and in traditional mass media. In the process of research, it was decided not to specifically distinguish between marketing activities and PR activities. In our opinion, in real practice these types of university activities are realized in a single process, first of all, when the tools of communication influence are investigated. One of the first scholars who argue for the integration of marketing and PR in higher education was B.A. Miklich (Miklich, 1988).

Each university was analyzed in the following area.

Sites: languages; Structure; Interesting facts or sections, which attract the attention; mentioning of the website in Internet; PR activity highlighted on the site; conferences and other scientific events, which took place in the university; papers and other scientific publications; scientific achievements; international cooperation; sections that are not on the sites of RUDN.

Social networks: social networks where the university is presented; number of subscribers; the main information presented in the network; Interesting facts or sections, which attract the attention; PR activity highlighted in the network; conferences and other scientific events, which took place in the university; papers and other scientific publications; scientific achievements; international cooperation.

Traditional mass media (press, radio, TV): scientific articles of the academy staff; Interview of the representatives of academy staff to mass media; mentioning about the university in news, expert
reviews, articles; participation of university staff in public speeches as experts; other forms of
information about the university.

It should be said that the main goal of our research was to study how to use modern means of
communication for PR

Taking into account the collected and analyzed significant factual material, we’ve concentrated on the
main results of the research without their detailed elaboration. This research is planned to be carried
out annually, expanding the number of research universities to 50 including a number of Russian
universities and universities from the CIS countries.

ANALYSIS AND RESULTS

Websites of the universities

The university’s website is the first source to be contacted in order to obtain information about the
university. Therefore it is very important that it reflects all the opportunities and dignities of the
university.

In the opinion of Wendy G. Ford, very little literature exists on the functional purpose of a college’s
Web site (Ford, 2011). The main elements of the analyzed universities websites are given above. Due
to certain limitations, we present only some of the results of our study on the issue.

First of all it was revealed that the most part of the selected universities has sites with several
language versions. Sites in English are dominated. 95% of universities have version in English, 37% of
them – in English only, 53% - in two languages: on the local language and in English and just 5% of
the sites has version in additional language besides English and local language.

In the course of the study the following interesting sections and features of site navigation were
identified:

1. News about the achievements of the universities
2. Job opportunity in social network
3. Rector’s blog
4. Information about graduates
5. Donations
6. Tips
7. Job opportunities
8. Cooperation
9. Comfortable navigation
10. Objects of the university for the year
11. Join programmes
12. Research portal on-line
The most prevalent positions which were indicated by the students as the potential users were “Interesting design”, “Comfortable navigation” (42% of the universities). Next by popularity are “Comfortable interface” and “Events in the University on the first page (37%). News about the achievements” attracted the attention in 26% of the universities, but Job opportunity in social networks”, comfortable search at courses and “Information about graduates” in 11% of the universities.

Information about the studied universities (and about their sites) could be found in the Internet-sources, dedicated to the education abroad (58%). Also more than a half addresses of the sites can be found on the most popular web-site Vikipedia (53%).

**Social networks**

As part of the study it was indicated that all the analyzed universities make active use for their promotion the following popular social networks; YouTube, Facebook, Twitter, Instagram. It’s absolutely true that people usually become motivated to share important information with their friends on the network, because they expect their experience to be helpful or of any use to someone (Gajic, 2012).

While the higher the university in the QS Ranking the greater its presence in global social networks. Absolute leader in the number of subscribers in all social networks is Yale University (USA) – more than 80 000 subscribers.

The most popular social networks among the universities are: Twitter (83% has it), Facebook (78%), YouTube and Instagram. Exceptions are Chinese universities; in particular Tsinghua University in social networks is not represented at all.

On YouTube usually scientific events are loaded as well as Awards ceremony of competitions and Olympiads, video for the different festivities, exhibitions and festivals. Sometimes you can find interesting information about the university, interview with representative of science, video clip about students’ life.

On Facebook the universities usually place information about scientific events, PR events, articles’ review, and scientific achievements of the universities. More than a half of the information is occupied by non-scientific announcements, such as: international internships, student events, concerns, exhibitions, festivals, alumni meetings, competitions, prizes, interesting facts about the university, the city where the university is located, the country in general, also tips for students.

Twitter links to the publication of the official site of the University, as well as on the photos and videos published by the university.
In Instagram, the information about university life in all its manifestations: scientific achievements, awards, prizes, studies, articles, exhibitions, competitions and other. Also student photos and video materials about current events are presented.
In general universities quite broadly cover interesting facts about themselves in social networks, which causes interest both for entrants and their parents, and for the students themselves to their university and its life.
In the course of the study the following interesting sections were identified:
1. Photo and video from the scientific and non-scientific events
2. Actual problems of the universities
3. The results of R&D
4. Traditions, customs and symbols of the country
5. Internship, joined programs
6. Students life
7. International cooperation
8. Sports achievements
9. Charity events
10. Information about honorable graduates
11. Congratulations students

The most popular are news of the university (25%), then photos and videos of the university and its students (17%), another interesting fact in social networks is student life (12%) and interesting scientific development of universities (10%).

Very interesting examples specific to individual universities were identified. For example, University of Hong Kong has its own Smartphone application where you can find the following information: the main news, current events, students’ life, map, library’s news, foods, timetable, bus schedule.
University of Copenhagen has launched application for Smartphones through which UCPH students can see on-line the timetable of lessons and exams; receive notifications of upcoming events, contact with lecturers and access lectures.

**Mass Media**

As part of study it was made an attempt to estimate the scale and features of the using by the universities of traditional mass media for their promotion. It was discovered that it’s quite difficult to find published articles and speeches of the university representatives. Such informational actions leave few "traces" in the information space. Therefore, we had to evaluate this channel by indirect indicators, using the links to them from the university websites, social networks and specialized portals on the Internet.
Many universities have published articles in popular science journals; however, not all the universities have a single server, database, archive for the references to specific sites and sources of all articles. Most articles are scattered on the Internet, which makes it very difficult to find them.

In the course of research it was revealed that a number of universities use very actively the speeches in the genre of "conversations with an expert" and interview with the representatives of the universities. These tools are placed not only in traditional mass media but also on the web-sites and in social networks. Moreover according to the rough estimates obtained in the course of the study it turned out that 30-35% of total number of all interviews and expert speeches is related to the traditional mass media.

It should be noted the main part of the interviews is mainly focused on the acute issues of economics, sociology and medicine. Interviews about university life are just in fourth place and mainly placed in the social networks.

SUMMARY AND CONCLUSIONS

The results of this study allow us to formulate the following conclusions.

1. All leading universities generate a significant, and apparently increasing, information flow directed at a wide variety of external and internal target groups. External ones are employers, the scientific and educational community, applicants and their parents, state and non-profit organizations. Internal - students, teaching staff, university faculty.

2. Such huge information flow implies the existence of an administrative and proactive system for the content creation, its editing and transmission. In fact we can state a full-fledged marketing information system in the analyzed universities, focused primarily on the maximum PR-activity.

3. Marketing and PR-activities of the universities are increasingly shifting to the Internet. The importance of direct advertising in traditional mass media is declining. More and more this activity goes to the Internet. The main communication channels are the university's website and the world's major social networks. Even the promotion in traditional media is provided by a complex of electronic communications.

4. All these tendencies form extremely urgent challenges for Russian universities. A serious reorganization of marketing approaches is needed, for the increasing their recognition and attractiveness in the world market of higher education.

5. This research can be useful for the following study of the marketing activity of universities. Further researches should explore such topics as the influence of certain factors on the choice of the university, adaptation of marketing programs to the local markets, promotion of the university's...
brand in foreign markets, the possibility of applying the marketing tools of foreign universities to promote their own university etc.

ABSTRACT

The aim of this paper is to demonstrate the economic and health burden of Cardiovascular diseases (CVDs) in the context of Bangalore during the period 2010-2013. A data set containing in excess of 1 million historic records corresponding to all-cause mortality was obtained from the central repository data register. After a data quality assessment, a dataset of n=183,893 was obtained. Spatial analysis was carried out to highlight the hotspots of CVD. Potential Years of Life Lost due to CVD and Present Value of Lifetime Earnings were computed. CVDs were responsible for 25% of the total of potential years of life lost. The potential value of lifetime earnings highlighted a loss in excess of 8 billion INR over the four years. CVD poses a tremendous challenge for socio-economic development, and there is an urgent need for a strategic action to promote CVD prevention and enable a sustainable development for the economy.

Keywords: Cardiovascular diseases, economic health burden, GIS spatial analysis, Bangalore, potential years of life lost, present value of lifetime earnings.

INTRODUCTION

Cardiovascular diseases are the world’s leading cause of mortality. According to the World Health Organisation (WHO, 2013), an estimated 17.3 million people per year die of CVDs worldwide. Thus, CVD-related deaths accounts for 3 times more than those related to infectious diseases, including HIV/AIDS, Tuberculosis and Malaria combined (Beaglehole and Bonita, 2008). The World Health Organisation estimate that by 2030 the number of deaths due to CVD will increase to 23.6 million, remaining as the single leading cause of death globally (WHO, 2013). Bloom et al. (2011) state that over half of those who die from chronic non-communicable diseases such as CVD are generally in the prime of their productive years. This loss of lives may therefore have a significant impact not only on
society but also on the economies of the nations. This is particularly true for low- and middle-income countries as they bear the burden of over 80% of CVD-related deaths per year worldwide. 

Despite the abundance of studies stressing the fact that CVDs have a direct impact on socio-economic development, limited research has been conducted to quantify such a burden to the context of a region, a nation or even a city. This highlights the need for research which informs decision making in addressing the challenges posed by CVDs to society.

*Cardiovascular diseases in the context of India*

India is set to become the world’s youngest nation by 2020, when the country is expected to have 64% of its population in the working age group. While the western economies, Japan and even China are aging, this demographic potential presents India with an unprecedented edge due to a significant growth rate (The Hindu, 2013).

There is however a threat to India’s economic growth. India has witnessed a significant increase in CVDs over the recent decades (Gupta et al., 2011) and CVD has become the top cause of mortality in the country (Ramaraj and Chellappa, 2008). In 1990, CVDs accounted for 63% of all deaths in India, which contributed to 17% of worldwide mortality. Research conducted in the early 2000s by the World Health Organisation (WHO) estimated that by 2010, 60% of the world’s cardiac patients would be Indians (Ghaffar et al., 2004). Furthermore, Gaziano (2006) predicted that in this decade 50% of the Indian population who die from CVD will be below the age of 70.

The human, social and economic consequences of CVDs are felt by the society in large. The effects of CVD are not only a health concern but also affects the social aspects of life. As the disease correlates to a decreased life expectancy, there is a huge impact on the individual as well as their family (HealthTalk, 2014). Individuals are known to be concerned about not being able to see their children or grandchildren grow up, they also go through a range of emotions that include anxiety, loss of confidence, anger, frustration, irritability and short temperedness, and depression.

Healthcare in India is highly privatised, with most of the outpatient or inpatient care sourced through the private sector (NSSO, 2006). The large population lacks any form of health cover with nearly 90% of the population paying for healthcare as out-of-pocket (OOP) expenditures (MOHFW, 2005). This form of OOP expenditures has catastrophic effects on households where an individual is affected by CVD. India is witnessing more and more younger people affected by CVD in the country, with an increasing number of them being the sole bread winners for the family has a devastating social and economic impact on individuals and their households.

In abstract economic terms, India was estimated to have lost US$8.7 billion due to affliction from CVD and diabetes up until the end of the last decade (Ajay and Prabhakaran, 2010), and the WHO
estimated that this figure reached US$237 billion in over the 10-year period between 2005 and 2015 (Goenka et al., 2009). Furthermore, the GDP of the country was estimated to have fallen by 1% due to the combined economic impacts of CVD and diabetes (Prabhakaran et al., 2016; Abegunde and Stanciole, 2006). There is scientific evidence that indicates that Indians tend to acquire the disease at least 10 years earlier than their western counterparts (Vamadevan et al., 2011). This will have a significant impact on the economically active population due to disability and premature death as a result of the disease. However, despite the relevance of the subject there has been a limited number of studies that highlight the statistics of CVD and its actual economic impact in India. Without an understanding of the economic burden of CVDs, it is difficult for decision makers to determine the approach and allocation of resources for management of CVD prevention and control strategies.

This research has been set to demonstrate the potential impact that CVDs may have on socio-economic development. The study is based on the city of Bangalore due to its economic significance for the country’s development. By analysing CVD mortality in Bangalore and its impact on economic growth, this research has highlighted the imperatives of a strategy to raise awareness at all levels, from policy makers to the public, on the relevance and potential approaches to CVD prevention and control. To achieve this aim, a data set containing in excess of 1 million historic records corresponding to all-cause mortality in Bangalore was analysed using a Geographic Information System. Hotspots of CVDs in Bangalore were identified, Potential Years of Life Lost due to CVDs and Present Value of Lifetime Earnings were computed, relating these to geographic locations across the city.

METHODS

Case study rationale

Although there is a devastating social and economic burden of CVD in India, there have been limited studies to highlight the economic losses that result from these diseases. Access to quality, reliable data about the disease and its impact on society and economy is one of the key barriers to research in this area. Access to a novel data set from Bangalore paved the way to initiate this research, which carried out an intensive examination of mortality and its relation to CVD, taking the Indian city as a case study. Other factors including the explanatory nature of the research, the fact that the phenomenon was to be studied in its real-life context and the multitude of variables related to CVD and its impact on economy and society, made case study an ideal approach to the conduct of this research (Yin, 2009).

Case study area
Bangalore is the capital of the Indian state of Karnataka and is home to several major industries, as well as commercial and educational centres. It is also a leading hub for Information Technology (IT) and biotechnology centres. Bangalore is popularly known as the ‘Silicon Valley’ of South-East Asia. In addition to the wealth of employment and educational opportunities Bangalore offers, it also enjoys a pleasant climate. Bangalore has hence witnessed a population boom with an increased migration subsequently influencing the infrastructure of the city (Aranya 2003). Bangalore has a population of 8.4 million people making it the third largest city in India. The economic growth and the urban evolution have contributed to cultural shifts in lifestyles and behaviours in the city. Although Bangalore is inundated with issues derived from the incidence of CVDs in its population, not enough research has been done to understand the incidence of the diseases and no known study highlights the CVD mortality statistics and their economic impact. This makes of the context of Bangalore an ideal case scenario for the study of the subject.

Data collection

Data was obtained from the administrative body responsible for the civic and infrastructural assets of the Greater Bangalore metropolitan area, (the Bruhat Bengaluru Mahanagara Palike – BBMP hereafter). For the purposes of this research, the central repository centre was visited and authorisation was obtained to collect the inputted records from the system. Given the perceived importance of this research and the potential benefits associated to its findings, the researchers were provided with access to the entire database, including a total of \( n = 1,090,899 \) historic records for the years 1930–2013. Each of these records included date of death, address, age, gender and cause of death.

Pre-analysis of the data collected

A statistical software package, IBM SPSS20, was used for the analysis of the data collected. The variables to be analysed were geographical zone, age groups, year of death, place of death, gender and the cause of death. The data was coded according to cause of death by using the International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM). ICD-10-CM is a system used by physicians and other healthcare providers to classify and code all diagnoses, symptoms and procedures recorded in conjunction with hospital care in the United States. ICD-10-CM codes start from A00-Z99, with CVD mortality codes ranging between I00–I99.

Data cleansing and reduction

The data set was subjected to descriptive statistical analysis to determine its quality in terms of the parameters described in Table 1. The initial analysis showed that not all of the original \( n = 1,090,899 \) records had the cause of death recorded. The absence of cause of death does not assist in the analysis.
of death rates attributed to specific conditions such as CVD. Hence those records were deemed invalid for the purpose of this research.

A second stage in the process of data reduction consisted of the contextual analysis of the data. Given the potential variations in CVD-related statistics as well as in the socio-economic background of Bangalore over the period covered by the data set (1930–2013), the researchers concluded that not all data was valid for the study. It was decided to focus on the data for the last four years (2010-2013), which consisted of a dataset with n=183,893. For the purpose of data quality assessment, the resulting dataset was finally subjected to data quality assessment using the parameters defined by Turner (2002), summarised in Table 1.

Table 1: Dimensions of Data Quality (Turner, 2002)

</tr>
</tbody>
</table>

The accuracy of the dataset resulted in 19.4% of the initial number of records being discarded as the cause-of-death recording was either absent or inaccurate. As the geographic distribution of deaths is vital to determine the trends and patterns of deaths, it is necessary that all records have the address of the deceased accurately recorded. The current Medically Certified Cause of Death (MCCD) recording practice in Bangalore does not prioritise the recording of the address of the diseased. This resulted in a further reduction of the valid dataset.

As a conclusion of this stage of the data reduction process the assessment of the current data quality issues in recording mortality events conducted by Chinnaswamy (2015), determined that the system for Bangalore had a completeness level of 73%.
RESULTS OF THE DATA ANALYSIS

This section presents a comprehensive analysis of the CVD deaths in Bangalore. Descriptive statistics highlight overall CVD deaths in the city and CVD deaths by zone. Spatial statistics using a GIS map the CVD deaths highlighting the hotspots of the disease in the city. The rate of death, potential years of life lost due to CVD and the present value of lifetime earnings for CVD are computed in this section.

Descriptive analysis of CVD mortality

The statistical analysis of the data revealed that the total Non-Institutional deaths over the years 2010-2013 were 86,818 of which 33,075 deaths were due to CVD and 53,743 deaths were due to all other causes. CVDs over the four years on an average contributed to 38.10% of all deaths. Zones West and East had the highest mortality followed by zones South and Mahadevapura. However, when the percentage of total deaths is considered, CVD deaths in zone East was the highest contributing to 50% of the total deaths.

Mapping of CVD deaths using Geographic Information Systems

The place where a person lives can influence and often determine their health and health-related quality of life and well-being. Numerous studies have highlighted the relationship between proximity to polluting sources such as highways and the risk of CVD. To aid in determining levels the rates of CVDs in the city, a Geographical Information System (GIS) was employed. GISs have the capability to identify the geographical and geospatial pattern of disease occurrences. Due to their strong capability to perform spatial analysis and decision making capabilities, GIS is gaining popularity in environmental and demographic research areas. An Environmental Health Information System (ENVHIS) based on GIS was developed which allowed the integration of data available and perform spatial analysis. Choropleth maps of the population highlighting the zones with the highest population were produced. CVD deaths were then geocoded for every zone was also integrated as a layer in the GIS-based system. Overlay techniques were used to superimpose the layers and visualise any patterns. The zones with the highest CVD levels were mapped. Hotspots were also determined at the zonal level (Figure 1).
This analysis highlighted that the zones West, East and South have the highest CVD mortality rates across the region (Figure 1). Table 2 represents the analysis of deaths by age groups and gender. Although in absolute numbers the quantity of CVDs are highest for the age group 75+, when CVDs affecting early death i.e. below 70 years of age the total number of deaths is 41,388 contributing to 66% of total CVD deaths. This is an important factor to consider as the younger a person dies, the more socio-economic impact there is on the individual’s family and the community at large.

However, rather than counting every death as equal, a measure potential years of life lost (PYLL) measurement can provide an appropriate measure of socio-economic impact by recognising that death at younger ages has higher impact than deaths at older ages which is discussed in the following section.

Disability Adjusted Life Years (DALY) measures the losses from disability or death with diseases accounting for more DALY having a higher public health impact (Murray and Lopez 2006). Health measures are then taken to reduce the number of DALY. The DALY has become a key measure employed by the WHO and countries generally perform DALY calculations to assess and monitor their population’s health and to set priorities within their health sector.

DALY formula
DALY are the sum of years of life lived with disability (YLD) and Years of potential life lost (YPLL), per disease category or outcome, and per age and gender:
\[ \text{DALY} = \text{YLD} + \text{YPLL} \]

The YLDs are the morbidity component of the DALYs, and are proportional to the number of incident cases and the severity of the disease:
\[ \text{YLD} = \text{Number of Cases} \times \text{Disease Duration} \times \text{Disability Weight} \]

The YPLLs are the mortality component of the DALYs, and are proportional to the number of deaths and the average age of death. As the comprehensive morbidity data was not available for Bangalore, only the YPLL was calculated.

Years of potential life lost (YPLL), also sometimes referred to as potential years of life lost (PYLL) is defined as an estimate of the average years a person would have lived if he or she had not died prematurely (Gardner and Sanborn, 1990). Hence it can be described as a measure of premature mortality. PYLL gives more weight only to deaths that occur among younger people.

**Calculation**

The years of potential life lost is calculated by setting an upper reference age, this reference age normally corresponds to the life expectancy of the study population. The reference age in developed countries is usually set at 75, but this is lower in developing countries. PYLL is expressed with respect to the reference age [75]. For the purposes of this analysis, an upper reference age was first set to calculate the potential years of life lost. The upper reference age refers to the life expectancy of the Indian population, which has been determined to be 66.21 years (Chauhan and Aeri, 2013). In order to calculate an individual PYLL, the difference between the person’s age at death and the reference age is calculated. If the person’s age at death is higher than the reference age, it is set at 0. There is no negative PYLL, for example:

1. Reference age = 66; Age at death = 60; PYLL[66] = 66 - 60 = 6
2. Reference age = 66; Age at death = 6 months; PYLL[66] = 66 - 0.5 = 65.5
3. Reference age = 66; Age at death = 70; PYLL[66] = 0

\[ PYLL \ (66)\ (t) = \sum_{i=0}^{66} [D_{A}(66 - A)] \]

- PYLL (66) is the total PYLL as a result of CVD, at time period t
- \( D_{A} \) - the number of CVD per age group
- \( A \) - the age at death by CVD per age group
- \( i \) - the number of age groups for \( A \) from 0 to 66
To calculate the PYLL for the population over a certain period, the individual PYLLs are summed for all individuals in that population who died in that year. Potential Years of Life Lost (PYLL) provides a way of weighting deaths occurring at younger ages that is preventable. This was undertaken as a cause-specific mortality for Bangalore and it was determined that CVD accounts for 25% of all PYLL in Bangalore during 2010-2013.

Because PYLL gives more weight to deaths among younger individuals, it is the favoured metric among those who wish to draw attention to those causes of death that are more common in younger people. Table 3 provides the PYLLs due to CVD according to age, gender and zone for Bangalore. It can be seen from the table that the middle age groups 35-39, 40-44, 45-49 have the highest PYLLs. For both the genders, the most affected age group is 45-49 after which the PYLL has a decline. However, CVDs have a prominent effect on males with over twice as many PYLL lives lost in males compared to women of the same age group.

India is the second most populous country in the world and is projected to be the world’s most populous country by 2022. More than 50% of its population is below the age of 25, and more than 65% is below the age of 35. By 2020, the average age of an Indian will be 29 years and the country will thus become the world’s youngest country with 64% of its population in the working age group. This demographic potential offers an unprecedented edge and economists believe it could add a significant 2% to the GDP growth rate. While the country’s young demographic base is beneficial for India’s growth, the threat of CVD to the population is a major challenge. With CVD contributing to over 25% of all PYLLs, there is an urgent need to address the prevention of CVD to all age groups, but in particular the younger population as valuable lives are lost to the disease.
Present value of lifetime earnings – Loss

This section describes the estimation of the present value of lifetime earnings (PVLE) for CVD for 2010-2013. PVLE is a simple quantitative measure used to quantify the expected value of lost earnings as contributed to the society by an individual if he or she was able to live out a full lifespan (National Center for Injury Prevention and Control, 2003). The potential economic losses to society are estimated by computing the PVLE for different age and gender groups. The average lifetime earnings for each 5-year age group by gender was obtained from the estimation as provided by Menzin et al. (2012). The estimation is based on the assumption that all working-age individuals (>20 years) would continue to be employed. Table 4 shows the estimation of PVLE earnings by age and gender. The average lifetime earnings are multiplied by the number of premature deaths for each age group and for every gender group to calculate the expected value of lost earnings in each group. All the monetary values are expressed in Indian Rupees (INR).

</tbody>
</table>

This allows to conclude that the PVLE lost due to CVDs in Bangalore during 2010-2013 was INR 8,764,424,535. As presented in Table 7, it can be noted that the value of lifetime earnings varies for different ages and for genders. For men, the highest peak is at the age groups 25-29 while for women the highest age group is 30-34. It then begins to decrease at a fast rate in the middle age groups. It can be inferred that men have higher lifetime earnings in comparison with women, reflecting their potential for higher market earnings. For males, the highest potential earning groups are 25-29 and their earnings are over 40% higher than for women; by ages 65-69, men’s lifetime earnings are almost 10 times that for women in India.

Lifetime earnings are perceived as a vital component of cost-of-illness studies and is a good approach that values life where productivity is based on an individual’s earnings. Pre-mature mortality can hinder the labour force and impact the nation’s economic resources considerably. The PVLE measure
can highlight the growing economic concern due to early deaths due to a disease and hence promoting interventions.

**Present value of lifetime earnings – Zonal**

As highlighted above, the zones with the highest CVD mortality were East, South and West. The distribution of deaths by gender and age groups was categorised and the PVLE computed for the respective zones by gender and age groups (Table 5). The analysis revealed that the zone West had the highest loss of approximately 2.8 billion INR followed closely by Zone South with 2.7 billion INR.

Only these three zones contribute to 87% of the total PVLE in Bangalore.

| Table 5: PVLE according to age groups, gender and zone |
|---|---|---|---|---|---|---|---|---|---|---|---|---|

Bangalore is one of the fastest growing economic hubs in India and has an estimated economic growth of 10.3%. With the highest IT-related exports in the country, Bangalore's 523 billion (US$7.8 billion) economy makes it an important economy for India as a whole. Forbes (ICFN, 2013) has described Bangalore as one of “The Next Decade’s Fastest-Growing Cities”. The city is also home to over 10K-dollar millionaires and over 60,000 super-rich people. However, with the loss of life due to CVD and its associated economic costs, prevention of CVD should be of high priority for the city. The middle age adults have a prime contribution to Bangalore’s economy and the loss of early CVD deaths will have a significant socio-economic burden.

**DISCUSSION**

A key strength of this study consists of having used data collected by BBMP and the application of an established methodology to estimate the value of productivity losses for the Indian city of Bangalore. The analysis of deaths by zone, gender and age groups has also highlighted the patterns of CVD deaths across the city. However, the analysis was limited by a number of issues related to the nature of the data available for the research. Some of these are highlighted in this section. Although estimates
of PVLE have been provided, there is uncertainty over the correct valuation of the average lifetime earnings. While we have used the best approach to valuation based on the available data, the application of a different method might result in a different estimation. Additionally, age-adjusted rates of death could not be determined due to data non-availability, as the population census data does not include the breakdown of age groups.

Finally, using the data available this study could only provide economic estimates related to lifetime earnings for CVD mortality. We are unable to calculate DALYs or loss to households or caring activities because of the unavailability of comprehensive morbidity data. Bangalore has a disintegrated system for morbidity data collection which does not facilitate the estimation of other factors that would help project the economic consequences of CVD prevalence.

CONCLUSIONS

To the best of our knowledge, this study is the first of its kind to provide estimates of CVD statistics and economic implications for a city, based on a country where CVD has been recognised as a major healthcare burden. These findings are applicable to many other cities and countries, which have a similar socio-economic profile to Bangalore. The impact of CVD can be measured as economical, societal or individual. The economic impact measures how the interventions and the subsequent results had an impact on the economy. Ill health adversely affects the development of human capital, which is crucial for a developing economy. The societal impact focuses on the society as a whole. Many of the risk factors that contribute to CVD are further compounded by underlying socio-economic factors as well as environment factors. The right investments will lead not only to better health, but also to longer and more productive lives. This will impact the individual, the individual’s family, society and community at large.

CVD in Bangalore is established as not only as a health threat but also a major risk to the economy and development of the city. The analysis in this paper has highlighted that CVDs contribute to approximately 38% of the total deaths in the city, with more men being affected by the disease than women. The study also explored the extent of the PYLL and PVLE losses to Bangalore for the years 2010-2013, estimated in excess of 8 billion INR (more than $120M).

It is any government’s priority to provide public health programmes and a CVD management program to face the challenges of CVD health issues. The WHO (2011) states that over 50% of the CVDs can be prevented with early interventions. Quality treatment, early diagnosis, good quality medical and nursing care, specialist services - such as surgery and rehabilitation for those with CVD or who are at risk - will facilitate patient recovery and/or wellbeing. The government as a major priority must focus on prevention, diagnosis and treatment.
Evidence has indicated that with timely effective treatment and adequate intervention and prevention measures, the suffering due to CVD can be reduced and prevented. CVD policies are to be based on the best available evidence-based approaches that result from well-conducted, systematic reviews of the relevant evidence. Policies must evolve to incorporate the conclusions of important new research as it becomes available. The spatial analysis conducted allowed for different zones of the city to be identified as the hotspots of CVD, which is also contributing to the highest PVLE. This enables governments to introduce interventions in the zones at most risk first, and this can be achieved through monitoring policies, comprehensive advice services, identification of populations at risk, increasing awareness among public health officials, doctors, health workers on the possible links of air pollution and CVD, and support the raise of public awareness about the health impacts of air pollution.

This research also supports decision makers in designing population-wide interventions such as those raising awareness of factors related to CVD, such as smoking, healthy eating or a healthy lifestyle. Knowledge of dietary factors, for example, can lead to transformational influence on diet and other lifestyle behaviours that can have a direct impact on these diseases in the society. For interventions to take effect it is important to make the interventions people-centric. Thus, the following measure should be promoted:

Bangalore will benefit from evidence-based programs that address the risk factors for CVD. A multi-stake holder approach must be implemented to advocate effective prevention policies to improve population health and tackle inequalities linked to CVD. Additionally, the city would benefit for a revised approach to data collection which would enable future research to provide more accurate advice by including, for example, a breakdown of age groups in the mortality data. Further research could seek to conduct a similar research in other countries with different socio-economic backgrounds, looking for relevant data sets which could allow for more detailed analyses, e.g. by determining age-adjusted rates of death, or estimating losses to households due to CVD.

ACKNOWLEDGEMENTS

The authors wish to thank the BBMP for providing the data used for the purposes of this research.

ABSTRACT

Internet technologies have spurred various unethical consumer activities. A very common illegal activity is digital piracy. This article uses qualitative data from 10 semi-structured interviews, to explore attitudes towards digital piracy of young adults, as well as to investigate what characterises the factors that lead them to eventually engage in digital piracy behaviour. This study is based on a convenient sample. It reveals that different moral views and social influences form dissimilar attitudes towards digital piracy. These influences were moderated by factors such as legislation, safety risk, availability of copied material, package offered and convenience of internet users. The study exposes the powerful trend of illegal downloading and gives a clear picture of the way attitudes can be shaped.

Keywords: Digital Piracy, Digital Piracy Behaviour, Moral View, Social Influence, Music and software industry, Consumer Behaviour

1. INTRODUCTION

In a recent meta-analysis published by Lowry, Zhang and Wu (2017) there were analysed more than 250 empirical digital piracy studies. In another study by Culiberg, Koklic, Vida and Bajde (2016) it was revealed that most recent studies use different theories such as the theory of reasoned action/ the theory of planned behaviour (Cronan and Al-Rafee, 2008; Wang & McClung, 2012; Akbulut, 2014; Arli & Tjiptono, 2016; Kos Koklic, Kukar-Kinney & Vida, 2016), general theory of crime (Donner, Marcum, Jennings, Higgins, & Banfield, 2014; Malin & Fowers, 2009), social cognitive theory (Jacobs, Heuvelman, Tan, & Peters, 2012), focus theory of normative conduct (Cho, Chung, & Filippova, 2015), cognitive dissonance theory (Redondo & Charron, 2013), and ethical decision-making models (e.g., Arli, Tjiptono, & Porto, 2015; Shang, Chen, & Chen, 2008).

“Internet enables the proliferation of various ethically questionable consumer activities” (Chatzidakis and Mitussis, 2007, pp. 306). Digital piracy is on the increase, and the reason is that individuals tend to stay anonymous, and it is difficult to detect them (Chiou, Huang, and Lee,
2005). A review of the literature suggests that most of the consumers consider illegal downloading as ethically acceptable. This perception is explained by the reason that consumers have neutralized their actions so that the ethical matters have been resolved or deny that they exist as well as they evaluate if their concerns for psychological costs of norm violation relating to social or legal punishment are worth taking (Harris and Dumas, 2009).

The development of fast connections has boosted digital piracy which affects many industries such as music, movies, software, video games and books, because anyone can easily obtain a digital copy (Peitz and Waelbroeck, 2006). Technological developments have decreased the costs of copying as well as raised the accessibility of technologies to pirate information goods (Andres, 2006). Haque, Khatibi and Rahman (2009) argue that Internet piracy threatens the economy, the social and cultural well-being of the consumer and they add that this action gives short-term benefits the expense of long-term disadvantages. Besides, sales are concentrated among a small number of companies (Zenter, 2006). The ways that companies respond are either to educate the consumers by creating new norms, to lower the price or to make use of the emotional appeal that their favourite artists have on them. Another option is to authorize the copyrighted goods because in that case consumers may prefer to obtain only the pirated goods (Peitz and Waelbroeck, 2006).

The majority of the latest literature review on previous empirical research about digital piracy showed that companies’ sales are harmed but if they have a strategy to use, they could take advantage of this new trend. The opponents of digital piracy argue that piracy threatens the future of artists, composers, and record producers (Gopal, Bhattcharjee, and Sanders, 2006; Liebowitz, 2006). These latest habits of music listeners could lead the industry to have declined sales on the fast increase of file sharing. As a result, it would lead many individuals to be sued by the companies. The tactics of accepting the online piracy can help mainly the bigger companies or the most famous artists and create economic damage to smaller or less popular companies (Zenter, 2006). On the other hand, there is an opportunity for the new-coming artists to use this technology in order to enter the market at a low cost. Otherwise an increase in copyright protection could decrease profits at the industry level where there is small music-audience (Duchene and Waelbroeck, 2006).

The research question of the study is as follows: What are the antecedent factors of digital piracy behaviour? In addition, the study has the following four sub-objectives to investigate: a) How do peer-to-peer sharing and social norms influence people’s behaviour when illegally downloading documents? b) How does the moral connection influence individuals’ attitude towards Digital Piracy?
c) What is the knowledge of people on the current regulation about digital piracy and their observation on the existing punishment?

d) How do companies’ current response through media change behaviour concerning their decision to download illegally or to buy legally, and test the effectiveness of the existing strategy to use celebrities in anti-piracy campaigns?

The theoretical contribution of this study is the development of a conceptual model of the antecedents of digital piracy behaviour without the use of the different theories that recently many authors have capitalized on. In particular, the unique contribution of this study refers to the knowledge gained through in-depth interviews on the antecedents of digital piracy behaviour under consideration which are: peer influence, personal morals, legal and technology factors, and media and celebrity endorsement. This knowledge gives comprehensive information in relation to the way consumers perceive each of these antecedents. The results of the in-depth interviews have useful implications for marketers of digital companies and for policy makers who could reform their communication strategies in line with the antecedents which are found to be important for consumers. This study builds a model which offers the digital companies awareness in their prediction of piracy behaviour. Another unique contribution of this study is the fact that the adult university students interviewed are of various nationalities. This fact offers a view on how global consumers perceive digital piracy behaviour in relation to the antecedents mentioned above in this paragraph.

This empirical study reveals through in-depth interviews that morality is important. However, downloading is considered by some participants in the interviews that although the action is illegal they care about the results of acquiring specific music, video or film without cost. Some respondents perceive this behaviour as a habit. Social influence is another factor which is engaged in the decision-making of downloading. Particularly, peer downloading and sharing seems to be important. Some participants believe that downloading music, video or films for or with friends or at groups at Facebook pertain the illegal action. Some other participants in the survey take into consideration the relevant legislation but due to the low risk of being punished they keep downloading illegally. They believe that legislation is not strong enough to control internet and that after all it is very convenient way of getting anything from internet at no cost. Some of the participants responded that they pay when they want to support a celebrity. The respondents point out that if there is a case to harm their PCs they will think twice before downloading illegally. Nevertheless, in some cases temptation of downloading is stronger than having a good intention and being legal in all actions.
Throughout the following sections of this paper there is a review of the relevant literature which examines the existing published scientific work on the digital piracy and presents a conceptual model, the method used and an analysis of the findings. Lastly, there is a section with the study’s conclusion, implications, limitations and further research direction.

2. LITERATURE REVIEW

2.1. Significance to Companies

The main affected industries are music and software. In the music industry, we see that artists make profit from activities such as selling tickets for live performances, getting hired to perform on television and on radio advertising, and selling ringtones for mobile phones, rather than only from sales of recorded media. Even when the profit is lower because of the piracy, the profit generated from live performances is higher as compared to the profit without piracy, due to the fact that the reputation of the artist is boosted. The difference here is that illegal copies compete directly with the monopoly publisher, thus it obliges the publisher to reduce prices (Gayer and Shy, 2006). The positive view on file sharing networks is what Peitz and Waelbroeck (2004) call ‘the matching effect’. It is a marketing promotion in the form of sampling because the users who download illegally might find the content that matches most their tastes (Liebowitz, 2006; Peitz and Waelbroeck, 2004). On the other hand, they have ‘the competition effect’ where consumers substitute the original with a copy that is not perfect, however, it satisfies them and may reduce their willingness to buy the original (Gayer and Shy, 2003a).

Regarding to the computer software industry the manufacturer can impose different costs of piracy on different groups of consumers. Many manufacturers insist that larger businesses use licence-counting software in order to ensure that all software in use on a network is licensed, because the fines for piracy get extremely high for businesses. The logic behind this is that businesses consider that supplementary consumption by consumers increases the value of the product for business consumers. The businesses purchase software to be used by their employees that have already obtained knowledge at home (Slive and Bernhardt, 1998).

Shy and Thisse (1999) argue that one type of consumers prefers to purchase originals while the second type is not concerned about the quality. Takeyama (1994) recommends that when the companies authorize copying they can be more effective by charging ‘price discriminate’ to different segments of consumers. Pietz (2004) adds that the low-quality segment has very strong network effects, thus when the low segment is large and the copy is not available, then a good...
strategy is to charge low price to the original. However, it is critical that the originals should have different features from the copy (Duchene and Waelbroeck, 2006).

2.2. Conceptual model

Below a conceptual model is developed showing the antecedent factors of digital piracy behaviour (see Figure 1).

![Conceptual model of the antecedents of digital piracy behaviour](image)

Fig. 1. Conceptual model of the antecedents of digital piracy behaviour

2.2.1. Peer influence

File-sharing systems started to grow since Napster first established online sharing of music files for a short period of time and afterwards Kazaa that became popular among certain online communities and a target for legal prosecution by the people who have copyrights (Peitz and Waelbroeck, 2004). Copyright law acts as a prohibitive factor for the consumers to copy digital material without permission. However, in some cases peer influence and social norms say that it is “ok” to do so. This is the reason why there is an attempt on behalf of the artists to change these norms in favour of the music community by convincing the fans to voluntarily reinforce and respect artists’ copyrights. Furthermore, a person’s behaviour is also based on group morality. Persons act in accordance with what the group thinks it is proper because they do not want to lose their status within the group, or they seek reward from the group. This behaviour is defined by Lowry, Zhang and Wu (2017) as ‘social learning’ which is the process where individuals learn new
behaviours by observing others. They add that imitation of a criminal behaviour is significant when individuals observe people who they like and admire.

An interesting finding from Levin’s, Dato-on’s and Manolis’ (2007) research is that social norms have a major impact on future downloading behaviour, thus, members of the group will think twice whether to download again in the future depending on what others think about them as regards downloading. File sharing might be seen as an opportunity gap in the market which is constituted by entertainment enthusiasts willing to explore many digital goods and even to support the creators (Cenite, Wang, Peiwen and Chan, 2009).

2.2.2. Personal morals

Lowry, Zhang and Wu (2017) in their meta-analysis found that in piracy literature some studies show that morality matters (e.g., Seale, 2002; Siponen et al., 2012), whereas others do not (e.g., Chan et al., 2013; Holt & Morris, 2009).

Arli & Tjiptono (2016) debate that moral obligation is negatively related to consumer’s attitude towards digital piracy and to consumer’s intention to pirate digital products. Moreover, Logsdon et al. (1994) proved that the higher the level of moral development is, the less likely the individual will have a positive attitude towards digital piracy. Kohlberg (1984) found out that a variety of aspects such as age, gender, education, religion, and culture differentiate the morals. Another influential factor on voluntary behaviour is the individuals’ perception about how strict the legal system and the punishment for illegal downloading are. Moore and McMullan (2009) believe that even though consumers know that these actions are illegal, they neutralize the facts in their minds and they tend to do digital piracy because they deny that there is a victim, they deny the fact that they cause injury, and they believe that everyone else is doing so. Moreover, consumers download to satisfy desires that present business markets poorly can, such as time, convenience, access to a large range of content. Kohlberg (1969) developed three levels of morality. To the pre-conventional level belong persons who try to avoid punishment in order to achieve some level of self-gratification. The conventional level individuals are sensitive to peer pressure. Post-conventional level means that individuals are concerned about consequences toward society in general. Lane and Lane (1996) found that many students belonged to the second level of Kohlberg’s (1969) moral system. This means that students’ morals are influenced by their peers, however, they do not worry about the legislation.

2.2.3. Legal factor

Legitimate companies may own the copyright or make deals with copyright owners to distribute their music, for example, iTunes, Napster, etc. (Gayer and Shy, 2003a). These services are
distributed without charge and allow users to download both licensed and unlicensed files. The increased copyright protection raises the quality differentiation between originals and copies. This leads to a higher enthusiasm to pay a higher price (Duchene and Waelbroeck, 2006; Zenter, 2006). An example is the legal actions in the US by the RIAA against piracy technologies and their users, backed up by the support of the copyright law stated in the Digital Millennium Copyright Act, that translate these concerns (Peitz and Waelbroeck, 2006). The new Peer networks systems have proven to be more complicated to fight legally as they do not require a central server to operate and many of these new systems are set up in countries with different legal systems (Varian 2000). For instance, Kazaa is registered in the South Pacific island nation of Vanuatu, the software distributor is in Australia, and the servers are in the Netherlands. In addition, the reduced users of Kazaa can be a result of the legal strategy that encouraged individuals to use other less popular sites and forums where the risk of being sued might be lower. Nevertheless, there is another opinion that claims that the recovery of sales in the music industry may be explained by the success of the new legal strategy (Zenter, 2006).

2.2.4. Technological factor

The continuous development of digital technology makes the information sharing and the sampling of digital goods easy, less costly (Barua et al. 2001; Cunningham, Alexander, and Adilov 2004) and accessible to more people (Conner and Rummelt 1991; Gopal and Sanders 1997; Bhattacharjee, Gopal, and Sanders 2003). Software firms enforce piracy protection technologies, such as encryption, that increase the cost of pirating software for the consumers and lead them to purchase the product. However, Gopal and Sanders (1997) argue that companies should focus on prevention controls that rely on educational and legislative schemes to avoid piracy. With the increase of the technology the distribution channels have changed and the traditional stores have been replaced by the online retail. People can upload CDs to their PCs’ hard drives and listen to music on their computers, compress files to an MP3 format to decrease the storage space memory requirement and to facilitate sharing of the files over internet, convert files back to a CD format and burn CDs that can be played in a regular player. These technological developments represent a noteworthy decline in costs if we concede that 50% of music costs are distribution expenses (Zenter, 2006). Digitally-stored products could be downloaded from fixed Internet sites in a server that all consumers have access to download. The owners of the site make profit by charging the users for downloading the information, or by placing advertisements. Another way for the users to download illegally is by the exercise of file sharing Internet distribution channels. Each channel provides a group of users with the same networking program to connect with each other, and directly retrieve files from one another’s hard drives. After the installation of the software program
(e.g. Gnutella), each user puts the Internet Protocol (IP) address of his computer, which immediately becomes both a client and a server (Gayer and Shy, 2003b).

2.2.5. Media & Celebrity Endorsement

Most of consumer information related to the legislation for digital piracy comes from the media. News media is a significant source of information as they inspire trust to the public, which is a necessary condition for trust in other social actors such as companies (Mayer, Davis, & Schoorman, 1995). This occurs because individuals believe that they will get objective information from the media (Gambetta, 1988). In addition to this, the current strategy used as a response to Digital Piracy is to endorse celebrities in the campaigns. It is believed that celebrity endorsement has a great deal of impact on society worldwide because this person is famous and attracts media interest because of his/her celebrity idolization (Dimanche and Havitz, 1994). When celebrities state publicly that they are against Digital Piracy, the fans will perceive this as interaction between them and the celebrities, which is very meaningful to the fans (Alperstein, 1991). Loyal fans will only purchase copyrighted albums (Raviv et al, 1996).

3. METHODOLOGY

3.1. Data collection and designing the interview

This research comprised a comprehensive series of semi-structured interviews of young university students in the United Kingdom. In total 10 semi-structured interviews were conducted among students and each of them lasted 45 minutes. To ensure the balance of opinions the informants of both genders were carefully selected. The in-depth face-to-face interviews were conducted, thus giving an opportunity to have a dialogue with the informants, to analyse a list of topics for discussion as well as to give a chance to people to speak out about issues that they would not be able to cover in a questionnaire. Besides, it seemed a good opportunity to tape them or even film them in order to analyse in depth their non-verbal reactions and feelings (Arksey and Knight, 1999).

The semi-structured interview was chosen to make the students feel more comfortable in this environment. The list of topics for discussion is based on the analysis of the literature review, and it aims to answer the research questions posed in this inquiry. The prototype of a set of questions used for the interviews is presented in Table 1 The questions are composed as open type questions so that the individuals feel free and more comfortable to express themselves.

Table 1. Interview questions prototype
The use of interviews in the specific kind of research helps researchers not just describe the facts but to interpret them as well. An in-depth, multi-dimensional examination of a small amount of informants could build dependable observations that could be impossible otherwise (Ragin, 1994). This is important because similar incidents are explained by different informants in a different way. Open-ended questions enhance understanding of the background of events by giving them more meaningful explanations (Patton, 1990). Moreover, qualitative methods can identify models and configurations between variables and create divisions. In addition, the structured observations of the interviews were preferred over focus groups as for the particular topic the interactions among group members would not be revealing (Morgan, 1988). On the contrary, they could influence their answers and the group members could be afraid to express their real moral views in public. Cognitive interviews strengthen the view that qualitative methods help researchers understand how people perceive and interpret the language and their own experiences (Sofaer, 1999). Validity is accomplished through cohesion among the questions, the findings and the research model. Moreover, reliability of the findings is confirmed because the interview questions come as a result of a pilot survey that helps to find out the main areas that need further in-depth investigation.

1. Can you describe your position towards Digital Piracy? What feelings do you have when you download illegally? What feelings do you have when you download legally?

2. Can you describe the first time you downloaded illegally? Is there any difference in your feelings as compared to the last time you downloaded illegally?

3. What factors will you consider while taking a decision whether to download legally or illegally? Why are these factors important to you?

4. What would be your reaction if your favourite celebrity stated publicly that he/she is against Digital Piracy and why?

5. Are there any media that influence your opinion on Digital Piracy? Do you find any differences between the social media and the news media as regards their influence on you?
4. FINDINGS

4.1. Moral views

According to Kohlberg (1969), different levels of morality will result in different decisions at the same situations. Through the answers that the informants gave, different categories of morals were identified. It appears that individuals that have high morals will observe their actions and balance them to the goodness of the society that they live in. This is the point of comparison they use to weigh the rights of the companies and the rights of the people in order to conclude that they have high ethical values. It is clearly seen from the answers below that the higher an individual's moral judgment is, the lower their attitude towards digital piracy is. (Al-Rafee and Cronan, 2006; Kohlberg, 1969).

In general I am against ... I believe these are the rights of people... I am feeling that I am stealing somebody's rights... Maybe it will be easier if you download from those giant companies like Microsoft... because they are already 'eating a lot.' (A, age 30)

...Chinese for example can download the songs and you cannot because you are in England. This does not make sense to me. The regulations must be global. For me if I travel in a country that downloading is legal I will do it. Just because it is forbidden in one country I would like to do this if I was in another country. I believe that there is a gap here in the legislation. (B, age 25)

Another theme pertains to the current legislation is being perceived as unfair. From the studies performed it has been confirmed that consumers respond to businesses they deal with in terms of perceptions of fair treatment. (Houston and Gassenheimer, 1987). Respondent B states that not all of the Internet users have the same treatment because the law varies in different countries. In addition, people do not believe illegal downloading is a serious crime. The answer of respondent B shows that he believes that it is unfair to be punished so strictly when at the same time more serious crimes occur on the Internet.

Respondents C's and D's views on morality of downloading are that they have indifferent feelings towards digital piracy and they are not in favour or against it. (Oestreicher-Singer and Sundararajan, 2004). Respondent C is interested in a more convenient way to obtain the digital product and respondent D does not think about it too much. It is like a habit to him. As for respondent E, he raises an interesting issue that perceptions people have for digital piracy are too common because everyone is doing so.

To me there is no difference between the first time I downloaded and the last time because I just want to get the result, I mean I got the song and I don’t really care about the process. But it will...
be more convenient for me if I ask my friends to download it for me rather than buy the digital product by myself. (C, age 26)

I recognize that it is illegal but I am still doing it. In other stuff I act legally, this is the only illegal action that I do. I believe that it is wrong to do other illegal things but I do not have the same feelings about downloading... there are no feelings, you just use it as if you go to the bathroom, you brush your teeth, you make your food and eat it! (D, age 23)

I am not against but I cannot say that I am in favour, because I think that everyone is doing illegal downloading, so it is ok. Besides, I am not a frequent downloader. (E, age 23)

Respondents F and G have an absolute view towards Digital Piracy since they appear to believe that even though they know that Digital Piracy is illegal they sometimes forget it because they have got used to it. However, respondent G will always download illegally because she considers the convenience factor more important to her. They both seem not to think whether it is moral or not while making this decision. This could be explained by Kin-wai Lau (2006) whose research showed that they tend to be more accepting of piracy by deciding what is ‘good’ and ‘bad’ according to the social evaluations.

I am in favour of illegal downloading because it is supposed to be illegal but I am just used to it... it is very common to do this in Hong Kong and China... we are used to it and I just don’t feel that it is illegal although I know that it is. (F, age 24)

To be honest, I prefer to download mostly from websites illegally. It is convenient and easier. In an album, I don’t usually like all the songs. I will see which ones I like and go to the Internet to download them. (G, age 24)

Furthermore, according to Belle, Macdonald and Wilson (2007), affordability influences piracy intentions. The informants with a more economically driven view consider most of the products expensive, thus, they prefer to download illegally since they have an opportunity to do so. In addition, it appears from the findings that people are more likely to practice illegal downloading while they are teenagers because they cannot afford buying originals themselves. (Mandel and Süssmuth, 2009).

The factors that I will consider making this decision are firstly the money... The economic factor is important to me. (C, age 26)

... I prefer to download legally because I have the ability to afford it, but if I cannot afford it maybe I will choose to download illegally. (H, age 23)

...if I pay for that sometimes it’s too expensive. For example, one song costs about $10 or $5 I think, it is too expensive for me and I do not want to pay for that. I think the price is the biggest
issue. If I just have to pay very little money for a song or for a movie, I think I will pay for it. (I, age 29)

Also, Van der Byl and Belle (2008) proved that the cognitive beliefs are significantly correlated to the attitude towards Digital Piracy. It comes to an agreement with the current investigation. Piracy seems to take place when the individuals consider the price of the products too high. Thus, being unable to buy the original, they prefer to save money buying pirated digital media or download illegally themselves rather than to pay for the authentic.

If I download legally that means that I am doing the right thing but at the same time I am paying a lot of money and I am feeling like ‘why do I have to pay money, while I can get it for free?’ (A, age 32)

I don’t pay... because if there are available sources which you can download without charge I will just do this... so I just use these websites each time that I want to download freely. (F, age 24)

If each song is 15 Euros and the customer considers this absurd, then obviously the customer will seek for other solutions... Nowadays the songs have as an expiry date a 6-month period, so it is expensive and I would not bother to buy these songs. I would only do that for quality music. (B, age 25)

...you won’t buy the CD or DVD for only one time, especially for movies I only watch them once, because it is a waste and I do not know why I have to pay... I seek for something free and comfortable and do not think if this is legal or not. (E, age 23)

Another issue raised by respondents B and E is that certain digital products such as movies or music are not worth buying. They seem to consider them to be short-life products or goods that they will only use once. As a result, these products have a low value perception for them.

4.2. Social influence

It has to be noted that many participants answered that they are more influenced by their friends at the very beginning of practising digital piracy. Their friends are the people that transmit the knowledge to them regarding the means they can use to download illegally. It usually happens when individuals are teenagers and they have not yet developed their own opinion and attitude towards digital piracy. Also, respondents G’s, H’s, F’s and E’s view on digital piracy is that they consider this issue as too common and do not discuss with their friends whether it is illegal or not. They tend to talk more about certain digital products that they like downloading.

I started when my friends showed me. Then I got used doing this.... We just say which songs we downloaded, we don’t talk about from which website we downloaded. We don’t care about the fact that this is illegal. It’s a kind of a habit... It’s a common issue. (G, age 24)
I remember that I was told by friends how to download... when I talk to my friends we talk about what resources we use to download things, the speed or the content etc.... We just think that this is one of the things that we usually do. (F, age 24)

I ask what they have downloaded because I may be interested to download this stuff too. I also ask which website I can visit to download things and they give me the web address if I am interested to download something. (H, age 23)

Many people share things in forums and I think sharing things in the forum is not illegal from my point of view... all of the people have to be caught and go to jail or be fined. It does not make sense. (E, age 23)

At the beginning, I didn’t know how to download when I was much younger, so my friends who were downloading told me “this is how you download” and this is how I learned. (D, age 23)

It was also observed that individuals’ piracy behaviour is sometimes motivated by their friends’ behaviour, so that their actions are not disapproved by them. There is a need to feel that they are a part of a group.

Sometimes when you have a lot of people saying that ‘we download, we do this’ you have a feeling that maybe it is something fine because everyone is doing that, but I will not do it. (A, age 30)

The legislation is important for me when I am going to take the decision to download. The reason is that I want to be a good citizen and I do not want to break the law. It could damage your reputation if you were caught downloading things illegally. (H, age 23)

Another theme that seems to influence the informants is that the threat of embarrassment might also influence a consumer’s tendency to pirate (Keltner and Buswell 1997). Thus, when respondent H’s expected level of embarrassment increases that means that she is more controlled by the social norms and as a result gets more eager to pay for a legal download.

The virtual peer friends in online groups also play a very important role in the pirate behaviour. (Skinner & Fream, 1997). The participants seem to be influenced by their friends in the Internet groups such as Internet Blogs, Forums and Facebook because they are more likely to exchange digital material among them. The individuals accept this form of sharing and do not consider it as illegal downloading.

... nowadays we have something that is called file sharing. So it is not always illegal downloading, you also share files with people...when I talk with my friends we say: ‘You’ve seen
these new stuff? There is a new movie coming out, let’s not go out and waste money at the theatre because we just went yesterday, we download it and we watch it. (D, age 23)

My friend told me the website many years ago... we ask each other ‘where can I get it’ and maybe one got it already and just passes to us and then we do not really bother how we got this song. (C, age 26)

What signifies social groups is that it appears to have a positive influence towards the attitudes to practice digital piracy. Social groups such as Facebook or Internet Blogs can influence people’s opinion especially if the Internet users are teenagers or adults with lower levels of education.

persons with a higher level of education are influenced less from the media than the persons with a lower level of education... People who have not shaped an opinion about digital piracy are more likely to be influenced. (B, age 25)

The Internet channel is more convenient. For example, I can watch a video on Facebook or sometimes on YouTube but they divide the movie in many small portions but you can still watch it. (C, age 26)

the influence depends on your friends. If all of your friends are against that, they will influence you and make you feel ashamed if you download illegally and prefer to download legally. If all your friends do so, you don’t have any feeling of guilt. (H, age 23)

In some cases, social groups are used against digital piracy in order to make fans more dedicated to a celebrity or brands. Here, respondents F and E express different opinions about the social groups influence. Respondent F says that he would feel committed if he was a member of a group, however, respondent E believes that people tend to be members in several groups and soon they forget and she has doubts if a campaign with participation of social media would be successful.

If for example, most of my friends on Facebook started a campaign and opposed to this... I could be more influenced as compared with news media. This is probably because I have a stronger association with networking media such as Facebook as compared to news media. (F, age 24)

On Facebook, there are thousands of hundreds of groups, so it is difficult to use Facebook to improve the situation. It is not the best solution from my point of view because you just click “join the group” and then you forget about it. (E, age 23)

News media work as a tool to pass the information concerning the current legislation on digital piracy and to raise awareness on illegal downloading through media coverage. Although media tried periodically to raise public awareness regarding online misbehaviour, there is a lack of positive response from the public (Hoffer and Straub, 1989). Besides, absence of sufficient
information occurs in some countries. As a result, people do not to realize immediately if the
digital product they are downloading is pirated or not.

…we do not have enough awareness in China. Now that I have more awareness in the UK I
realize that nothing changed in my behaviour. (G, age 24)

…it is very hard to compare directly if it is legal or illegal... I don’t think there has been enough
coverage in the press to influence me. (F, age 24)

I just download things and the website doesn’t ask us to pay, so I don’t know whether it is
illegal or not. I don’t intent to download illegally... Media influence my opinion because they
are broadcasting things. The news media influence more effectively because it is run by the
government or a famous publisher like BBC, SKY etc. (H, age 23)

The news is not like a campaign, they bring the news and that’s it; but the social networks is
like campaigning. Individuals start something and sometimes they could be influenced by some
big companies. (A, age 32)

Participants stated that they trust news media because the information forwarded to them is
more reliable and not as subjective as from the social groups. Respondents A and H believe that the
messages delivered by the news media are more objective than from other source of media.

Moreover, Chiou, Huang, and Lee (2005) in their research show that consumers’ singer
idolization will affect negatively their general attitudes toward music piracy. It was observed that
individuals are willing to support their favourite celebrity. In this case they turn against digital
piracy and they are willing to pay for the genuine product. Fans have a negative behaviour
towards digital piracy because they have an emotional bond with their idols and do not want to
hurt them. If they are not fans this statement will not produce the same effect on them.

Of course, if this is my favourite celebrity who is stating that, I won’t download illegally. I love
my favourite celebrity and I want to support him. I must have his CDs. (E, age 23)

Generally, I prefer to buy a CD if I like the artist to support the celebrity... I would take his
statement more seriously, if I knew that he needs the money to survive and he is my favourite
celebrity. (B, age 25)

If I like a singer or some movie star, I will prefer to buy a real CD or DVD just for them. And I
don’t care about the rest of them. (C, age 26)

If my favourite celebrity is against DP, I might have a chance to think more about Digital
Piracy. Because we feel happy when we share same point of view with someone we love. (J, age
30)
If I hear a celebrity state that, I will not really feel differently. I know that all of these celebrities are against digital piracy because it affects their income and I just don’t have any strong feelings, even if they say so. (F, age 24)

Of course, I support him but I think that I am just one person and I cannot cause too many negative effects to him. (I, age 29)

Although celebrity idolization influences the attitudes to practice Digital Piracy, various answers show that some of the individuals do not have a favourite celebrity. Respondents F and I have no strong feelings towards them, so that they would not be convinced by celebrity statements.

4.3. Legislation

Digital piracy is a risky behaviour thus it depends on the perceived risk related to this behaviour. It is interesting to observe that the perceived risk depends on the possibility of getting caught and on how strict the punishment is. Lysonski and Durvasula (2008) point out that the “stick” approach of an increased possibility to get caught or a strict punishment such as jail or an excessive fine would influence negatively the attitudes to practice Digital Piracy. However, most of the informants choose to violate the copyright law because they do not consider it strict enough.

When I am downloading, I think about the law because I don’t want to get fined. If they found that I downloaded only one song and punished me and I had to pay £1000, then it would be better not to download it. (C, age 26)

I think about the legislation, but I’m more concerned about whether it is well executed or not... I download illegally because it is free and it is highly unlikely I will be caught, so why not do this? (F, age 24)

Legislation influences my decision because there is punishment if you do something wrong...If there was no law, I would feel better doing it. I would still feel guilty but sometimes I say that I will just do it once or twice and after that I will not do this again. If there is law, it means that this is something serious (A, age 32)

Participants seem to believe that even if the laws are strict it is impossible to get caught because on the Internet it is difficult to put laws and they consider Internet as a source of freedom that no one can intervene. Even though the laws do exist, the problem is that they are not always enforced. (Al-Rafee and Rouibah, 2008).

When I first started to download, I used to have thoughts like ‘What if I get caught?’ Now I don’t have this fear because if you scramble an IP address you will never get caught ...
Legislation is not important to me at all. There is no strong legislation to control piracy. (D, age 23)

On the Internet, it is difficult to put laws. It is a source of freedom. It is like imposing a military regime. (B, age 25)

The legislation is important for me but I think nowadays the law is not strict enough. I think it is not possible to put a law because I believe that 99% of the people worldwide will download anyway. This is too common. So, I think the government cannot do moves to find all the people who download. (E, age 23)

If they had strong legislation about Digital Piracy, I would be worried about the punishment and I wouldn’t download illegally anymore...The reason why I am doing illegal downloading is that there is almost no chance to cause a problem at the moment. (J, age 30)

If the law was very strict it would affect my decision, but I think it is very difficult to find me because Internet is so big and there are too many people who do that. (I, age 29)

The law is not quite strict in order to prevent Internet users to download illegally. The reason is that they have the perception that there is no actual appliance of the law in practice, so everyone can download from the Internet without any impacts.

4.4. Moderators

It is noticeable that the digitalization of many products made the pirating much easier. The data obtained from the interview prove an interest of the informants in the website features. People seek to find convenience when they download and it was observed that they prefer easy means of downloading, If the downloading is complicated, they will drop it and not download.

I consider easiness and comfort in downloading of primary importance. For example, I may feel bored to get dressed and go to the cinema, so I will just download it, wait for 5 minutes and watch it in my pyjamas. (D, age 23)

If I download from a reliable source that is legal, usually the speed is higher and it is easier to download. (F, age 24)

It is convenient and easier. In an album I don’t usually like all the songs. I will see which ones I like and go to the Internet to download them. (G, age 24)

According to the study of Johnson, Bellman, and Lohse (2003), an easy-to-learn navigation design leads to more frequent visits and higher levels of purchasing. The answers show clearly that individuals prefer to visit websites with superior functionality and sometimes this is the factor that they will consider most while taking their decision whether to download a legal or a pirate digital product.
I don’t pay when I download because it is more convenient rather than to provide another website with my credit card details, etc. (E, age 23)

You just have to type the song or movie you want to search, then you click and wait for about 3 hours and you can have a movie to watch... I think that because it is easy and free, I do it very often... For example, YouTube is also very convenient... if the payment system is easy and convenient I think I will just pay for it... waste too much time to do that, I think I will just pass it and go for illegal downloading. (I, age 29)

I will think if it is convenient to download because sometimes the process consists of too many steps. If it is complicated, then I will just give up... I feel that their process is complicated to apply for an account and I don’t know how to pay for the song, how much money to pay, how many songs etc. It is very complicated to calculate payment efficiently and make it cheaper. (C, age 26)

Teece (1986) confirms that persons prefer to obtain digital products in a package that includes a mixture of ‘complementary assets’, such as marketing, competitive manufacturing, or after-sales support. The participants state that they would prefer a unique package mix which they could not find anywhere else. Besides, people tend to buy the package because the package is superior from the pirate download.

...sometimes they give some kind of packaging with gift or some promotion, then I will buy the real one. Otherwise I won’t. (C, age 26)

It is understandable from the data collected that safety hazards are vital for the individuals. These risks are a serious concern for participants because any gains from getting the digital product for free can be undermined.

No matter if it is illegal or legal I will as well consider the safety of the website because I do not want my software to get a virus. (C, age 26)

Honestly the first thing that I think about when I want to download illegally is the quality of the software, whether it is going to harm my computer and my software. So I will pay money rather than download something which I have to pay more because of the damage happening. (A, age 30)

Participants showed particular emphasis on the importance of the available access that they have to download illegal material.

It is available and it is for free. Why not go for it?... if a person makes a movie, it is available only in the Internet even before it is released in the cinema. Why? Because someone in the manufacture links it out. If they don’t do this, we can’t download. Catch those people who are
releasing material into the Internet. If there is nothing to download, then how can we download? (D, age 23)

I look what I want to download and if I can find it from other sources... The first time I downloaded was when I was trying to find a video from a TV show from two very famous Greek artists and I could not find this on a CD, so because I wanted it so much I downloaded it... If you cannot find something elsewhere then why not downloading it from the Internet? (B, age 25)

I’ll just go directly to the website to download. If they charge me and I really like the song and there is no other way I can download it for free, then I am willing to pay for the album. (G, age 24)

It appears that availability has as a consequence an even larger piracy behaviour due to the fact that it makes people download illegally more frequently. The findings coincide with the research of Belle Mcdonald and Wilson (2007) that proves that piracy attitude influences piracy behaviour, moderated be available enabling technology.

5. DISCUSSION, CONCLUSIONS, IMPLICATIONS, LIMITATIONS AND FUTURE RESEARCH DIRECTION

5.1. Discussion, conclusions, and implications

This investigation suggests that there is a need for a proper background to generate a new business strategy to respond to the issue of Digital Piracy. These strategic changes may include a change in the business model as well. This research aims to give empirical evidence to the previous studies most of which were carried out by quantitative research and simultaneously to fill in the gaps relating to Digital Piracy literature. The in-depth interviews provide evidence of the relationship indicated of moral views and social influence to lead to an attitude towards Digital Piracy and thereby, to the adaptation of a Piracy Behaviour. The current qualitative research sheds more light on the variables influencing people’s attitude towards Digital Piracy and constitutes an answer of the proposal of Huang (2005) for the investigation of the effect of social networks on piracy behaviour, the suggestion of Belle, Macdonald and Wilson (2007) for a qualitative research to investigate their model as well as a result of the examination of numerous articles.

Apparently, most of the participants showed familiarity with and acceptability towards illegal downloading. Each informant is driven by dissimilar moral views. Specifically, informants who weigh the rights, have high moral standards, however, they will consider who they are ‘stealing’ from and who gets the copied material. (Al-Rafee and Cronan, 2006). Conversely the absolute
viewers of morality will answer to Digital Piracy with a “Yes” or “No” (Kin-wai Lau, 2006). Indifferent feelings towards digital piracy occur to individuals when they do not put much thought to see downloading as a moral decision. Downloading for them is a habitual action (Oestreicher-Singer and Sundararajan, 2004).

The economically driven view of morality makes individuals consider the affordability of the product and the value perceptions about it. Different ethical positions require a different strategic approach. The companies should understand that individuals believe that digital products are overpriced. By lowering the prices, the digital pirates will make second thoughts in their piracy attitudes and prefer to give money for the authentic, because for customers the opportunity cost is low and the difference in quality is significantly different. Moreover, when companies provide the digital product for free that might have revenues too but not necessarily directly from internet users. An example is the free online newspapers, where the publisher ‘sells views’ by being paid by the companies who are being advertised in the website. Arli and Tjiptono (2016) suggest that the digital industry should promote the benefits gained by buying legally such as the lack of repair and customer service from both marketers and Information Technology support.

It appears that social influence factors which include peer file sharing, social groups and the general media formulate attitudes towards Digital Piracy. Peer file sharing is most feasible to influence individuals positively for illegal downloading (Warr, 2002). As mentioned in findings, social groups have strong influence to attitudes, especially in younger ages (Skinner & Fream, 1997). The strategy of maintaining fans’ commitment seems to be the most suitable. Findings show that media tend to give a prohibited picture to the informants about Digital Piracy. They appear to explain the legal side as well as presenting celebrities’ statements against this matter (Chiou, Huang, and Lee, 2005). Companies should focus their marketing efforts on young individuals by giving them sufficient information to fill the gaps in their knowledge regarding to what digital piracy is, why it is illegal and how they can distinguish a legal digital product from an illegal digital product. In addition, a good strategy to keep the individuals bonded to the brand is to involve the group members in the creation of new products and having regular interaction with them.

It was also revealed in the findings that the influences of these two aspects on attitudes towards digital piracy are moderated by legislation, which include the perceived risk (Lysonski and Durvasula, 2008) as well as the inefficiency of the current legislation (Al-Rafee and Rouibah, 2008). As it turned out from the interviews, other moderators such as availability, safety risk, ease and convenience and packaging offers act as moderators for the people who are willing to make a decision to download. These factors are not less significant since they may possibly have the last
word in their decision to download legally or illegally. For that reason, these moderators have to be exploited to give a benefit to the companies of increasing the authorized decisions for downloading.

5.2. Limitations

Although face-to-face interviews can provide an in-depth analysis, there will always be the limitation that their findings cannot be extended to wider populations. As a consequence, the significance of each factor to the model which can only be viewed by quantitative analysis is not quite clear. Due to the limited time given for the interview it was not feasible. Moreover, time limitations led to an interview executed by convenience sampling. Therefore, there is a danger for the data collected to be biased since most of the informants do not come from the Western countries where they have more absolute terms of morality. In other words, some of the individuals use the social evaluations to decide what the ‘right thing to do’ is (Kin-wai Lau, 2006).

5.3. Future research direction

Some suggested factors to be added in the model are the societal environment, the perceived importance, the Ego strength, the impact of sampling, and the organizational or school ethical climate (Belle, Macdonald and Wilson, 2007). Another empirical research can test if different levels of price can change piracy behaviour. Also, it would be beneficial for the future researchers to investigate personal characteristics such as the gender due to the fact that the ethics literature suggests that males have a lower ethical standard than females (Ford and Richardson, 1994). Age could be another personal characteristic that can be tested since we know from the ethics literature that younger persons have lower moral standards than older individuals. Moreover, wealth differences can be tested as regards their influence on the attitudes and behaviour that lead to Piracy Behaviour (Belle, Macdonald and Wilson, 2007). There is a need for a larger scale quantitative investigation to be implemented and for the model to be tested in a long-term timeline. Besides, a longitudinal study gives the advantage to compare changes in the relationships geographically and over the time (Limayem, Khalifa and Chin, 2004).

Future research should investigate the differences between the intrinsic (fun, thrill, enjoyment, revenge) and extrinsic motivations of piracy behaviour and any other environmental drivers. Also, differences should be investigated separately for software and music digital piracy behaviour (Lowry, Zhang and Wu, 2017).

A quantitative research by obtaining data from broader geographic and demographic categories can increase the generalisability of the findings (Arli & Tjiptono, 2016), and provide comparison
points, especially in comparative continents such as Europe, United states of America and Asia (Kos Koklic, Kukar-Kinney & Vida, 2016).

A longitudinal study could capture the ever-changing digital market and the digital piracy behaviour of the consumers (Culiberg, Koklic, Vida and Bajde, 2016).

Since in the present research it was observed each participant had a dissimilar moral view on the subject it would be interesting for future research to compare views of people who are in favour and people who are against digital piracy, on a larger scale quantitative research.

ABSTRACT

The goal of this paper to analyze the effects of crowdfunding on the open innovation capabilities of the agri-food business. The research is based on a survey methodology, which is useful to enhance the generalization of results (Dooley, 2001).

The paper builds on the theoretical framework and the consequent conceptual model to conduct the empirical research, which follows two main steps. First, the literature review led us to develop the questionnaire and therefore the variables of our model. Second, we have tested the model and the hypotheses through hierarchical regression model, which was considered a suitable method in innovation management studies.

Keywords: open innovation, crowdfunding, access to new knowledge, agri-food business

INTRODUCTION

Open innovation is becoming increasingly important in the food sector. According to Sarkar and Costa (2008), there is rapid growth in the number of open innovation projects.

Around the world, consumers are increasingly opting for specialized diets that address their desire to eat organic, low-fat, low-carb, or eliminate ingredients based on food sensitivities, allergies or personal convictions. Approximately two-thirds of the respondents (64%) in Nielsen’s new Global Health and Ingredient-Sentiment Survey said they follow a diet that limits or prohibits consumption of at least some foods or ingredients (Nielsen Research, 2016). Moreover, a majority of European consumers are believers in positive nutrition, with 56% using food/drink to improve health (Vitafoods Europe, Datamonitor Consumer Survey, 2016).

In order to address these challenges, the Italian agri-food business have to increase their innovative capacity by creating new products and services, commanding a premium (OECD, 2013).

As Michael Porter states (2007), the actual models of competitiveness rely on radical innovations and home based factor endowments in achieving competitive
advantages. As presented by Carayannis and Wang (2009), there are two types of competitiveness: resource-led and innovation-led competitiveness. The resource-led competitiveness model states that higher productivity results from through lower cost of natural resources or lower costs of an unskilled labor force. On the other hand, the innovation-led competitiveness model emphasizes that a higher productivity is achieved through a higher efficiency and this is based on knowledge and innovation. This means that the fast development of technologies and the rapidly changing markets, combined with increased global competition (also due to relieve of EU’s protection measures) and changing customer demands, imply that a firm’s focus on production capacity and cost reduction can only generate a temporary competitive advantage. In this scenario, Knowledge management (KM) has already been recognized as a key managerial process necessary for achieving competitive advantage (Carayannis, 1999; Argote and Ingram, 2000; Dias and Bresciani, 2006). Specifically, it assumes that tangible resources are sources of competitive advantages only when they are applied with certain knowledge (Grant, 1996), consequent to the difficulty of imitating knowledge (literature (Nonaka, 1994; Spender, 1994; Nonaka and Takeuchi, 1995; Alavi and Leidner, 2001; Soto-Acosta and Merono-Cerdan, 2008; Bresciani, 2010).

Despite of this, innovation is becoming increasingly complex and expensive making difficult for individual businesses to develop and introduce new products and processes independently. Innovation has become an unavoidable interplay of various parties who combine their knowledge and turn problems into design requirements. This is the reason why the concept of open innovation introduced by Chesborough (2003) has thus become a key concept. This term characterises the shift to a system in which chain partners, knowledge institutions, governmental bodies and even competitors work together to develop new products and processes quickly and effectively.

In order to assess these challenges, this study would analyze agri-food business typically described as a relatively mature and slow-growing area of business. Small agri-food business displays a relatively low level of R&D investment and are quite conservative in the type of innovations they introduce to the market (Costa & Jongen, 2006). Moreover they shows much lower innovation-absorption capabilities than their larger counterparts and a lack of effective technology transfer and flexible IP-
management rules (OECD, 2015; FAO, 2015). Due to the lower innovation-absorption capabilities and to the limited resources for in-house R&D, agri-food business must maintain a broad network of partners to provide them with scientific and technological input (Knudsen, 2007). In the current dynamic environment, firms increasingly have to heighten internal Knowledge Management Capacity (KMC) in order to manage inward and outward flows of knowledge exploiting and exploring external opportunities (Santoro, Vrontis, Thrassou, Dezi, 2017).

IT applications could allow firms in conveying relevant information useful to reconfigure innovative mechanisms (Del Giudice and Della Peruta, 2016). In particular, Web 2.0 technologies are empowering firms to outsource their internal business tasks and activities to individuals, or the crowd, on the Internet who are capable of completing these business tasks. The crowd can also invest in business ideas and projects that are initiated by entrepreneurs in the crowd who do not have the traditional monetary resources, such as banks and investment agencies, to implement their ideas. These entrepreneurs can pledge for financial resources from the crowd in various open social communities. This emerging approach of raising money via the Internet is called crowdfunding. Massolution reported that the volume of crowdfunding grew 81% from 2011 and reached $2.7 billion in 2012. In addition, the reward-based type of crowdfunding [3, 4] was expected to reach $1.4 billion in 2013.

As a result, we propose that open innovation is directly associated with innovation capacity, and that crowdfunding positively affects the relationship between open innovation and Innovative capacity.

The paper is structured as follows. First, we review extant literature on the application of the open innovation and Knowledge management concepts in the food industry. Next, we analyze the impact of the crowdfunding on open innovation. Finally, we summarise the conclusions of our analysis, draw implications for the future of open innovation in the food sector and highlight areas where more empirical research is needed.

THEORETICAL BACKGROUND AND HYPOTHESES

Open innovation in the agri-food business

Recent important changes in the nature of both food demand and supply, coupled with an ever-increasing level of competitiveness, have rendered innovation not only an unavoidable corporate activity, but also one that is increasingly vital for overall agribusiness profitability.

Recent general advances in areas like biotechnology, nanotechnology and preservation technology offer an unprecedented number of opportunities for
added-value applications in the food industry, many of which have the potential to adequately meet modern consumer demand (Juriaanse, 2006).

Such perceived wariness, together with the necessary stringency of legal requirements related to safety, transforms food product and process innovation in a highly complex, time-consuming and risky endeavour, and hence one not to be lightly undertaken.

Many of the emerging technologies that can potentially sustain (or complement) a wave of successful new food applications (e.g., nanotechnology) are being developed outside the processing industry. The pressure on these organizations forces them to continuously adapt to the environmental shifts (Greenwood & Hinings, 1996) and to create organizational forms able to provide faster and innovative response to market threats and opportunities (Coleman, 2009).

On another hand, drivers of opening up infood industry are closely related to the growing number of chain actors, the contradictory requirements of chain actors, the heterogeneous needs/new trends in consumers’ demand, the Mass customization market and to the Legislators (Sarkar, Costa, 2008; Bilgliardi, Galati, 2013).

The market issues and the number of actors of different sectors involved in food production, together with their difficulty to single-handedly meet all the heterogeneous requirements of intermediate customers, end-users and legislators, determine that innovation activities must be carefully coordinated. This in turn compels innovation processes to be managed both within and across organizational boundaries along the value chain (Costa & Jongen, 2006; Grunert et al., 2005; Mikkelsen et al., 2005).

Cooperating with others on the development and commercialization of new products and technologies is an important way to innovate. This is one of the several ways to start 'open innovation' (Chesbrough et al., 2006). Open innovation can be defined as the combination of internal and external paths for both the development and commercialization of new technologies and products (Chesbrough et al., 2006). Open innovation (OI) could involve outside-in and inside-out flows of technologies and ideas (defined as ‘technology acquisition’ and ‘technology exploitation’) (Lichtenthaler, 2008).
The establishment and management of inter-organizational relationships with customers, competitors, suppliers, public and private research institutions or even seemingly unrelated businesses, with the aim of acquiring additional knowledge and skills for innovation processes are increasingly growing (Gatignon, Tushman, Sith, & Anderson, 2002; Hauser, Tellis, & Griffin, 2006; OECD & Eurostat, 2005). Amongst the highest profile adopters of OI is Procter & Gamble (P&G), with former CEO, AG Lafley, inspiring a culture change from “not invented here” to “proudly invented elsewhere”. P&G’s Connect & Develop (C&D) programme has been highly successful, producing more than 35% of the company’s innovations, including Pringle Prints, and billions of dollars of revenue.

Another example of the application of OI in the food sector is International Flavors and Fragrances. IFF taps into the creative potential of its customers when conceptualising and designing products. Using an internet toolkit with a large database of flavours, the company involves the customer when creating a new flavour. Co-creation allows it to increase its ability to meet individual customer expectations and to reduce time-to-market.

Despite of this, Open innovation (OI) approach works well for the high-tech industry but it doesn’t well perform for the low-tech industries. Moreover, given the high number of actors of different areas involved in italian food supply as well as their difficulties to single-handedly meet all the heterogeneous requirements of intermediate customers, end-users and legislators (Costa & Jongen, 2006; Grunert et al., 2005; Mikkelsen, Kristensen, & Nielsen, 2005), cross-boundary innovation management should thus be a widespread practice in food value chains and networks. Consequently, the goal of this study is to analyze open innovation capabilities in small and medium agri-food business, focusing on the role of readiness to collaborate, partner intensity (Ahn et al., 2016) and openness variety capabilities (Laursen and Salter, 2006; Aloini et al., 2015).

As Mortara (2007) argued, agri-food sector recognises the potential power of OI: the ‘outperformers’in the food industry use external sources of innovation. From this perspective, OI could improve successful approach to achieving sustained high growth and containing innovation costs. By cooperating in networks, firms have better access to new knowledge enhancing the innovative potential of an organization. Moreover, by cooperating with different partners along the value chain, firms are able to cover a larger part of the value chain. This can lead to increased added value for customers by offering a total solution. At the same time, by combining (financial) resources in which cost and risk reduction play a crucial role, new knowledge can be developed which was impossible for each member to obtain alone. Open innovation will lead to added value for participating firms (De Rochemont et al, 2007).

The next section will explore the role of knowledge management as a key to open innovation.
Knowledge management: key to open innovation

The trend towards open innovation requests an integrative perspective and calls into question traditional perspectives on firm boundaries (Chesbrough, 2006; Santos and Eisenhardt, 2005; West, 2008) considering knowledge exploration, retention, and exploitation inside and outside organizational boundaries. These dynamics describe ‘knowledge capacities’ as a firm’s capabilities of managing different knowledge processes. Quantitative empirical studies on external knowledge sourcing provide evidence that involving a large number of external sources of knowledge in innovation is a promising choice for large firms (Lakhani et al. 2006; Laursen and Salter 2006). Open innovation scholars also agree that external sourcing of knowledge does not replace in-house R&D and highlight the importance of “absorptive capacity,” which allows firms to identify, absorb, and make use of external knowledge (Cohen and Levinthal 1990; Dahlander and Gann 2010).

According to the Community Innovation Surveys (OECD, 2016) conducted on more than 1300 European innovative food firms, since most food firms don’t have the competencies nor the capital needed to innovate on their own, they need to find partners to join forces in open innovation collaborations. However, Small and Medium Sized Enterprises (SMEs) in the food sector often face difficulties in establishing a strategic and efficient network.

Agri-food companies are as innovative as companies in other industrial sectors, but the innovations developed are largely incremental (about 2/3 of innovations). Between 2006 and 2008, 44% of companies implemented a product or process innovation. If we broaden the measure of innovation to take account of intangible innovation (organisation, marketing), 61% of agro-food companies report that they innovated between 2006 and 2008 (Lesieur, 2011). Organisational innovations are, incidentally, the most used category of innovation because 36% of agro-food companies implement them, regardless of size. The proportion of companies who innovate decreases for the other kinds of innovation (32% for marketing or process, 28% for products).

Following these evolutionary analyses, a large number of works have been concerned with the role of the diverse relationships and cooperation developed by firms with other stakeholders to “absorb” (Cohen, Levinthal, 1989; 1990) external knowledge. The idea of these authors is that the capacity of a firm to exploit external knowledge is a critical determinant of its capacity for innovation: a firm will be more or less able to exploit the technological opportunities of its environment depending on its knowledge-base and the learning process that occurs within this.

The survival of a brand in this kind of market depends on its capacity to distinguish itself from its competitors, this capacity being reflected in particular in a strategy of innovation in products and processes (Martin et al., 2006 a). In particular, companies with fewer than 50 employees, and...
particularly those with fewer than 20 employees, favour changes in their organisation and marketing innovations slightly more than technological innovations. With few resources to develop innovations (R&D staff but more generally human and financial resources), these SMEs innovate in an incremental way by continuously improving their organisation, their products and processes.

To capture internal and external knowledge exploration, retention, and exploitation, six knowledge capacities are needed (Argote et al., 2003; Lane et al., 2006): inventive, absorptive, transformative, connective, innovative, and desorptive capacity.

Fig. n 1 Capability-based view of open innovation processes (Chesbrough, 2003, Argote et al., 2003; Zollo and Winter, 2002)

When adopting an open innovation approach, firms tend to build up collaborations with actors of their ecosystem, which generate vibrant inward and outward flows of knowledge (Chesbrough, 2006). The role of absorptive capacity in agri-food business is critical to compensate for lower internal research capabilities (Carpenter et al., 2003; Dyer et al., 2004; Huston and Sakkab, 2006).

While inventive capacity refers to internally exploring new knowledge, absorptive capacity relates to exploring external knowledge. Based on Cohen and Levinthal’s (1990) original definition of recognizing, assimilating, and applying external knowledge, Zahra and George (2002) differentiated between potential and realized absorptive capacity. In a similar vein, Lane et al. (2006) distinguished exploratory, transformative, and exploitative learning processes. Following these reconceptualizations, absorptive capacity in the knowledge management capacity framework focuses on knowledge acquisition, i.e. potential absorptive capacity (Zahra and George, 2002) and exploratory learning (Lane et al., 2006). Because of this focus on knowledge exploration processes (Lichtenthaler, 2009), it does not guarantee successful knowledge commercialization, which is part of the knowledge exploitation processes. External knowledge sourcing may span various kinds of external innovation partners, who relate to different knowledge flows and can provide access to widely differing knowledge domains such as science, technology, design, societal trends, customer insights and product-market trends (von Hippel 1988; Sidhu, Volberda, and Commandeur 2004)

On another hand, due to the lower innovation-absorption capabilities and to the limited resources for in-house R&D, agri-food business must also maintain a broad network of partners to provide them...
with scientific and technological input (Knudsen, 2007) Interorganizational relationships, e.g. alliances, may be considered as a firm’s external knowledge retention (Grant and Baden-Fuller, 2004; Gulati, 1999). Similar to internal knowledge retention, external networks have to be maintained and managed over time (Kale and Singh, 2007). From this perspective, connective capacity refers to a firm’s ability to retain knowledge in interfirm relationships, it comprises elements of alliance capability (Kale and Singh, 2007) and relational capability (Lorenzoni and Lipparrini, 1999). Connectivity capacity is closeley related to absorptive capacity. As a matter of fact, the more knowledge a company has in a particular field, the easier it is to manage interfirm relationships and to profit from external knowledge retention. Accordingly, connective capacity comprises the process stages of maintaining knowledge in interorganizational relationships and subsequently reactivating this knowledge (Garud and Nayyar, 1994; Grant and Baden-Fuller, 2004).

To be effective, agri-food business need to improve also Innovative capacity transmuting knowledge and converting this knowledge into new products or services (Khilji et al., 2006). In order to generate innovations from internal or external knowledge and improve commercialization opportunities, a company needs sufficient prior knowledge (Kogut and Zander, 1992; Smith et al., 2005). Despite of this, it should not be overlooked that Italy is mainly composed by SMEs and, under a family control (Maggioni & Del Giudice, 2012). For this reason, we do not have to be satisfied with some best practices, but we must act in a systematic way in Italy. Moreover, it is necessary to trigger a virtuous circle that increases the awareness of the importance, rather of the need, of investing massively on digital innovation at all levels. Because digitalism is a transversal gap, a decisive step in this direction can only begin to argue in the light of the ecosystem for firms, universities and institutions and civil society to join forces and travel united (Carayannis & Campbell, 2012).

Even if SMEs have increased their activity in open innovation, inbound open innovation is far more diffused than outbound open innovation (van de Vrande et al. 2009). Moreover, due to the the resource constraints and the role of informal interorganizational relationships in innovation, SMEs prefer nonmonetary activities such as networking and informal knowledge sourcing over pecuniary and complex transaction-based ones, such as acquisitions and in-licensing.

All these factors could negative affect desorptive capacity as well as the ability to externally exploit knowledge.

Open innovation proposed by knowledge management literature suggested that firms can and should use external as well as internal ideas, and internal and external paths to market, as they look to advance their technology (Chesbrough, 2004; p. 1). Thus, new innovation models entlais new forms of interactions and collaborations for fostering new products and processes development (Wang et al.,
Exploiting internal and external knowledge flows, and developing digital ecosystems through new ICTs, could be essential in bearing the acquisition and management of knowledge (Del Giudice and Straub, 2011).

Crowdfunding could represent a novel mechanism of fundraising to cope the resource constraints as well to improve formal interorganizational relationships. According to some scholars, crowdfunding is based on digital platform embedded in the current financial innovation (Moenninghoff & Wieandt, 2013), which operates in order to produce convergent innovation (Dubé et al., 2014). It means innovation that produces both economic and social (human) outcomes.

As also Loren (2011) suggested, open innovation can be implemented using crowdsourcing, or the issuance of a challenge to a group of experts and non-experts found outside the organization, using an Internet-based platform. More thoroughly, Chesbrough and Appleyard identify four challenges for effectively managing open innovation processes:

- attracting participation from a broad group and sustaining it over time;
- effectively competing for contributors in a world with a limited supply;
- effectively setting the tone and expectations for the meaning of involvement on the part of users through careful leadership and agenda formation; and
- finding ways to profit from activities carried out in an open environment. (Chesbrough and Appleyard, 2007).

In the next section we will analyze the role Crowdfunding in open innovation.

Crowdfunding for open innovation: hypotheses development

The concept of “crowdfunding” is related to the one of “crowdsourcing”, which refers to the outsourcing to the “crowd” of specific tasks, such as the development, evaluation or sale of a product, by way of an open call over the internet (Howe, 2008). The type of contributions by the investor – and related rewards - may vary, depending on the internet platforms, the type of firms and the projects. Indeed, as new platforms are created across countries, in a context of low regulation, new features and business models are continuously emerging. The types of funding may range from donations to equity, thus giving rise to processes with different degrees of complexity and different contractual relationships between the firm and the individual investor (Kleeman et al. 2008).
Crowdfunding has been proved as useful tool to connect entrepreneurs, researcher and potential funders, individuals who can supply financial capital (Wheat et al., 2013; Marlett, 2015). This is possible thanks to intermediation internet based platforms, which act as marketplace where is possible to collect and canalize the scattered unlocked private capitals to sustain business ideas, also decreasing the weight of geographical proximity in the innovation process (Agrawal et al., 2011).

Despite the advantages, adopting open innovation throughout crowdfunding platforms is a challenging process (De Jong, 2007 and Chesbrough et al., 2006). Collaborating with a number of partners is more complex because of increased coordination and control efforts (Doz and Hamel, 1998 and Das and Teng, 2002). Previous research has demonstrated that many firms do not feel comfortable in these ‘open’ scenarios in which the return especially depends on the partnering actors. Networks of innovating partners bring with them significant strategic and organizational challenges, about which there is little prior knowledge (Vanhaverbeke and Cloodt, 2006). Moreover, prior research shows that the failure rate of bilateral alliances is quite high, ranging from 50-75% (De Rochemont et al., 2007). Cooperating in groups with an increased number of participants raises the likelihood of conflicting interests, and consequently, could lead to a breakdown of the cooperation (Park and Russo, 1996).

For the above reasons we can hypothesized what follows:

Hp. 1: The greater Knowledge exploitation through ICT, the Higher level of Open Innovation

Hp. 2: The higher level of Open Innovation, the higher the effects of Knowledge exploitation through ICT on Open Innovation

Fig 2 Conceptual Model
METHODOLOGY

Research sample and design

The research involves data gathered from European agri-food business involved in crowdfunding campaigns on Kickstarter and Indiegogo platforms. An email with invitation to participate in the survey along with a letter containing an explanation of the study’s purpose was sent to all the firms. In total 192 firms have expressed the interest in entering the study. A questionnaire, composed of several questions (open and closed), was sent to these firms, which was answered and returned by 80 firms, which represents the final sample. The answers for all the variables and general information of the firm were gathered from the different key managers to avoid concerns regarding common method bias. Therefore, the research is based on a survey methodology, which is useful to enhance the generalization of results (Dooley, 2001).

The paper builds on the theoretical framework and the consequent conceptual model to conduct the empirical research, which follows two main steps. First, the literature review led us to develop the questionnaire and therefore the variables of our model. Second, we have tested the model and the hypotheses through regression model, which was considered a suitable method in innovation management studies. The questions were stated according to a funnelling technique. Therefore, general questions were followed to the specific one. In this way, we have collected general information about the time successful gain of the Crowdfunding campaign goals, strategies firm such as number of employees, industry, financial data, etc. Consequently, specific questions were outlined and focused mainly open innovation, knowledge exploration and knowledge exploitation. The single questions of the questionnaire have been separated in order to reduce the risk of rationalizing the answers of the respondents. Moreover, we placed dependent and independent
variables in different position within the questionnaire to limit potential common method variance.

Variables employed
Data acquired from the questionnaire were used to develop the variables of the quantitative study. Accordingly, variables were developed using multi-item scales according to relevant literature to ensure their validity. In particular, we asked to respondent to evaluate several statements with a seven-points likert scale.

With regard to knowledge exploration as dependent variable, it measures the ability of a firm of developing new products or services, creating dialogues, learning and communities of practices, and explore knowledge externally (Edvardsson, 2008; Parida et al., 2012). To assess knowledge exploration we asked to the respondent to indicate the importance of: a) exploring external knowledge; b) developing innovative ideas and knowledge regarding products and processes; c) exploring innovative ideas and knowledge externally (Lichetnthaler and Lichtenthaler, 2009).

With regard to Open Innovation we focused on the combination of internal and external dimension (Chesbrough et al., 2006). In this regards, we asked to indicate the level of: a) Partner Intensity (Laursen and Salter, 2006; Aloini et al., 2015); b) Openness variety (Laursen and Salter, 2006; Aloini et al., 2015); c) Interaction with Experts on Intellectual Property Rights (IPR) (Bessant and Rush 1995; Hurmelinna-Laukkanen, Kyläheiko, and Jauhiainen 2007).

Finally, we employed the variable ICT knowledge exploitation according to the literature which emphasises its role for knowledge storage and sharing (Merono-Cerdan et al., 2007). In detail, we asked to evaluate the usage of collaborative technologies for knowledge sharing and the ICT adoption.

</tr>
</tbody>
</table>
Finally, we assessed internal consistency of each independent variable (Cronbach’s alpha Open innovation=0.841; Cronbach’s alpha knowledge exploitation ICT =0.898; Cronbach’s alpha Knowledge exploration=0.937), which shows good results.

Finally, we controlled for several variables that can influence the other variables and the analyses. We controlled for the size of the firm (calculated as the number of employees of the firm) because it can be considered as a measure of greater capabilities (Dewar and Dutton, 1986). Second, the age of the firm (calculated as the number of years since founding) can detect the experience of the firm accumulated through the years (Huergo and Jaumandreu 2004). The log term of these two variables has been processed in the models.

**DISCUSSION AND CONCLUSION**

Descriptive statistics show that most of the firms of the sample are small (the average number of employees is 98.90), spend internal R&D 10% in average and they are rather innovative in terms of (1) knowledge exploration (5.369), (2) knowledge retention (5.10) and (3) knowledge exploitation through ICT (5.108). This positively affect (4) open innovation performance in terms of partner intensity, openness variety e Interaction with expert on Intellectual Property Rights (5.25). Then, they have (5) a good performance in terms of time to successful gain crowdfunding campaign goals (65%).

We tested the hypotheses using regression analysis and the results are presented in table 3. We developed three models that test the direct effect of knowledge exploitation through ICT on open innovation and the moderating effect of knowledge exploration.

In detail, in model 1 just the control variables are entered, which effect is non-significant. In model 2 the effect of ICT knowledge exploitation and Open Innovation are considered. Knowledge exploitation through ICT is positively and significantly associated with Open Innovation (0.180; p<0.05). Model 3 considers the moderating effect of knowledge exploration on the relationship between ICT knowledge exploitation and Open Innovation, which is positive and significant (0.623; p<0.001). Finally, we can conclude that HP 1 and HP 2 are both confirmed by our analyses.

Notes: *p<0.05; **p<0.01; ***p<0.001

The first conclusion to be drawn from our review and analysis is that the time to successful gain Crowdfunding goals is positively related to Open Innovation.

Knowledge Exploitation through ICT measured through the capability of Converting knowledge into new products or services. From this perspective, Crowdfunding could help agri-food business to improve Innovative capacity transmuting knowledge and converting this knowledge into new products or services (Khilji et al., 2006).

Moreover, results show that open innovation takes place within the food sector, in spite of this being known as a relatively more traditional and mature industry. In particular our sample shows a good performance in openness variety (considering the number of external sources involved in the innovation process) and partner intensity (assessing the depth of the relationship between the focal firm and the extern context). At the same time, sample shows a moderate level in Interaction with
expert on Intellectual Property Rights. In order to improve successful knowledge commercialization, interaction with Experts on Intellectual Property Rights (IPR) is fundamental. To access technological knowledge, SMEs may rely on intermediate service providers. Experts on IPR can provide crucial information services that help to bridge the gap between a technological opportunity and its successful commercialization (Bessant and Rush 1995). However, the involvement of IPR experts is costly and also requires SMEs to deal with complex regulations and drawn-out patent protection procedures. Thus, it may make it more difficult to quickly move an idea to the commercialization stage (Hurmelinna-Laukkanen, Kyläheiko, and Jauhiainen 2007). Interaction with Network Partners could address this challenge creating long-term relationships with network partners as well as joint value rather than efficient transactions. (Nooteboom et al. 2005).

The second conclusion to be drawn from our review and analysis is that Active investments by the crowd improve access to new knowledge. Entrepreneurs offer investors to become active in the initiative, next to offering rewards to them. This may provide valuable feedback to the entrepreneur on potential market demand and product characteristics that the market may prefer most. Also, the active involvement may be structured in forms discussed above under the concept of crowdsourcing. Making investors become active by giving making investors become active by giving.

We also found evidence of a good effect of the ICT knowledge exploitation on the relationship between open innovation practices and knowledge exploitation. It reflects the innovative capacity of business and the related capability to apply knowledge that has been explored and retained inside or outside the firm (Khilji et al., 2006; Lane et al., 2006). Therefore, we could assess that Crowdfunding positively affect innovative capacity as a firm's ability to internally exploit knowledge. Crowdfunding seems a successful approach to achieving sustained high growth and containing innovation costs. Combining financial resources in which cost and risk reduction play a crucial role, new knowledge can be developed which was impossible for each member to obtain alone. By cooperating in networks, firms have better access to new knowledge enhancing the innovative potential of an organization. By cooperating with different partners along the value chain, firms are also able to cover a larger part of the value chain. This can lead to increased added value for customers by offering a total solution.

Our analysis of crowdfunding practices provides avenues for future research. One urgent question is the relation with intellectual property rights. Entrepreneurs making use of crowdfunding will need to disclose some of their ideas to the crowd well in advance, creating risks of idea stealing due to the fact that potentially valuable information is put into the public domain. In the next research we will also analyze which kind of business models of crowdfunded ventures and crowdfunding platforms
perform better in terms Access to new knowledge by cooperating in networks. To this aim we will use classification proposed by Lambert and Schwienbacher.

Moreover, open innovation strategies come in a variety of forms and, as such, are also met with a wide variety of outcomes. Consequently, there is a clear need for a better understanding of open innovation in the food sector, which should be addressed by the performance of more and more focused case-studies and empirical research.

Another interesting question concerns the informational content for entrepreneurs for obtaining the crowd committing capital. To which extent this affect the precision about potential demand that the entrepreneurs may receive for his product as well as which remuneration scheme for the crowd generates the most information about potential demand.

GOVERNANCE OF NON-PROFIT INSTITUTIONS: A MANAGERIAL ISSUE?
Civitillo, Renato
Sannio University, Department of Law, Economics, Management and Quantitative Methods-DEMM, Benevento, Italy

ABSTRACT
The nonprofit phenomenon is a topic conceptually much debated by scholars who deal with this both in Italy and in the international context. Often, the lack of profit in nonprofit organizations, together with the limited availability of financial resources, determining the crucial issues and difficult to overcome: the voluntary (or, in more general terms, the absence of profit-making) tends to give a little consideration to the use of practices and traditional management tools generally considered business reality.
Based on what mentioned above, this work is aimed at giving response to the theme of the relationship between nonprofit and its requirements of professionalization or management overhaul.
Highlighting those items might be useful for the management of nonprofit organizations: in this sense, if the critical factors just mentioned make up for these potential causes of problems, then, and on the other hand, the effective and efficient their presence would guarantee the achievement of any one or more competitive advantages, by means of their appropriate and adequate enhancement.

Keywords: nonprofit; third-sector; management

THE “NONPROFIT”: WHAT IS IT?
The nonprofit phenomenon is a logical category of difficult discussion. If we omit the fundamental clarification of the necessary distinction between nonprofit and third sector, we can say that the difficulties of interpretation are found in the definition of the concept: in fact, it appears to be ambiguous, owing to the vagueness of its use in everyday language, either (and more) in view of its application to empirical reality, because of the many and varied traditionally made organizational forms, related to that term.
Consequently, it is not difficult to imagine the essentially residual use of nonprofit concept, generally deputed to indicate any form of organization in which citizens act in the public arena.
This conceptualization is also the form “healthy” nonprofit that justifies the system of protection generally provided by the different legal systems. On the opposite end of this continuum, however, we find the form that we could call “pathological”, if we refer to the group forms aimed exclusively to the enjoyment of facilitating measures (primarily tax, as well as competitive, labor disputes and other) and without, therefore, the actual social utility fees which, however, they should represent their fundamental assumptions. On this point, it really is necessary to note that there are several authors (Moro, 2014) who believe that the “deviant” forms of nonprofit don’t constitute the mere and simple distortions of the original associative phenomenon, but manifestations of the inherent characteristics of the same. This critical reflection is not insignificant, because it allows us to highlight the crucial point of the matter: the proper conceptualization of the nonprofit.

It can be seen, in fact, that it is extremely difficult to identify a universally shared definition of “nonprofit sector” although, on the other hand, several were the scientific attempts to initiate in-depth studies and specific on the subject. In this sense, an essential point of reference is the definition elaborated during extensive international survey organized, since 1990, from Johns Hopkins University and sponsored by the University of Baltimore. At the head of this project, the researchers Lester Salamon and Helmut Anheier, in 1996, in order to systematically collect information on the sector of the nonprofit organization, conducted a comparative study between thirteen countries, taking its cue from the need to ensure proper supervision of third Sector through a general reconfiguration of social and economic life that, until then, was anchored to the ideal presence of only two actors: the state and the market. In other words, a similar conceptual approach did not consider the existence of “private” organizations in the form, but having substantially purposes related to the public sphere.

From the analysis of the main reference literature, it is possible to identify certain requirements that typically can be found within the nonprofit organizations:

- The private nature;
- The prohibition of the distribution of the assets of the organization itself;
- The ability to self-government of their organizational structure;
- Voluntariness, which characterizes involving stakeholders who are part of them (Salamon, 1999).

The definition just introduced clearly shows the breadth of the boundaries within which they would contain a wide and varied range of organizations that qualify as nonprofit and differentiated according to the aims pursued and the type of activity.
This aspect highlights how the nonprofit phenomenon is characterized by several limits and criticality (Fiorentini, 1997; Barbetta, Cima & Zamaro, 2003; Bronzetti, 2007; Sargeant, 2009) that can be divided into:

1) definitional issues: they relate to the construction of the remaining subjects (and objects) to encompass the “nonprofit sector”. In other words, the concept has always been rebuilt in the negative, starting with the definition of what is or is not, well, what should not be.

2) evaluation issues: concern the absolute quantitative element prevails (financial, income, employment, etc.) in the evaluation of the nonprofit phenomenon that, too often, is abandoned to an appreciation of isolated and limited to this (single) dimension.

3) The “reverb” effect: the positive effect generated by certain types of activity (and thus of organizations) to all those included in the vast and heterogeneous logical container namable “nonprofit”. In short, the positive image of part of actually being part of the nonprofit is actually reverberated throughout the whole that, therefore, benefits from the gratitude and social utility products on the one hand (often limited) the whole context (Abrahamson & Baumard, 2008; Cho, Laine, Roberts & Rodrigue, 2015).

Much of the first highlighted problems resides in the difficult conceptual delimitation of the nonprofit, which fall within institutions for purposes of social, moral and cultural and whose activities range from those of a cultural, educational and recreational, to those typical scope health, environmental or social assistance to the promotion and development of civil rights, volunteers and many others (ICNPO).

Actually, we can affirm that the social objectives that distinguish this particular phenomenon are a factor which does not simplify the management of these bodies but, on the contrary, makes it even more complex and problematic: we are referring to the fact that such entities, regardless of their extreme characterization “social”, typically represent business entities, both for the features characteristic and for the operating modalities.

THE “NONPROFIT” SECTOR: WHY?

The various interpretive and conceptual difficulties here shortly outlined have further place in the scientific results of researches conducted by many scholars of the nonprofit phenomenon and aimed at answering a seemingly too banal question: why does nonprofit exist?

The answers to this dilemma have always been attracted to the consideration of the typical functions exercised by nonprofit organizations and, therefore, for reasons unrelated to the necessity of a company. The Third Sector in practice exist in response to so-called “state failures” (Winston, 2007;
Dolfsma, 2013; Zagrebelsky, 2014), essentially constituting an alternative to the State in the production of public goods (Weisbrod, 1972; Phelps, 1975). On the other hand, different and opposite explanations are represented by another theory inspired by macroeconomic motives, which considers the existence of the nonprofit sector as a response to “market failures” or “profit oriented” companies: it would be the maximization of profit to generate such failures due to information asymmetries which, on the other hand, could be reduced by the reality of nonprofit distribution constraints in the nonprofit sector (Hansmann, 1980).

These theoretical interpretations, although very interesting, focus the discussion exclusively on considerations of economic and general, leaving out any type of economic-business aspect considering the “nonprofit sector”. Moreover, the use of a business approach (Bronzetti, 2007) in the Third Sector is not only crucial to the business nature of nonprofit organizations, but also represents the necessary reading key to unify different positions and apparently alternatives (such as those synthetically theoretical before mentioned). The Third Sector can in fact be seen as an element of interconnection between the Public and Private sectors: this border position is, however, materially represented by well-defined economic institutions: business organizations.

However, it should be noted that some of the business philosophy has even assumed managerial repercussions depending on the typology, the specific characteristics and the purposes of the companies: such an interpretation would seem to indicate that the “nonprofit” own features could make it negligible or even, misleading compliance management criteria such as cost effectiveness, systemic vision and decision-making autonomy. In fact, on the contrary, the characteristic of durability, of business organizations, it implies that any activity can be defined as such only if the management activities are continuously and consistently oriented to the above criteria as well as the achievement of corporate typical economic balances.

In fact, in organizations can coexist both “original” or “derivative” (or delegated) purposes: the first are in the whole category of human needs and their satisfaction, the latter are the ones that make every single corporate institution unique. The element which, however, both supports is represented by the capacity to generate value that represents the only condition capable of ensuring the existence of an organized entity qualifying as a “business organization”.

This nonprofit interpretation has not always been so deserved. On the contrary, the social aspect has always monopolized the vision of nonprofit entities that, starting from this and combining with the nonprofit purpose, has been predominantly and primarily focused on the poor (or worse, nothing) attention to proper management of a business organization. In that sense, the same “profit” to “nonprofit” distinction has led to the wrong conviction that the term “nonprofit” implies, signifies
and requires the mere denial or rejection of profit or indeed the abandonment of any logic of managerial management (Cavalieri & Ferraris Franceschi, 2010).

THE ITALIAN “NONPROFIT” SECTOR: THE “NONPROFIT” IN THE PROVINCE OF BENEVENTO

According to the latest Istat (Italian Institute of Statistics) census available at December 31, 2011, non-profit institutions in Italy are 301,191, an increase of 28% compared to the data available in 2001. Overall, third sector organizations account for 6.4% of legal-economic units across the national territory, while non-profit accounts for 3.4% of the total number of employees. Regardless of their employment dimension, non-profit institutions are, in some sectors, the main productive reality of the country. In the figure below, the distribution of the institutions active in the Third Sector in the Italian regions is shown in percentages (Figure 1).

A recent statistical survey (Civitillo, 2016) attempted to illustrate the main features and criticalities of the non-profit phenomenon in the Province of Benevento through the use of a questionnaire. The questionnaire was administered to a statistically representative sample of n. 250 institutions.

The Figure 2 highlights clearly how the figure of the President is normally present in all non-profit institutions belonging to the survey. Collegiate bodies, however, such as the Assembly of Members or the Steering Committee are still quite widespread, though not present in all the realities. The Director, on the contrary, is only present in an association, thus highlighting a particularly poor use of this managerial role.

The Figure 3, moreover, shows that planning and programming tools usually used in Non-profit institution analyzed in the survey are mainly made up of Annual Plan of activities, which means that these types of functions are basically set on a short-term vision (a single year).
Figure 1. Italian Non-profit institutions by Region (%). Source: Istat, 2013.

Figure 2. Management bodies in Non-profit institution in the Province of Benevento. Source: our elaboration, 2015.
The sudden growth of the industry has given increasing attention to managerial tools and techniques for improving the management of increasingly complex and articulated organizations. This requirement was mainly met by the acquisition of typical methodologies of profit oriented companies. However, it is necessary to point out that this push to the management mentioned above has been, for the most part, limited - simplistically - to sterile attempts to import instruments, criteria and logic typical of the “profit” sector within Third Sector organizations, with the aim to meet the specific and contingent needs of each and every time considered to be remarkable. This approach undoubtedly represents one of the greatest limitations that, in our view, has contributed to hindering the efficient and effective development of the phenomenon. In fact, the failure to construct a concrete “professionalization” of non-profit – to be understood as a complete and accomplished process of “managerialisation” – has often led to stunted and improvised practices of Third Sector organizations, which are basically incapable of relying on management skills capable of ensure the necessary “professional” orientation.

THE “NONPROFIT” MANAGEMENT: A (POSSIBLE) GOVERNANCE MODEL (?)

The key factors to be considered

The synthetic analysis outlined in the previous pages may be useful to highlight some considerations that characterize the nonprofit phenomenon and the Third Sector which, in general, have known over the last decades a huge expansion (Salamon & Anheier, 1996; Speckbacher, 2003). Such an evolution
could simply be interpreted as a response to a sharp increase in the demand for goods and services of
general interest by the community, which in turn finds an explanation in the crisis of the so-called
welfare state conjugated to the apparent demographic revolutions of society. Hence, as we all know,
the Third Sector has seen its prevalent framing in terms of an organizational, alternative and
intermediate model between the state and the market, which is responsible for ensuring the
production, provision or protection of certain categories of public goods Guaranteeing the collective
good of citizens (or their categories).
It is, therefore, quite obvious that such a logical approach has determined, by intimately and deeply
conditioning it, the genesis of the phenomenon, as well as its subsequent evolution: all the major
regulatory interventions of the Third Sector have never been animated by the necessary coordination
of a discipline that has become increasingly complex and unstable by the rule stratification itself and
the presence of ever-uniform approaches (Cavaliere & Ferraris Franceschi, 2010).
The traditional nonprofit conceptual approach is based on its categorization (and denomination) as an
intermediate figure between the state and the market, which would result - inter alia - from the same
term “Third Sector”. However, this value has certainly been reduced from the consideration of the
current evanescence of the ideal border between the public and private sectors, which increasingly
rely on numerous elements of mutual interconnection (for example, the various forms of cooperation
and public-private partnerships, which are increasingly widespread).
It is precisely on the basis of the setting outlined above that it can be seen how the “business” nature
of nonprofit organizations is precisely in the need to guarantee the generation of public value through
their production processes aimed at meeting individual and collective needs.
It should be noted, however, that, according to best literature (Moore, 1995; Catturi, 2003), the public
value can ideally be split into two components: the proposed value and the recognized val-
ue. The first
is the combination of utilities incorporated into goods and services produced and sold over a period of
time, where the latter is linked to the actual capacity to respond to the demand and to meet its needs.
In the context just outlined, the proposed value becomes recognized only when it is accepted, since the
value attributable to an asset or service cannot be identified solely with reference to the utility it
incorporates, above all, the actual demand for the asset of service by a consumer who, therefore,
chooses as a means of satisfying one or more needs.
In addition, it is added that, in identifying the value created by a nonprofit organization, one cannot
neglect how its action is aimed at satisfying the needs of individuals or families, as well as towards the
overall and systemic needs of the community. Therefore, it becomes useful to distinguish,
respectively, an individual dimension and a plurality of public value (Bozeman, 2007; Benington &
Moore, 2011; West & Davis, 2011), where the first one obviously is insufficient to achieve the overall economic viability of management (Borgonovi & Mussari, 2011).

This allows, therefore, to highlight with certainty that the reasons for the Third Sector’s intervention in the socio-economic system cannot be traced back to the mere market failures or the public sector: on the contrary, nonprofit organizations would retain an autonomy, representing an alternative response to the needs of the community. In this sense, nonprofit, having experienced a phase of downsizing due to the prevalence of capitalist economy models, finds its reason for being in the need to bring the person back to the center of social and economic processes (Ricci & Stefanini, 2016), constituting a key element of the whole process of creating value for the public. In this perspective, the issue of generating value leads to the recognition that «nonprofit is not a second best but a way to re-interpret creatively and efficiently the role of the social state. Nonprofit is an important interlocutor for the formulation of economic-social policies as a reader of needs, a response innovation factor, a subsidiary of subsidiarity and a mediator between vertical and horizontal subsidiarity» (Benevolo & Caselli, 2011).

What is said, on the other hand, makes it possible to spell out the close bond between economy and sociality: one of the central aspects of the phenomenon of the so-called civil economy is represented by the rejection of the classic separation between “for-profit” and “non-profit” (Bruni & Zamagni, 2015). The obvious multiformity of business expressions finds in one of its clearer and broader manifestations typical of the civil economy: these are organizations that synthesize both for-profit and nonprofit entities. The result is the actual impossibility of their possible placement or for-profit, owing to the strongly social significance of their respective purposes or to the “nonprofit” institutions, since it is not a priori aprioristically excluded, Eventual distribution of wealth among the various business entities involved in the overall management activity. It is clear, therefore, that what has been said before: the traditional “nonprofit” boundaries are now considerably deteriorated and nuanced so as to involve considerable categorization problems and a correct understanding of the overall reality (Austin, 2000; Ben-Ner, 2002): nonprofit organizations highlight more and more characteristics typically belonging to the business world, while on the other hand, the various forms of volunteering are unable - as far as they have been pointed out - to overlook the vital logic of enterprise and managerialization to which the entire Third Sector must necessarily inspired (Civitillo, 2016).

In fact, the voluntary (or, in more general terms, the absence of profit-making) of typically Third Sector organizations tends to give a little consideration to the use of practices and traditional management tools generally considered business reality. The voluntary nature of nonprofit organizations is certainly a distinguishing feature and, therefore, to take into due consideration, but

‘[…] if market economies are about profit, why do some organizations elect not to make profit?’

The same concept of value has undergone a profound evolution, especially as far as the business economy is concerned. Specifically, the traditional vision focused solely on the concepts of profitability and profitability has been overcome to benefit from new paradigms which, based on the need to ensure the effective and efficient fulfillment of the needs and expectations of all business stakeholders, aim at the creation of Value in its traditional economic style, but also (and above all, in certain respects) of a social type (Molteni, 2004): «the value creation has an economic-strategic nature and involves relationships, skills, experiences, in order to create value for use for stakeholders» (Benevolo & Caselli, 2011).

It is clear, then, that the main problem of this work is the need for a complete rethinking of the whole framework, not just legal-normative but (and more, we might say) theoretical-conceptual (Civitillo, 2016).

The sudden growth of the sector has given increasing attention to managerial tools and techniques to improve the management of increasingly complex and articulated organizations. This requirement was fulfilled mainly through the acquisition of typical profit-oriented businesses methodologies. However, the use of nonprofit budgeting and reporting techniques poses many difficulties: poor managerial skills have led to sterile attempts to import tools, criteria and logic typical of the “profit” sector in nonprofit organizations. This approach undoubtedly represents one of the greatest limitations that in our opinion has contributed to hindering the efficient and effective development of the nonprofit phenomenon.

The analysis of critical issues and considerations on the level of professionalization of nonprofit, however, have the ability to bring out certain elements probably crucial to the closing of this research reflections.

First of all, the variety of activities provided by nonprofits represents a sure element of complication: in this perspective, the criticality of the accounting information system of any kind of organization becomes even more pronounced with regard to nonprofit companies. These have - physiologically - distinctive and distinctive features compared to the generality of companies traditionally meant: hence, the necessity of providing an information and accounting system adapted to these specific needs (Marcon & Tieghi, 2010).

Nonprofit entities are characterized by management operations that are not the subject of traditional business accounting (Civitillo, 2016). The Third Sector, for example, is characterized by the conditions for acquiring the factors of production and the sale of goods and services that may be very different from those of the capitalist markets: the acquisition of free inputs, the sale of goods and services without direct consideration, acquiring legacies and donations, and many more. Nonetheless, the need for adequate accounting systems clashes, in nonprofit organizations, with accounting systems
that are elementary and inefficient (Bandini, 2013). As highlighted by several scholars (Bandini, 2013), the reasons for this are connected, once again, with the lack of managerial culture. In this sense:

‘There is not always sufficient emphasis on managerial culture - and related tools - needed to manage well and knowingly a nonprofit organization’ (Bandini, 2013, pp. 152-153)

The financial statements and the entire accounting document system are the most important tool for presenting the financial and economic situation and the most effective way to meet the needs of their stakeholders and to provide an overview of the state of health of the organization, especially for a nonprofit company (Civitillo, 2016). Consequently, a specific aspect to reflect is the need to ensure that this set of information is appropriate to the reality to which it relates, and is capable of ensuring the completeness, consistency and transparency of them with respect to the multiplicity of internal and external subjects, in any way related to the company itself. Such a need can only be answered with the regulatory apparatus that should provide an information and accounting system that is at least proportionate to the relevance of the Third Sector which is ever greater, as we have been able to perceive earlier.

The need for information transparency, on the other hand, directly involves the need to

‘report on the use of economic and financial resources, the correctness with which the actors involved in the management, the adequacy and the responsiveness of behaviors assumed in relation to the objectives set, and with direct and indirect results, actually achieved in the short and long term’ (Ricci, 2012, p. 245).

This is, as already explained above, the concept of accountability.

From this definition, we can argue that an adequate degree of accountability, especially for nonprofit entities, is able to ensure not only the clarity of information about the organization, but above all the due responsibility of the directors regarding the pursuit of the goals and of goals previously defined.

The relational ability typical of nonprofit organizations, consisting of a dense network of relationships with numerous and varied stakeholder categories, combined with the social aims pursued, denotes a clear need for transparency of the entire management activity, especially with regard to public financial resources just above highlighted. This need for transparency is evident, cannot be achieved solely through budget documents or through traditional financial programming and control instruments, as they are almost sterile to only communicate a few tangible aspects of management activity and, on the other hand, they are not able to provide a transparent view of the social goals which similar organizations are generally inspired. Such information, albeit important, must necessarily be supplemented by other documents able to describe, also from a qualitative point of view, the degree of achievement of the objectives of nonprofit companies: the reason for this need lies in the finding that, for these, the accounting records and the financial statements are unable to ensure
the effective and efficient achievement of the aims pursued by them. In this sense, social reporting and the use of “wider” (or non-financial) reporting tools in nonprofit institutions could certainly be a valid support for the information and management correctness mentioned above.

Indeed, the use of accounting-related tools that are not merely quantitative and/or accounting based, can certainly provide significant potential benefits, representing in some sense the necessary completion of traditional corporate accounting systems. At the same time, social reporting becomes more effective in controlling activities, as it is geared towards the overall management of stakeholder relations.

The last consideration on the subject addressed in this work can only be related to the lack of financial resources, one of the main concerns of the nonprofit phenomenon. With regard to this, it is largely perceptible, as evidenced by the findings of the empirical study previously outlined, that the tendency of insufficient financial resources is a problem noticed by nonprofit companies as well as transversal to most of their different types.

Moreover, the considerable expansion of the Third Sector registered over the last decades, as mentioned, has not been devalued as well as profound changes in the different operating paradigms of nonprofit business realities. In this direction, the remarkable and rapid growth of the community’s social needs was supported by a clear expansion of the range of services offered by nonprofit organizations (Civitillo, 2016). However, this increase was not only of a quantitative nature, as the continuous evolution of social needs demanded and determined an enrichment of the qualitative level of output and outcome of the nonprofit sector. Such quantitative growth, coupled with the continued reduction of public-sector financing flows, has therefore created the preconditions for the tightening and progressive worsening of the financial conditions of nonprofit organizations.

It is no coincidence, therefore, that fund raising has therefore become a matter of special attention by the Third Sector. Fund raising can be generally defined as a synonym for financial resources collection. However, national and above all international scientific literature tends to identify with this term a considerably wider, articulate and broader concept in its scope (Allison & Kaye, 2005; Morton, 2012). The real and concrete utility of fund raising is, in fact, not simply the material money procuring, without any pretense of systematicity and coordination. Fundraising tools, on the contrary, must be seen as important strategic tools. In this perspective, they are aimed to:

‘Qualitative and quantitative development of incomes’ (Bandini, 2013, p. 190), in perfect coordination with the goals of the organization.

The mere attempts to raise financial resources with no strategy and coordination, on the other hand, cannot qualify as real fundraising forms, and can be confined to simple fundraising and thus, paradoxically, of effective and effective positive impact on the structure of a nonprofit organization:
the absence of a co-ordinated and finalized approach could in fact result in inefficient use of the resources thus acquired.

Developing an adequate fundraising strategy as a process requires intense system design activity to be truly effective. The purpose of this research is not an exhaustive discussion of fundraising techniques and tools, but it is still necessary to point out the decisive importance of the proper identification of the underlying motives which should underestimate every attempt in this direction. Determining the financial need it considers necessary cannot ignore the highlight of the organization’s mission as well as the main activities that characterize the entire organizational structure. Such basic information will be crucial for the proper identification of the so-called “fund raising markets” to be addressed and of the tools to be used for the collection of financial resources, albeit in the previously mentioned systemic and coordinated sense (Civitillo, 2016).

With regard to this last aspect, the so-called “digital fund raising” is particularly relevant. The new frontiers of digital and telematics technology have upset the company’s operating rules not only with regards to the aspect of external communication (e.g., web site, social network, etc.) or in relation to internal computerization (e.g., management software Management and control, computerized databases, etc.). For nonprofit organizations, specifically, new IT technologies are indeed a very powerful tool for overall and overall improvement of their financial structure. In the United States, to cite one of the most striking examples, financial resources channeled to the Third Sector through new online channels represent more than 14% of the total donations (Bandini, 2013). The example given above, however, must be properly understood in order to avoid any dangerous misunderstandings. The obvious enormous scope of digital fund raising cannot currently be interpreted merely as a possible and additional tool for nonprofit companies, thus legitimizing behavior that tends to consider such a mere integrative eventuality. The US context must necessarily make it clear that the implementation of such digital innovations is, in essence, a new strategic direction to be pursued by trying to pursue maximum efficiency and effectiveness. On the contrary, the superficial consideration of digital fund raising in the terms just portrayed could result not only in a lack of strategic opportunity, but especially in the risk of pursuing other poorly effective choices. In this sense, digital fund raising represents a crucial strategic choice to ensure the improvement of the overall conditions of nonprofit organizations with implementation difficulties, among other things, definitely not prohibitive considering the tools it uses. The fulcrum is represented by the web site that should not only perform a simple informational and relational function since, as mentioned above, it could be an important (if not the main) tool for the implementation of digital fundraising solutions. The website, however, is not the only digital channel available to nonprofit organizations in this sense: email, social networking, and search engine indexing are also crucial tools in fundraising through digital channels.
However, it is crucial to point out that the mere availability of the aforementioned means is not automatically a source of “digital” financial resources. How easy it is to understand, each of these communicative vectors is effective for fund raising only if structured according to the strategy designated and pursued by the specific nonprofit entity. The ultimate goal, therefore, should be to ensure adequate visibility, engagement, fidelity and sensitization of users of digital platforms by creating spontaneous but strongly engaging relationships. In this way, fundraising becomes an indirect but almost consequential effect on the “digital” structure of the organization itself.

May we have a model?

The concluding considerations outlined in the last part of this paper allow us to identify the factors on which to act for the design of effective governance strategies.

The typical system of programming and control of nonprofit entities is not unlike any type of corporate organization (Anthony, 1992), articulating in the following phases (Figure 4):

1) Planning;
2) Programming (and formalization of objectives);
3) Measurement of management and reporting outcomes;
4) Analysis of results (and feedback).

Figure 4. The business planning system. Our elaboration 2017.

Nevertheless, the nonprofit sector is characterized by a different logical setting of the organizational-management planning phase. The traditional business programming paradigm is based on the
optimization (or maximization) of economic convenience (Figure 5). Basically, the definition of the kind of needs to be met would affect the entire organizational structure, determining the choices on the identification of processes of activity and, consequently, human resources needed for the latter.

The paradigm of nonprofit organizations, however, is characterized by a completely opposite approach. In this case, it is the knowledge of the motivations of the people who make up the organization that, together with the study of needs, allows to define the organizational structures and processes (Figure 6).

![Figure 5. The traditional business programming paradigm. Our elaboration 2017.](image)

![Figure 6. The paradigm of nonprofit organizations. Our elaboration 2017.](image)

On the other hand, however, highlighting such key elements could be useful for the management of nonprofit organizations: in this sense, if the critical factors mentioned above constitute potentially
critical causes for them, on the other hand, the effectiveness and efficiency of their presence could ensure the achievement of one or more competitive advantages through their appropriate and appropriate enhancement. In other words, a systemic view of nonprofit, consequent (even) to the correct weighting of these components, could be the interpretative tool of the whole phenomenon: critical factors would thus become successful factors. In fact, this could even allow the identification of constituent elements of a conceptual reference model that seeks to highlight the ideal trajectory of the management of nonprofit organizations. In this sense, the model would represent a system of constituent elements bound by relational constraints according to universal interaction laws (Popper, 1994). A possible pattern schematization attempt is summarized in Figure 7.

![Figure 7. The “nonprofit” management: a (possible) governance model (?). Our elaboration 2017.](image)

The proposed conceptual model, which is the result of the above considerations, is ideally structured on the key factors mentioned above:

1) The accounting system;
2) Non-financial disclosure processes and tools and the Corporate Social Responsibility;
3) An adequate level of accountability and organizational transparency;
4) Marketing activities and the fundraising system.
These “conceptual pillars” should represent the backbone of a nonprofit organization that can qualify characterized by sufficient levels of effectiveness and management efficiency.

The accounting system, for example, is undoubtedly an important element for any corporate organization, as well as for nonprofit organizations. It is, in fact, the logical and substantive assumption for each phase of the business planning system mentioned in Figure 1: Both the planning and programming phases, and the resulting measurement, reporting and analysis of the results activities cannot take place without the accounting support which, in its function of the company information system, is able to provide the management with the appropriate informational information necessary to management.

However, it should be pointed out that the accounting system alone is unable to provide some necessary information that does not have an accounting nature: financial and asset information should at least be supplemented by information of different kinds. The wide range of stakeholders cannot be satisfied solely by the accounting data: it is therefore necessary to accompany the budgetary information those generated by non-financial disclosure tools: Social reports, sustainability reports and other similar documents can provide information the knowledge of which is crucial, especially for the mission of the nonprofit reality. For their effectiveness, however, the mere introduction of such reporting documents is not enough: in this way, they would constitute a simple bureaucratic fulfillment depriving them of value and meaning. In contrast, an information “extended” is only guaranteed by the natural implementation of sequential activities of disclosure, grouped according to organizational characteristics and management specifications: only an accomplished social reporting process may be able to make fluid the activities and documents system and to provide information about the organization that is really “integrated”.

The “enlarged” disclosure processes and activities mentioned above are based on adequate levels of accountability and organizational and management transparency. Although the term accountability is a rather complex and chameleonic concept (Sinclair, 1995; Mulgan, 2000), it “implies the duty to act in a responsible way and to be accountable to others for one’s actions, in order to maintain effective and logical links between planning, deciding, action, and verification” (Ricci, 2016, 2017). In the nonprofit sector, it is essential to report on the use of financial and non-financial resources, the correctness of the behavior of the subjects involved in the management, the adequacy and compliance of the behaviors undertaken with the objectives set, as well as the results actually achieved: its importance for any type of business organization, especially for nonprofits, is evident.

Finally, we cannot overlook the importance of fundraising. As already explained above, fundraising
should be an integrated system of tools aimed at the qualitative and quantitative development of the revenue of nonprofit organizations. On the contrary, fundraising is not the inorganic and unorganized collection of monetary resources as it should be perfectly aligned with the purposes of the organization, its mission and, of course, the activities it exercises. This therefore involves a close connection between fundraising and marketing.

However, this structure, in turn, must necessarily “rely” on a solid conceptual basis of managerialism: the characteristic of professionalism that should permeate every aspect of the organizational and managerial structure. In this sense, it is transversely structured across the whole structure, which is fundamental to the stability of the same “conceptual pilates” mentioned above.

In relation to the issue of management and its relevance to nonprofit organizations, several scholars have shown that it is no longer exclusively attributable to profit oriented organizations, arguing that:

«Twenty years ago, management was a dirty word for those involved in nonprofit organizations. It meant business, and nonprofits prided themselves on being free of the taint of commercialism and above such sordid considerations as the bottom line. Now most of them have learned that nonprofits need management even more than business does, precisely because they lack the discipline of the bottom line» (Drucker, 1989).

A WEB OF EMOTIONS – THE EFFECT OF ONLINE BRAND EXPERIENCE ON BRAND LOYALTY

Clef, Thomas; Walter, Nadine
Pforzheim University, Pforzheim, Germany

ABSTRACT
The article analyses how online brand experience can be measured and determines its impact on brand loyalty. Similar to offline brand experience, online brand experience is broken down into sensory, affective, cognitive, behavioral and relational elements of brand experience. This is based on the belief that – although online brand experience lacks physical presence such as a store – it has the possibility to create a virtual brand experience through visual, audible, gambling or community-based features. Therefore, the brand elements of offline brand experience are applied to online brand experience. Since online brand experience engages customers’ feelings and emotions, it can lead to an improved brand image and to behavioral and attitudinal brand loyalty. The present empirical research investigates the influence of the five different types of online brand experiences – sensory, affective, cognitive, behavioral, and relational – and the website usability on brand loyalty through an empirical study of the travel website qyer.com in China. Respondents (n=69), i.e. users of the qyer.com website, confirm through a standardized online survey, the positive impact of online brand experience on brand loyalty. Especially affective and behavioral brand experience impacts brand loyalty largely - sensory, cognitive and relational brand experiences have a slightly lower but significant impact. Website usability shows the lowest impact. The study proves the significance of online brand experience to create brand loyalty and identifies the most important dimensions of brand experience.

Keywords: Brand experience, online brand experience, brand loyalty, travel

INTRODUCTION
Brand experience engages the customers’ senses and emotions. It can create an emotional connection to a brand leading to an improved brand image and an increased brand loyalty. In a physical store customers can use all five senses and see, touch, smell, taste or try out a brand. Online brands lack this physical presence, but they have the possibility to create a virtual brand experience through audio, video, games or communities. Especially interactivity with users offers an opportunity to create an
emotional bond possibly even stronger than the offline brand experience. This can lead to a favorable attitude and repeat purchase of the brand, hence to increased brand loyalty.

THEORETICAL BACKGROUND

Brand Experience

Definition of brand experience

Brand experience was firstly mentioned in the pioneering article by Holbrook and Hirschman (1982) “The Experiential Aspects of Consumption: Consumer Fantasies, Feelings, and Fun”. The authors identify new consumption patterns “that relate to the multi-sensory, fantasy, and emotive aspects of product use” (Holbrook and Hirschman, 1982). In contrast, traditional marketing saw buyers rather as rational decision-makers who base their purchasing choice on functional features and where buying is mainly a necessary act to supply needed goods. Experiential marketing acknowledges that consumers are also emotionally driven and aim to achieve sensual and pleasurable experiences (Cleff et al., 2014). Brakus et al., (2009) sees brand experience as “subjective, internal consumer responses (sensations, feelings, and cognitions) and behavioral responses evoked by brand-related stimuli that are part of a brand’s design and identity, packaging, communications, and environments”. An experience should consist of “personal relevance, novelty, surprise, learning and engagement” (Poulsson and Kale, 2004). Sensual elements of an experience are even believed to have a greater impact on shaping customer preferences than the attributes of a product or service (Zaltmann, 2003; Lou et al., 2011). Since brand experience engages the customers’ sense and emotions, it can create an emotional connection to the brand leading to an improved brand image and brand loyalty (Schmitt, 1999; Brakus et al., 2009).

Reasons for the evolution of experiential marketing

The transition from traditional marketing towards experiential marketing has occurred as a result of three major developments over the last years (Chu et al., 2013): Firstly, advertising overexposure by traditional communication channels forces marketers to change their ways to gain consumers’ attention and reach them with their messages (Mortimer, 2009). Secondly, saturation of markets has led to fierce global competition – driven by the phenomenon that functional product benefits are becoming exchangeable. This complicates strategies for companies to differentiate on functional product features (Fransen and Lodder, 2010). Pine and Gilmore (1998) claim that since “goods and services become commoditized, the customer experiences that companies create will matter most”. Thirdly, more and more consumers lead hedonistic lifestyles and look for pleasurable experiences (Fransen and Lodder, 2010), which experience marketing is able to provide.

Measuring brand experience
Various researchers have made efforts to develop operational typologies to scale and measure brand experience. The common belief is that a customer experience should be holistic and multidimensional (Gentile et al., 2007). Drawing from various psychological and behavioral studies this includes three main dimensions of experiences: sensation, cognition and affect. Most brand experience frameworks have these elements in common, such as Hirschman and Holbrook (1986), Pine and Gilmore (1998), Schmitt (1999) and Brakus et al. (2009). Hirschman and Holbrook (1986) propose the Thought-Emotion-Activity-Value (TEAV) model with four dimensions: “thought” includes cognitive processing (i.e. mental events); “emotion” involves feelings, expressive behaviors, and physiological responses; “activity” includes physical and mental events; “value” includes evaluative judgements. These four areas were empirically validated by Lofman (1991) through a large exploratory study. Pine and Gilmore (1998) sort experiences into four “e”-categories: entertainment, educational, esthetic (aesthetic) and escapist, according to where they fall along the dimensions “active/passive participation” and “immersion versus absorption”. These four categories were validated in an empirical study by Sands et al. (2008). Schmitt (1999) identifies five different types of experiences: sensory experiences (SENSE), affective experiences (FEEL), creative cognitive experiences (THINK), physical experiences, behaviors and lifestyles (ACT) and social experiences that result from relating to a reference group or culture (RELATE). Tsaur et al. (2006) have validated these five dimensions in an empirical study on the Taipei Zoo. Brakus et al. (2009) came to the conclusion that brand experience is influenced by brand-related stimuli that constitute “subjective, internal consumer responses”, such as sensations, feelings and cognitions, and behavioral responses. As a result, Brakus et al. (2009) constructed a brand experience scale with four dimensions: sensory, affective, behavioral and intellectual. This builds on the work of Schmitt (1999): The categories SENSE, FEEL, ACT and THINK of Schmitt (1999) are analogous to the categories “sensory”, “affective”, “behavioral” and “intellectual” of Brakus et al. (2009). Schmitt (1999) however, has included with the fifth dimension RELATE an important element which “relates to the need to be perceived positively by others” (Schmitt, 1999). This includes social-identity experiences that result from belonging to a group. Since this is especially important in online channels (e.g. websites, social media, brand communities), this dimension has proven relevant in further empirical studies (Cleff et al., 2014).

Online Brand Experience

Introduction to online brand experience

Brands use their online presence as touch points with their customers. The Internet and its various channels (including the Website, blogs, social media, chat rooms, interactive images and virtual communities) have established themselves as essential within an integrated marketing communication
campaign. Companies inform, share and co-create experiences with brands online (Simon et al., 2013; Prahalad and Ramaswamy, 2004). Van Noort et al. (2012) state that “consumers increasingly consider brand web sites as the most important medium to seek and find information”. In addition, brands have built up internet shopping platforms which show significant numbers of users and transaction volumes. With the increasing expansion of the virtual marketplace, the topic has drawn the attention of researchers and online brand experience has emerged at the beginning of this century as a new research area.

**Definition of online brand experience**

Online brand experience is linked to various other concepts: Online customer experience (Rose et al., 2012), customer experience in online environments (Novak et al., 2000), Web experience (Constantinides, 2004; Lin et al., 2008), brand experience on the web (Ha and Perks, 2005), consumers’ online flow experience (van Noort et al., 2012), virtual experiential marketing (Luo et al., 2011) and online purchase experience (Jin and Park, 2006). The essence of all concepts remains the same: During their online activities, users are immersed in an experience which is “cognitive and affective” in nature (Morgan-Thomas and Veloutsou, 2013). It combines cognitive responses (such as usability and functionality of a website) with affective experiences (hedonistic experiences that bring fun and enjoyment). In contrast to brand experience that directly targets the senses, virtual experiential marketing relies on interfaces that act as a replacement for “real world experiences” (Luo et al., 2011).

The scope of online brand experience varies. On the one hand, scholars see it as marketing for pure online brands such as retailers and search engines (Morgan-Thomas and Veloutsou, 2013). On the other hand, it can also be seen as a general concept to add experiential marketing to websites. This would also include brands that have a physical presence (a brick and mortar store) and at the same time an online presence. Without store atmospherics and its sensual clues (especially touch, taste and smell), the challenge for pure online brands to create a brand experience is even larger than for offline brands (Morgan-Thomas and Veloutsou, 2013). Therefore, online brands have to use visual (i.e. color, graphics, layout, design, animations) and auditory clues to arouse emotional responses (Lou et al., 2011). However, some authors argue that for pure online brands, the continuous active relationship and its two-way interaction with the user offer additional possibilities for interactivity and engagement with the customer, an offline brand does not have (Morgan-Thomas and Veloutsou, 2013).

**Measuring online brand experience**

An operational categorization to measure (offline) brand experience exist (Schmitt, 1999; Brakus et al., 2009) but there is no framework for the conceptualization of online brand experience. However, online brand experience is closely linked with two neighboring research areas: Firstly, scales that are focusing
on the rather technological usage of the website (website functionality) or secondly, online brand experience based on the construct of flow (flow online brand experience).

The first research area, website functionality, focuses on the ‘mechanical’ usability of the website. The most analyzed areas are functionality factors (including usability, e.g., site navigation or ordering/payment process, and interactivity, e.g. customer service or interaction with personnel) and psychological factors (e.g., transaction security, data safety, guarantees/return policy) (Constantinides, 2004). Scholars that focus on online experience are also part of this research area, for example Jin and Park (2006) analyze website design, order fulfillment, communication, merchandising, security/privacy and promotion. Although this research area provides important aspects to analyze the functional aspect of the website with the aim to increase conversion and sales, it lacks relevant factors to create a hedonistic brand experience. The factors analyzed are necessary (i.e. without them a brand experience cannot be achieved), but they are not sufficient (i.e. they alone do not create a true brand experience). Therefore, they are pure hygiene factors.

The second research area, flow customer experience, focuses on the construct of flow in the context of online customer experience (Novak et al., 2000; van Noort et al., 2012; Rose et al., 2012; Lou et al., 2011; Mathwick and Rigdon, 2004). The authors are building on the work of Csikszentmihalyi (1990 and 1997). He originally defines flow as an optimal mental state of complete immersion in an activity. Flow experiences can happen in daily life, e.g. at the workplace, in education or in sports. Hoffman and Novak (1996) have applied this psychological concept to online customer experience. When performing online tasks flow is created through “high levels of skill and control, high levels of challenge and arousal and focused attention and is enhanced by interactivity and telepresence” (Hoffman and Novak, 1996). However, for measuring the ability of companies to provide a sensual experience, these variables are only partly usable. Although variables like telepresence, time distortion and arousal measure the level of customer experience well, other variables of the construct, such as skill, control, speed or challenge are only necessary conditions for online brand experience – but not sufficient to create a true brand experience. Flow includes unfortunately also many hygiene factors and can therefore not serve as a true indication for online brand experience.

As a summary, none of the two research areas can serve as the theoretical foundation for a quantitative validation, since both lack relevant factors for brand experience. However, (offline) brand experience categorization frameworks exist that have proven in various studies to measure brand experience well (Brakus et al., 2009), so we believe that with some adaption they should also provide a good basis to measure online brand experience. The source of experience – no matter if it is offline or online – does not fundamentally change the nature of the experience. This still consists of the five elements “sensory, emotional, cognitive, behavioral, and relational” (Schmitt, 1999). Therefore, we believe an adaptation of
the brand experience framework to online brand experience would provide additional insights to this research area. We therefore use the dimensions sensory, affective, cognitive, behavioral and relational. In addition to these brand experience dimensions, we recognize the need for hygiene factors to ensure the necessary conditions for a brand experience are given. Limited web functionality is a key source for online dissatisfaction and can diminish brand experience (Constantinides, 2004). Website usability ensures the easy use of the website including browsing convenience, site navigation and accessible information. Therefore, we include the website usability dimension (USE) to our research framework. The brand experience model will therefore consist of six dimensions (sensory, affective, cognitive, behavioral, relational, usability).

Brand loyalty

Two types of brand loyalty concepts exist: behavioral and attitudinal loyalty (Day, 1969). Traditionally, literature describes the loyalty concept with an emphasis on the behavioral aspect, which defines behavioral loyalty by “consequential actions, such as repeat purchases, share of wallet and word of mouth marketing” (Lou et al., 2011). According to this definition, brand loyalty has been measured by indicators such as repeat purchase frequency or relative volume of same brand purchasing. The loyalty concept has been enriched later by taking into account the attitudinal perspective. Dick and Basu (1994) suggested in their theoretical model that a favorable attitude and repeat purchase were required to define loyalty. East et al. (2005) empirically validated this concept and confirmed the theory that consumer loyalty is characterized by both, a favorable attitude and repeat purchase. Bandyopadhyay and Martell (2007) have built on this by a broad empirical study and have found that behavioral loyalty is influenced by attitudinal loyalty. Therefore, we will use in this research both, behavioral and attitudinal brand loyalty, in the construct.

CONCEPTUAL FRAMEWORK AND HYPOTHESES

Experiential marketing engages the consumer through senses and emotions. A holistic experience leads to an emotional fulfillment creating a special bond with the brand (Morrison and Crane, 2007). This can lead to a more positive brand image perception and a stronger brand loyalty. Previous research has analyzed the effect of (offline) brand experience on various aspects of the brand. Empirical research has found a positive impact on brand attitude and brand relation (Fransen and Lodder, 2010), on satisfaction/behavioral intention (Tsaur et al., 2006), and on brand loyalty (Yoo and Donthu, 2001; Brakus et al., 2009; Cleff et al., 2014). Regarding online brand experience, there are also various studies that confirm the positive impact on certain brand dimensions, such as on brand relationship (Morgan-Thomas and Veloutsou, 2013), on brand trust (Ha and Perks, 2005) and especially on brand loyalty (Jin
Loyalty is confirmed in most studies with behavioral and attitudinal dimensions. Therefore, we assume that there is a positive relationship between online brand experience and (behavioral and attitudinal) brand loyalty:

H1: Online brand experience elements have a positive effect on brand loyalty

In addition to the overall construct online brand experience, we intend to analyze the relationship of the dimensions sensory, affective, cognitive, behavioral and relational. The brand experience construct is based on the fact that these experience dimensions are evoked by brand-related stimuli. However, we are aware that there is no “one-to-one related correspondence” (Brakus et al., 2009), i.e. that one certain stimulus triggers one certain brand experience type, but rather several dimensions. However, we want to find out if online experiences are fundamentally different from traditional brand experiences of customers. Therefore, we examine all factors separately.

**Sensory brand experience**

Since online brands lack the possibility to create a physical experience, not all senses can be stimulated in an online experience. Out of the five traditionally recognized senses (sight, sound, smell, touch, taste) smell, touch and taste cannot be perceived. However, “the more senses an experience engages, the more effective and memorable it can be” (Pine and Gilmore, 1998). Therefore, sight and sound play a crucial part to compensate and to ensure an arousing and memorable sensory experience. Visual stimulants, such as colors, graphics, layout, design, animations or audio elements like music and podcasts are key. Especially the combination of sight and sound can stimulate a high level of arousal. Therefore, we believe that a remarkable online sensory brand experience can be created with a positive impact on the brand, and assume that

H1.1: sensory brand experience has a positive effect on brand loyalty

**Affective brand experience**

The affective brand dimension includes moods and emotions evoked by the online experience. Positive emotions can be triggered by relevant and visually appealing content. In addition, the content can be enriched with appealing sensory stimuli (sight, sound and interactivity in videos, games etc.) to enhance its effect. Online campaigns that appeal to the consumers’ curiosity are also a means to enjoyment (Simon et al., 2013). Therefore, we assume that

H1.2: affective brand experience has a positive effect on brand loyalty

**Cognitive brand experience**

Customers encounter an online brand experience through incoming sensory data (such as text-based information, images and audio) which they can interpret in a sensorial or in a cognitive way (Rose et al., 2006; Luo et al., 2011; Mathwick and Rigdon, 2004; Rose et al., 2012).
al., 2012). The latter includes conscious mental processes and engages customers into thinking about the brand. This can result in a creative mental state (imaginative/divergent) but also in an analytical problem solving process (analytical/convergent (Gentile et al., 2007; Brakus et al., 2009). Therefore, we assume that

H1.3: cognitive brand experience has a positive effect on brand loyalty

Behavioral brand experience

The behavioral brand experience targets the customers’ physical experiences by showing alternative behavior or alternative lifestyles. Behavioral changes can be triggered by rational approaches, but are usually most successful if they are “motivational, inspirational and emotional in nature” (Schmitt, 1999). Behavioral changes can be triggered online to the same extent as offline, since alternative manners or lifestyles can also be shown in the virtual world. Therefore, we assume that

H1.4: behavioral brand experience has a positive effect on brand loyalty

Relational brand experience

Online brand interaction that includes interactive elements can take place on two levels: either with the brand itself or with other customers. Regarding the first, the interaction of a customer online with a brand can be “viewed as an ongoing relationship where the experiences associated with the brand create emotional ties between the customer and the branded product” (Morgan-Thomas and Veloutsou, 2013). This can create a long lasting and sustainable bond between the brand and the customer. Regarding the latter, social interactions are taking place through sharing of information and opinions between customers online. This can create social identity with a group that shares similar interests and lifestyles (Lou et al., 2011) and provide customers a sense of belonging (Dholakia et al., 2004). Platforms such as virtual communities can enhance the sharing of information and foster this feeling. Social identity with a group or community can be part of a brand experience since it builds a sense of belonging. Therefore, we assume – both through brand interaction between brand and customer as well as customer and customer – that

H1.5: relational brand experience has a positive effect on brand loyalty

Usability

Usability relates to the usage and navigation of a website and to the fact how intuitive and easy to navigate it is to interact with it (Simon et al., 2013). Lin et al. (2008) argue that a positive brand experience is likely to arise if the website is well designed. The main components of usability for brand experience are (Preece, 2001) firstly navigation (e.g. easy and fast browsing), secondly information design (e.g. understandable information) and thirdly dialog and social interaction support (e.g. the ease
to execute demands). Other usability factors such as site ordering/payment processes are rather E-Commerce-related than branding related, and therefore of less relevance (Constantinides, 2004). Therefore, we assume that H1.6: usability elements have a positive effect on brand loyalty

RESEARCH DESIGN

The Chinese travel website qyer.com (founded 2005) has been selected to conduct the empirical research. With more than 10 million users it is a widely known travel website in China. It is a user-generated platform and its main component is an online forum for users to share their own travel experiences, find travel partners and look for travel tips. It also contains a travel-related search engine, downloadable travel itineraries, as well as a hotel and ticket price comparison and booking system. All products and services of qyer.com are only offered online or through mobile apps. Therefore, the measurement of online brand experience is not affected by any offline brand experience. The initial pool of items to measure online brand experience and brand loyalty were developed by reference to preexisting scales: The items measuring the sensory dimension, the affective dimension, and the cognitive dimension were based on the work of Brakus et al. (2009) and Simon et al. (2013). These items are entirely applicable either in an online or an offline context. For example, the item “this brand makes a strong impression on my visual sense” captures the sensory dimension in offline and online settings respectively. The relational dimension represents the interactive nature of online brand experience. Since there was no pre-existing pool of items, the authors have developed these based on the theoretical foundations of Schmitt (2009) and Simon et al. (2013). The original pool of items for the behavioral dimension was adapted from the typology of Muntinga et al. (2011) who classify users’ website engagement in consuming, contributing and creating. The usability dimension contains elements regarding convenience, site navigation and information access based on Preece (2001) and Morgan-Thomas and Veloutsou (2013). Brand loyalty consists of attitudinal and behavior components (Dick and Basu, 1994; East et al., 2005; Bandyopadhyay and Martell, 2007). Items of both loyalty dimensions are included. Attitudinal loyalty is measured by “I like the website better among other similar websites” and also by the word-of-mouth dimension “recommend the website to my friends” (Reichheld, 1996). Behavioral loyalty is measured with “I visit the webpage or blog regularly” and “I will purchase the products or service of the brand again”.

All brand experience items and all brand loyalty items are rated on a 5-point Likert scale (1=strongly disagree; 5= strongly agree). A pretest was conducted before distributing the questionnaire. Ten users of qyer.com were asked to take the survey and comment on it. Some of the respondents were interviewed to explain the reasons for problems and misinterpretations, so that ambiguity questions
could be modified. Respondents’ suggestions focused mainly on the topic around the understandability of questions. The question “the requirements to run online community software are clear” was dropped from the final survey, because several respondents commented that the statement is unclear. Table 2 and Table 3 show the items of online brand experience and loyalty in the finally used questionnaire. Besides, the two socio-demographic variables gender and age were included into the questionnaire.

DATA COLLECTION AND SAMPLING METHOD

Data collection is aimed at the qyer.com consumer target group. Therefore, the survey was posted in the online forum of qyer.com. In addition, we used the high affinity of the target group to online media with a non-probability random snowball sampling and collected data via an online survey. Links to the survey were placed on Weibo and WeChat, the two most popular Chinese social media platforms. According to qyer.com’s marketing data, 20% of qyer.com users are Chinese people who study and work outside of mainland China. To reach these users, the survey was also posted on the Facebook groups of Chinese students in Germany and group members were asked to ‘share’ the link on their ‘walls’ for greater network effects. Respondents of the questionnaire were asked to ‘repost’ the survey link via social media platforms to reach their followers. The target population of interviewees includes only Chinese male and female individuals between the ages of 18 and 45 who have access to the Internet and use the online-presence of qyer.com. Data was collected during the dates May 26th through to June 15th, 2014. The net sample size of the interviewees included 81 participants, of whom 69 persons filled in the questionnaire completely (completion rate = 85%). Of these 69 persons, 55.9% were male and 44.1% were female. The biggest age group was 20 to 29 years covering 62% of the respondents followed by the 30 to 39 years age group covering 32 % respondents.

RESULTS

The brand experience construct was created by means of a principal component analysis using the items listed in Table 2. According to the original theoretical model of brand experience, results are suggesting a clear factor structure of six factors: Behavioral, Usability, Sensory, Affective, Cognitive, and Relational (total variance explained: 76.3%). Since the value for Cronbach’s Alpha is 0.926, the internal consistency of the scale is sufficiently proven. The Kaiser-Meyer-Olkin Measure of Sampling Adequacy is equal to 0.817, all item-based values for Measures of Sampling Adequacy (MSA) are above 0.759, and the p-value of Bartlett’s Test of Sphericity is less than 0.0005. These results indicate a very good factor solution (see Table 2).

Table 2. Table 2: Rotated Component Matrix for all online brand experience items

The principal component analysis was also conducted for all items of the Loyalty dimension. The analysis yields a single component with an eigenvalue greater than 1. The internal consistency of the scale is sufficiently proven (Cronbach’s α=0.826). All item-based values for Measures of Sampling Adequacy (MSA) are ranging from 0.736 to 0.848. The Kaiser-Meyer-Oklin Measure of Sampling Adequacy (0.773) and the Bartlett’s Test of Sphericity (p-value <0.0005) are indicating a very good factor solution (see Table 3).

Table 2. Table 3: Rotated Component Matrix for all loyalty items

In order to estimate the multivariate influence of the different online brand experience factors, age and gender on the brand loyalty of qyer.com, Ordinary Least Square Regressions were used. As limited web functionality is a key source for online dissatisfaction (Constantinides, 2004) we included in a first regression model – beside the six main online experience factors, gender and age – five additional cross-product terms: Each of the five brand experience factors were separately crossed with the Usability factor to capture the interaction between website usability and the different brand experience factors. However, none of the cross-products reveal a significant influence on the brand loyalty (see model (1) in Table 4). The same picture of insignificance emerges with the socio-demographic variables gender and age (see model (1) and model (2) in Table 4). Both variables do not exert any statistically proven influence on brand loyalty.

In the final regression analysis (see model (3) in Table 4), the authors included only the main effects of the six online brand experience factors which are Behavior, Affective, Usability, Sensory, Cognitive and Relational: Around $R^2=50.8\%$ of the variance of the brand loyalty can be explained by these six independent variables. All of them are statistically significant either on the one percent (Behavior, Affective, Sensory, Cognitive, and Relational) or the five percent (Usability) significance level. The biggest brand online experience factor in explaining the variance of brand loyalty is been covered by the brand experience factor Affective (26%). It is followed by Behavior (21%), Sensory (15%), Cognitive (14%), Relational (13%) and the hygiene factor Usability (11%). In summary it can be concluded that Hypothesis H1 and all Sub-Hypotheses (H1.1 to H1.6) are verified.

CONCLUSIONS

The empirical study has revealed a positive impact of online brand experience on brand loyalty. Overall, affective brand experience has the highest impact on brand loyalty (with the highest standardized regression coefficient), closely followed by behavioral brand experience. The impact of sensory, cognitive and relational brand experience is slightly lower. Usability shows the lowest but still significant impact. These results show that affective brand experience is most effective in creating brand loyalty. Online experiences that appeal to customers’ inner feelings, moods and emotions can create a strong bond with the brand. Qyer.com manages with its colorful pictures, travel tips and destination descriptions to inspire users and to create a special mood and feeling. Based on our results, behavioral brand experience shows the second largest impact on brand loyalty. Behavioral brand experience gives people ideas about alternative behavior or alternative lifestyles. The online presence of qyer.com succeeds in showing consumers an escape from their daily working routine by traveling to foreign destinations. Schmitt (1999) states that behavioral experiences can be triggered by rational approaches. However, they are usually most successful if they are “motivational, inspirational and emotional in nature” (Schmitt, 1999). Qyer.com’s product is per se a very emotional product since people seek indulgence and physical experiences when traveling. Although the website has only an online presence and no physical attendance, the content with its colorful pictures, descriptions of sights and reports about travel experiences proofs that it can create a similar experience in the virtual as in the real world. This is also enhanced by the possibility of users to make comments on the website and to post own experiences online. Besides the large impact of affective and behavioral brand experience on brand loyalty, sensory, relational and cognitive brand experiences impact brand loyalty as well, but to a lower extent. The fact that sensory brand experience is lower than affective and behavioral brand experience can be explained by the nature of the qyer.com website. The website uses mainly pictures as sensory stimuli. Videos, podcasts or games are not used on qyer.com at all. That might lower the experience and hence, the brand loyalty. However, it is rather surprising that the relational brand experience has a lower impact on brand loyalty, since the nature of the website is based on users getting in contact with each other and sharing similar interests. However, the results prove that the interactivity with other users plays a less significant role than moods and feelings as well as the prospect of travelling. These elements seem to be most important when it comes to create loyalty. Cognitive brand experience has a rather low impact on brand loyalty. Although the website features mostly emotional elements (pictures, postings), it also contains some cognitive elements, such as hotel booking options, downloadable travel guides or detailed travel itineraries. Users appreciate these more cognitive offerings, but it does not have the same impact on their brand loyalty as affective and behavioral elements. Qyer.com is aimed to create a rather emotional brand experience and transport
feelings, rather than giving fact-based information about travel itineraries or prices. And this seems to be most effective in creating brand loyalty. The lowest but still significant impact on brand loyalty has usability. This was expected since usability is rather a hygiene factor which means that a certain level of usability is a ‘must’ and expected by the customer. But it does not have the same potential of creating brand loyalty like the brand experience elements. As a result, it can be concluded that an online travel website like qyer.com has the largest potential to create loyalty by providing affective and behavioral experiences online.

LIMITATIONS

This study analyzed the impact of online brand experience on brand loyalty for qyer.com in China. The first limitation to the validity of this research report is the applied sampling method. Firstly the survey was distributed over qyer.com’s online forum. However, it was also circulated over a non-probability random snowball sampling. This may lead to the limitation that results are heavily influenced by the choice of initial seeds and by the first contacts within the sampling process. Results probably tend to be biased towards favoring more cooperative as opposed survey participants and to those that are part of larger personal networks (Magnani et al., 2005). The volunteer effect through the self-selection of participants cannot be ruled out and methods of inferential statistics may produce non-generalizable results.

Secondly, the study focused on the Chinese market and due to cultural differences the findings cannot be transferred easily to other countries. Future research should focus on possible cross-cultural differences to develop a deeper understanding of the influence of online brand experience on brand loyalty. A third limitation is that the findings are limited to qyer.com (and for other similar online travel sites), but cannot be generalized for travel or other service companies. Further research could therefore analyze other industries. At last, this research is conducted as a cross-sectional study which involves observation of a representative subset at a defined time. For further investigation, a longitudinal study that involves repeated observations of the same items over a longer period of time is suggested.

HOW LEAN GLOBAL START-UPS SELECT THEIR PRICING STRATEGIES, PRACTICES AND MODELS

Cohen, Benjamin; Neubert, Michael
ISM International School of Management, Paris, France

ABSTRACT

This article analyses the research problem of price-setting strategies for product innovations in the medtech industry. It is based on the conceptual framework of price-setting practices, strategies, and models. A multiple case study research is then performed on six medical technology companies, focusing on how they set their initial product price for a new technology solution to either existing medical conditions or technology limitations. The research results show that medtech companies opt for competition-informed price practices and buy pricing models. The pricing strategies vary between skimming and market-based pricing strategies. Price innovations are limited due to regulation and financial considerations.

Keywords: Price-Setting, Pricing Practice, Pricing Strategy, Pricing Model, Medtech

INTRODUCTION

Price-setting for any new product is crucial in determining its future in the market. After years of research and development (R&D), product design, testing, market research and marketing, the first real interaction a product has with the customer is through its price. It is not the idea of how its utility will benefit the customer nor the vision and excitement given about how things will change. Those are unrealized expectations preserved until after the customer has ownership. The price is the real, hard currency promise of what this product will mean to the customer. There is a great need for all companies to understand and optimize their pricing strategy. Price-setting determines a company’s profit margin as well as market share; the ease in making sales or the difficulty in gaining adoption. It is perceived as a profit opportunity invitation to future competition and a territorial grab to existing competitors. Marn and Rosiello (1992) studied the economic parameters of 2,463 companies and found that a 1% improvement in price yielded an 11.1% improvement in operating profit, all else being equal. This compared dramatically high as compared to a 1% improvement in either the variable costs, sales volume, or fixed costs, which yielded operating profit gains of 7.8%, 3.3%, and 2.3%, respectively.
With the possibility of any product or industry to focus on, this paper has chosen the medical technology (medtech) industry. This focus has been chosen because of the amount of money spent on R&D investment, the rapid advancements made in recent years, the growing worldwide demand in advanced medtech products, and the absence of existing research. Further, medtech products often consist of physical products, consumables, and services, the combination of which increases the pricing complexity.

Medtech companies are providing cutting-edge technologies to patients, hospitals, and care providers around the world. It would appear that as the world becomes more interconnected toward a single common marketplace, the faster the rate of technological development becomes. With an increasing rate of technological development at the same time as larger customer exposure, greater necessity is placed on a medtech company entering new markets with the correct marketing and pricing strategies.

The purpose of this study is to identify various international pricing strategies and models used in real world companies. From this selection, comparison can be made of their relative strengths and proper implementation. The problem in this research is that international pricing decisions are more complex than domestic, frequently incurring currency value swings, differing inflationary pressures and difficulty in having production facilities in different markets, which leads to frequent price reviews (Hollensen, 2014).

This study has been performed in part by the call for research from Ingenbleek, Frambach, and Verhallen (2013). In their paper they call for further research on existing pricing processes with the intent of applying them toward optimal application for new product development. Thereto, it is suggested to address this need through qualitative research methods such as multiple case study research.

LITERATURE REVIEW AND THEORETICAL FRAMEWORK

Successful price-setting strategies and models can be derived from a large number of literature sources centered on either the conceptual derivation or empirical results. However, sources of failure risk are often more easily learned from case studies found in literature research. In short, the success and failure risk factors relevant to bringing a new product to market can be generalized as originating from either the product, company, competition, customer, international market complexity, or new sub-industry oriented focus. Evidence for each of these focuses is found in a selection of recently published literature.
Table A2: Definition of price-setting practices, strategies, and pricing models used (e.g. Hollensen, 2014; Ingenbleek, Frambach & Verhallen, 2013)

**Product-Oriented**

Product expectation from customers of a new product's performance should be adequately met by appropriate price-setting strategies. Proper pricing leads to a balance between the product's usefulness and the expectations placed on it from consumers. Ingenbleek et al. (2013) find that inappropriate selection of price-setting practices can counter the positive advantages of new product development. By pricing a product high, customers will have high initial expectations for quality, durability, application, and ease of use, among others, which the product must fulfill. Customer opinion may begin to undervalue the benefit it brings by comparing it with the standards applied to other products at similar prices. Undervaluing a product decreases the consumer confidence in performance and durability, as well as pride of ownership. The consumer is only content when the balance between cost and benefit is met. This selection of a pricing strategy is therefore dependent on the relative level of product advantage, intensity of competition, and relative product costs. This multiple case study research uses the theoretical framework of Ingenbleek et al. (2013) to analyze the pricing strategies of medtech companies.
Specifically, for a new product entering an existing market or creating a new market, value-informed pricing strategy provides the greatest support for a product’s pricing strategy. After this, competition-informed pricing adds substantially in situations where competitive intensity is low, whereas cost-informed pricing helps when competitive intensity is high. Likewise, managers pursuing a profit margin objective should express the advantage of their product, thus using value-informed pricing while avoiding cost-informed pricing. In total, Marn, Roegner, and Zawada (2003) estimate 80-90% of new products brought to market are priced too low, and consequently reach a smaller market size and level of profitability than is possible. This has significant negative effects on the company’s revenue stream by decreasing short-term profit as well as long-term customer confidence and loyalty (Lowe and Alpert, 2010).

Lowe and Alpert (2010) identified a clear causal effect for the pioneer’s price-setting decisions on product price and value perceptions, whereas a follower company’s product price seemed to influence perceptions of the follower, not the pioneer. These findings imply that reference price is brand specific, and that the pioneer, due to its proto-typicality, has a stronger influence on reference price perceptions than the follower. However, these effects were stronger for the more innovative product categories being examined.

Online distribution channels greatly increase price transparency, which leads to reduced price differentials between countries and a global standardization of prices (Gorodnichenko and Talavera, 2016). Prices in online markets have been found to change faster than in traditional stores, including a higher pass-through of exchange rate fluctuations. These changes depend on the products and on market conditions such as level of competition.

Specifically, for medical devices, the clinical trial procedure is found to be the best way to estimate a product’s cost effectiveness for future customers (Kirisits and Redekop, 2013). These trials are able to reach a broad and diverse range of potential customers with varying levels of severity of the condition being targeted by the new product. From these trials, the performance of the device and degree of benefit can be identified and weighed against its ease of use and any potential harms. The degree of rigor and completeness to these clinical trials is the best way to forecast its acceptance by the public.

Company-Oriented

When a firm develops a high-technology product filling a small market niche, its full potential needs to be quickly exploited in order to generate sufficient revenue needed to cover its R&D costs, to finance growth, and to offer competitive prices (Neubert, 2015; Trudgen and Freeman, 2014). Therefore, significant product growth is necessary, as well as creating and completing the product’s distribution path to the public. Proper relationships with the company’s supply chain as well as distributors,
Import/exporters, and retailers is critical as the performance of one company will depend on the performance of the entire chain (Wei and Zhao, 2014).

Luostarinen and Gabrielsson (2006) studied 89 companies in Finland who became international within their first three years, and thusly named born global companies (Neubert, 2015). They found that these companies often bypassed cost-informed pricing (setting a product’s price floor) by choosing below-cost pricing for their first international customer, and thereafter applying value-added pricing based on the benefits brought to its customers. This method was found to be hugely beneficial to the company creating the product in terms of creating the first international partnership, acquiring initial market share, and finding a more optimal partnership that conveyed confidence in customers not already familiar with the manufacturing company. This brings compounded returns in the form of additional business being brought-in more easily.

Even before focusing on the product and customers, the best qualities of successful lean start-up companies have been identified as controlling overhead costs and to automate as many of the company procedures as possible (Grohn et al, 2015). These actions are often indicative of proper cost-control efforts set by the management, and a focus on the bottom line. Examples of such efforts include the purchase of used equipment, or to negotiate with vendors and suppliers after a more thorough market research of asking prices.

**Competition-Oriented**

Knowledge of the pricing strategies, product development, and marketing practices of a company’s competitors leads to greater positioning of a company within the overall market. Success of any product originates from one or more advantages that it has over other available product options. Kuznetsova and Roud (2014) performed an industry survey among Russian manufacturing firms to rate their relative company advantages as compared to their competitors. From the results, they found that the highest perceived advantage of the survey respondents’ companies was product quality over their competitors, with 76% of respondents believing in their own company produced products at higher quality as compared to 17% of respondents believing in their competitor’s product quality advantage. The next largest discrepancy in perspectives was of fast, on-time delivery, in that 43% believed their company had the advantage as compared to 9% giving advantage to their competitors. Roughly 6% of respondents believed that their company possessed no competitive advantages at all, whereas 30% believed that the competitors possessed no advantages. The survey results showed roughly even match between the respondents’ company and its competitors in the categories of price, cutting-edge products, adaptation to consumer needs, and service.
Placement of one product helps the product and company succeed in the short-term. However, long-term planning and investment in product improvements and further technological advancement is vital in assuring continual benefit from the product line. Copeland and Shapiro (2015) found that continual and significant innovation increases the competitive advantage of a product, thus leading to higher prices for the innovator. The constant reworking and renewal of a product’s strengths, capacities, and features creates a moving barrier to entry for competitors. Likewise, slower rates of innovation make the retail market more competitive, leading to decreasing company markups and profits.

Customer-Oriented

No greater entity exists for the protection of customers’ best interests than the multitude of government sponsored healthcare programs around the world, and assuring patient safety as well as cost control from healthcare providers are the top two priorities. Specifically relating to overall cost, Gobbi and Hsuan (2015) determined that nearly 65% of the public sector in the US medical industry used collaborative purchasing (CP) power in 1995 to reduce the price of complex medical equipment purchases. They found that purchase of said equipment equates to the largest portion of total expenditure in the realm of healthcare. Because the healthcare providers (predominantly hospitals) have strikingly similar requirements of the machines, equipment, and devices purchased, the potential for CP to decrease overall costs is high. Proper purpose and functionality for the customer must be addressed in order to gain customer adoption of a new technology, as more often than not the needs of customers create the product opportunities for companies. Specifically, for medtech companies, aging demographics and increasing availability to modern medicine for most of the world have created significant growth opportunities. For example, the leading healthcare demands within the United States include decreasing costs, patient safety, personalized care, and advanced cancer research (Deloitte, 2016). Compare that with the Gulf Cooperation Council (GCC) states where healthcare concerns stem from the region’s increasing population, which include lifestyle diseases (including ischemic heart disease, stroke, type 2 diabetes and obesity), high incidence of road traffic accidents, and consanguinity (Howard, 2014).

Other countries have made medical tourism a primary focus for the growth of their economy. Such countries as Thailand, Singapore, India, Jordan, Turkey, and the United Arab Emirates have each incurred rapid growth in their healthcare infrastructure in order to satisfy their growing domestic markets as well as attract the international patients (Ebrahim and Ganguli, 2017). These countries aim to benefit from increased demand for the healthcare products and services beyond the level of domestic
demand. This effectively causes the hospitals, retailers, and healthcare providers to increase their customer base without the need for export/import concerns and costs.

*Foreign Market Complexity Oriented*

International expansion of a company is a significant milestone in its global growth and capture of market share. Yet for many companies this step proves to be a substantial inhibitor to smooth progress. The benefits of an increase in potential customer base are offset by increased costs burdened by consumers, additional governmental regulation and safety controls, cultural or language difficulties, and increased competition. This market adaptation includes a revision of pricing decisions (Neubert, 2016b).

Therefore, entry into a foreign market is only possible after extensive analysis of the market factors and competition (Neubert, 2013). Pricing decisions require regular reviews and structured decision-making processes in order to prepare for and mitigate disturbances caused by changes in foreign competition, currency exchange fluctuation, and inflationary pressures (Snieskiene and Cibinskiene, 2015). Thereby, exporting companies have been found to experience greater rate of success depending on the relationship and partnerships formed with importers (Obadia and Stöttinger, 2015). Exporters can increase the performance of their importers through their pricing strategies, especially by allowing higher margins or other incentive schemes. In response, importers then invest in the products where they can expect the best results, predominantly based on the marketability and the price margin.

Creation of a new product market or niche comes with the significant advantage in that high-tech firms have a high price-setting power to set the reference price for their new product categories. New niche creation has historically come with roughly one to two years of market control before competitor companies can technologically catch up (Lowe and Alpert, 2010). This advantage is substantially decreased in foreign markets that don’t enforce patent protection. Geng and Saggi (2015) analyzed pricing strategies of patented (e.g. pharmaceutical) products sold into markets without patent protection, and found that local competition was quickly generated. Such presence led to price competition for market share, meaning lower mark-ups and profitability.

**RESEARCH METHOD**

A multiple case study research method shall be used in order to best compare and contrast existing pricing strategies used by medtech companies. This study uses a multiple case study research design to answer the explanatory (why and how) research questions (Yin, 2014). According to Hennart (2013), a qualitative comparative case study research would help to answer the research question. In contrast to an experimental design or a survey, a multiple case study has more flexibility (Stake, 1995), allows an
in-depth analysis of a complex research problem within a highly contextualized environment (Rosenberg and Yates, 2007), and a comparison between different cases (Baxter and Jack, 2008; Eisenhardt and Graebner, 2007).

The medical industry in general is a very difficult but interesting industry to identify pricing strategies, particularly within the United States and other countries with large governmental healthcare payer systems. In most countries within the Organization for Economic Cooperation and Development (OECD) the majority of prices for medical services, equipment and prescription drugs are fixed, or set in reference to these government-established reference prices (Brandt, 2013). In the US, it is commonly known as the Centers for Medicare & Medicaid Services (CMS) billing rates. Therefore, the new medtech companies are principally targeting technology innovations not currently outlined in these governmental payer systems.

**SAMPLING**

The choice of the sampling strategy is based on the purpose of this study. This study uses a purposive case selection strategy (Seawright and Gerring, 2008), because it produces a representative sample with typical (Gerring, 2006) and successful examples of the total population. According to Yin (2014), this sampling strategy produces a statistically representative sample, if at least six to ten cases are selected. This study uses a sample size of six case study firms to allow a better triangulation of data and to strengthen the results of the whole study.

The six case study firms, EnteroMedics, Alphatec Spine, Inogen, Skyline Medical, GE Healthcare, and Intuitive Surgical, are born-global firms using the global exporter business model (Neubert, 2016a). These companies are all publicly traded companies (5 on NASDAQ, GE on NYSE), with market capitalization ranging in size from $8 million to $260 billion. Five of the six companies specialize uniquely within the medical equipment and supplies industry, while GE is a multinational conglomerate with exposure in a broad range of industries. This sample was determined sufficient for the study due to the breadth of pricing strategies and models identified between them.

**RESEARCH QUESTIONS**

The statement of the research problem has led to the following two research questions:

1. What pricing strategies and models are currently being implemented in the medtech industry?
2. Where are the observed differences and benefits between the pricing strategies and models?
RESEARCH FINDINGS

Through researching dozens of companies, it was found that a company cannot state outright its pricing strategy. This is firstly because the terms and definitions of pricing strategies and models are in no way standardized, and secondly because in doing so a company may substantially weaken its market position and brand quality, inviting in new competitors. Therefore, inferences must be made as to why and how a company chose its pricing models. In order to make such inferences, enough detailed information must be revealed about a company’s product line revenues and costs, thus leading the research to focus on publicly listed companies on US stock exchanges.

Findings RQ 1: What pricing strategies and models are currently being implemented in the medtech industry?

The companies of EnteroMedics, Alphatec Spine, and Inogen were researched, each belonging to a different specialty sector within the healthcare field. EnteroMedics manufactures its Maestro device that uses its neuroblocking technology known as vBloc Therapy to treat obesity, metabolic diseases, and other gastrointestinal disorders (EnteroMedics, 2016). Alphatec Spine manufactures a variety of products for the surgical treatment of spine disorders (Alphatec Spine, 2017). Inogen specializes in the design, manufacturing and marketing of portable oxygen concentrators for patients necessitating oxygen therapy (Inogen, 2017).

Table 2: Price-setting practices, strategies, and models for the case study companies

The first finding is that each case study company bases their product pricing in the US on the CMS billing rates (compare to table 2). By doing so, the prices are thus established by the US Medicaid reimbursement rates, meaning a competition-informed price-setting practice. Therefore, the price-setting strategy of all companies is that of market pricing. Each company additionally operates primarily under the buy only pricing model, with Inogen mentioning the service segment of their business generating significant revenue.

Skyline Medical is a company specializing in the collection and disposal of infectious fluids that result from surgical procedures and post-operative care (Skyline Medical, 2017). Their principle focus is the Streamway System, with features such as automated measurement of volumes, prevention of cross-contamination, and a tissue trap that allows for tissue retrieval. Disclosed in their 2015 annual report, Skyline implies that their pricing strategy is one of penetration pricing, specifically singling-out their competitor Stryker Instrument’s comparable system and citing notable differences (Skyline Medical, 2016). The significant differences mentioned are a 33% savings in device purchase price, an industry common installation process that can be performed by distributors, independent contractors, or customer in-house engineering, as well as underpricing the disposable kit needed for each patient operation by $1. Therefore, the pricing practice detailed in the report is that of competition-informed,
although undoubtedly an underlying degree of cost-informed practice evaluated to set their product price floor. The company’s pricing model is dominantly through the sale of the Streamway units, with the sale of non-reusable filters and cleaning solutions making up a smaller revenue component.

General Electric (GE) is a global conglomerate company with divisions in the aviation, power generation, electricity distribution, healthcare, oil and gas, transportation, household appliances, and financial industries (GE, 2016). In researching cutting-edge medtech technologies, the recent 3.0-tesla (3T) magnetic resonance imaging (MRI) machines developed at GE were identified as being cutting-edge technology in terms of their magnet strength, bore size, and quieter running status. However, pricing information was discovered only through distributors and then only from contact with sales associates. Consequently, a previous model, the 1.5-tesla (1.5T) LX MRI, was found with sufficient pricing information.

Not only had the 1.5T machines been sold initially at higher prices only to be lowered in time with increased competition from other companies and technologies, but sales were initially only available through GE authorized dealers, later opening up to affiliates and then third party vendors. From uncovering the historical change in pricing as well as sales practices, it is evident that GE uses value-informed price-setting practices to establish skimming price-setting strategies for its MRI products. GE does offer both the sale and lease of its MRI units, although not all vendors offer a leasing option. Undoubtedly, GE must have developed this pricing strategy through years of experience in the healthcare as well as other industries in order to maximize returns to the company.

The sixth and final case study included in this report is from Intuitive Surgical (Intuitive). They manufacture the da Vinci Surgical System used in robotic surgeries, along with related instruments and accessories (Intuitive, 2016). Being a young and ambitious medtech company listed publically, Intuitive has disclosed the largest amount of pricing information found for this research. In their annual report, Intuitive defines their business strategy priorities all in relation to value to its customers; patient, surgeon, and hospital. With the customer in mind, Intuitive has focused their product technology and further improvements on maximizing the value of the system for its customers, primarily through conversion of standard open surgeries to be compatible with the da Vinci system, to better train surgeons for a larger range of complex minimally invasive surgeries (MIS), and to develop procedures that could convert multiport laparoscopic surgeries into single port surgeries. In all, it is clear that Intuitive employs a value-informed price-setting practice.

Intuitive lists the revenue streams in 2015 from the sale of its surgical systems, sales-type and operating lease options, annual service plan, as well as the non-reusable or gradually degrading instruments and accessories. An impressive 492 robotic systems were sold in 2015, yielding 30% of their annual profits, with another 63 systems delivered to customers under lease terms, yielding less than 1% of profits. On
top of that were a combined total of 3,597 systems in use and covered under annual service contracts, bringing in 19% of 2015 profits, but most substantially was the sale of non-reusable or replacement instrument and accessories, equaling over 50% of the annual profits. From this information it is clear that Intuitive primarily employs a buy and use pricing model, with a much smaller percent of clients choosing the leasing option of a recurring pricing model.

Also in the annual report are the ranges of prices charged to its customers for the da Vinci Surgery System, the annual service agreements, and the non-reusable or gradually degrading instruments and accessories. The range values are not necessarily important, but the magnitude of the discounts given to some customers is substantial. Sale of the da Vinci Surgery System ranges from $0.6 to $2.5 million each, meaning some customers may receive up to a 76% discount. The annual service agreements range in price from $80 to $170 thousand per year (up to 53% discount), and the instruments and accessories, on a per-use basis, equate to a $700 to $3,200 per surgery cost (up to 78% discount). Calculating the average cost for these three categories from the total number of sales, operational units, and procedures in 2015 shows indication that the average price paid is roughly halfway between the maximum and zero discount range. They describes their customer base as being primarily US-based (71% of revenue) as well as being larger governmental hospital chains who the purchase the system in bulk, which explains why significant discounts are being offered.

Intuitive also describes their competition in the industry as being the traditional MIS, open surgery, interventional or pharmaceutical options. They describe their robotic option for surgery as an advanced technology albeit with higher costs, that results in increased and quicker success rates. In all, due to the high cost of the system and limited necessity for the limited specialized surgeries currently with guidelines written for execution using the system, Intuitive is implementing a skimming price-setting strategy with substantial price negotiation (discounting) with the customers.

Findings RQ 2: Where are the observed differences and benefits between the pricing strategies and models?

As seen in the six case study companies, the price-setting practices of competition-informed and value-informed are the dominant ones implemented. Where they differ is when the new technologies are applied to more patient-centered medical conditions (as is the case for EnteroMedics, Alphatec, Inogen, and Skyline) or towards the hospital-centered medical devices (GE and Intuitive).

The first three medtech products are addressing new higher technology solutions to existing patient conditions, and therefore have pricing restricted by the US Medicare CMS reimbursement price listing, or more generally a market pricing strategy. Bottom line profit for these companies is therefore most strongly determined by total cost reduction to the customers plus decreasing their own operating costs and expenses. Skyline’s product is not patient specific, and because of the company’s ambition towards
significant market share they have chosen to underprice the product, following a penetration pricing strategy. Bottom line profit for them will come from effective marketing, product performance, and market share growth. Both GE and Intuitive’s products are providing higher technology solutions to hospital equipment limitations or competition amongst hospitals for patients needing specialized procedures and tests, thus necessitating skimming price-setting strategies. Bottom line profit for them will come in terms of relative advances their equipment technology has over competitors plus value appeal to the surgeons and patients.

Within this case study selection, the first five companies primarily utilize the buy only pricing model as a result of them all manufacturing machinery or equipment that generate the majority of their revenue, with little to no additional instruments or accessories needed. The sixth company utilizes the buy and use pricing model, thereby having significant revenue coming from both its surgery system and the non-reusable components.

**CONCLUSIONS**

Through this six-company case study several advantages and disadvantages to the price-setting practices, strategies, and models were found. In short, the price-setting practice will be determined based on the customer being either single-use patients or large customer throughput hospitals, with the focus being on finding the greatest value for the targeted customers. The price-setting strategy is largely related to the price-setting practice, with modifications based on the relative newness of the technology, level of competition, and trade-off between growth in market share or higher profit margins. The pricing model is primarily dependent on the product delivery method and/or operation by the customer, but with modifications possible based on product customization, relationship with the customer, and specialized financing options.

Advantages in competition-informed price-setting practices plus market price-setting strategy include assurance of a fair price along with associated market share, but the disadvantages include significant competition and lower profit margins in order to grow market share. Advantages in value-informed practices as well as the skimming price-setting strategy include higher profit margins leading to quicker profitability while not growing your customer base faster than supply lines and infrastructure needs, but with the disadvantage of lower market share with higher R&D and marketing costs. Advantages of cost-informed practices and the penetration price-setting strategy include setting a price floor and gaining market share, whereas the disadvantages include lower profitability and potentially setting a low reference price from which your customers will continue to demand low prices.

Advantages to the buy pricing model include the largest customer payments at the earliest time to product delivery, which decreases the OEM’s financing requirements. The disadvantages to the buy
pricing model are that it is more financially intensive for customers, and if the technology advances quick enough will leave customers feeling left behind or disappointed. The lease pricing model is a favorable step for the customer, allowing additional payment options and thus an increased customer base. Disadvantages for the OEM include delayed revenue streams and increased staff to track the various accounts. Pay-per-use pricing models are not applicable for all healthcare device companies, but when they are they bring additional revenue for the OEMs as well as a fairer pricing model between customers who use the product more or less than others. Disadvantages include continual inventory monitoring for both OEMs and customers.

No particular ranking of the price-setting practices, strategies and models can be made generically. A specific product and target customer are to first be identified, working next to the price-setting. However, it is noted that in general the larger and more successful companies have product lines with price-setting practices and strategies that evolve with the product and industry age, and that contain diverse pricing models to draw in the largest possible customer base.

Future study must include a larger amount of case study companies within the medtech industry, expansion into other new technology industry segments, and could also incorporate the change in price through a particular product’s life cycle.

PRICE-SETTING STRATEGIES FOR PRODUCT INNOVATIONS IN THE MEDTECH INDUSTRY

Cohen, Benjamin; Neubert, Michael

ISM International School of Management, Paris, France

ABSTRACT

This article analyses the research problem of price-setting strategies for product innovations in the medtech industry. It is based on the conceptual framework of price-setting practices, strategies, and models. A multiple case study research is then performed on six medical technology companies, focusing on how they set their initial product price for a new technology solution to either existing medical conditions or technology limitations. The research results show that medtech companies opt for competition-informed price practices and buy pricing models. The pricing strategies vary between skimming and market-based pricing strategies. Price innovations are limited due to regulation and financial considerations.

Keywords: Price-Setting, Pricing Practice, Pricing Strategy, Pricing Model, Medtech

INTRODUCTION

Price-setting for any new product is crucial in determining its future in the market. After years of research and development (R&D), product design, testing, market research and marketing, the first real interaction a product has with the customer is through its price. It is not the idea of how its utility will benefit the customer nor the vision and excitement given about how things will change. Those are unrealized expectations preserved until after the customer has ownership. The price is the real, hard currency promise of what this product will mean to the customer.

There is a great need for all companies to understand and optimize their pricing strategy. Price-setting determines a company’s profit margin as well as market share; the ease in making sales or the difficulty in gaining adoption. It is perceived as a profit opportunity invitation to future competition and a territorial grab to existing competitors. Marn and Rosiello (1992) studied the economic parameters of 2,463 companies and found that a 1% improvement in price yielded an 11.1% improvement in operating profit, all else being equal. This compared dramatically high as compared to a 1% improvement in either the variable costs, sales volume, or fixed costs, which yielded operating profit gains of 7.8%, 3.3%, and 2.3%, respectively.
With the possibility of any product or industry to focus on, this paper has chosen the medical technology (medtech) industry. This focus has been chosen because of the amount of money spent on R&D investment, the rapid advancements made in recent years, the growing worldwide demand in advanced medtech products, and the absence of existing research. Further, medtech products often consist of physical products, consumables, and services, the combination of which increases the pricing complexity.

Medtech companies are providing cutting-edge technologies to patients, hospitals, and care providers around the world. It would appear that as the world becomes more interconnected toward a single common marketplace, the faster the rate of technological development becomes. With an increasing rate of technological development at the same time as larger customer exposure, greater necessity is placed on a medtech company entering new markets with the correct marketing and pricing strategies.

The purpose of this study is to identify various international pricing strategies and models used in real world companies. From this selection, comparison can be made of their relative strengths and proper implementation. The problem in this research is that international pricing decisions are more complex than domestic, frequently incurring currency value swings, differing inflationary pressures and difficulty in having production facilities in different markets, which leads to frequent price reviews (Hollensen, 2014).

This study has been performed in part by the call for research from Ingenbleek, Frambach, and Verhallen (2013). In their paper they call for further research on existing pricing processes with the intent of applying them toward optimal application for new product development. Thereto, it is suggested to address this need through qualitative research methods such as multiple case study research.

LITERATURE REVIEW AND THEORETICAL FRAMEWORK

Successful price-setting strategies and models can be derived from a large number of literature sources centered on either the conceptual derivation or empirical results. However, sources of failure risk are often more easily learned from case studies found in literature research. In short, the success and failure risk factors relevant to bringing a new product to market can be generalized as originating from either the product, company, competition, customer, international market complexity, or new sub-industry oriented focus. Evidence for each of these focuses is found in a selection of recently published literature.
Table A2: Definition of price-setting practices, strategies, and pricing models used (e.g. Hollensen, 2014; Ingenbleek, Frambach & Verhallen, 2013)

*Product-Oriented*

Product expectation from customers of a new product’s performance should be adequately met by appropriate price-setting strategies. Proper pricing leads to a balance between the product’s usefulness and the expectations placed on it from consumers. Ingenbleek et al. (2013) find that inappropriate selection of price-setting practices can counter the positive advantages of new product development. By pricing a product high, customers will have high initial expectations for quality, durability, application, and ease of use, among others, which the product must fulfill. Customer opinion may begin to undervalue the benefit it brings by comparing it with the standards applied to other products at similar prices. Undervaluing a product decreases the consumer confidence in performance and durability, as well as pride of ownership. The consumer is only content when the balance between cost and benefit is met. This selection of a pricing strategy is therefore dependent on the relative level of product advantage, intensity of competition, and relative product costs. This multiple case study research uses the theoretical framework of Ingenbleek et al. (2013) to analyze the pricing strategies of medtech companies.
Specifically, for a new product entering an existing market or creating a new market, value-informed pricing strategy provides the greatest support for a product’s pricing strategy. After this, competition-informed pricing adds substantially in situations where competitive intensity is low, whereas cost-informed pricing helps when competitive intensity is high. Likewise, managers pursuing a profit margin objective should express the advantage of their product, thus using value-informed pricing while avoiding cost-informed pricing. In total, Marn, Roegner, and Zawada (2003) estimate 80-90% of new products brought to market are priced too low, and consequently reach a smaller market size and level of profitability than is possible. This has significant negative effects on the company’s revenue stream by decreasing short-term profit as well as long-term customer confidence and loyalty (Lowe and Alpert, 2010).

Lowe and Alpert (2010) identified a clear causal effect for the pioneer’s price-setting decisions on product price and value perceptions, whereas a follower company’s product price seemed to influence perceptions of the follower, not the pioneer. These findings imply that reference price is brand specific, and that the pioneer, due to its proto-typicality, has a stronger influence on reference price perceptions than the follower. However, these effects were stronger for the more innovative product categories being examined.

Online distribution channels greatly increase price transparency, which leads to reduced price differentials between countries and a global standardization of prices (Gorodnichenko and Talavera, 2016). Prices in online markets have been found to change faster than in traditional stores, including a higher pass-through of exchange rate fluctuations. These changes depend on the products and on market conditions such as level of competition.

Specifically, for medical devices, the clinical trial procedure is found to be the best way to estimate a product’s cost effectiveness for future customers (Kirisits and Redekop, 2013). These trials are able to reach a broad and diverse range of potential customers with varying levels of severity of the condition being targeted by the new product. From these trials, the performance of the device and degree of benefit can be identified and weighed against its ease of use and any potential harms. The degree of rigor and completeness to these clinical trials is the best way to forecast its acceptance by the public.

Company-Oriented

When a firm develops a high-technology product filling a small market niche, its full potential needs to be quickly exploited in order to generate sufficient revenue needed to cover its R&D costs, to finance growth, and to offer competitive prices (Neubert, 2015; Trudgen and Freeman, 2014). Therefore, significant product growth is necessary, as well as creating and completing the product’s distribution path to the public. Proper relationships with the company’s supply chain as well as distributors,
import/exporters, and retailers is critical as the performance of one company will depend on the performance of the entire chain (Wei and Zhao, 2014).

Luostarinen and Gabrielsson (2006) studied 89 companies in Finland who became international within their first three years, and thusly named born global companies (Neubert, 2015). They found that these companies often bypassed cost-informed pricing (setting a product’s price floor) by choosing below-cost pricing for their first international customer, and thereafter applying value-added pricing based on the benefits brought to its customers. This method was found to be hugely beneficial to the company creating the product in terms of creating the first international partnership, acquiring initial market share, and finding a more optimal partnership that conveyed confidence in customers not already familiar with the manufacturing company. This brings compounded returns in the form of additional business being brought-in more easily.

Even before focusing on the product and customers, the best qualities of successful lean start-up companies have been identified as controlling overhead costs and to automate as many of the company procedures as possible (Grohn et al, 2015). These actions are often indicative of proper cost-control efforts set by the management, and a focus on the bottom line. Examples of such efforts include the purchase of used equipment, or to negotiate with vendors and suppliers after a more thorough market research of asking prices.

**Competition-Oriented**

Knowledge of the pricing strategies, product development, and marketing practices of a company’s competitors leads to greater positioning of a company within the overall market. Success of any product originates from one or more advantages that it has over other available product options. Kuznetsova and Roud (2014) performed an industry survey among Russian manufacturing firms to rate their relative company advantages as compared to their competitors. From the results, they found that the highest perceived advantage of the survey respondents’ companies was product quality over their competitors, with 76% of respondents believing in their own company produced products at higher quality as compared to 17% of respondents believing in their competitor’s product quality advantage. The next largest discrepancy in perspectives was of fast, on-time delivery, in that 43% believed their company had the advantage as compared to 9% giving advantage to their competitors. Roughly 6% of respondents believed that their company possessed no competitive advantages at all, whereas 30% believed that the competitors possessed no advantages. The survey results showed roughly even match between the respondents’ company and its competitors in the categories of price, cutting-edge products, adaptation to consumer needs, and service.
Placement of one product helps the product and company succeed in the short-term. However, long-term planning and investment in product improvements and further technological advancement is vital in assuring continual benefit from the product line. Copeland and Shapiro (2015) found that continual and significant innovation increases the competitive advantage of a product, thus leading to higher prices for the innovator. The constant reworking and renewal of a product’s strengths, capacities, and features creates a moving barrier to entry for competitors. Likewise, slower rates of innovation make the retail market more competitive, leading to decreasing company markups and profits.

Customer-Oriented

No greater entity exists for the protection of customers’ best interests than the multitude of government sponsored healthcare programs around the world, and assuring patient safety as well as cost control from healthcare providers are the top two priorities. Specifically relating to overall cost, Gobbi and Hsuan (2015) determined that nearly 65% of the public sector in the US medical industry used collaborative purchasing (CP) power in 1995 to reduce the price of complex medical equipment purchases. They found that purchase of said equipment equates to the largest portion of total expenditure in the realm of healthcare. Because the healthcare providers (predominantly hospitals) have strikingly similar requirements of the machines, equipment, and devices purchased, the potential for CP to decrease overall costs is high. Proper purpose and functionality for the customer must be addressed in order to gain customer adoption of a new technology, as more often than not the needs of customers create the product opportunities for companies. Specifically, for medtech companies, aging demographics and increasing availability to modern medicine for most of the world have created significant growth opportunities. For example, the leading healthcare demands within the United States include decreasing costs, patient safety, personalized care, and advanced cancer research (Deloitte, 2016). Compare that with the Gulf Cooperation Council (GCC) states where healthcare concerns stem from the region’s increasing population, which include lifestyle diseases (including ischemic heart disease, stroke, type 2 diabetes and obesity), high incidence of road traffic accidents, and consanguinity (Howard, 2014).

Other countries have made medical tourism a primary focus for the growth of their economy. Such countries as Thailand, Singapore, India, Jordan, Turkey, and the United Arab Emirates have each incurred rapid growth in their healthcare infrastructure in order to satisfy their growing domestic markets as well as attract the international patients (Ebrahim and Ganguli, 2017). These countries aim to benefit from increased demand for the healthcare products and services beyond the level of domestic...
demand. This effectively causes the hospitals, retailers, and healthcare providers to increase their customer base without the need for export/import concerns and costs.

*Foreign Market Complexity Oriented*

International expansion of a company is a significant milestone in its global growth and capture of market share. Yet for many companies this step proves to be a substantial inhibitor to smooth progress. The benefits of an increase in potential customer base are offset by increased costs burdened by consumers, additional governmental regulation and safety controls, cultural or language difficulties, and increased competition. This market adaptation includes a revision of pricing decisions (Neubert, 2016b).

Therefore, entry into a foreign market is only possible after extensive analysis of the market factors and competition (Neubert, 2013). Pricing decisions require regular reviews and structured decision-making processes in order to prepare for and mitigate disturbances caused by changes in foreign competition, currency exchange fluctuation, and inflationary pressures (Snieskiene and Cibinskiene, 2015). Thereto, exporting companies have been found to experience greater rate of success depending on the relationship and partnerships formed with importers (Obadia and Stöttinger, 2015). Exporters can increase the performance of their importers through their pricing strategies, especially by allowing higher margins or other incentive schemes. In response, importers then invest in the products where they can expect the best results, predominantly based on the marketability and the price margin.

Creation of a new product market or niche comes with the significant advantage in that high-tech firms have a high price-setting power to set the reference price for their new product categories. New niche creation has historically come with roughly one to two years of market control before competitor companies can technologically catch up (Lowe and Alpert, 2010). This advantage is substantially decreased in foreign markets that don’t enforce patent protection. Geng and Saggi (2015) analyzed pricing strategies of patented (e.g. pharmaceutical) products sold into markets without patent protection, and found that local competition was quickly generated. Such presence led to price competition for market share, meaning lower mark-ups and profitability.

**RESEARCH METHOD**

A multiple case study research method shall be used in order to best compare and contrast existing pricing strategies used by medtech companies. This study uses a multiple case study research design to answer the explanatory (why and how) research questions (Yin, 2014). According to Hennart (2013), a qualitative comparative case study research would help to answer the research question. In contrast to an experimental design or a survey, a multiple case study has more flexibility (Stake, 1995), allows an
in-depth analysis of a complex research problem within a highly contextualized environment (Rosenberg and Yates, 2007), and a comparison between different cases (Baxter and Jack, 2008; Eisenhardt and Graebner, 2007).

The medical industry in general is a very difficult but interesting industry to identify pricing strategies, particularly within the United States and other countries with large governmental healthcare payer systems. In most countries within the Organization for Economic Cooperation and Development (OECD) the majority of prices for medical services, equipment and prescription drugs are fixed, or set in reference to these government-established reference prices (Brandt, 2013). In the US, it is commonly known as the Centers for Medicare & Medicaid Services (CMS) billing rates. Therefore, the new medtech companies are principally targeting technology innovations not currently outlined in these governmental payer systems.

SAMPLING

The choice of the sampling strategy is based on the purpose of this study. This study uses a purposive case selection strategy (Seawright and Gerring, 2008), because it produces a representative sample with typical (Gerring, 2006) and successful examples of the total population. According to Yin (2014), this sampling strategy produces a statistically representative sample, if at least six to ten cases are selected. This study uses a sample size of six case study firms to allow a better triangulation of data and to strengthen the results of the whole study.

The six case study firms, EnteroMedics, Alphatec Spine, Inogen, Skyline Medical, GE Healthcare, and Intuitive Surgical, are born-global firms using the global exporter business model (Neubert, 2016a). These companies are all publicly traded companies (5 on NASDAQ, GE on NYSE), with market capitalization ranging in size from $8 million to $260 billion. Five of the six companies specialize uniquely within the medical equipment and supplies industry, while GE is a multinational conglomerate with exposure in a broad range of industries. This sample was determined sufficient for the study due to the breadth of pricing strategies and models identified between them.

RESEARCH QUESTIONS

The statement of the research problem has led to the following two research questions:

3. What pricing strategies and models are currently being implemented in the medtech industry?

4. Where are the observed differences and benefits between the pricing strategies and models?
RESEARCH FINDINGS

Through researching dozens of companies, it was found that a company cannot state outright its pricing strategy. This is firstly because the terms and definitions of pricing strategies and models are in no way standardized, and secondly because in doing so a company may substantially weaken its market position and brand quality, inviting in new competitors. Therefore, inferences must be made as to why and how a company chose its pricing models. In order to make such inferences, enough detailed information must be revealed about a company’s product line revenues and costs, thus leading the research to focus on publicly listed companies on US stock exchanges.

Findings RQ 1: What pricing strategies and models are currently being implemented in the medtech industry?

The companies of EnteroMedics, Alphatec Spine, and Inogen were researched, each belonging to a different specialty sector within the healthcare field. EnteroMedics manufactures its Maestro device that uses its neuroblocking technology known as vBloc Therapy to treat obesity, metabolic diseases, and other gastrointestinal disorders (EnteroMedics, 2016). Alphatec Spine manufactures a variety of products for the surgical treatment of spine disorders (Alphatec Spine, 2017). Inogen specializes in the design, manufacturing and marketing of portable oxygen concentrators for patients necessitating oxygen therapy (Inogen, 2017).

The first finding is that each case study company bases their product pricing in the US on the CMS billing rates (compare to table 2). By doing so, the prices are thus established by the US Medicaid reimbursement rates, meaning a competition-informed price-setting practice. Therefore, the price-setting strategy of all companies is that of market pricing. Each company additionally operates primarily under the buy only pricing model, with Inogen mentioning the service segment of their business generating significant revenue.

Skyline Medical is a company specializing in the collection and disposal of infectious fluids that result from surgical procedures and post-operative care (Skyline Medical, 2017). Their principle focus is the Streamway System, with features such as automated measurement of volumes, prevention of cross-
contamination, and a tissue trap that allows for tissue retrieval. Disclosed in their 2015 annual report, Skyline implies that their pricing strategy is one of penetration pricing, specifically singling-out their competitor Stryker Instrument’s comparable system and citing notable differences (Skyline Medical, 2016). The significant differences mentioned are a 33% savings in device purchase price, an industry common installation process that can be performed by distributors, independent contractors, or customer in-house engineering, as well as underpricing the disposable kit needed for each patient operation by $1. Therefore, the pricing practice detailed in the report is that of competition-informed, although undoubtedly an underlying degree of cost-informed practice evaluated to set their product price floor. The company’s pricing model is dominantly through the sale of the Streamway units, with the sale of non-reusable filters and cleaning solutions making up a smaller revenue component.

General Electric (GE) is a global conglomerate company with divisions in the aviation, power generation, electricity distribution, healthcare, oil and gas, transportation, household appliances, and financial industries (GE, 2016). In researching cutting-edge medtech technologies, the recent 3.0-tesla (3T) magnetic resonance imaging (MRI) machines developed at GE were identified as being cutting-edge technology in terms of their magnet strength, bore size, and quieter running status. However, pricing information was discovered only through distributors and then only from contact with sales associates. Consequently, a previous model, the 1.5-tesla (1.5T) LX MRI, was found with sufficient pricing information.

Not only had the 1.5T machines been sold initially at higher prices only to be lowered in time with increased competition from other companies and technologies, but sales were initially only available through GE authorized dealers, later opening up to affiliates and then third party venders. From uncovering the historical change in pricing as well as sales practices, it is evident that GE uses value-informed price-setting practices to establish skimming price-setting strategies for its MRI products. GE does offer both the sale and lease of its MRI units, although not all venders offer a leasing option. Undoubtedly, GE must have developed this pricing strategy through years of experience in the healthcare as well as other industries in order to maximize returns to the company.

The sixth and final case study included in this report is from Intuitive Surgical (Intuitive). They manufacture the da Vinci Surgical System used in robotic surgeries, along with related instruments and accessories (Intuitive, 2016). Being a young and ambitious medtech company listed publically, Intuitive has disclosed the largest amount of pricing information found for this research. In their annual report, Intuitive defines their business strategy priorities all in relation to value to its customers; patient, surgeon, and hospital. With the customer in mind, Intuitive has focused their product technology and further improvements on maximizing the value of the system for its customers, primarily through conversion of standard open surgeries to be compatible with the da Vinci system, to better train
surgeons for a larger range of complex minimally invasive surgeries (MIS), and to develop procedures that could convert multiport laparoscopic surgeries into single port surgeries. In all, it is clear that Intuitive employs a value-informed price-setting practice.

Intuitive lists the revenue streams in 2015 from the sale of its surgical systems, sales-type and operating lease options, annual service plan, as well as the non-reusable or gradually degrading instruments and accessories. An impressive 492 robotic systems were sold in 2015, yielding 30% of their annual profits, with another 63 systems delivered to customers under lease terms, yielding less than 1% of profits. On top of that were a combined total of 3,597 systems in use and covered under annual service contracts, bringing in 19% of 2015 profits, but most substantially was the sale of non-reusable or replacement instrument and accessories, equaling over 50% of the annual profits. From this information it is clear that Intuitive primarily employs a buy and use pricing model, with a much smaller percent of clients choosing the leasing option of a recurring pricing model.

Also in the annual report are the ranges of prices charged to its customers for the da Vinci Surgery System, the annual service agreements, and the non-reusable or gradually degrading instruments and accessories. The range values are not necessarily important, but the magnitude of the discounts given to some customers is substantial. Sale of the da Vinci Surgery System ranges from $0.6 to $2.5 million each, meaning some customers may receive up to a 76% discount. The annual service agreements range in price from $80 to $170 thousand per year (up to 53% discount), and the instruments and accessories, on a per-use basis, equate to a $700 to $3,200 per surgery cost (up to 78% discount). Calculating the average cost for these three categories from the total number of sales, operational units, and procedures in 2015 shows indication that the average price paid is roughly halfway between the maximum and zero discount range. They describes their customer base as being primarily US-based (71% of revenue) as well as being larger governmental hospital chains who the purchase the system in bulk, which explains why significant discounts are being offered.

Intuitive also describes their competition in the industry as being the traditional MIS, open surgery, interventional or pharmaceutical options. They describe their robotic option for surgery as an advanced technology albeit with higher costs, that results in increased and quicker success rates. In all, due to the high cost of the system and limited necessity for the limited specialized surgeries currently with guidelines written for execution using the system, Intuitive is implementing a skimming price-setting strategy with substantial price negotiation (discounting) with the customers.

Findings RQ 2: Where are the observed differences and benefits between the pricing strategies and models?

As seen in the six case study companies, the price-setting practices of competition-informed and value-informed are the dominant ones implemented. Where they differ is when the new technologies are
applied to more patient-centered medical conditions (as is the case for EnteroMedics, Alphatec, Inogen, and Skyline) or towards the hospital-centered medical devices (GE and Intuitive).

The first three medtech products are addressing new higher technology solutions to existing patient conditions, and therefore have pricing restricted by the US Medicare CMS reimbursement price listing, or more generally a market pricing strategy. Bottom line profit for these companies is therefore most strongly determined by total cost reduction to the customers plus decreasing their own operating costs and expenses. Skyline’s product is not patient specific, and because of the company’s ambition towards significant market share they have chosen to underprice the product, following a penetration pricing strategy. Bottom line profit for them will come from effective marketing, product performance, and market share growth. Both GE and Intuitive’s products are providing higher technology solutions to hospital equipment limitations or competition amongst hospitals for patients needing specialized procedures and tests, thus necessitating skimming price-setting strategies. Bottom line profit for them will come in terms of relative advances their equipment technology has over competitors plus value appeal to the surgeons and patients.

Within this case study selection, the first five companies primarily utilize the buy only pricing model as a result of them all manufacturing machinery or equipment that generate the majority of their revenue, with little to no additional instruments or accessories needed. The sixth company utilizes the buy and use pricing model, thereby having significant revenue coming from both its surgery system and the non-reusable components.

CONCLUSIONS

Through this six-company case study several advantages and disadvantages to the price-setting practices, strategies, and models were found. In short, the price-setting practice will be determined based on the customer being either single-use patients or large customer throughput hospitals, with the focus being on finding the greatest value for the targeted customers. The price-setting strategy is largely related to the price-setting practice, with modifications based on the relative newness of the technology, level of competition, and trade-off between growth in market share or higher profit margins. The pricing model is primarily dependent on the product delivery method and/or operation by the customer, but with modifications possible based on product customization, relationship with the customer, and specialized financing options.

Advantages in competition-informed price-setting practices plus market price-setting strategy include assurance of a fair price along with associated market share, but the disadvantages include significant competition and lower profit margins in order to grow market share. Advantages in value-informed practices as well as the skimming price-setting strategy include higher profit margins leading to

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
quicker profitability while not growing your customer base faster than supply lines and infrastructure needs, but with the disadvantage of lower market share with higher R&D and marketing costs. Advantages of cost-informed practices and the penetration price-setting strategy include setting a price floor and gaining market share, whereas the disadvantages include lower profitability and potentially setting a low reference price from which your customers will continue to demand low prices.

Advantages to the buy pricing model include the largest customer payments at the earliest time to product delivery, which decreases the OEM’s financing requirements. The disadvantages to the buy pricing model are that it is more financially intensive for customers, and if the technology advances quick enough will leave customers feeling left behind or disappointed. The lease pricing model is a favorable step for the customer, allowing additional payment options and thus an increased customer base. Disadvantages for the OEM include delayed revenue streams and increased staff to track the various accounts. Pay-per-use pricing models are not applicable for all healthcare device companies, but when they are they bring additional revenue for the OEMs as well as a fairer pricing model between customers who use the product more or less than others. Disadvantages include continual inventory monitoring for both OEMs and customers.

No particular ranking of the price-setting practices, strategies and models can be made generically. A specific product and target customer are to first be identified, working next to the price-setting. However, it is noted that in general the larger and more successful companies have product lines with price-setting practices and strategies that evolve with the product and industry age, and that contain diverse pricing models to draw in the largest possible customer base.

Future study must include a larger amount of case study companies within the medtech industry, expansion into other new technology industry segments, and could also incorporate the change in price through a particular product’s life cycle.

2UCLan Cyprus, Larnaca, Cyprus

ABSTRACT

The purpose of this study is to investigate the antecedent factors of brand equity used in another study by Dennis et al. (2016). The current study is based on four universities located in Estonia and Finland, i.e. the University of Tartu, Vaasa University, JAMK University of Applied Sciences and Aalto University. Furthermore, this study investigates the moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement between brand attachment strength and commitment, trust and satisfaction. The research methodology is based on 172 surveys collected through an on-line questionnaire placed on the platform connect.ee, and students, members of staff and administrative employees were asked to complete this questionnaire. The findings of the study reveal that all relationships between antecedent factors i.e. internal reputation, brand image, brand meaning, brand identity, brand attachment strength, commitment, trust, and satisfaction with brand equity are positive and significant. In addition, three moderators play an important role in the model, namely the moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement on the relationship between brand attachment strength and commitment in relation to brand equity. Finally, the study discusses the managerial implications and limitations of the study and future research directions.

Keywords: Brand equity of universities, antecedent factors, moderating effects, university innovative philosophy/industry innovation adoption/content of mission statement

1. INTRODUCTION

The entrepreneurial university type is nowadays a demanding profile among higher education institutions (Minola et al. 2016) and they should be customers’ oriented with central focus on students’ well-being. Previous studies have investigated student loyalty in relation to satisfaction, affective
commitment, calculative commitment and trust (Bowden and Wood, 2011) and whether gender is a mediator between loyalty and the rest of above mentioned constructs. In a more recent study, Pham and Lai (2015) examined the impact of disconfirmation on student satisfaction and in turn the influence of student satisfaction directly on loyalty or indirectly through commitment and adjusted expectation. Nevzat et al. (2016) examined the strength of the university Facebook community in relation to the level of identification with the university community and level of identification with the university brand trust and in turn university brand loyalty. Furthermore, Dennis et al. (2016) investigated the role of brand attachment strength in higher education. Particularly, they examined a complicated model including as a dependent variable brand equity and antecedent factors i.e., internal reputation, brand image, brand meaning, brand identity, brand attachment strength, commitment, trust, and satisfaction.

According to Dennis et al. (2016), the future research direction could focus on the actual dimensions of brand characteristics in depth by concentrating on specific higher education institutions (HEIs). In addition, it is important to find out the strength of the moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement (Coudounaris, 2016), for example on brand attachment strength.

This study has the aim of investigating the impact of antecedent factors, i.e., internal reputation, brand image, brand meaning and brand identity, brand attachment strength, commitment, and trust and satisfaction in brand equity. An objective is to test the moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement on brand attachment strength and consecutively commitment, trust and satisfaction.

In the remainder of the article the author focuses on a related literature review and the implemented research methodology. Finally, the findings are presented followed by a discussion of the managerial implications, limitations of the study and future research direction.

2. LITERATURE REVIEW

Though there has been limited published research relating to B2C service-markets linked to brand equity, relevant concepts are discussed: in particular, brand equity as a tool of competition, brand equity processes in the B2C context, a revised customer-based pyramid for B2C, and B2C.

Service brand process, building a B2C brand with functional and emotional values, internal branding in the business sector, and brand relevance – all of these have become concepts under consideration for the current framework. A full review of these concepts is, however, beyond the focus of this study.

A list of papers relevant to brand equity are included in Table 1. There are at least fourteen models incorporating the construct of brand equity during the period 1993-2016, as shown in Table 1.

Three of the models are conceptual ones, while the remaining eleven are based on empirical studies. The criteria used for incorporating studies in Table 1 are the following: a) conceptual and empirical studies providing a model on brand equity, b) the studies are included in academic journals, and c) the papers have been published in the period 1993-2016.

This study contributes to the literature by partly replicating a USA study in a different environment and integrating existing literature in the area of brand equity based on four Higher Education Institutes (HEIs) based in Estonia and Finland. In addition, the author utilizes three constructs used in another study (Coudounaris, 2016) related to innovativeness in tertiary education, i.e. university innovative philosophy, industry innovation adoption and content of university mission statement. These three constructs are tested in the current model as moderators between brand attachment strength and consecutively with commitment, trust and satisfaction. The previous work by Dennis et al. (2016) was performed with students and graduates of USA universities.

2.1 Brand equity

There are at least fourteen models that have incorporated the construct of brand equity during the period 1993-2016, as shown in Table 1 above. Three of the models are conceptual ones, while the remaining ten models are based on empirical studies. The criteria used for incorporating studies in
Table 1 are the following: a) they are conceptual and empirical studies providing a model of brand equity, b) the studies are included in academic journals, and c) the papers have been published within the period 1993-2016.

Note: * In this figure there are only three out of eight moderating effects of students vs academic staff on the relationship between antecedent factors and brand equity

Figure 1. The conceptual model of brand equity of universities and its antecedent factors

2.2 Hypotheses building

Figure 1 above shows the hypotheses that will be tested in this study. Internal reputation was examined within the context of brand equity based on the work by Chaidhuri (2002), and the hypothesis is as follows:

H1.1 There is a positive relationship between internal reputation and brand attachment strength

Brand Image, Brand Meaning and Brand Identity are concepts which were tested in different studies (Alwi & Da Silva, 2007; Escalas & Bettman, 2005; Goi et al., 2014. The hypotheses are as follows:

H2.2, H2.3 and H2.4: There are positive relationships between brand image, brand meaning and brand identity with brand attachment strength, which is operationalized based on the work by Park et al. (2010).

Furthermore, brand attachment strength influences commitment, trust and satisfaction. The operationalization of commitment, trust and satisfaction is based on the work by Jillapalli and Jillapalli (2014). Therefore, the hypotheses run as follows:
H3.1, H3.2 and H3.3: There are positive relationships between brand attachment strength and commitment, trust and satisfaction.

In addition, commitment, trust and satisfaction impact on brand equity, which is operationalized by the study Yoo et al. (2000). Therefore, the hypotheses are as follows:
H4.1, H4.2 and H4.3: There are positive relationships between commitment, trust and satisfaction with brand equity.

Furthermore, university innovative philosophy, industry innovation adoption and content of mission statement, which were all operationalized in the study by Coudounaris (2016), have moderating effects on the relation between brand attachment strength and commitment/trust/satisfaction. Therefore, the hypotheses run as follows:
H5.1, H5.4 and H5.7: The moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement have a positive impact on the relationship between brand attachment strength and commitment.
H5.2, H5.5 and H5.8: The moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement have a positive impact on the relationship between brand attachment strength and trust.
H5.3, H5.6 and H5.9: The moderating effects of university innovative philosophy, industry innovation adoption and content of mission statement have a positive impact on the relationship between brand attachment strength and satisfaction.

Finally, the study tests the moderator of students versus academic staff between antecedent factors and brand equity (Dennis et al., 2016). Therefore, the hypothesis is the following one:
H5.10: The moderator of students versus academic staff impacts positively on the relationship between all antecedent factors and brand equity.

3. RESEARCH METHODOLOGY

The author sent email invitations with a link to the on-line questionnaire to students, academic employees and administrative employees of four universities, i.e. the University of Tartu, Vaasa University, JAMK University of Applied Sciences and Aalto University. Three reminders were sent during the period of investigation. The collection of data lasted for 5 months between December 2016 and April 2017. It is worth noting that a link to the 10 page questionnaire was sent as an invitation to emails found on the web pages of above universities. The survey questionnaire was uploaded onto a web page platform rented from connect.ee, i.e. www.connect.ee/survey/374746316/. The questionnaire refers to different aspects of the brand equity of the above universities. In total, 172 completed questionnaires were received and used in the analysis. 99 questionnaires were received from the
University of Tartu, 33 from Vaasa University, 21 from JAMK University of Applied Sciences and 19 from Aalto University.

In addition, the author checked for nonresponse bias in the sample and common method bias. Regarding nonresponse bias, we divided the sample into three subgroups. The three subgroups were the early group (comprising the first 57 participants), the middle group (including the following 57 participants) and the late group, consisting of the last 58 participants. The t-test analysis or a comparison of independent samples revealed no significant differences among the three groups. Consequently, there were no common significant differences among the three comparisons of samples, leading to the conclusion that the phenomenon of nonresponse bias was non-existent in our sample (Armstrong & Overton, 1977).

4. FINDINGS

4.1 Estimation of the model

The researcher estimated the default model by implementing a confirmatory factor analysis (CFA). The estimation of the model had a very good fit because \( \chi^2/df \) was 1.950 with 464 degrees of freedom and the value of CFI was high, i.e. above .900 (CFI= .915) and GFI of .771 above the threshold of .7. Furthermore, RMSEA reached .075 with ECVI equal to 6.425. Additionally, NFI, RFI, IFI, and TLI values were .842, .820, .916 and .903, respectively. Figure 1 indicates the model developed with no deductions in the variables (Byrne, 2010). The attitudinal model shows a good fit because RMSEA is 0.075, which is below the critical value of 0.08 (Hair et al., 2010). Moreover, CFI is above the critical value of 0.9 (CFI=.915) and CMIN/DF is below 2, that is \( \chi^2/df \) = 1.950. It is worth noting that for the attitudinal model the calculated Cronbach α equals .905 for the construct ‘Brand Equity’, and for the remaining eight constructs ‘internal reputation’, ‘brand image’, ‘brand meaning’, ‘brand identity’, ‘brand attachment strength’, ‘commitment’, ‘trust’, and ‘satisfaction’ the values of Cronbach are α\(_1\)=0.906, α\(_2\)=0.874, α\(_3\)=0.862, α\(_4\)=0.884, α\(_5\)=0.928, α\(_6\)=0.937, α\(_7\)=0.934, α\(_8\)=0.900, and α\(_9\)=0.905 respectively. The average Cronbach’s Alpha values are above .7, specifically .903, so the manifest variables are unidimensional. Therefore, one can conclude that the Cronbach’s α of all constructs show high internal consistency reliability. The study utilized 172 cases and no outliers were found.

The model was tested for common method bias. To secure evidence of its non-existence, a CFA was performed, in which all indicators included in the structural model were restricted to load on a single factor (Podsakoff & Organ, 1986). The fit indices obtained from this analysis indicated a poor model fit, which implies that common method bias does not appear to be a problem in this study. The hypothesized associations between the constructs were tested by estimating the SEM using the
maximum likelihood technique. It is worth noting that the chi-square for the model was found to be significant ($\chi^2 = 904.730$, $p = .000$), although this statistic faces limitations.

The correlation matrix (Table 2) shows that there is good correlation between the constructs and they are statistically significant and below 0.7.

</table>

The standardized path coefficients of the latent variables and their p-values appear in Table 3. The table shows that, based on SEM analysis, all relationships are supported. The standardized coefficients of Betas, particularly for all relationships, are positive and statistically significant at the 95% confidence level. The following relationships between internal reputation and brand image ($\beta = 0.846$, $p < 0.05$), internal reputation and brand meaning ($\beta = 0.813$, $p < 0.005$), brand attachment and commitment ($\beta = 0.783$, $p < 0.05$) and satisfaction and brand equity ($\beta = 0.779$, $p < 0.05$) have the greatest impacts in the model. However, the relationships between brand meaning and brand attachment strength ($\beta = 0.375$, $p < 0.05$), brand identity and brand attachment strength ($\beta = 0.523$, $p < 0.05$), brand attachment strength and trust ($\beta = 0.468$, $p < 0.05$) and commitment and brand equity ($\beta = 0.531$, $p < 0.05$) have the lowest impacts in the model.

Furthermore, the construct internal reputation has most impact on brand image, brand image mostly influences brand attachment strength, brand attachment strength highly impacts commitment, and finally satisfaction has the most effect on brand equity. In contrast, the construct brand meaning has the least effect on brand attachment strength and brand attachment strength has a
low impact on trust. In conclusion, one can argue that the brand equity of the four universities under investigation is positively and significantly influenced by internal reputation, brand factors (image, meaning, identity), brand attachment strength, commitment, trust and satisfaction. The current results regarding the hypotheses are mostly similar to the results by Dennis et al. (2016). However, in the latter study brand attachment strength had a negative effect on satisfaction, and the path from commitment to brand equity was not significant. The positive and significant paths of this study (see Table 3) are in line with the positive and significant paths of the study by Jillapalli and Jillapalli (2014).

3.2 Moderating effects of brand attachment strength on commitment/ trust/ satisfaction

Table 4 below tests whether the moderators are significant. Particularly, based on regression analysis, the moderating effects between brand attachment strength and commitment, trust and satisfaction are tested. Table 4 reveals that all the moderators are positive and significant. Specifically, three moderators have the greatest effects, i.e. the moderating effects of university innovative philosophy on brand attachment strength and commitment, the moderating effects of industry innovation adoption between brand attachment strength and commitment, and finally the moderating effects of content of mission statement on brand attachment strength and commitment.

</table>

Note: *University Innovative Philosophy, Industry Innovation Adoption and Content of Mission Statement are measured by a number of variables shown in Appendix 1.

Furthermore, the split-group approach was used to examine the moderating effects of students versus academic staff on the link between each of the eight antecedent factors and brand equity (see Table 5). In particular, the sample was divided into students versus academic staff. Two models were estimated for this hypothesized moderator: a constraint model, in which the path influenced by the moderator was fixed to 1, and a free model, in which all paths were freely estimated. A significant chi-square difference between the two models indicated that the moderating effect was significant in relation to the hypothesized relationship. Table 5 shows that the moderating effects of students are higher on the...
relationship of antecedent factors and brand equity than the moderating effects of academic staff. This finding supports that efforts should be focused on students by satisfying them in different ways, i.e. socially and scientifically by developing different educational clubs and bringing in foreign academics to teach them. Academic staff seem to impact in a weaker way on the relationship between antecedent factors and the brand equity of the university.

Note: * Dependent variable = Brand Equity, df=464.

4.2 Reliability and validity of the model

Table 6 below shows the estimates of standardized regression weights (based on CFA) of the variables of the nine dimensions of brand equity. For assessing convergent validity and reliability, we proceed with the following three steps. Firstly, the loading estimates (standardized regression
weights) of 33 variables are well above 0.5 within the range of 0.607 to 0.952, showing a satisfactory convergent validity. Due to the fact that 66.7% of the values of the loadings are above 0.800 and another 30.3% between 0.700 to 0.800, it can be concluded that there is an adequate convergent validity.

Table 6. Estimates of standardized regression weights

Satisfaction 3: I think I did the right thing when I decided to take this university’s program/degree/course

Brand Equity 1*: Even if another university had the same features as this one, I would prefer to study at this university

Brand Equity 2*: If there was another university as good as this one, I would still prefer to study at this university

Brand Equity 3*: If another university was similar to this university in any way, it would still seem smarter to study at this university

Note: * Dependent variables

Secondly, the calculation of the variance extracted (VE) of each construct exceeds 50%, and the model has adequate convergent validity. Specifically, the variance extracted for the nine constructs was above 50% (see Table 7) and the average variance extracted was 0.84. Since each construct has VE>0.5 and the AVE=0.839>0.5, this consequently satisfies the discriminant validity criterion of AVE>0.5 introduced by Fornell and Larcker (1981). It should be noted that AVE of less than .5, which is not the case for the calculated AVE of this study, indicates that, on average, there is more error remaining in the items than there is variance explained by the latent factor structure imposed on the measure (Hair et al., 2010).

Finally, the construct reliabilities are calculated for each construct which some of them do not exceed 0.7. The mean construct reliability estimate is 0.711, which exceeds the critical value of 0.7. This suggests a satisfactory degree of reliability.

5. CONCLUSIONS, MANAGERIAL IMPLICATIONS, LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

5.1 Conclusions

This study reveals important relationships that influence brand equity. For example, internal reputation has the most impact on brand image. Brand image influences mostly brand attachment strength, brand attachment strength highly impacts commitment, and finally satisfaction has a major effect on brand equity. In contrast, the construct brand meaning has a minimum effect on brand attachment strength, and brand attachment strength has a low impact on trust. In conclusion, one can argue that the brand equity of the four universities under investigation is positively and significantly influenced by internal reputation, brand factors (image, meaning, identity), brand attachment strength, commitment, trust and satisfaction. Additionally, three out of nine moderators have important effects on brand attachment strength and commitment, i.e. university innovative philosophy, industry innovation adoption and content of mission statement. Finally, the moderating effects of students are higher on the relationship of antecedent factors and brand equity than the moderating effects of academic staff impacting the same relationship. Consequently, the efforts of the university authorities should be concentrated on the students by satisfying them in different ways, i.e. socially and scientifically, by developing different educational clubs and bringing in foreign academics to teach them. Academic staff seem to play a less important role in influencing the relationship between antecedent factors and the brand equity of the university.
5.2 Managerial implications, and limitations

The study reveals that antecedent factors of the brand equity of universities in Nordic countries, i.e. Estonia and Finland, are similar to those studied related to the brand equity of USA universities, and the relationships are positive and significant. Based on this, the university authorities in Nordic countries should think more about how to strengthen factors such as internal reputation, brand image, brand meaning, brand identity, brand attachment strength, commitment, trust and satisfaction. Furthermore, on the one hand the university authorities should pay attention to the strong relationships found in this study, i.e. relationship of internal reputation to brand image and brand meaning, brand attachment strength to commitment, and satisfaction to brand equity in order to remain important. On the other hand, the authorities of other universities in Eastern and Central Europe should investigate in future studies what is happening in their universities in order to improve the situation in their academic institutions. Apart from above implications, the university authorities of other academic institutions in Europe should improve their university innovative philosophies and develop the content of the mission statement for their institutions. Finally, governmental authorities should strive to support industry innovation adoption in their countries as this is an important moderating factor that was found in this study.

The study faced some limitations related to the responses. The author uploaded the link of the questionnaire to the facebook page of the University of Tallin and Tallin University of Technology, but no replies were received. Also the author sent invitations to different departments of the University of Tampere, but there was no reply. Further investigations should be made in other Finnish Universities.

5.3 Future research directions

Researchers should investigate external reputation measured by different international rankings and its impact on brand equity. and in addition how commitment can be initiated to produce higher brand equity of the universities. It is possible that the brand equity of universities in the UK may be influenced in a different way to Estonian and Finnish Universities and this aspect could be a possible future research direction

Being a student at our university is about considerably more than just taking courses
We offer outstanding cultural and student environments and a unique student life
Our students meet up with the latest research in modern premises and laboratories and at same time they have the opportunity to experience centuries-old traditions and offerings of choirs, orchestras, and other activities
Our university’s mission includes the advancement and stewardship of a living cultural heritage
Our university is well poised to meet the major societal challenges of today and tomorrow
Our breadth in research and education provides strength and potential
Research pursued here helps to understand our society and to improve the world, making life easier for many people
Our research reveals new perspectives on the fundamental questions of science and, at the same time, knowledge that contributes to environmental sustainability, human health, and social progress
SOCIAL MEDIA TECHNOLOGY USE AND MANAGERS PERCEPTION. 
A PRELIMINARY STUDY IN THE ITALIAN WINE INDUSTRY
Crescimanno, Maria; Galati, Antonino; Tulone, Antonio; Tinervia, Salvatore
Department of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT
This preliminary study contributes to enrich the empirical evidences on the role and impact of SM technology adoption in the Italian wine sector. In particular, the aims are to (i) understand the reasons that guide entrepreneurs to adopt SMs, (ii) identify the usefulness of SMs in the various business activities and (iii) examine the perception that the implementation of these tools has on the company's economic and organizational performance. In order to collect these information an electronic survey has been conducted among Sicilian wineries. Our findings show that the main reasons driving entrepreneurs to adopt SMs technology are the need to promote corporate image and to exploit a new communication channel. These tools are used to monitoring comments in order to understand both the attitudes towards purchasing and buying preferences and how messages are perceived by customers. Results confirm a positive effect of SM adoption in terms of corporate image and customer relationship management. This research has some theoretical and practical implications. If appropriately used our results can support the entrepreneurial choices taking into consideration that these tools allow to improve the customer relationship management and in particular the corporate image of the firm into the market.

Keywords: Social Media marketing, Business performance, Wine sector, .

INTRODUCTION
The firm’s need to survive to the global competition has led to a restatement of the business models. This was facilitated by the spread of Internet and digital technologies and particularly Social Media (SM) (Galati et al., 2016). According to Whelan et al. (2013), SM are able to provide to the users, interactive, fast, and inexpensive contents. Interactivity, speed, and cost-effectiveness are, in fact, the three factors that have favoured the success and diffusion of these new marketing tools at the firm level. Through interaction, users can participate in online communities by providing their judgments on products or companies (Zheng et al., 2015), can dialogue and discuss among them, can sharing ideas, thoughts and images (Utz, 2015) and disseminate information in the network through word-of-
mouth and blogging (Van Doorn et al., 2010). Reviews and comments provided by users are also considered by consumers as more reliable and truthful than other forms of advertising proposed by firms (Dar et al., 2014). In addition, the speed of these new communication channels allows to a growing number of users to connect, resulting in a greater opportunity to disseminate information about a firm brand and to break down geographic boundaries by linking individuals who share the same interests in different areas (Sakas et al., 2015). Lastly, the low investment required (Broekemier et al., 2015; Michaelidou et al., 2011) and the contraction in operating costs (Charoensukmongkol and Sasatanun, 2017) determine the viability of these new tools.

According to the Eurostat data, 45% of EU-28 firms, with at least 10 employees, declared for the year 2016 to use at least one SM in conducting their business activities (Eurostat, 2017). In the EU context, Italian data is below to the UE average data. In fact, only 39% of firms integrate SM into their communication plans. Among SM, social networks represent the most widespread category (Eurostat, 2017). As suggested by Genç and Öksüz (2015) Social networks represent real opportunities in business processes, becoming an integral part in business strategies and practices (Peters et al., 2013) and offering the opportunity to intercept the widest range of potential end users (Meredith, 2012). In EU-28, 42% of firms adopt Social Networks (SNs), while in Italy this percentage goes down to 37% (Eurostat, 2017). Facebook is judged by 66% of the Italian entrepreneurs as an effective or very effective tool for achieving business activities (Casaleggio Associati, 2016).

The diffusion of SMs among companies has fuelled a growing interest in the scientific community, focusing on the analysis of the impact of SM on consumer buying choices and Customer Relationship Management (CRM) and the relationship between SM and Business performance (Galati et al., in press; Kim and Drumwright, 2016; Trainor et al., 2014). On the contrary very few studies have investigated the role of SMs in the business process, the reasons that encourage entrepreneurs to invest in these new tools, the possible uses of business management and the level of gratification resulting from their use (Charoensukmongkol and Sasatanun, 2017; Mack et al., 2017; Dahnil et al., 2014).

With this in mind, the following research questions are proposed:

RQ1. To what extent SMs are used in business activities?

RQ2. What are the reasons for companies to be present in the SMs?

RQ3. What is the level of satisfaction resulting from the SMs use in relation to business performance?

To answer these questions, the present study aims to analyze the adoption and the role of SMs in Sicilian wineries and in particular (i) understand the motivations that guide entrepreneurs to adopt SMs, (ii) identify the usefulness of SM in the various business activities and (iii) examine the
perception that the implementation of these tools has on the company’s economic and organizational performance.

Sicily was chosen because, in recent years, numerous wineries have implemented modernization processes paying increased attention to improving product quality, packaging and marketing in particular (Giacomarra et al., 2016; Galati et al., 2015). With specific reference to the marketing and communication strategies, Galati et al. (2016) found that a prevalence of Sicilian wineries adopt internet in their own website as a means of communication to promote their image, increase their visibility and bringing down communication costs. This is in line with the growing recognition of the relevant role of digital marketing as valuable and appropriate tool to reach consumers (Viana, 2016).

The paper is organized as follows. A literature review on the relationship between SM adoption and business performance and the manager’s perceptions is presented in the second section. The third section summarizes the methodological approach used. Results are presented and discussed in the fourth section. The last section contains final considerations and some concluding remarks.

LITERATURE REVIEW

The advent of Web 2.0 technologies and the growing diffusion of SM have transformed the ways in which firms can enact their business and their marketing and communication strategies. In recent years, an increasing number of firms have incorporated SM strategies in an integrated communication and media plan by intensifying their marketing efforts and changing the way of doing business (Dahnil et al., 2014; Kaplan and Haenlein, 2010). As noted by Berthon et al. (2005) SM can be used by firms in three different ways, as traditional marketing channels, in which economic return on investment (ROI) is the firm’s main objective, in a traditional-experimental way, where purely economic aspects are associated with social interactions (social-ROI), and, as experimental approach in which the firm integrates a human voice into the social-media platform. Many studies show that firms’ adoption of marketing strategies based on SM have a positive impact mainly on the direct interaction with consumers, indeed, as asserted by Kietzmann et al. (2011), business become a network member in a system of interactions among customers and between customers and company. Is widely recognized that some firms use SM for customer relationship management (CRM), because communication in SM can be made in real-time, thereby allowing companies to interact with and respond to customers instantly (Charoensukmongkol and Sasatanum, 2017). SM technology although not be sufficient to gain immediately a competitive advantage have the potential to create capabilities that could translate into useful resources that allow firms to better meet the needs of customers and which can turn result in competitive advantages and higher performance (Trainor et al., 2014; Lau, 2011; Leonidou et al., 2011).
Empirical researches have been largely focused on the Social Media marketing and in particular on the impact of SM and SNS in consumers’ purchasing intention (Dehghani and Tumer, 2015; Gunawan and Huarng, 2015; Whan and Wei, 2012), on their effect on the brand awareness (Gao and Feng, 2016; Breslauer et al., 2009), to provide useful market research data and to generate electronic word-of-mouth conversation (Erkan and Evans, 2016; Nunan and Yenicioglu, 2013; Trusov et al., 2009).

Very few studies in the economic literature have been carried out in order to understand the effectiveness of the investments of SM tools and the determinants of the adoption of SM at the firm level. In relation to the first point, some Authors emphasize the difficulty in determining the economic impact of SM investments in terms of Return on investment and Return on sales (Wu, 2016; Kim et al., 2015; Chung et al., 2014; Kumar and Mirchandai, 2012) in relation to the complexity of distinguish customers from online community members (Ang, 2011). As funded by Moorman (2015) only 15% of marketers have been able to prove the quantitative impact of SM on their business. However, as suggested by Charoensukmongkol and Sasatanum (2017) the entrepreneurs who used SM intensively for CRM tended to report higher satisfaction with their business performance and this evidence appeared to be significantly higher for the entrepreneurs who exhibited lower level of social competency in business.

With specific reference to the determinants with the most impact on the adoption of SM at the firm level, some Authors emphasize that firms incorporate SM in their promotional plans in order to reduce both internal communication and marketing costs, and transaction costs (information, negotiation, and monitoring costs), through an improvement of the efficiency of their communication process (Bughin et al., 2011). Compared to non-virtual media or traditional marketing channels, SM represent an inexpensive promotional options with relatively low cost (Broekemier et al., 2015; Dehghani and Tumer, 2015). Kirtis and Karahan (2011) found that the use of SM as a marketing tool is a marketing strategy that can save business costs as through the use of SM, millions of consumers can be reached in a short period of time and the information can be disseminated quickly.

Companies use SM platforms, such as Facebook, in order to increase brand awareness and enlist people’s participation through online comments, posts, and other types of engagement (Wallace et al., 2014). This is especially true for products such as wine, in which the interaction between wine producers and consumers, or among consumers themselves, has a key role to orient consumer behaviour affecting the sales process. SM helps to advance wine sales due to SM platforms’ ability to spread wine consumers’ opinions to others, encouraging customers to try different wines (Quinton and Wilson, 2012; Leigon, 2011). Quinton and Wilson (2016) investigate business relationship management in the wine industry within a social media network, they found that participation in the social network can lead to enhance business performance. In particular, business performance is
enhanced through collaborative problem solving of technical or specific issue which will improve resource efficiencies, the creation of ideas which enhance the credibility of the business in the marketplace, and the establishment of new business contracts through the Social media networks which will increase revenue generation and profit.

The firms' adoption of modern digital technologies and of new and innovative tools, such as SM, is affected, as emphasized in many studies, by firms' managerial characteristics (Galati et al., 2016). Empirical evidences suggest that younger managers are more likely to adopt SM tools, and managers or owners with a higher level of education have the ability to create a favourable atmosphere for the adoption and implementation of innovative tools (Fosso and Carter, 2014; Vlachvei and Notta, 2014). The latter results has been confirmed also in the wine industry in the study of Galati et al. (in press) according to which wineries more engaged in SM were those run by managers with a high level of education, probably because such managers had increased awareness of the benefits associated with the integration of SM in their marketing plans. A different result was found by Mack et al. (2017); the Authors find not differences amongst entrepreneurs of different ages, races, and educational levels in their internet and social media use but highlighted that prior entrepreneurial experience is the most important explanatory factor in explaining the internet application and SM use. In addition, Alarcón-del-Amo et al. (2016) found that the introduction of SM tools in the business strategies is tied to managers' beliefs. In fact, managers' beliefs about the adequacy of social media capabilities for dealing with foreign customers generate a positive managerial attitude and a greater intention to use these applications.

**METHODOLOGICAL APPROACH**

*Sample and data collection*

Data were collected through an electronic survey conducted among Sicilian firms operating in the wine sector in 2017. The reference universe consisted of 245 wineries engaged in the production of wines from grape according to the classification of economic activities NACE 2007 (code 11.02). Of these, firms present in the social networks were 99 and comprised the target population surveyed. An electronic questionnaire has been sent to each of the wineries via e-mail to capture information on both the wineries and managers characteristics, and the main factors explaining the adoption of SM and the perception of firm entrepreneurs about the use and the effectiveness of social media strategies. A total of 37 questionnaires were obtained.

*Measures*

The scale adopted to analyze the main reasons affecting the manager/owner of the wineries to be present on SM and SNS in particular, the business activities in which these tools are used and the
impact of the adoption of the SM on the economic and organizational performance, were developed based on the review of prior research and modified taking into account the specificity of the wine industry. In particular, for the question related to the reasons that guide manager/owner to incorporate SM strategies in their marketing and communication plan we adapted to the sector studied the items proposed in previous empirical researches (Garay et al., 2017; Trainor et al., 2014). All items were rated on a 5-point Likert scale ranging from 1 (not at all) to 5 (Extremely important). In order to measure the SM use in the business activity ten questions built, on the basis of the research of Andzulis et al. (2012) and Charoensukmongkol and Sasatanum (2017) and modified taking into consideration the specificity of the sector studied, have been proposed. For these questions a five-point Likert scale was used. Finally, managers/owners were asked to assess to want extent they were satisfied following the social media adoption with their firm performance. A five-point Likert scale ranging from 1 (very dissatisfied) to 5 (very satisfied) was used.

RESULTS AND DISCUSSION

Sample description

On average, wineries of the sample operate in the sector for more than 35 years and produce about 270,000 bottles a year, with a range varying between 1.3 million and 4 thousand bottles, highlighting a great heterogeneity of behavior. An interesting aspect that emerges from our survey is the high investment in advertising and promotion that reaches on average 1.9% of turnover and ranging between 0% and 15%. This high investment justifies the number of employees working in this area, which averages 1.4 units.

Concerning the manager characteristics, the sample studied presents a strong presence of young owner-managers under 40 years (51%). This is certainly in line with the spread of modernization and the introduction of innovation in the wine sector and confirms recent studies that young managers are inclined to adopt SM compared to older ones (Wamba and Carter, 2014). Furthermore, results show a high level of education among the firm entrepreneurs. In fact, more than 58% of respondents have a bachelor or master degree. As Mack et al. evidenced (2017), this is a resource for the entire industry because high levels of education are associated with greater ability to acquire information and reduce uncertainty (Damanpour and Schneider, 2009), as well as being able to recreate conditions to work in a more innovative atmosphere (Wamba and Carter, 2014) and be more capable of taking deciphering and solving problems (Damanpour and Schneider, 2009).

Factors affecting the adoption of SM technology

The main reasons affection the decision of Sicilian entrepreneurs operating in the wine industry to be present in the SMs and SNs in particular are ranked in Figure 1. The results show that the key factors
driving entrepreneurs or owners to implement SMs technology in their communication plan are the need to promote corporate image (4.43) and to exploit a new communication channel (4.34). Other important factors guiding firm owners to adopt SM strategies are to communicate with customers (4.06), to introduce the company to a larger audience (3.89) and to interact with customers (3.80). These findings are in line with the results of Wallace et al. (2014) who found that SM platform is used in order to increase brand awareness and involve user’s participation in on-line comments and post. On the contrary, SMs and SNs in particular are less used as tools capable to acquire information on collaborators (2.24) and competitors (2.47) and to conduct market research (2.82). An interesting aspect that emerges from our survey is the low influence in the choice to adopt SNs of motivations linked to the opportunity to reduce advertising and communication costs, or to increase the competitive advantage. These findings contrasts with the results of some authors according to which SM are used in order to reduce transaction costs (Bughin et al., 2011) and to reduce business costs (Kirtis and Karaham, 2011; Broekemier et al., 2015; Dehghani and Tumer, 2015).

Figure 1 - Raisons to be present in the SMs

Source: Our elaboration on collected data

Findings show that Facebook and other SMs are used by firm owners to provide real time information about the product (3.94), to share and exchange information with customers about the products (3.71), to interact with, talk to, and share opinions with customers (3.62). As emphasized by Charoensukmongkol and Sasatanum, (2017) SM are used by firms mainly for customer relationship management, taking into account that these tools have a positive impact on the direct interaction with customers. Furthermore, the entrepreneurs interviewed use SNs to monitoring comments in order to understand attitudes towards purchasing and buying preferences and how messages are perceived (3.27 and 3.24, respectively). In contrast, Facebook and other SMs are less used by winery
entrepreneurs to acquire information on each customers in order to differentiate and classify customers and create a specific strategy for each group of customers.

Regarding the perceived impact due to the adoption of SM technologies, the findings suggest that the main positive effect is on the corporate image (4.26) and on the customer satisfactions (3.89). Additionally, some firm owners interviewed said that they gain a customer long term retention (3.69). Most of the entrepreneurs interviewed found no improvement in the profit and profit growth (3.06 respectively), and in the sale volume and sale growth (3.23 respectively). The latter results are probably due to the difficulty of entrepreneurs, showed by some authors (Wu, 2016; Kim et al., 2015) to determine the economic impact of SM investments in terms of profit and sales.

**Figure 2 – Impact of the SMs use on the business performance**
CONCLUSIONS

This study contributes to the few research on the role and impact of social media technology adoption by firms operating in the Sicilian wine sector. In particular, our findings shows that the main reasons driving entrepreneurs or owners to invest in SMs technology are the need to promote corporate image and to exploit a new communication channel. Between SMs, the SNs are the virtual platform most used for business purposes. The entrepreneurs, in fact, use SNs to monitoring comments in order to understand both the attitudes towards purchasing and buying preferences and how messages are perceived by customers. Regarding the impact of SMs adoption on the business performance, our findings confirm the positive effect of SM adoption in terms of corporate image and customer relationship management.

This study has some theoretical and managerial implications. From a theoretical point of view, our results contribute to enrich the empirical evidences on the role of SM technology and their impact on the business performance. From a managerial perspective, our results if appropriately used can support the entrepreneurial choices taking into consideration that these tools allow to improve the customer relationship management and in particular the corporate image of the firm into the market. As a result, SMs contribute to increase the business performance and to improve their competitive advantage in the wine market.

That being said, it is important to point out some limitations of this work. First, the results are based on a single region (Sicily). For this reason, future works should focus on several territories in different areas of the globe to overcome this limitation. Second, the analysis is based on a limited number of

Source: Our elaboration on collected data
wineries, which greatly limits the veracity and the applicability of the results on a large scale. In the future, it would be advisable to extend the sample to verify the reliability of the results obtained.

The originality of this study lies in being a preliminary study in the Italian wine sector, focusing on SMs technology use and on the managerial perceptions.

ABSTRACT

The objective of this paper is dual. The first is to identify the key factors that characterize the most successful organizational models of firms operating in the Greek wine industry. The second is to verify if the adoption of third party certifications influences the firms performance. In particular, paying attention on the internal resources of firms, the Resource based view approach is proposed as theoretical framework. Through a cluster analysis has been possible gather the wineries observed on the basis of a similar organisational model, while a non parametric test has been used in order to verify the influence of voluntary certifications on firm performance. Findings show that the most successful wineries are those the most modern, with a higher orientation toward adoption of voluntary certification and managed by expert managers or owners, with a good educational level. The results could provide useful information in order to improve own performances, especially for firms characterized by a limited availability of economic and physical resources.

Keywords: RBV Approach, Wine industry, Organisational Models, Greece, Quality Certification, Environmental Certification.

INTRODUCTION

Despite the globalization phenomenon is not a new in the wine industry, in the last decades its contribution to the complex evolution of world’s wine market, has been increasingly decisive. Evidences of this change are the growth of international wine trade, the reconfiguration of the productive scenario, and the changes in the wine consumptions (more oriented toward higher quality products) (Crescimanno and Galati, 2014; Mariani et al., 2012; Rossi et al., 2012; Vrontis et al., 2011). In particular, if in one hand, the effects have been positive for stakeholders in the new producers countries (such as China, New Zealand, South Africa and Chile), in the other hand, this has presented a serious challenge to old producers countries like Italy, Spain and France (Anderson et al., 2003). As results of
the increased competitiveness in the international wine trade there is a stronger export orientation by firms operating in the largest producing countries, which, in order to preserve own competitive advantage in the market, have to adopt new strategies and organizational models more efficient (Mariani et al., 2012; Rastoin et al., 2006).

Now more than ever, the study on the key factors of a successful business model is a fundamental interest of researchers and practitioners. Whereas the success of organizations may be attained through different ways, that is, taking advantage of own internal capabilities, the external position or both (Aghazadeh, 2015), not few authors have examined the different sources of competitive advantage of firms. How emerges from the economic literature, indeed, in addition to the two fundamental perspectives suggested for the comprehension of competitive advantage, based on marketing perspective (Porter, 1985), and internal resources (Wernerfelt, 1984; Barney, 1991), a third perspective has been suggested, that considers the interaction of these two sources for the achievement of competitive advantage (Day, 1994). Not few studies, according to Resource-Based View, have put in light the influence of internal factors on the firms’ business performance (Galbreath and Galvin, 2008), in particular on internationalization process, that is, for example, one of key requirements for Small and Medium Enterprises (SMEs) in order to remain on the market (Dutot et al., 2014).

Among the internal resources capable to influence the performance of firms, there are the organizational attributes, which include characteristics of communication flow, emphasis on human resources, decision-making practices, organization of work etc. (Hansen and Wernerfelt, 1989). Among these, over the last decades, the increasing spread of quality and environmental certifications, in the agri-food sector particularly, have drove researchers to analyse the impacts generated by these certifications, both at the market and firm level.

Economic literature is full of studies about the impacts of the adoption of voluntary certifications and the important role that they play for the companies oriented to improve own economic performance and beyond (i.e. Gómez-Conde et al., 2013; Chen et al., 2015; Macheka et al., 2013; Henson et al., 2011; Suburvie and Vagneron, 2013). However, few studies have assessed the impact of the adoption of a voluntary certification on economic, financial and organizational performance of firms operating in the wine industry (i.e. Aggelogiannopoulos et al., 2007; Giacomarra et al., 2016).

In view of the above, in this paper we employed, as theoretical lens, the Resource-Based View of the firm in order to identify the key factors for a successful organizational models, in terms of superior export and economic performance, and verify a relationship between adoption of third party certifications and firms performance.

An empirical survey has been carried out in Greece, in particular, we focused in Attica and Peloponnese, two of the most important Greek wine regions both in terms of area under vines (over a
quarter of the Greek area devoted to wine grape production, is in these two regions), and qualitatively (considering that more than 25.0% of PDO wines is produced in these two regions) (New wines of Greece, 2016), both characterized by a significant presence of Small and Medium Enterprises (SMEs) and micro enterprises.

Our paper is structured as follows. After this introduction, we first introduce the theoretical framework. The following sections describe the research approach and the results. Finally, we end the paper with concluding remarks in last section.

THEORETICAL FRAMEWORK

Since decades, studies on strategic management of enterprises enhance the role of company’s internal resources, as potential sources of competitive advantage, adopting a different approach in relation to that was used previously studies mainly focused on the influence of external factors and, according to which, the competitive advantage derives exclusively from the placement of firms in the market (Porter, 1985). The Resource-Based View (Wernerfelt, 1984) agrees and supports this point of view, but also suggests a number of empirical indicators by which to identify resources that can provide a competitive advantage (Barney, 1991). The RBV has its roots in the Theory of the Growth of the Firm formulated by Penrose (1959), the first economist to recognize the role of resources in the process of growth and development of enterprises, but the analysis of the performance of companies based on internal resources has spread only after that Barney (1991) has defined the characteristics and explained how these are to be used in order to gain a sustainable competitive advantage and durable. According to the Author, in fact, companies operating within the same industry differ in terms of internal resources, in other words, each company has a unique bundle of resources that distinguishes it from its competitors. Furthermore, these internal resources beyond to be characterised by a marked heterogeneity, they have to be also Valuable, Rare, Inimitable and Non-substitutable, in order to generate a sustainable and durable competitive advantage.

Barney (1991) has also classified the resources in three different categories: (i) tangible resources, including the technology used, the facilities, equipment, geographic location and access to raw materials; (ii) intangible resources, which include human capital, such as the level of training, experience and knowledge of employers and employees, as well as their relationships that determine the quality of the work environment of an enterprise; (iii) and, organizational capital, or communication skills (within the enterprise and between enterprises), planning, control and coordination. Makadok (2001), instead, makes a distinction between a firm’s resources and capabilities. The former can be observable but not necessarily tangible asset that can be independently
valued and traded. The second are unobservable and hence necessarily intangible, cannot be independently valued, and changes hands only as part of its entire unit.

Today the RBV is one of the most widely accepted theoretical perspectives in the strategic management field, probably because is focused on the role of internal resources which, not only can affect the performance of firms, but also influence the marketing strategy decisions.

In this study our attention is focused on the role played by tangibles and intangibles internal resources of firms, associated both to the firms and managers characteristics, and to the organizational resources, in the generation of successful business models.

Concerning the firms’ characteristics, numerous studies reveal that larger size of firms in terms of number of employees or sales, that is, firms with a greater availability of resources and, are more likely to export activity than smaller ones (Erramilli and Rao, 1993; Suárez-Ortega and Álamo-Vera, 2005; Maurel, 2009). How suggested by some authors (Majocchi et al., 2005; Suárez-Ortega and Álamo-Vera, 2005) firms’ age can be considered a potent explanatory variables of the export performance, since it could be considered synonym of maturity in the field of management, international transactions, and business partnerships. Other authors (Kotabe et al., 2002; Fernandez Olmos, 2011), instead, find that one of the main determinants that can contribute to increase the degree of firms’ internationalization is the amount of investments in advertising and promotion activities.

As it is evident from the economic literature, managerial characteristics also have a relevant influence on the organizational model choice of firms. Age of managers and owners and their level of education are explanatory variables of the firms’ export performance. Some evidences, suggest that younger entrepreneurs are more associated with policies of corporate growth than older managers and more risk-oriented (Suárez-Ortega and Álamo-Vera, 2005; Serra et al., 2012), as well as, managers with a higher degree of education are more able to use the opportunity of exploring new context (Tihanyi et al., 2000; Wieserma and Bantel, 1992).

Finally, we consider the implementation of quality or environmental certifications, like a organizational resource that can represent a key factor of the successful organizational models. How suggested by Sampaio et al. (2009), the effects generated by the adoption of voluntary certifications on economic and organizational performance of companies can be grouped into two categories, namely internal and external effects. In the first category they include the impacts that occur in the interior of firms, such as the improvement of the quality of products and of efficiency of production processes (Kafetzopoulos and Gotzamani, 2014; Karaman et al., 2012; Mensah and Julien, 2011). The second one, instead, contains the external effects related to sales, marketing and communication activities. How Has been found by several authors, the adoption of quality and environmental certifications, may
represent a useful tool for improve the economic performance in terms of labour productivity (Gomez Conde et al., 2013), turnover and overseas market share (Macheka et al., 2013; Chen et al., 2015), increasing of selling price of products (Suburvie and Vagneron, 2013), and achieve higher income levels than non-certified companies (Dora et al., 2013; Handschuch et al., 2013). In particular, in the wine sector, Aggelogiannopoulos et al. (2007), with reference to a small Greek wine cellar, have shown that the adoption of a voluntary certification can result in the improvement of the level of internal communication, the growth in market share and the opportunity to enter new foreign markets. Other advantages offered by adoption of voluntary certifications has been highlighted by Giacomarra et al. (2016). In the Italian wine industry, in fact, the implementation of a voluntary certification represent a factor able to improve performance of certified wineries in terms of efficiency of production processes.

**METHODOLOGICAL APPROACH**

The questionnaire

In order to identify the key factors affecting the most successful organizational models of Greek wineries an ad hoc questionnaire was constructed based on the RBV approach. The questionnaire consist of four parts, each of which aims to capturing the needed information in order to explain the influence of firms’ and managers’ characteristics on the economic and exportation performances of wineries. The first section is focused on the general information on wineries. In particular the questions concern the location and the legal form of firm, the starting year of activity and sales in foreign markets. In add, in order to establish the physical size of firms, we ask the production capacity (in terms of annual number of wine bottles produced), and the number of fix employees. The second part allows to define the entrepreneurs or managers profile. This section gathers information such as age, years of experience in the wine sector and the education level. In the third part we collect information about commercial aspects. More in detail, in order to establish the economic size of wineries we ask the average annual turnover, wine production, while in order to assess the export orientation of firms we ask the percentage of turnover generated by the sold in the foreign markets. In the same section, are included also the questions concerning the promotion, business and marketing activities, such as sales channels (Ho.Re.Ca., wine shops, wine bar, Large-Scale Retail trade, direct selling or through intermediaries), investments in advertising (in terms of percentage of annual turnover), participation to fairs (national and international). The last part of questionnaire is focused on the adoption of voluntary certifications by wineries. To each interviewed has been submitted a list of quality and environmental management systems the most widespread in the agri-food and wine industry (i.e. ISO family, BRC, IFS Food, GlobalG.A.P.), and we asked if the own winery adopts on or more of these.
The samples

The target population is represented by the wineries operating in the Greek wine industry. In particular, the sample consist of 41 wineries, identified thanks to the lists provided by Greek Wine Federation and Central Union of Wine Producing Cooperative Organizations of Greece (KEOSOE) which include, 112 wineries, on the whole. The information was collected through the submission of the questionnaire by telephone, email or face-to-face. The samples reflect the distribution of wineries in the Attica and Peloponnese areas (with a higher number of wineries in East Attica and Corinthia).

The main characteristics of firms and managers, are synthesized in Tables 1 and 2. How emerges by data, there is a prevalence of individual firms that operate in the wine sector since 33 years on average and prefer sell through intermediaries. More than half adopts at least one voluntary certification.

* In parentheses minimum and maximum values.

The method
With the aim of identifying similar organizational models among the Greek wineries observed, and verify which of these are those with the most successful, on the basis of their internal resources, we performed a hierarchical cluster analysis using SPSS software version 21. The variables included in the model are expression both of the firms characteristics and managers, as well as, of the organizational resources of firms. Among the firms characteristics, we considered the age of wineries in terms of number of activity years (Fernandez Olmos, 2011; Maurel, 2009), the export experience that is valued in terms of number of years of trade in the foreign markets of firms (Galati et al., 2014), the size of firms in terms of number of fixed employees (Maurel, 2009; Fernandez Olmos, 2011; Galati et al., 2014), the efforts in promotion and advertising in terms of annual number of participations to national and international wine fairs (Galati et al., 2014), and finally, the percentage of volume of product sold directly by firms how description of sale strategy. Regarding to the profile of managers, we have inserted in the cluster analysis the variable that is expression of their educational level (Suárez-Ortega and Álamo-Vera, 2005; Maurel, 2009; Fernandez Olmos, 2011; Galati et al., 2014), while, about the organizational resources of firms, we have included two variables (QC and EC), that are, the adoption of quality and environmental certifications (i.e. IFS Food, GlobalG.A.P., and ISO family’s certifications) in light of their positive effects on the increase the international presence of firms (Liberman et al., 2010). The Ward’s method has been selected, among the other clustering criteria, in order both to minimize the intra-cluster distance and maximize inter-cluster distance, and to obtain a similar amount of observations in each cluster and that no outliers were present among the variables included in the model. The distance among clusters has been measured using the squared Euclidean distance. In order to identify the number of cluster components, in addition to the dendrogram examination, scree plot, and the VRC using the ANOVA procedure for each of three segment solutions, we did a two-steps cluster analysis, using the same variables and specifying the most probable solution in terms of number of cluster, and we have performed the analysis again changing the order of observation in the dataset.

In order to verify if the adoption of third party certifications influences the firms performance, we carried out the Mann-Whitney U test for the comparison of two independent samples. The two samples are composed by certified and non-certified firms, respectively, and the index adopted for the measure of firm performance were, the Labour Productivity (LP) and the Export Intensity (EI). The first index, previously used in other empirical researches in order to assess the economic performance of firms (Giacomarra et al., 2016; Ullah et al., 2014; Gómez Conde et al., 2013; Starke et al., 2012), is the ratio between the annual turnover and the number of fix employees. The second index, instead, explains the export performance of firms and it is obtained by the ratio between the value of turnover on foreign markets and the total turnover. The choice to apply a non-parametric test, derives from the
fact that the values of these index are not normally distributed inside of the investigated samples (this information emerges from the test results of the normality of Shapiro-Wilk).

RESULTS AND DISCUSSION

The results of cluster analysis and the average values for the variables studied are presented in the Table 3. Each cluster includes, respectively, 11, 7, 6 and 17 wineries.

Table 4 shows the analysis of variance between and within clusters, the result of the Fisher test (F) and the model significance. Results show that four clusters are statistically different and three variables are statistically significant at the 99% level, while one variable is significant at the 95%. In particular, the variable “Direct selling” is the most influential variable in the profile of clusters (F=68.411), while “Educational level of manager” is the less influential (F=2.857).

The results show that wineries with the lowest experience in the sector and the highest level of adoption of quality and environmental certifications (even if these variables are not statistical significant), are grouped in the first cluster, which could mean that firms more modern and more willing to adopt innovations (like voluntary certifications). Furthermore, the same wineries are characterized also by the highest economic performance (in terms of average turnover) and highest participation to international fairs. This result partially confirming that, the adoption of voluntary certifications helps to improve the firms performances (He et al., 2015; Kafel and Sikora, 2012).

Wineries grouped in the second cluster are those characterized by the lower physical and economical size, with the lower experience in the export activities and the lower diffusion of environmental certifications. In addition these wineries are conducted by managers or owners with...
the lower education level and the lower proficiency in foreign languages, among all people interviewed. These wineries are more oriented to the local market, in light of the highest participation to national fairs and the highest volume of product directly sold.

The third cluster, is composed by the oldest and the biggest wineries (in terms of number of employees and production of bottles), with the longer experience in the export activity, among all the wineries observed, however, they show a low frequency of participation at oenological fairs or other exhibitions. Managers and owners of these wineries are the younger and they are characterized by the higher educational level and the best knowledge of foreign languages.

The last cluster includes wineries with a highest frequency of participation to wine fairs. They are characterized by the lowest spread of quality certifications and by the lowest volume of product directly sold. Furthermore, this group includes also the older managers/owners which compose our sample. These findings, considering that the same wineries are also the most market oriented (on the basis of percentage of product sold in the foreign markets), are contrasting with findings of Serra et al. (2012) and Suárez-Ortega and Álamo-Vera (2005), according to which younger managers (or entrepreneurs) are more risked-oriented and adopt market-oriented strategies. The same people show a good level of education, this confirm how asserted by Tihanyi et al. (2000) and by Wieserma and Bantel (1992), that is, managers with a good degree of education are more able to take advantage of the opportunity offered by new international markets. The high volume of product sold through intermediaries-exporters could explain the good export performance of these wineries. In line with the results obtained by other authors (Mohsenzadeh and Ahmadian, 2016; Al-Ali et al., 2013), this result underlines how a good competence in the management of marketing and sales (including the selection of distribution channels) can affect the export performance of firms. Regarding to the highest participation to wine fairs, a good promotion capability in global markets, including all marketing related activities, allows firms to adapt to foreign markets, to persuade global consumers to purchase their products (Murray et al., 2011) and increase export sales (Hultman, et al., 2011).

In the first part of our study, through a cluster analysis, we identified four different organisational models characterizing our sample, after that, our investigation continues with the verification of the existence of a relationship between adoption of voluntary certifications aside of wineries and their performances.

Table 5 shows the rank values (mean and sum) which show a substantial similarity between certified and not-certified wineries in terms of LP, while the same groups seem different in terms of EI.

How emerge by Table 6, the value of Monte Carlo significance (greater than 0.05) does not allow to reject the null hypothesis and essentially confirms the absence of differences in terms of LP and EI between certified and non-certified wineries. In other words, certified and not-certified wineries, originate from the same population. These results are conflicting with findings of Gómez Conde et al. (2013) which found that the adoption of voluntary certification positively affects both the level of internationalization of Spanish food companies (measured by an index based on the share of total sales generated by overseas sales), both their performance (expressed in terms of labor productivity). Conversely, these agree with results of Schuster e Maertens (2015) which reveal how the adoption of third party certification does not exercise any influence on the export performance of Peruvian firms.

CONCLUDING REMARKS

The present study shows that Greek wineries included in our sample are characterized by similar organisational models, more or less successful. In particular, the most successful wineries are those the most modern, with a higher orientation toward adoption of voluntary certification and managed by expert managers and owners, with a good educational level. However, the results of test implemented do not provide any significantly statistically evidence that confirms a relationship between adoption of voluntary certifications and firm performance (both in terms of Labour Productivity, and Export Intensity).
From academic point of view, this is one of the few studies aimed to understand the role of internal resources and, at the same time, of important strategic tools like voluntary certifications, in the characterization of organizational models in the firms operating in the wine industry. Furthermore, we empirically verified the theoretical tenets of RBV approach, according to which, firms’ resources can influence the organization and the performance of firms.

Beyond the theoretical implications, our paper provides a valuable support for firms’ decision makers which operate in this industry, for the purpose of choose the most appropriate strategy in order to improve their economic and organizational performance. Results obtained, suggest that, a greater promotional commitments and advertising investments, so as to have a greater visibility, (for example through a higher participation to national and international fairs), could help firms to improve their performance, while, has been seen also that a correct choice of sale strategy and sale channels, allows to take advantages of the opportunities offered by international markets.

For policymakers, findings suggest the need to develop policies aimed to help, in particular, the small-scale wineries in their internationalisation process, supporting them, for example, in the introduction of useful innovations, such as quality or environmental certifications required to sell in some sensible markets.

Obviously, this study shows some limitations. One of these is that study is focused in the wine industry exclusively, in addition, the area investigated, is limited to two (even though important) wine regions of Greece, and the sample analysed, is not representative for entire population, so, any effort to extend results to other industries, represents an error.

Finally, considering the obtained results and that not many studies have faced this issue in the wine industry, and in particular in the Greek wine industry, could be interesting, for future research, analyse the organizational models taking into consideration also external factors, through a multiple theoretical approach.

NEW PERSPECTIVES IN MANAGING RISKS IN SMES

Crovini, Chiara

Department of Management, University of Turin, Turin, Italy, chiara.crovini@unito.it

ABSTRACT

The present study concentrates on risk management in SMEs and provides the hypotheses and reasons behind the non-implementation of this process.

This research represents a theoretical contribution in the field of corporate and risk governance of SMEs. It differs from other studies because it does not follow incremental gap-spotting ideals but instead emphasizes assumption-challenging in the construction of research questions, which are formulated by problematizing some dominant assumptions in existing research. To do that, this paper follows the philosophical and epistemological concepts of abduction and pragmatism, elaborated by Charles Peirce.

The purpose of this paper is to understand from which point of view it is necessary to restart analysing the topic of risk management in SMEs and to suggest a new perspective that could lead managers and owners of small and medium enterprises to improve their risk attitude.

In particular, the research underlines the necessity to concentrate on the human being and his personality and to consider risk management as an integral part of decision-making.

Keywords: risk management, SMEs, theoretical paper, decision-making, new perspectives

INTRODUCTION

Since 2008, the global crisis has revealed significant new problems in risk assessment and management, caused by the increasing uncertainty derived from a demanding environment. Risk management is a transversal process to each company and has a strategic importance because it helps managers set and possibly achieve the objectives of their companies. So why is there a lack of sensitivity in adopting a sound risk approach, especially in SMEs?

Why, despite all the literature regarding the importance of having an adequate internal control system, are there still cases of bankruptcy and scandals?

One of the most important reasons lies in the fact that the management of risks in some realities, especially in those very small, is seen as a burden and a final objective itself.

SMEs represent an important reality in the entire economic system. They are crucial in promoting economic growth at the international level and their vitality helps reduce the unemployment rate.
Therefore stability and prosperity of SMEs assume systemic value for all countries (World Trade Organisation, 2013).

In many countries, there is no regulatory or institutional code of risk management: SMEs do not usually adopt a formalised risk management process. But in some cases there is no need to formalise this process or to implement the ERM systems.

This research represents a theoretical contribution in the field of corporate and risk governance of SMEs. It differs from other studies because it does not follow incremental gap-spotting ideals but instead emphasizes assumption-challenging in the construction of research questions, which are formulated by problematizing some dominant assumptions in existing research (Davis, 1971). To do that, this paper follows the philosophical and epistemological concepts of abduction and pragmatism, elaborated by the American philosopher Peirce.

This paper has been motivated by the need to understand from which point of view it is necessary to restart analysing the topic of risk management in SMEs and to suggest a new perspective that could lead managers and owners of small and medium enterprises to improve their risk attitude. In particular, there will be the necessity to concentrate on the human being and his personality and to consider risk management as an integral part of decision-making.

The paper is organised as follows. The research design with details about the methodology and epistemological approach are stated in the second section. The theoretical background about the risk management process in SMEs is presented in the third paragraph. New perspectives on the theme and discussions about theory development instead are in the fourth section. The final paragraph instead deals with the conclusion.

**RESEARCH DESIGN**

This research represents a theoretical contribution in the field of risk management in SMEs. It differs from other studies because it contradicts incremental gap-spotting ideals, by emphasizing assumption-challenging in the construction of research questions (Alvesson and Kärreman, 2007, 2011; Sandberg and Tsoukas, 2011).

There are several works following different methodologies concentrating on the management of risks in SMEs. They focus on specific kinds of risks or on procedures to be implemented in a small- and medium-sized company. They all underline the importance of developing a sound risk governance and an appropriate approach.

But why are still there corporate failures? Why is still there an immature approach in managing risks in SMEs? Why is risk management still regarded as a burden or a major cost?

It seems that academics should investigate more the real reasons behind this phenomenon.
This study follows a methodology that is less focused on gap-spotting and incremental contributions. The aim is to formulate research questions by problematizing some dominant assumptions in existing research (Davis, 1971). Formulating novel research questions through problematization involves not just using a particular preferred meta-theoretical standpoint in order to challenge the assumptions of others (as is often the case in the paradigm debates) or as in various applications of critical perspectives (Alvesson and Sandberg, 2011). ‘Real’ problematization also involves questioning the assumptions underlying one’s own meta-theoretical position (Alvesson and Sandberg, 2013a). The ambition is to unpack one’s own position sufficiently so that some of the ordinary held assumptions can be scrutinized and reconsidered in the process of constructing novel research questions.

The aim of the problematization methodology ‘is to come up with novel research questions through a dialectical interrogation of one’s own familiar position, other stances, and the domain of literature targeted for assumption challenging’ (Alvesson and Sandberg, 2011, p. 252). This approach would support a more reflective-scholarly attitude (Abbott, 2004) and consider a different epistemological approach.

To do that, the following methodological principles are central (Alvesson and Sandberg, 2013b):

1. identify a domain of literature;
2. identify and articulate assumptions underlying this domain;
3. evaluate them;
4. develop an alternative assumption ground;
5. consider it in relation to its audience;
6. evaluate the alternative assumption ground.

Successful problematization is a matter of creativity, intuition, reading inspiring texts that offer critical insights (but without being accepted as a new fixed framework), talking to other people, having specific experiences, or making observations that may trigger new thinking (Alvesson and Sandberg, 2013a). This methodology also has the advantage of facilitating focus, working as a support for a research identity around being a problematizer and a path-up setter (and not a gap-spotter), and facilitating description of what one has done and accomplished (Alvesson and Sandberg, 2013b). The conventional notion of rigour, requesting to systematically vacuum clean existing literature to demonstrate how to make a contribution to the extant literature, should be combined with imagination (Cornelissen and Floyd, 2009; Donaldson et al., 2012; Weick, 1989). However, while conventional rigour in the sense of logical consistency and thoroughness requires to analyse the underlying assumptions of the existing literature, in this paper those assumptions are studied in order to conceptualize the subject matter in question: risk management in SMEs.
To do that, this paper follows the philosophical and epistemological concepts elaborated by the American philosopher Peirce: abduction and pragmatism.

Peirce abduction had its proper place in the context of discovery, the stage of inquiry in which we try to generate theories which may then later be assessed. In his opinion abduction is the process of forming explanatory hypotheses and it is the only logical operation which introduces any new idea. Deduction and induction, then, come into play at the later stage of theory assessment: deduction helps derive testable consequences from the explanatory hypotheses that abduction has helped the researchers conceive, and induction finally helps reach a verdict on the hypotheses, where the nature of the verdict is dependent on the number of testable consequences that have been verified.

Peirce's pragmatism has a sort of a constructivist approach because he admits the possibility to change one's own opinion, values and thought, and it represents another form of relativism in which objective and convincing critiques might change the reality and the assumptions of a researcher.

Constructivism considers knowledge and learning as the result of a collective dimension of interpretation of reality. The new knowledge is built not only on the basis of what has been gained in past experiences but also through sharing and negotiation of meanings expressed by a "community of interpreters." The "construction" is therefore based on cognitive maps that serve to individuals to orient themselves and build their own interpretations.

In this case, the study aims at creating hypotheses to solve the following research problems:

- **Research problem 1**: Why, despite several studies underlying the importance to implement control activities and procedures to manage risks, SMEs do not integrate risk management in their business?
- **Research problem 2**: In this context of profound change in the risk approach, how could researchers lead SMEs to reconsider risk management?
- **Research problem 3**: What are the theoretical bases academics should refer to in order to support the development of sound and effective corporate governance and internal control system?

**THEORETICAL BACKGROUND.**

*Risk and uncertainty: the importance of managing risks.*

It is necessary to present the theoretical background about the topic of risk and uncertainty in order to show the central role that risk management has been acquired over the past few decades.

Starting from the topic of risk, Bernoulli in 1738 proposed to measure risk with the geometric mean and to minimize risk by spreading it across a set of independent events (Bernoulli, 1954).

The concept of risk has been the subject of careful and important studies in the general economic field since the beginning of the twentieth century (Willet, 1901; Fisher, 1919; Hardy, 1931).
Knight (1921) was one of the most important thinkers and distinguished between risk and uncertainty with respect to the nature of decisions made in a company. He associated generating economic profit with making entrepreneurial decisions under uncertainties. This uncertainty is complex because it cannot be reliably hedged unless it is reducible to risk. In his opinion, the mathematics of probability that is used for risk calculations may lose relevance. Fast-and-frugal heuristics, on the other hand, provide robust strategies that can perform well under uncertainty. Therefore, risk and uncertainty are strictly linked to the topic of decision-making (Mousavi and Gigerenzer, 2014).

In the business administration field, the research of Oberparleiter (1955), Chapman and Cooper (1983) and Sassi (1940) was particularly important. The common element of all these studies is that risk can be the possibility of economic or financial losses or gains, as a consequence of the uncertainty associated with pursuing the course of an action. But more specifically risk is considered an adverse eventuality.

Risk has consequences in terms of economic performance and professional reputation, in addition to environmental and social considerations. Despite the underlying element of uncertainty, it is often possible to predict risks and to set in place systems and design actions to minimize their negative consequences and maximize the positive ones (Kaplan and Mikes, 2012). Those risks that arise from disorder can be controlled through better management and governance. This way, businesses that adopt a risk management strategy and adequate planning and programming are more likely to survive and grow (Amaduzzi, 1961; Brusa, 2012).

Therefore the concept of risk is not unique but depends on the situation in which the company operates, on the uncertainty every company might face and on the consequences of certain events. Furthermore risk is inherent to and part of the existence of every company (Bertini, 1987; Ferrero, 1987). Uncertainty and negative consequences were also discussed by Ferrero (1987). He stated that there are two kinds of uncertainties: objective and subjective. The former are linked to the unknown in an absolute sense and they depend on the knowledge and the environment that surround the company. Subjective uncertainties instead can be dominated by the management because they are linked to insufficient information and to the informative system of the company.

Risk management theories evolved in particular after the COSO Report (1992) and its updated version (2004), elaborated by Committee of Sponsoring Organizations of the Treadway Commission. The movement towards enterprise risk management (ERM) (COSO, 2004) has shifted the focus to a more holistic appreciation of risk. It highlights that appropriate risk-based controls need to be put in place to help ensure that organizational objectives are achieved (Soin and Collier, 2013).

Several researchers concentrated on the definition of the risk management (RM) process and on the Enterprise Risk Management (ERM), by analysing all phases and activities (Brustbauer, 2016;
Henschel, 2009). In particular, COSO Report underlines that the risk management process has eight components interrelated with the management process of the company. These components are the following: internal environment; objective setting and Risk Appetite Framework (RAF); event identification; risk assessment; risk response; control activities; information and communication; and monitoring.

Consequently, the risk management process can be seen in a strategic way, because it is functional to the development of the company strategy and control (D’Onza, 2008; Coso Report, 2004). Therefore it deals with planning, organising, directing and controlling resources to achieve given objectives when unexpectedly good or bad events can happen (Head, 2009) and it also provides a link between organizations and the external environment in which they operate. In addition, risk management is the key driver for value creation, competitiveness and profitability (D’Onza, 2008).

The research of Michael Power (2004; 2007; 2009) presents a different and critical approach towards risk management because he raises a number of issues, also concerning the role of management accountants, that are of particular interest for management accounting and control researchers. Two elements are particularly relevant: the side effects of risk management and the relationship between risk management and uncertainty. Power argues about the ‘risks of risk management’ and the emergence of ‘secondary’ or ‘defensive’ risk management.

He suggests that: “experts who are being made increasingly accountable for what they do are now becoming more preoccupied with managing their own risks” (Power, 2004).

Power states that this “culture of defensiveness” (p. 14) can be seen in the ‘individualization’ of risk by various professionals – whereby, experts are becoming pre-occupied with managing their own risk which necessitates reflexive behaviour (Beck, 1992; Giddens, 1990). Further side effects include blame avoidance (Hood, 2002), fear of sanctions, legalization and the re-drawing of (organizational) boundaries that arguably may lead to a re-enforcing of the ‘box ticking’ culture.

In terms of risk management and uncertainty there have been substantial developments in organizational practice that focus on risk management and issues of governance, but the impact of risk and uncertainty has not been fully explored. Managers have always faced uncertainty, which is a central feature of any organizational setting. Power (2007) underlines that when uncertainty is organised, it becomes a risk to be managed. The range of uncertainties deemed in need of management has significantly increased and includes threats such as operational risks, reputational risks and strategic risks. Therefore the new wave of risk management can be regarded as a defensive reaction to an increasingly demanding environment.
There emerge the need for an ‘intelligent’ risk management which is not control obsessed, but based on knowledge and on risk appetite framework, an impoverished concept that may lead to board failure and that should be redefined and enforced (2009).

Risk management in SMEs: the state of the art.

As regards SMEs, they have little guidance on how best to manage risk and where to turn to for advice. Over the past few years few Guidelines, representing conceptual frameworks, have been published. Some of them represent Corporate Governance Codes for Unlisted Companies (OECD, 2006; ecoDa, 2010; OECD, 2015) and in 2009 the International Organisation for Standardisation (ISO) elaborated ISO 31000:2009 about Risk Management and in 2016 ISO published a practical guide for SMEs about how to implement risk management.

The literature reveals that risk management in SMEs is still in an early phase of development and is rather fragmented (Verbano and Venturini, 2013; Marcelino-Sádaba et al., 2014). Despite that, several national and international studies highlight the immaturity with which companies and, in particular, SMEs face risks. This approach can derive on the one hand from the lack of familiarity, the fear of change and additional costs that the implementation of a risk management system could result and, on the other, from the actual lack of awareness of the benefits that an integrated risk management system might have, not only in terms of prevention, but also as regards the opportunities (Hiebl, 2013; Thun et al., 2011). Most unlisted enterprises are owned and controlled by single individuals or coalitions of company insiders (e.g. a family). In many cases, owners continue to play a significant direct role.

Good governance in this context is not a question of protecting the interests of absentee shareholders (agency theory: Jensen & Meckling, 1976). Rather, it is concerned with establishing a framework of company processes and attitudes that add value to the business and help ensure its long-term continuity and success, by satisfying the stakeholders’ needs (stakeholder theory: Freeman, 1984).

Furthermore many SMEs face resource constraints (Jarillo, 1989). Consequently, existing resources need to be used with care as erroneous decisions will have more serious complications than they would in large businesses (Amelingmeyer and Amelingmeyer, 2005). Therefore risk management would better cope with these resource constraints (Smit and Watkins, 2012) and deal with the issues of survivability and growth (Islam et al., 2008).

Vargas-Hernandez (2011) underlined that a further motivation to support the implementation of risk management in SMEs is to protect innovative projects, which are fundamental to gain competitive advantage and succeed in the market, but necessarily involve risky decisions and activities.

Many other studies focused on the role of risk management in SMEs and on the risk attitude of those companies (Gao et al., 2013; Mutezo, 2013; Gilmore et al., 2004; Hollman, 1984).
Some researchers instead concentrated on specific kinds of risk in SMEs and how they are managed (Poba-Nzaou, 2011; Sukumar et al., 2011).

Furthermore research on the most effective procedures of risk management in SMEs was conducted (Henschel, 2010), even if it is still at a very early stage (Rautenstrauch and Wurm, 2008). In particular, Henschel (2010) identified the missing integration of the identified risks into the business planning as the main problem. According to him, this integration is needed to determine the complex risk position of each company, which is also influence by the firm size.

In other studies, Islam et al. (2008) and Islam and Tedford (2012) aimed at identifying potential risks existing within the SME infrastructure, by developing and testing a strategic RM framework. This model consists of five steps: identification of disturbances (undesirable events and setbacks), identification and classification of root causes, classification of origins of disturbance, risk assessment and risk handling and monitoring and control. The research findings suggest that SMEs encounter disturbances in the areas of production, safety and business operation. These studies also highlighted a lack of systematic RM strategies among the SMEs surveyed.

McCarthy (2000) explored how entrepreneurs think about risk and deal with it in the strategy formation process, demonstrated that risk-taking propensity is subject to change, depending on the business development. McCarthy and Block et al. (2015) underlined that entrepreneurs should be considered in their own uniqueness because with learning, organisational context and history, they influence the development of a sound risk approach.

As regards risk assessment, Herbane (2010) underlined that this task represents a daily activity but it has a tacit and implicit nature rather than being formalised in a planned risk analysis. Risk framing is a result of the owner’s personal experience and knowledge derived from being part of informal networks.

**NEW PERSPECTIVES IN MANAGING RISKS IN SMES.**

The theoretical background of the previous paragraphs helps answer the first research problem, because it underlines that the above-mentioned studies in the field of risk management in SMEs concentrated on specific kinds of risks, or on the strategic aspect of this process or on the importance to develop appropriate procedures and control activities in order to assess, manage and monitor risks. The research of Power, McCarty, Block et al. and Herbane instead centre the point and the real problem: many SMEs do not integrate the risk management process in their business because there is little knowledge about the potential benefits, there is a lack of a developed risk attitude and behaviour. It is a matter of mindset, managers’ personality and history of the company. That
represents the answer to the first research problem and the first hypothesis, as explanation of the phenomenon.

Afterwards, to answer the second and third research problem, by trying to suggest an appropriate way of thinking to find a solution that might lead SMEs to consider risk management as fully integrated in the business, it is important to analyse what COSO Report (2004) states in the Executive Summary: Limitations in managing risks can result from the fact that human judgment in decision making can be faulty. Decisions on how to respond to risk and establish controls need to consider the relative costs and benefits, breakdowns can occur because of human failure, such as simple errors or mistakes, controls can be circumvented by collusion of two or more people, and management has the ability to override ERM decisions. These limitations may prevent boards from achieving the entity’s objectives.

Consequently, there emerges that risk management activities are strictly related to strategic decision-making. The new perspective for the improvement of managers and owners’ risk attitude and for the integration of the risk management process in the business of every SME is to start analysing the way decisions are made. Decision-making is the process of choosing the best alternative to achieve individual and organizational objectives (Guo, 2008). Therefore this process is inherent in all managerial functions and is closely related to the planning function. People responsible for setting and achieving certain objectives are also responsible for managing the related risks.

There are different models describing the decision-making process. In this case, the research refers to the model elaborated in 2008 by Kristina Guo for health care managers, called DECIDE, which is an acronym that stands for six different steps:

- D: define the problem;
- E: establish the criteria, being as specific and precise as possible in order to understand what should be achieved or avoided;
- C: consider all alternatives that could meet the criteria;
- I: identify the best alternative;
- D: develop and implement a plan of action;
- E: evaluate and monitor the solution and feedback when necessary.

The steps of this model are related and they are similar to those of the risk management process (Figure 1).
Figure 1.  
*Risk management process and decision-making model: a comparison.*

Defining the problem and setting the objectives are the first step in both processes. It is important to establish the risk appetite and the way decisions could be made. Afterwards, every manager should consider the possible choice to make and identify events that could generate risks. Thirdly, there emerges the need to make the choice and respond to the risk with appropriate actions. The final step of both processes consists of evaluating and monitoring the solution. It is not enough to just make a decision. It is crucial to evaluate the decision made and actions implemented and to investigate ‘what could go wrong.’ This step helps prevent, minimize and overcome all possible adverse consequences. Feedback is important because it provides information related to the decision or risk response. Feedback helps a manager find out whether the decision or control activities led to the intended results, even if unintended consequences may have occurred. Information and communication are always present during these processes.

In SMEs risk management, as entrepreneurs do not usually implement it formally, may become fully embedded when they make a decision, as they are both crucial in setting and achieving the objectives. Furthermore, improving knowledge, the risk appetite and the awareness of how decisions should be made means implicitly to start developing a risk consciousness, which can be translated into a sound risk approach. Moreover corporate culture, values and ethics play a fundamental role in each company because they represent the internal environment that can affect the business management.
CONCLUSION

This research underlines and demonstrates that in the field of risk management in SMEs it is important to understand why in most of the cases risk procedures and control activities are not implemented. There is no need to further underline the importance and the role of the internal control system and of risk governance because other researchers did. The real problem is to understand from which point of view it is necessary to restart analysing again this subject matter and to suggest a new perspective that could lead managers and owners of small and medium enterprises to improve their risk attitude.

To solve this problem, the solution might be to start concentrating on the human being and on the way he makes decisions for his company. Furthermore it is fundamental to consider that a preliminary and, often unconscious, risk analysis is conducted while making the decision. Therefore by starting improving the awareness, responsibility and sensitivity to risks, managers and owners would improve their knowledge about their company and about the risk appetite framework. Only after passing this step, then we could talk about procedures and control activities to be implemented and about the formalisation of this dynamic and transversal process.

Risk management, as integral part of the organisational decision-making process, enables the small and medium-sized company to be resilient and agile in all its activities by dealing with consequences of unforeseen events.

Integrating risk management means adopting ways to enhance and improve the managerial processes that already exist. Therefore it is necessary to first understand how decisions are made and implemented and then determine how managing risks should be integrated into those decisions.

This theoretical analysis contributes to existing knowledge as it extends the platform for research on strategic decision-making in SMEs, by associating it to the risk management process in order to provide a new way of regarding it in SMEs.

One of the limits of this paper is that it is the first step of a far deeper analysis that should lead to further qualitative and empirical investigation for researchers in the field of corporate governance and risk governance of SMEs and it might be useful for managerial practice.

Additional empirical research, regarding in particular the implementation and control of risk management in SMEs, is needed in order to shed more light on the difficulties small and medium enterprises face and to identify practical strategies to help these companies.

Multiple-case studies in particular would better fit into this framework because it is fundamental to validate and test theories and concepts analysed in this study.
For owners and managers of SMEs, a better understanding of the decision-making process and the potential benefits of having a risk-oriented mindset provides the basis for improving the risk appetite framework and therefore enhancing the setting of organisational objectives.

For practitioners and professional accountants, this study could be useful in providing the evidence that they play a key role for managers and owners of SMEs, because they are consultants with the aim of being collaborative in the decision-making process and helping them achieve the objectives, satisfy the stakeholders and create value over the long period.

ABSTRACT
Creating Shared Value (CSV) has been presented as the saviour of capitalism, a way to vanquish the perception that business profit at the expense of society. The concept of solving societal issues by gaining economic benefits has caught the attention of companies and prominent researchers. Yet, CSV has been referred to as nothing more than a buzzword and criticized because of similarities with existing models and lack of empirical evidences. In this paper, we offer new perspectives on CSV analysing it from the points of view of related concepts, such as stakeholder theory, sustainability, social entrepreneurship, Bottom of the Pyramid, Blended Value and CSR. Examples and discussion outline fundamental differences among similar concepts, thereby shedding light on CSV and both strengths and limitation thereof. Conclusions pave the way to a clear understanding of CSV concept, the locus of which include, but is not limited to, CSR, while giving directions for further research and theoretical development.

Keywords: Corporate Social Responsibility, Creating Shared Value, Business, Society, societal value, economic value.

INTRODUCTION
The debate about CSV revolves around different paradigms according to which business can gain economic returns and create value for society. Stakeholder theory, social entrepreneurship, sustainability, Bottom of the Pyramid (henceforth, BoP), Blended value, CSR and CSV are clearly intermixed (Dembek et al., 2015) because they produce the same outcome (i.e. creating societal value), although different from each other in many ways. The objective of this article is to develop some propositions on CSV in order to facilitate a clear understanding thereof. This paper is structured as follows: we first provide an overview on CSV; we then discuss each one of the concepts overlapping with CSV in a step by step fashion, analysing both literature and practice to highlight differences and similarities with CSV, thereby contributing diverse perspectives on its theoretical stance; we finally present conclusions and indicate direction for CSV theoretical development.
Creating Shared Value

Business and society coexist and thrive alongside one another, with the former having a value creating role towards the latter (Moran and Goshal, 1996). This is the portrait of the economic and social development, or at least it used to be before the heightened public awareness of the dangers of human activities for the environment unveiled that business may also exert detrimental actions on society. Unresolved steady social problems and the urgency of global challenges such as climate change, the consequences of which appear to be every day closer, have led to an increasingly large number of individuals paying greater attention to these issues. Clamorous cases of improper business conduct and natural catastrophes associated with poor risk management practice have certainly contributed to spread the perception that business profits at the expense of society. Given the situation, Porter and Kramer (2011) came up with the concept of Creating Shared Value, according to which companies can solve societal problems in profitable ways. Strategic decisions about how to allocate corporate resources are carrying higher level of complexity because nowadays companies are also assessed on how they met social expectations (Waddock and Graves, 1997). The idea behind CSV is to integrate social issues into the capitalistic economic mechanism in order to enlarge benefits for both business and society, thereby enabling the reconciliation of the two separated realms. Porter and Kramer, (2011; 2012) identified three ways by which companies can create shared value, namely a) reconceiving products and markets, b) rethinking productivity in the value chain, and c) local cluster development. Since its inception, CSV reached the ears of many corporate leaders providing them with lens to see social problems as growth opportunities (Pfitzer et al., 2013). Scholars researched insights on how CSV initiatives might enlarge the total value created for business itself, society and the environment (e.g. Bowe and van der Horst, 2015; Schmitt and Renken, 2012; Spitzeck and Chapman, 2012; Vaidyanathan and Scott, 2012; Esposito et al., 2012), while others extended the concept (e.g. Moon et al., 2011). Therefore, there is no doubt about CSV being an appealing and useful concept, although it has been referred to as “a bit undercooked” (Schumpeter, 2011). Porter and Kramer (2011) have certainly not been particularly rigorous in the development of CSV, neither in grounding the concept with due theoretical background (Crane et al., 2014; Beschorner, 2014). In particular, the claim that CSV supersedes CSR has been legitimately criticized in the literature (Crane et al., 2014; Beschorner, 2014), giving rise to several issues concerning the originality of the concept. Because our goal is to provide a clear understanding of CSV as a theoretical concept, we analyse it through the points of view offered by stakeholder theory, social entrepreneurship, sustainability, Blended Value, BoP, and CSR, thereby “cooking” CSV a little bit more.
PROPOSITIONS: TOWARDS AN UNDERSTANDING OF CREATING SHARED VALUE

Stakeholder theory

Stakeholder theory challenged the conventional conception of the firm as a closed entity which operates solely in the interest of shareholders (Freeman, 1984; Freeman et al., 2007). According to stakeholder theory, firms have to take into account the needs and interest of the actors who either influence or are influenced by them (Freeman, 1984; Freeman et al., 2007). For this very reason, by not considering the firm in a vacuum, stakeholder theory naturally embraces sustainability and corporate social responsibility because it is in the interest of customers, governments, employees and shareholders that companies conduct sustainable and responsible businesses (Jeurissen, 2004; Freeman et al., 2007; Tricker, 2012). Stakeholder management “has become commonplace in the management literature, both academic and professional” (Donaldson and Preston, 1992: 65) primarily because business continuity strongly depends upon them. With regards to stakeholder management as source of value creation, CSV actions has been referred to as strategically effective because they simultaneously create value for different stakeholder groups (e.g. shareholders and society) and does not reduce the value of other stakeholders (Tantalo and Priem, 2014). CSV has been referred to as a stakeholder management approach (Crane et al., 2014; Beschorner, 2013). It is clear how the process by which a firm shifts to a “greener” production process, thereby contributing to pollution abatement, can be seen as a stakeholder management practice. Especially when a firm has hard-hitting negative externalities on the environment, we believe the whole population of the Earth might be considered as a stakeholder group. Therefore, CSV is certainly included in stakeholder management, but it is not limited to it. For example, at time $t$ a company may invest a significant amount of money in a foreign underdeveloped country to create the conditions wherein the demand for its product naturally blossoms at time $t_1$ because of societal development. At time $t_0$, when the decision was taken, the customers were not possibly included among the stakeholders of the firm. Therefore, we propose that CSV opportunities are not bound to the extant groups of stakeholders considered at a given time.

$P_1$: CSV is a stakeholder management practice, although opportunities to create shared value are not bound by the stakeholders considered as such by the firm.

The stakeholder approach to strategic management offers an important perspective on CSV, which also relates to the call made by Beschorner (2014: 110) for “normative corporate philosophy” to answer the questions “what does our company stand for? What is our contribution to society? What are our fundamental values and what business strategies emerge out of them?” (Beschorner, 2014: 110). These questions have been addressed through the “enterprise level strategy” by Freeman (1984: 101). Freeman (1984) suggests a firm should pursue a stockholder strategy if managers believe the externalities of the firm are mainly of
economic nature, prioritize the obligation to shareholders, and perceive economic growth as the main social issue. On the other hand, a firm should pursue a utilitarian strategy if managers perceive the firm to have diverse effect on stakeholders, prioritize the maximization of social benefit, and identify many social issues affecting the firm (Freeman, 1984). If we were to follow this line of thought, we would say that CSV as strategy represent a compromise between stockholder and utilitarian strategy, through the pursuit of which managers can attend their fiduciary obligation to shareholders while creating social benefit, not necessarily provoking misfit across the different stakeholder interests, corporate values, and societal issues as intended by the two strategies. Therefore, we propose the following:

\[ P_2: \text{Through the pursuit of CSV as strategy, managers can attend their fiduciary obligation to shareholders while creating societal value, not necessarily provoking misfit across the various stakeholder interests, corporate values, and societal issues perceived as important by the firm.} \]

\[ P_3: \text{CSV is not per se sustainable.} \]

Social entrepreneurship

Social entrepreneurship can be seen either as addressing societal problems using business-like approaches (Pomerantz, 2003), wherein the social dimension is the core objective, or as addressing societal problems to generate economic returns, wherein the social dimension is central because...
recognized as source of opportunities to be exploited. With regards to the latter, social entrepreneurs are more prone to find business opportunities in social challenges because they are not bound by narrow thinking induced by traditional business mental models (Porter and Kramer, 2011; Elkington and Hartigan, 2008). Social entrepreneurship as intended by Mort et al. (2003) consist of balancing the interests of multiple stakeholders while maintaining the social mission. Boundaries of the social entrepreneurship concept are blurred as well. Some enclose social entrepreneurship within the non-profit sector (Dees et al., 2002) bearing in mind that non-profit does not necessarily mean non-income, with wealth being a means to achieve the social mission and income being the condition for self-sustainability. Others point out that social entrepreneurship is not to be confined within non-profit boundaries (Abu-Saifan, 2012). We tend to consider particularly valuable the contribution of Abu-Saifan (2012: 26-27) who conceives social entrepreneurship as limited to “non-profit with revenue” and “for-profit with mission”. In comparison with CSV, not all the revenue-generating activities necessarily generate income (i.e. economic value) and, most important, theoretically a for-profit does not have to have a social mission to create shared value. As a matter of fact, Maltz and Schein (2012: 63-65) distinguish between “economics-first” and “mission driven” perspectives on the basis of the emphasis managers who engage in shared value initiatives place on the economic or social dimension, respectively. Hence, we propose that CSV is not limited to for-profit organizations who have a social mission as their core objective.

**P4: To create shared value, a firm does not have to have a social mission as its core objective.**

The literature on social entrepreneurship offers another perspective on CSV. Starting from Dees’ identification of social entrepreneurship as one species in the genus entrepreneurship (1998), Austin et al. (2006) differentiated commercial from social entrepreneurship, with the former being the identification and seizure of opportunities resulting in profits, while the latter being the identification and seizure of opportunities resulting in social value creation. CSV can be seen as the marriage between two types of entrepreneurship, being the identification and seizure of opportunities resulting in both profit and social value creation.

**P5: CSV occurs within the continuum between commercial and social entrepreneurship.**

**Blended Value**

Economic and social value are interconnected and indivisible, as highlighted by Freeman (1984: 40). Building on this line of thinking, the concept of blended value was introduced by Emerson (2003a; 2003b) who challenged the conventional view that economic value is separate from social value since it ignores the dynamic interplay between the two. According to him, the trade-off between social and economic value which leads to a zero-sum game is a misconception, because these values are integrated
with each other, or blended (Emerson, 2003a; 2003b). Traditionally economic value and social value were considered as separate from each other and task of different types of organizations. According to blended value, every organization generates value that comprises of economic, social, and environmental components, since each of its activities simultaneously generate all three forms of value, regardless its for-profit or non-for-profit orientation (Emerson, 2003a; 2003b). Blended value highlights the fact that economic and social value are indivisible, thereby calling for new metrics to perform better investment decisions which lead to multiple returns, including social and environmental returns rather than solely financial ones. Given that, a company creating shared value can only help investors in their pursuit of a “unified investment strategy” whereby “true value is not just a function of financial success” (Emerson, 2003b). CSV and Blended Value are complementary concepts, the one focusing upon corporate practice, while the other has a broader vision and implications for how we understand the nature and returns of capital. Hence, we propose Blended Value is inclusive of, although not limited to, CSV corporate practice.

P6: CSV is integral to blended value, the latter being a broader concept focusing on the blended (i.e. financial, economic and social) returns and nature of capital.

By carefully analysing CSV and blended value, it could be noticed how they both pave the way to overcome the misconception that organizations can meaningfully manage only one goal (Pirson, 2012) since it is not possible to pursue the maximization of more than one dimension at the same time (Jensen, 2001). Here is where blended value and shared value intersect, since they both allow for total value maximization, whereas total value consists of economic, social and environmental value. Therefore, we propose CSV is integral to blended value conception of total value maximization.

P7: CSV is integral to total value maximization, whereas total value consists of economic, social, and environmental value (i.e. blended value).

Bottom of the Pyramid

The fundamental proposition of Bottom of the Pyramid (henceforth, BoP) is that multinational companies (MNCs) can make huge profits and grow very fast by serving low income markets (Prahalad and Hammond, 2002). Prahalad and Hammond, (2002) believe that MNCs can enhance their prosperity by launching operations on untapped markets in poor regions, thereby improving the life of the local population. Therefore, BoP highlights that companies have the opportunity to alleviate poverty while creating economic value for themselves, which is the core essence of CSV. As a matter of fact, Michelini (2012) explored new business models to create shared value at the bottom of the pyramid. However, BoP concept limits its radius to the bottom of the economic pyramid while CSV considers a wider spectrum of markets.
Pc CSV is an extension of BoP, the latter focusing on the bottom of the economic pyramid while the former targeting whole economic pyramid.

Corporate Social Responsibility

There is no agreed definition about CSR primarily because it is not easy to clarify what the social responsibility of business consists of (Dahlsrud, 2008). For instance, some believe companies should be responsible to society as much as the people constituting them (Ludescher et al., 2012), while others argue that CSR is not always meaningful since lots of corporate social initiatives are just symbolic (Hess and Warren, 2008). CSR is an ill-defined concept primarily because in the literature it has been extensively discussed about the motivation underlying CSR practice. For instance, Baron (2001) intends an action as socially responsible, hence labelled as CSR, if it is taken with the ratio to serve society at the cost of profit. Further, Baron (2001) states that strategic CSR (henceforth, SCSR) is a profit-maximizing strategy which is privately, not socially, responsible. Therefore, following Baron’s line of thought SCSR cannot be labelled as CSR. This clearly explains why most of CSR practice consists of firms engaging in socially oriented activities completely detached from their core business in order them to be perceived as authentic and true (Jamali, 2007; Di Bella and Al-Fayoumi, 2016). McWilliams and Siegel (2011: 1481) wisely connect an activity to SCSR if it “allows a firm to achieve SCA [sustainable competitive advantage], regardless of motive”. Taking motivation out of the discussion was quite a good step for CSR theoretical development, which is exactly what Porter and Kramer (2011) did with CSV. Porter and Kramer (2011) left aside any discussion concerning motives to create shared value, basically because irrelevant. Motives take second place because the bottom line of a CSV initiative consists in better social condition and enlarged profits, thereby both business and society are better-off. When there is room for Pareto improvements (i.e. actions that harms no one while improving the conditions of at least one in the economy) motives have no relevance.

Pc: The motives whereby firms engage in CSV initiatives, which by definition result in the creation of both economic value for them and societal value, will not be relevant if the conditions for Pareto improvements hold.

Investigating the business case for CSR, Carroll and Shabana (2010: 102) argued that, since CSR not always positively relates with financial performance, “firms should understand the circumstances of the different CSR activities and pursue those activities that demonstrate a convergence between the firm’s economic objectives and the social objectives of society”. This is at the core of CSV theoretical stance, which consists of the identification of business opportunities in societal challenges and their seizure to create shared value. Therefore, we propose CSV resolves the debate in the literature about CSR being positively or negative related to financial returns:
CSV opportunities are those opportunities wherein CSR is certainly positively related to financial returns.

Therefore:

\[ P_{12}: \text{From the economic point of view, CSV is an economically efficient way for firms to put CSR into practice.} \]

As previously discussed, one of the most criticized aspects of CSV consists of how it intends to supersede CSR. Although it has been clearly stated in the literature that the rationale to engage in SCSR practice is profit maximization (Baron, 2001; Andrew Caulfield, 2013), Porter and Kramer (2011) reports that CSR is separate from the pursuit of profit maximization when highlighting the difference between CSV and CSR. Porter and Kramer (2011) have clearly had a partial understanding of CSR practices when they explained how CSV differs from CSR (Wilburn and Wilburn, 2014; Beschorner, 2014). However, considering the significant contribution of Porter and Kramer (2006) to SCSR development, this partial understanding might be voluntary. They were probably referring to CSR as intended in practice, given that many firms use to engage in CSR activities which are altruistic in nature and quite distant from strategic objectives (e.g. Jamali, 2007). The confusion around CSR concept should be considered when evaluating the attempt to detach CSV from CSR. Perhaps, a brand-new concept that breaks up with confusion was needed to direct business practice. For instance, Bruyaka et al. (2013) analysed 100 companies operating in the orphan drugs market and they found that although about a half of those companies were involved in CSR, less than a third included the development of orphan drugs in their CSR. These results give strong evidence of SCSR not being particularly clear to firms. We believe it is worthwhile taking a moment to look at this result through the lens of CSV: All of those companies operate in the orphan drugs market, thereby alleviating the burden of rare diseases on people (i.e. mitigating a quite big societal challenge). If those 100 biopharmaceutical companies were asked if they were solving a societal problem generating profits (i.e. CSV), only the firms who were experiencing losses could have answered they were not. Almost three decades earlier the CSV inception, Peter Drucker (1984: 55) argued that “only if business … learns that to do well it has to do good can we hope to tackle the major social challenges facing developed societies today”. Such a powerful statement has not received the due attention because submerged in the confusing waters of CSR. Perhaps it was necessary to untie the concept from social responsibility. As anticipated by Drucker (1984: 62) “the proper “social responsibility” of business is … to turn a social problem into economic opportunity and economic benefit, into productive capacity, into human competence, into well-paid jobs, and into wealth”, that is to create shared value. The reverberation of CSV could be primarily ascribed to the marketability of the concept rather than its literary foundations. The art of giving a name should not be disregarded when evaluating the diffusion of CSV, indeed. For some companies, “social responsibility” may evoke a sense
of blame for the impact they exert on society which is their duty to deal with, accompanied by the misconception that this duty always comes at a cost. On the other hand, “creating shared value” is associated to profits to the company, prosperity to society, and happiness to everyone. Therefore, we propose the reason why CSV has captured the attention of corporate leaders is in part to be ascribed to its disentanglement from the confusion gravitating around social responsibility.

P12: The success of CSV could be partially ascribed to its “detachment” from social responsibility.

We believe that CSV contribution is vital to the development of CSR practice, whereby we intend CSR as “the responsibility of enterprises for their impacts on society” (EC, 2011: 6). The simplest definition ever, yet comprehensive and clear. Boundaries are set by firm activities, the impacts of which represent what the firms must pay attention to. The European Commission has also given direction to business practice: “To fully meet their corporate social responsibility, enterprises should have in place a process to integrate social, environmental, ethical, human rights and consumer concerns into their business operations and core strategy in close collaboration with their stakeholders, with the aim of: [1] maximising the creation of shared value for their owners/shareholders and for their other stakeholders and society at large; [2] identifying, preventing and mitigating their possible adverse impacts” (EC, 2011:6).

The European Commission included CSV as a driver to meet the social responsibility of business, which we think is the real power of CSV. Since CSV scope is limited to societal issues through the mitigation of which companies create economic value (Dembek et al., 2015; Crane et al., 2014), the European Commission included the identification, prevention and mitigation of negative externalities (EC, 2011), as a separate point from shared value creation, thereby addressing also the cases wherein “business value and social value do not go hand in hand” (Beschorner, 2014: 109). Indeed, CSV cannot possibly substitute CSR since the responsibility of firms toward society cannot be limited to shared value creation opportunities. This is mainly due to the fact that, as explained earlier, CSV is not per se sustainable. Bruyaka et al. (2013: 51-52) indirectly explain the relation between CSR and CSV by saying “where CSR is successfully used in a strategic manner the firm will create shared value for itself and for various of its stakeholders or society as a whole”. To put it simple, even though the reconciliation between economic value and societal value has been extensively discussed within the corporate social responsibility framework (Snider et al., 2003), with CSV it becomes integral part of it. Hence, we propose CSV does not supersede CSR, but it is rather part of CSR and, therefore, it significantly contributes to CSR practice:

P13: CSV does not supersede CSR, whereas the latter is inclusive of, but not limited to, the former.
However, this last proposition should not be misconceived. It might be the case that CSV lies outside the scope of CSR. Think about a mobile network operator who exploited its core competencies in telecommunication and ICT to develop a e-health platform for remote monitoring of patients, which, once adopted by the medical centres of the region, permits to increase their capacity of hospitalization without expanding their facilities, thereby meeting the needs of an increasingly large numbers of elder individuals with chronic diseases. In this case, even if the product that allows for shared value creation helps medical centres to meet their corporate social responsibility, it lies out the scope of the corporate social responsibility of the ICT firm who developed the CSV initiative. In other words, the shared value initiative portrayed in the aforementioned example does not finds its root within the CSR of the firm initiating it. In fact, quite the opposite may be true, as new social responsibilities may emerge from this CSV initiative (e.g. privacy concerns of personal sensible data transmissions). Hence, we propose that a CSV initiative which falls outside the scope of the CSR of the firm initiating it may give rise to new social responsibilities for that firm.

P14: Extra-CSR initiatives which create shared value may give rise to new social responsibilities for the firm initiating them.

This extra-CSR nature of CSV is to be ascribed to the fact that CSV is, de facto, part of value creation, whereby shared value is not limitedly intended as value shared by business and society (Porter and Kramer, 2011), but rather as value shared by the firm and a multitude of different stakeholders (e.g. Adner and Kapoor, 2010), a broader topic that falls outside the scope of the present work.

CONCLUSIONS

In this paper, we analysed CSV from different perspectives offered by stakeholder theory, sustainability, social entrepreneurship, Blended Value, BoP and CSR. This analysis triggered several propositions which altogether may be useful to achieve a better understanding of CSV. These propositions intended to settle the debate around the validity of CSV and the theoretical stance thereof by conceiving CSV as a useful, yet not sufficient, approach for companies to meet their Corporate Social Responsibility, which need to be complemented by negative externalities-minimization criteria and mechanisms. However, we pointed out that CSV initiatives could lie outside the scope of a firm’s CSR, giving rise to new corporate social responsibilities for it.

Even though a more complete profile of the CSV concept emerges from this paper, it remains an open question whether CSV can really help businesses in gaining legitimacy from society. With respect to CSR communication, we believe the operationalization of CSV may offer great opportunities to provide the large public with tangible proofs about the interiorization of CSR into the organization. We expect companies who create shared value better transmitting their “CSR Identity” (Crane and Glozer, 2016: Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
to external stakeholders, who can perceive social responsibility as part of the corporate identity through direct observation of the social outcomes. Researching the legitimization effect of CSV would certainly contribute valuable insights for both CSR literature and practice. Another topic of interest related to social legitimization could be the ability of CSV to break with the controversial argument about historic corporate social responsibility of companies (Schrempf-Stirling et al. 2015), i.e. companies held accountable on the basis of their past harm-doing. More specifically, the pursuit of a CSV strategy may reveal itself as an effective way for companies to “right their wrongs” by emphasizing their present well-doing to the eyes of society rather than their past harmful behaviour. Furthermore, we proposed that a firm can pursue a CSV strategy without having a social mission as core objective, whereby managers can attend their fiduciary obligation to shareholders while creating societal value, not necessarily provoking misfit across the various stakeholder interests, corporate values, and societal issues perceived as important by the firm. If so, we expect CSV to spread across those enterprises who have not been particularly oriented towards social issues as well. The alignment between self-serving purposes and public-serving ones patently taking place in CSV initiatives offers organizations the opportunity to “…conceive CSR as a meaningful part of their business strategy” (Jamali, 2007: 23). It may be interesting to explore whether CSV has the power to direct capitalism towards societal problem resolution, regardless if motives fall within opportunism, altruism, or points in between.

ABSTRACT

This paper refers to two recent political phenomena: the Brexit, separation of the United Kingdom from the European Union, and the election of Donald Trump as President of the United States. It is important to note that the results on both occasions did not meet the expectations based on opinion polls, on one hand, and, on the other, seemed to be influenced by the adoption of populist attitudes by some of the people and parties involved. It is therefore necessary to deepen the knowledge about the two situations, their fundamentals and their outcomes. That is the objective of this paper. To gather published information and try to use it for the understanding of the results based on existing theories and thoughts.

Keywords: Brexit; Trump; elections; socio-economic; populism

INTRODUCTION

The political geography seems to be changing (Buhaug, et al., 2016) with the Brexit, that will lead to the separation between the United Kingdom and the European Union, as well as with Donald Trump’s victory in the American presidential elections at the end of 2016. Disruptive phenomena are normally associated with economic stagnation or depression in the past. These create conditions for strong expansionist programs, where redistribution is the key word, as stated in the initial work of Dornbush and Edwards (1990). But that was not the case in the two situations mentioned, even though both the UK and the United States have suffered the effects of both the sub-prime crisis initiated in the USA in 2007 and had been hit by the progressive globalization and commercial openness, with social consequences that are being evaluated. Traditionally, international commerce has been described by economic theories as a source of progress and increase in efficiency among countries (Gilpin, 2016; Broadberry, et al., 2016; Clarke et al., 2017). However, the experiences of Brexit and, even more strongly, the election of Donald Trump in the United States, should drive our attention to the sensation of many citizens that feel being excluded by the system that may not have protected them as they were
expecting. As a matter of fact, negativity towards the institutions of formal politics is currently a concern across much of the democratic world (Clarke and Ricketts, 2017).

Europe and the United States have benefited from half a century of prosperity and growth practically since the end of the Second World War until the sub-prime crisis. The increased liberalization of the world trade and the globalization of the economy resulted in strong gains for the economies of these two countries, only momentarily interrupted by the oil crisis that occurred in between. And both the USA and the UK recovered quickly from the sub-prime crisis, as the improvement in economic indicators shows. Thus, the general economic situation of both countries when the referendum on Brexit and the election of Donald Trump occurred were good. Those weren't, in fact, periods of economic recession or accelerated unemployment. Other factors emerged, namely populism, with long time prospects that should be studied. In fact, the current surge of populism in Europe and the US is a significant challenge not only for mainstream political parties but, more importantly, for the prosperity and political stability of advanced economies across the world (Andersen et al., 2017). Since 2016 and 2017, there is a proficient literature about the Brexit phenomenon and the Donald Trump election on USA from various fields of science, but none of these deals with the social-economic fundamentals and the citizen's attitudes that are in the basis of Brexit and Trump's election.

The problem of this paper is how to prevent "new" populist movements and what causes / theories are at their origin. Do the current theories explain these phenomena or not?

The objective of this study is then to contribute to the identification of the causes that originated these social attitudes in such different social and political contexts as were lived in the UK and the USA at the time and find the theories that may explain the observed changes.

FROM THE LATIN AMERICAN POPULISM TO THE PROTEST VOTE IN THE UK AND THE TRUMP'S ELECTION

The pioneering work from Dornbusch and Edwards, (1990) about macroeconomic populism analysed the two populist economic programs, in Chile, during Allende’s Unidad Popular (1970-1973) government, and Peru, under Alan Garcia’s rule. According to these authors, the initial condition for the implementation of both programs was the dissatisfaction of citizens with the country’s growth performance. Most typically, though not always, the countries had experienced moderate growth, stagnation or outright depression as a result of previous stabilization attempts. Once the debate was initiated, a number of studies were developed, mainly in Latin America, with the aim of determining the main causes and the consequences of populist policies. Damill, et al. (2015) analysed macroeconomic policy in Argentina in the period starting in 2002. The results, based on panel time-
series data and analysis, confirm the prediction that recently elected governments coming into power after periods of political dictatorship, and which are faced with demand for redistribution, end up engaging in populist (or redistributive) policies, which tend to lead to high inflation and overall poor macroeconomic performance. Fonseca (2011) confirmed these results for Brazil in the time of Vargas’ economic populism. According to this author, the Second Vargas Administration in Brazil (1951-1954) is commonly associated with the phenomenon of populism. The author concludes that “besides, based on this historic experience, it is advocated that there is no incompatibility between developmentalism and the adoption of macroeconomic stability-oriented measures”. With the recent economic crisis, conditional lending and mandatory structural reforms arrived in the European Union. On the opposite way in European countries “with the recent economic crisis, conditional lending and mandatory structural reforms arrived in the European Union. Greece and a number of other crisis countries were subjected to a rigorous process of economic adjustment in exchange for emergency credits from the troika (European Commission, European Central Bank, and International Monetary Fund)” (Hermann, 2016). With the recent economic crisis, conditional lending and mandatory structural reforms arrived in the European Union. (Hermann, 2016).

Populism is conceived of as a political style essentially displaying proximity of the people, while at the same time taking an anti-establishment stance and stressing the (ideal) homogeneity of the people by excluding specific population segments. Second, it is pointed out that defining populism as a style enables one to turn it into a useful concept that has too often remained vague and blurred. (Jagers, and Walgrave, 2007; Abts and Rummens, 2007). Although these phenomena were initially associated with economic recession or depression, instability, and inflation in Latin America, their political geography changed to North America and Europe, the most recent examples being Brexit, Trump’s elections, but also the growth of populist parties in The Netherlands, France, Austria, Italy, Germany, Hungary and so on, despite the fact that macroeconomic and social conditions are substantially different from the ones that were in the basis of the populist movements in South America. Scholars of contemporary Europe’s Mediterranean strategy note that efforts by Europe to link with its southern neighbors do more than simply establish norms for external relations. They are also used to define what (and where) Europe is (Steinberg, 2016). However, in recent times, the warlike conflicts in the Mediterranean countries and the growing wave of migrants have somehow conditioned the policies in Europe and had effects in Trump voters. According to Steinberg (2016), Notwithstanding this dream of free and peaceful commerce across a tamed inland sea, whenever there is interaction there is also the potential for hostility. As such, just as the designation of the Arctic as a Polar Mediterranean is used to promote a vision of Europe (and North America) peacefully extending its frontiers, it is also used to suggest a vision of the inland sea as an arena of conflict. In the last three years, the number of deaths from war
has once again risen, mainly due to the bloody civil war in Syria (Gleditsch, Nordás, 2014). This war has had profound impacts at the European and American political level, which is difficult to predict at the level of the voters' sense of voting. States had engaged in a variety of border enforcement practices to reassert control over migration and territory in spite of international human rights obligations. State responses to asylum seeking are illustrative of the subsequent movement and proliferation of borders far from the territorial borderline (Gorman, 2017).

**METHODOLOGY AND DATA**

The methodology includes a qualitative and quantitative analysis. At the quantitative level analysis, a study was carried out of all scientific papers published in the SCOPUS indexed database and the Social Science Citation Index and Web of Science, which included 116 papers in the different scientific areas published between 2016 and 2017. After were selected all those scientific papers included in the Social Sciences / Economic / Econometric / Miscellaneous / and Management scopes. All these works are duly analysed and referenced in this work. At the level of the quantitative analysis, two types of analysis were performed: a univariate analysis and an econometric analysis with the ARIMA model (in progress). Univariate analysis includes two distinct procedures. First, the macroeconomic indicators were analysed on the basis of OECD databases; The World Bank and the European Commission, referring to the years 2009 and 2016. Secondly, the data concerning the Ipsos Public Affairs Inquiry for the database on the economic situation in UK and USA were analyzed. The ARIMA Econometric model was based on data referring to the years 2009 to 2016 regarding the socio-economic and political conditions that foster these populist movements. The variables include a formed panel data based on quantitative indicators for 32 European countries and the United States as a comparative term. The variables include economic indicators relating to educational levels (EDU) of citizens; Indicators for economic growth (GDP) (GDP growth rate); Employment scientific (SE). At the level of investment of GDP in R&D, as well as social data such as average annual average income and by category (YA). In addition, we created a dummy variable that evoked the existence of extreme phenomena in 2016 (EX), as well as a trend variable @TREND. The econometric model was based on Choi and Varian (2009) made use of simple autoregressive models augmented by the index taking the following form: \( AR-1 \) model \( y_t = b_1 y_{t-1} + b_9 y_{t-9} + e + u \) for the period 2009 a 2016.

\[
\ln y_t = \alpha_0 + \alpha_1 \ln y_{t-1} + \alpha_{12} \ln y_{t-12} + \beta x_t + u_t \quad (1)
\]

Where \( y_t \) is the value of the series under investigation year \( t \); \( y_{t-1} \) is the value of that series in the previous year \( y_{t-9} \) is the value of the serie of 9 years earlier and \( x_t \) is the value of the series of 9 years earlier and \( xt \) value of the dummy trends query for the terms associated with the series.
Because simple fixed annual dummies may offer an alternative approach to the modelling of the populism movements in the studied countries, for each data term we began with a general unrestricted model (2) according Choi and Varian (2009) that included a secular time trend (TREND) and fixed annual dummies \((S_j)\) as well as the 1-period and 9-period lags of the dependent variable (POPU) and the value of the relevant value of populism searched.

\[
\ln y_t = \alpha_0 + \alpha_1 \ln y_{t-1} + \alpha_{12} \ln y_{t-12} + \beta x_t + \gamma \text{TREND} + \sum_{j=0}^{10} \theta_j S_j + u_t \tag{2}
\]

RESULTS AND DISCUSSION

Socio-Economic conditions in the UK and the USA

Table 1 presents the main economic indicators in USA and UK in 2009 and 2016, during and after the subprime crisis. Recession in the USA reached -8% of GDP, -2.3% in the United Kingdom. Results started to improve in 2010, though, and it could be said that there is now a moderate economic growth. Unemployment among young people was strongly affected, reaching 16 and 20%, respectively, in the United States and the UK, in 2009. And it decreased to 11 and 13% after 2010. Despite the improvement, the rate of young people that cannot find a job is still 6 to 8 points higher than general unemployment in those countries. On the other hand, trade balance was always negative, increasing 50% in the USA from 2009 to 2016. The UK performed better, with a decrease of around 10% along the same period.

Table 4. Economic outlook of USA and UK Source: OECD, 2016.

Socio-Economics Characteristics of the Brexit voters

As for the socio-economic characteristics of the voters favouring Brexit, it is possible, according to Brooks et al., 2016 and O'Reilly et al., (2016), to distinguish them by socio-professional characteristics, such as the profession associated with educational level, level of wealth (heritage) and religious factors. Nearly two thirds of manual workers (64%) voted “Leave”, and their voice was augmented by approximately half of the middle classes with the same behaviour. The majority of the professionals and managerial classes (57%) voted “Remain”. An observation of the housing characteristics of “Leave”
voters illustrates this unusual ‘contradictory coalition’. Most of those who owned their own home, without a mortgage (most likely older voters and the very rich), and two thirds of council and housing association tenants voted “Leave”. Homeowners with a mortgage voted “Remain”.

Gender divisions did not prove evident, but ethnic divisions were; and they were also fractured. White voters were slightly more likely to vote “Leave” (53%) than to vote “Remain” (47%). Two thirds (67%) of those describing themselves as Asian voted to remain, as did three quarters (73%) of black voters. Nearly 6 in 10 (58%) of those describing themselves as Christians voted to leave, while 7 in 10 Muslims voted “Remain”. However, some migrants from the Commonwealth voted “Leave” only because they wanted a fairer system of migration that did not give preferential treatment to East Europeans over people from their own countries (Parveen, 2016; O’Reilly et al., 2016). The economic crisis, the refugee crisis, pressures on the Euro and immigration, combine to stress the shortcomings of the EU. Brexit is also one kind of expression of democracy. Inglehart and Norris (2016) analyses whether populist support is associated with economic or cultural variables. Their results confirm that cultural values are consistent predictors of support for populist parties strengthened by anti-immigrant attitudes, mistrust of global and national governance, support for authoritarian values, and left-right ideological self-placement. According to Andersen et al. (2016), economic indicators are not reliable predictors. It thus seems likely that economic policies have not directly led to a populist backlash, but have indirectly reinforced it, by creating a world of greater labour mobility, and growing prominence of supranational government. The current surge of populism in Europe and the US is a significant challenge, not only for mainstream political parties but, more importantly, for the prosperity and political stability of advanced economies across the world.

The main factor that explains the Brexit was the lower educational level of the population and lack of investment in education (Streeck, 2014). In fact, UK, together with Greece, has the lowest share of secondary education students learning two or more languages, below 10% and decreasing since 2009. (EUROSTAT, 2016; Streeck, 2014). Meanwhile, good reasons existed for some section of the population to vote for Brexit. If the EU and the elites do not protect citizens from the crisis and economic difficulties, why bother? The Brexit vote most importantly underlines income and territorial inequalities, a growing cleavage between globalization winners and losers and a profound Brexistential crisis about the future of the Union European (Le Galès, 2016).

Socio-economics characteristics and attitudes of the Trump voters

As for the socio-economic characteristics and attitudes of the voters of Trump election (Table 2 and Table 3), it is possible to distinguish them by socio-professional characteristics, such as gender, race, age, education, geographical location of the voters, religion, the profession associated with educational level, and attitudes about the situation and the future of the country, immigration and openness to
international trade and mistrust towards mainstream politicians: voters have serious mistrust about the qualities of the politician in which they vote and political ideology is mainly conservative in Trump voters. Trump voters are mainly politically conservative, male (52%), 45-64 years old (53%) and 65 and over years (53%), less educated (51% of people having high school or lower degrees, and 52% of those some college/associate degree), 50% of voters with average income in the $50,000 - $99,999 bracket. The low-income voters, receiving under $30,000 or between 30,000 - $49,999 voted mainly for Clinton. One other characteristics of Trump was place of residence - the majority lives in suburbs (50%) and small city or rural areas (62%) - religion - Protestant or other Christian (58%) or Catholic (52%), while Clinton attracted 62% of voters with no religion and 69% of those with other religious belief. As far as attitudes and values, 69% of the Trump voters consider that the direction of the country is seriously off track, they are mainly concerned with the emigration (64%) and worried about the economic situation of the country (42%). When asked about the family financial situation, they consider that it is worse today (78%) and expect for the next generation of Americans to have a worse life than today (63%). About 65% consider that the effect of trade openness with other countries on U.S. jobs takes jobs away from American workers, 86% agree with the construction of the wall along the entire U.S. border with Mexico and 84% strongly agree with the deportation of illegal immigrants working in the U.S.A. For 84% of Trump voters the most important candidate quality is that he can bring needed change. These results seem to indicate that Trump voters correspond, on one hand, to those excluded from globalization and the system, and, on the other, probably to the revolt of the elites towards the political system. They are thus willing to take more risk and vote for a candidate with no political experience and outside the political mainstream.

Results about the attitudes and perceptions of the citizens from UK and USA about the economic situation of the country

Data are taken from Ipsos Public Affairs (2017). Citizens in the UK, USA and other 23 countries assessed the current state of their country’s economy. The first question was: “Now, thinking about our economic situation, how would you describe the current economic situation in? Is it...”. The answers should be given in a modified Likert scale, with four possible results: Very good; Somewhat good; Somewhat bad and Very bad. The number of answers was a thousand in each of the countries involved. In Figure 1 one can see the results for the UK. Globally, the results show that 49% of the respondents consider the economic situation somewhat bad. The social-economic characterization of these respondents shows that there is a difference according to gender. More than 52% of women and only about 46% of man gave that answer. Other characteristics include 54% of people in the 50-64 years age bracket, 44% of those under 35 years old and 50% of respondents aged between 35-49. Also, 51% of the persons who answered somewhat bad were unemployed; 52% of the people with high salaries and 44% of those with medium and low incomes gave this answer; 52% were married, from whom 52% did not have a chief income earner; 52% did not occupy a senior executive place. It should be noted that only 37% of people in high hierarchical position were in this group of respondents. For 39% of the people inquired, the economic situation in the UK is somewhat good. 41% of these respondents were male, 37% female. This answer is equal for the highest age groups, with 37%, but only 34% of people under 35 years old voted this way, probably as a result of high unemployment in this age group; 39% belonged to a low income household, 44% to a high income. Votes were independent of marital status. Citizens sharing this opinion had mainly, 44%, low education levels. Only 34% of medium and 39% of highly educated people agreed with this answer; finally, 41% of chief income earners shared the same opinion, against 37% of not chief income earners and business owners. The economic situation is very bad only for a total of 8% of the respondents. There is no evidence for a gender discrepancy. But, on the other hand, it seems that it is within the bracket age under 35 and lower education levels that this answer is mostly chosen. The contrasting choice, the economy is very good, is chosen by only 4% of the persons, mainly among men with lower education but high income households, including business owners and chief income earners.

In conclusion: the majority of the sample, 57%, in the United Kingdom considers that the economic situation of the country is bad or very bad. It is mainly among women, with medium educational level or unstable employment and lower hierarchical positions, low income, part-time jobs and risk of
unemployment, within the age bracket 35-49, that this opinion prevails. These results confirm the findings of O’Reilly et al. (2016) that two thirds of the voters in favour of the Brexit were manual workers and that their voice was reinforced by approximately half of the middle class (Stewart et al., 2016).

The same question was asked in the United States to a sample of 1000 inhabitants according to Ipsos Public Affairs (2017) methodology. The results, shown in Figure 3, confirm significant differences in the perception of American citizens when compared to their British counterparts. As a matter of fact, 52% of the people submitted to the questionnaire considers that the economic situation in the USA is good or very good. It mainly is among males (59%), aged under 35 (63%) – in contrast to the 48% of those between 35 and 49, or 43% older than 49 – married (52%), living within high income households, and with a Chief Income Earner (77%), Business Owners or Senior Executives (78%), with higher education (67%) that this opinion prevails. As far as geography is concerned, these results are favorable especially in the US Midwest Region (54%), US South Region (53%) and US West Region (53%), being smaller in the US Northeast Region (48%).

Figure 1. Economic situation in UK, 2017 (Source: Ipsos Public Affairs (2017)).
Possible explanations of the results

Several authors tried to forward explanations for the results of the elections: Clarke, and Ricketts, (2016) through the return of the Jacksonian tradition; (Newmann, 1957; Neumann et al., 2013).) using the critical theory. Clarke and Ricketts (2016) concluded that in many respects, the 2016 presidential race witnessed the return of Jacksonian sentiment to center stage in American politics to challenge the post-Cold War consensus on foreign policy. Although these results refer to the UK, their conjugation with the factors based on the Jacksonian theory, may partly explain Trump’s election, which cannot be based on the economic factors, since, as previously stated, most the respondents to the Ipsos Public Affairs inquiry (2017) considers them to be good or very good. It may be added that they also express that the economy is not their main source of worries, since the negative effects of the subprime crisis seem to be surpassed. On the contrary, in the UK, the inquiry shows that the majority (57%) of the respondents consider the economic situation in the country bad or very bad. On the other hand, economic indicators show that the subprime crisis negatively affected the economy. Young people were among the most affected, despite their academic qualifications and thus the Prospect Theory was not confirmed. However, older less educated persons opted to vote for Brexit, as their American counterparts voted for Trump. It may be concluded that the Jacksonian Theory may be applied in both situations, with people expressing negative feelings towards formal political institutions, be them national, in the case of the USA and UK, or supranational, in the case of the UK. At economic level the Prospect Theory proposed by Kahneman, and Tversky, (1979) could explain these electoral or referendum phenomena. Choices among risky prospects exhibit several pervasive effects that are inconsistent with the basic tenets of
utility theory. In particular, people underweight outcomes are merely probable in comparison with outcomes that are obtained with certainty. This tendency, called the certainty effect, contributes to risk aversion in choices involving sure gains and to risk seeking in choices involving sure losses. The application of the Prospect Theory to the results of the Presidential Elections in the United States and the Brexit referendum in the United Kingdom would justify that voters who faced negative experiences in the past are more receptive to vote in a riskier proposal (whose consequences they do not entirely know), but that offers them higher potential of additional gains, instead of choosing a safer alternative with smaller potential advantages. Fuchs, (2017) based on Neumann, (1957) and Neumann et al., (2013) explain the Trump election on the basis of the Critical Theory, namely, in such situations, the “fear of social degradation [...] creates for itself ‘a target for the discharge of the resentments arising from damaged self-esteem’”. persecutory anxiety can lead to ego-surrender in the mass through affective identification with a leader.

*Consequences of the Brexit and Trump’s Election*

The analysis of the Brexit referendum reveals that the regions that voted strongly for Leave tended also to be those with the greatest levels of dependency on European Union markets for their local economic development (Galbraith, 2017). Donald Trump’s victory showed how market reaction to populism is hard to predict. Globally, populist policies are focused more on immigration, trade, and governance, which are typically market negative. As such, populist electoral victories would imply modest downward revisions to baseline growth forecasts and risk greater instability. It has not been the case so far. Populist electoral victories in Europe would result in unsettling brinkmanship and provide an existential threat to the EU, though compromise is the most likely outcome since subsequent risks are two-sided.

**CONCLUSION**

The election of Donald Trump as President of the United States and the Brexit, separation of the United Kingdom from the European Union must be seen as the result of a complex situation involving social, political and economic aspects. Firstly, it is evident that there is a growing mistrust of a large part of the citizens on traditional institutions, political parties and long term politicians, be them national, in the case of the United States, or national and supranational, in the case of the United Kingdom. Secondly, citizens tend to feel that, in some way, they have been abandoned by the state to the effects of globalization and immigration without any effort being made to protect them. This in turn justifies the support for policies based on isolation and the growing believe that, on their own, with restrictive trade and immigration policies, both the United States and the United Kingdom would perform better.
Finally, it is also evident from the study that the groups that favored Trump’s election and the Brexit are those who think have more to lose with the current policies and are, therefore, open to try other ways, even if they may doubt the outcome.

CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE
GOVERNANCE FOR NON-PROFIT ORGANIZATIONS AN EITHER / OR
CHOICE?

Eller, Helene

ZHAW School of Management and Law, Winterthur, Switzerland

ABSTRACT

Non-profit organizations provide services and goods for its clientele, with profit being a minor objective. With this definition in mind it is obvious that the goal of non-profit organizations is to serve several bottom lines and not only the financial one. This approach is underpinned by the no-distribution constraint. Single shareholders who might have an interest in such an organization would be unable to benefit from its prosperity personally. Good governance is mandatory in order to support the aims of non-profit organizations.

Looking for a measure for good governance the principals of corporate governance gain attention. Corporate Governance (CG) reaches this goal by focusing on supervision and control. Today, there exists an enhanced measure for this aim: Corporate Social Responsibility (CSR). The focus of this concept is on a so-called triple bottom line, which means to consider economical, social and also ecological concerns when making profits. The purpose of this paper is three-fold: Firstly, it is to find out if Corporate Governance and Corporate Social Responsibility are intertwined concepts based on their theoretical background. Secondly, both phenomena are discussed within the non-profit area. Finally, it is to ascertain, whether non-profit organizations should adapt also Corporate Social Responsibility to reach their goal of good governance. It is alleged that these organizations with their distinctive features are already unconsciously applying elements of Corporate Social Responsibility in their Corporate Governance and for this reason good governance is assured by the application of an enhanced Corporate Governance.

Keywords: corporate social responsibility, corporate governance, profit-organizations, non-profit organisations, shareholder wealth, stakeholders, sustainable profits
INTRODUCTION

Corporate Governance\(^1\) and Corporate Social Responsibility have already been widely discussed in science. Both concepts received attention in the scientific world thorough several incidents. The breakthrough for the attention of Corporate Governance was many worldwide crashes of corporations due to a lack of guidance and supervision. Corporate Social Responsibility received its attention in science due to a changing world. It is no longer enough to know how profits are used but above all how profits have been made. At a first glance, it might appear that there is no interconnection between both concepts.

This discussion paper starts with an overview of the theoretical background of both concepts. Afterwards, the question whether Corporate Governance and Corporate Social Responsibility should be applied as an “either/or choice” is elaborated. Furthermore, both concepts are transferred to non-profit organizations and an interconnection of both concepts shows up, as well. Finally, the proposition that non-profit-organizations are already applying an enhanced Corporate Governance with elements of Corporate Social Responsibility is evaluated.

CORPORATE GOVERNANCE AND CORPORATE SOCIAL RESPONSIBILITY – LITERATURE REVIEW

Corporate Governance

Corporate Governance got its attention in science because of many worldwide crashes of corporations due to a lack of guidance and supervision. The confidence in “good governance” was lost. The true and fair view of balance sheets has been questioned. Sir Adrian Cadbury put a landmark with his definition of Corporate Governance in 1992 as “…the system by which companies are directed and controlled” (Cadbury, 2000) to start an intense scientific discussion. The visible result of this discussion is the development of several Corporate Governance codes. Today, there exist Corporate Governance Codes in each of the current EU member states with compulsory character as well as the US. Over the past ten years the EU has put effort on harmonizing all these country-specific codes (Walsh and Lowry, ©2011). Due to the worldwide importance of the topic, even the OECD has published principles of Corporate Governance. According to OECD “Corporate Governance involves a set of relationships between a company’s management, its board, its shareholders and other stakeholders” (OECD, 2015). Research and thorough discussion about Corporate Governance which started in 1992 has its result in various definitions in the extension of a wider or narrower focus: Sir Cadbury focuses his

---

\(^1\) The author has already undertaken thorough investigations into the field of Corporate Governance for non-profit organizations in the context of a doctoral study programme.
viewpoint about Corporate Governance on the system, i.e. the structure of a company whereas the OECD-definition explicitly mentions the various relationships and involves even stakeholders.

*Corporate Governance – theoretical background*

The theoretical background of corporate governance is multi-layered. It depends on the focus, which will be put on this concept. There is no doubt that agency theory is the predominant theory to explain the mechanism of Corporate Governance. In the centre of attention is the relationship between a principal and an agent where the principal delegates the execution of an action including decision making to an agent (Jensen and Meckling, 1976). The focus has to be on the principal as he is the bearer of the residual loss. The problem is that the agent may not act in the best interest of the principal. Different goal-orientations, risk preferences, information asymmetry are described as agency problems. Control will help to solve these agency problems (Fama and Jensen, 1983).

Agency theory is based on a special type of people. Between both parties, the principal and the agent, it is assumed that there is a trade-off between their goals. Both parties are assumed to be self-interested. In contrast, stewardship theory has been developed to draw attention to an opposite type of people acting in organizations, above all non-profit organizations. Stewardship theory’s parties are the principal and the agent, too, but the agent – better defined as “steward” – maximizes the principal’s interest by maximizing his personal goals at the same time (Davis et al., 1997). The behaviour of a steward in stewardship theory is diametrically opposed to those of an agent in agency theory. This underlying assumption has far-reaching consequences: As already mentioned, the focus in agency theory is on control to cope with the divergent interests over the agent through more or less sophisticated incentive systems and governance structures. Control is also a matter of stewardship theory but with a completely different focus: Trust is an important prerequisite to install a control system, which presumes itself high identification with an organization. It gives the managers a high level of autonomy and working-conditions, which support trustful decision-making (Hernandez, 2008).

The attempt to understand Corporate Governance by using only one theory is hardly one-sided. A comprehensive picture of the basis of Corporate Governance is only possible by looking at further theories, too. The company or an organization’s environment consists of a network of relationships with stakeholders. This focus is also emphasized by the Corporate Governance definition of the OECD. A company not only has shareholders but also a lot of stakeholders who might have a stake in an organization. Within for-profit organizations the shareholder is seen as the most important stakeholder, and therefore the focus is on it. Regardless this focus, stakeholders play an increasingly important role even in for-profit companies. Stakeholders are in the central focus of non-profit organizations as they represent the missing owner. The well-known definition of Freeman that a
A stakeholder is any group or individual who can affect or is affected by the achievement of the organization’s objectives (Freeman, 2010, 1984) is central to this paper as it belongs also to the concept of Corporate Social Responsibility, which will be discussed below. Stakeholder theory’s actors are stakeholders. Stakeholder of a company or organization can be everybody who is of interest to a company or organization. The number of stakeholders depends on the size, mission and legal form. In theory, there have been developed several methods to reduce the number of stakeholders. The most important concept refers to that of Mitchell/Agle/Wood where power, legitimacy and urgency are attributes to reduce the number of stakeholders (Mitchell et al., 1997).

The comprehensive picture of theories of Corporate Governance is not conceivable without business ethics. The purpose of a business is to create value for all groups and individuals who have a stake in the business (Freeman, 1993). This valuable purpose of business reflects two concepts which are business ethics and normative stakeholder theory. It becomes obvious that these concepts might be interconnected. But the assumption exists that ethics do not go together with attaining business goals such as maximizing profits. According to Elms et al. it is surprising that business ethics in the form of applied ethics have the same origin as strategic management. Unfortunately they grew apart as strategic management focused on profit making and business ethics on ethics itself. But by focusing the value creation process it becomes obvious that effective strategic management includes the considerations of ethics as well (Elms et al., 2010).

**Corporate Social Responsibility**

Corporate Social Responsibility gained attention in Europe in the years of 1990 although first ideas were released in the US in the late 1800s (Sitnikov, 2013). At this time, the concept was not attractive enough to be widely discussed in science. Obviously, the world had to change so that this concept perceived its value. The consequence of the various research activities in this field is that there does not exist a common definition, which states the unique understanding of the concept (Dahlsrud, 2006). Scholars claim the unclear situation regarding a unique meaning and try themselves to enrich the scientific discussion with their definitions or further explanations (This situation resembles those of the research field of Corporate Governance). It is still the responsibility of the author to choose an adequate understanding, which suits the discussed context. Carroll is the author who provides the most commonly accepted definition. He defines Corporate Social Responsibility as “… the social responsibility of business as encompassing the economic, legal, ethical, and discretionary expectations that society has of organizations at a given point in time” (Carroll, 1979).

The discussion about Corporate Social Responsibility has also attracted the European Union (EU) and the EU acknowledged the importance of this concept by providing a green paper. The understanding
of Corporate Social Responsibility in this paper is those that companies should integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis (Commission of the European Communities, 2001).

Corporate Social Responsibility – theoretical background

Today's meaning of Corporate Social Responsibility has been evolved over the years from previous theories and concepts like corporate social performance, corporate responsibility, business ethics just to mention a few examples. The concept is still far-reaching and offers a wide range of matters to focus on. Consequently, the underlying theories have to comprise all these matters, too. There exists hardly any more comprehensive overview of relating theories for this concept than those of Garriga/Melé (2004): The authors have classified the approaches and corresponding theories. The classification is done along underlying theories and has been clustered in four groups: The first group summarizes theories where the economic aspect of the interaction between business and society is focused. Social activity is welcomed only for the purpose of creating wealth to the corporation. These theories are called instrumental theories. Agency theory is represented within this group of theories. The second group of theories emphasizes the social power of the corporation with respect to its responsibility in the political area: political theories. The third group of theories looks at corporations in a way that they might have to integrate social demands in their business: integrative theories. Stakeholder theory, which is also used to explain Corporate Governance is an important theory within this group. The last group of theories deals with ethics: ethical theories. Business ethics has been mentioned above as well in the range of theories to explain Corporate Governance.

It is important to perceive that the theoretical concepts, which are used to explain Corporate Governance and Corporate Social Responsibility are partly congruent. In the next chapter it will be evaluated whether the discussed concepts are interconnected or have only the same starting point and then drift apart.

CORPORATE GOVERNANCE AND CORPORATE SOCIAL RESPONSIBILITY – AN EITHER/OR CHOICE

The central idea of both phenomena is “good governance” but with various interpretations. Corporate Governance itself has been developed due to big worldwide crashes of companies. These crashes called for “good governance” with a growing meaning till today.

Good governance is ensured by focusing on defining roles, responsibilities and power among different parties, i.e. the board, the management and shareholders within an organization. Furthermore, at that time the focus of companies was on profit maximization only which means a
single focus on the financial bottom line. How profits are made was not in the primary interest even sustainable growth. Corporate Social Responsibility’s focus lies on sustainable profits and growth. The single focus on the pursuit of the financial bottom line with the unique purpose to satisfy shareholders has been enriched to a broader view: Profit organizations are forced to gain sustainable profits and not short-time profits. Shareholder wealth is still in the focus of interest but it should be achieved by sustainable growth, which includes also social and ecological aspects. Within Corporate Social Responsibility good governance is achieved by following a so-called triple bottom line.

The more embracing interconnection of both concepts will be discussed on the following overview of Schmidpeter (2013). In this overview (see fig. 1) several concepts are arranged hierarchically. The overriding is Corporate Social Responsibility. Corporate Governance is classified as part of Corporate Social Responsibility, but its meaning is narrowed only to compliance, anti-corruption and transparency or boni for the management. Compliance means to obey relevant rules, standards and laws for an organization. Compliance has to be understood as prerequisite for good governance. It can be called the “hard law” (Brändle and Noll, 2013). However, “good governance” comprises an extended set of rules, i.e. laws and firm-specific standards, upon an organization is governed. Corporate Governance Codes, for example of Austria and Germany, state in their preambles that the rules refer to international standards of “good governance” in a broader sense including not only the shareholders but also stakeholders (German Corporate Governance Code, 2015). Schmidpeter shows with his overview that Corporate citizenship and responsible lobbying are also part of the overwhelming concept of Corporate Social Responsibility. Corporate citizenship means activities like donations, corporate volunteering or investment in regions and responsible lobbying and industrial standards focus on the creation of framework conditions for companies (Schmidpeter, 2013).

Figure 1. Fields of Corporate Social Responsibility

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
To reinforce the discussion about the interconnection of Corporate Governance and Corporate Social Responsibility, it is to state that Corporate Social Responsibility with its triple bottom line has already inspired Corporate Governance Codes (Mullerat, ©2011). And depending on the applied focus or used definition, especially for Corporate Governance, there is hardly any difference between the concepts. The drawback of Corporate Social Responsibility is that its appliance is voluntarily and therefore these ideas might not have already reached the reality of profit-organizations. Shestack underpins the meaning that companies of the 21st century will have to balance their visions by taking into consideration multiple stakeholders. A profit-organizations is no longer only an economic organization with the focus on shareholder wealth, it is a human or social organization, too (Shestack, ©2011).

Corporate Governance and Corporate Social Responsibility are intertwined concepts. Their interconnection has shown up. There is no either/or choice. Today, the single focus on profit maximization is no longer defensible as shareholders have a growing interest in sustainable profits, too. Today, good governance has obtained an enriched meaning. The limited issues of Corporate Governance in the shown narrow meaning are not far-reaching enough. The awareness towards the consideration of multiple stakeholders and other additional dimensions is apparent.

CORPORATE GOVERNANCE AND CORPORATE SOCIAL RESPONSIBILITY FOR NON-PROFIT ORGANIZATIONS

The discussion about Corporate Governance within the non-profit-area dates back to the very beginning of the 21st century. The outcome of the discussion within the non-profit area have been a few non-profit governance codes as well, for example in Germany (Diakonie, 2016), Switzerland (Zewo, 2016) and also Austria (Wirtschaftsuniversität Wien, 2013). The adoption of corporate governance to the non-profit area was put forward, because accountability and reliability of the board have become important topics also within this field. This refers above all to huge non-profit organizations as such organizations resemble more firms than typical non-profit organizations. The decision-making process in these huge organizations is mostly hierarchical. Corporate Governance structures have been implemented to increase reliability and accountability to the address of potential stakeholders (Bachert, 2006). Even smaller non-profit organizations have to prove their accountability towards their stakeholders above all if they gain their financial means through donations or membership fees. The formal implementation of this concept will be ensured by the several constitutions in its first step (Siebart und Reichard, 2004).

The thesis for this research is that Corporate Governance for non-profit organizations is not a mere concept of compliance but rather an enhanced one towards Corporate Social Responsibility. The
question is, if non-profit organizations have to put effort into adapting also Corporate Social Responsibility as a second concept or they enhance their exiting governance concepts with valuable aspects of Corporate Social Responsibility. Arguments are discussed along the model of Schmidpeter which has been presented in the chapter above.

Non-profit organizations are an important social, political and cultural part of a civil society. The non-profit sector is huge and the inherent organizations are different regarding scope, mission, social and political importance and professionalism (Zimmer and Hallmann, 2005). The cornerstone to underpin the statement of an enriched Corporate Governance for non-profit organizations is the fact that non-profit organizations pursue special missions. Non-profit organizations have no owner but founders. Non-profit organizations are multiple stakeholder organizations, too. A narrow definition of Corporate Governance is concerned with the enhancement of shareholder value and protection of shareholder interest. The consideration of other stakeholders is not the primary interest. However, the daily business of non-profit organizations demands for consideration of complementary, conflicting or concurring stakeholder interests. The phenomena of Corporate Social Responsibility has the range of stakeholders in its central attention.

According to the model of Schmidpeter (2013) Corporate Governance is narrowed to anti-corruption, transparency, legal compliance and management-boni. Of course, transparency and legal compliance are topics which are also in the interest of non-profits but a narrow definition of Corporate Governance is not the Corporate Governance of non-profit organizations for the following reasons:

Non-profit organizations in the legal framework of associations (Freise and Pajas, 2004) work with volunteers. Volunteer’s interest is to give time freely to benefit for example an organization (Eller, 2013). Consequently, agency theory which is used to explain Corporate Governance in for-profit organizations is not adequate to explain this phenomena within associations. Stewardship theory is more relevant to understand such organizations with their special missions (Eller, 2015): The board of non-profit organizations as associations operates on a voluntary basis and furthermore, a lot of volunteers are necessary to provide services to the relevant stakeholders, above all members (Eller, 2013). Non-profit organizations face the challenge of multiple bottom lines (Schuhen, 2005): According to their characteristic as not-for-profit-organizations the financial and economic perspective is only the basis of their activity. The primary mission is to provide services and goods for charitable, religious, educational, etc purposes (Hay, 1990). Besides, the non-distribution constraint does not allow non-profit organizations to distribute their profits (Hansmann, 2010). Non-profit organizations have no primary interest in making profits due to their missions. Gaining of management-boni based on profits is consequently not relevant. Whereas profit-organizations can measure their performance via financial measures latter are of limited use for non-profit organizations. The total performance will be
assessed mainly on a range of qualitative measures and additionally by the multiple stakeholders. In this respect, Corporate Governance in non-profit organizations resembles more Corporate Social Responsibility.

Corporate Social Responsibility claims also to achieve ecological goals. Such goals can be a prerequisite of the activities of certain non-profit organizations. For example, the World Wildlife Fund (WWF), it acts worldwide and its mission is to strengthen people’s awareness towards the protection of nature (WWF). Another example are Alpine Clubs: Such organizations located in merely all European countries have a statutory commitment to protect the Alpine environment (Austrian Alpine Club (UK)). However, an environmental interest as overall basis of the activities of non-profit organizations might have to be adopted consciously in statues or further organizational rules. The consequence would be that an organization always should have an environmental focus in mind with all its activities, e.g. employees are motivated to travel by public transport not by car or they use environmentally friendly cars.

Cost pressure may force non-profit organizations to question their ecological and social consciousness regarding their human and natural resources they need to provide services for their stakeholders. Social standards for employees, i.e. working conditions have to be adhered like also profit-organizations have to. Regarding social standards, employees in non-profit organizations are more intrinsically motivated and may cope with minor working conditions better. Payment for example is not the primary source of motivation. Besides this, non-profit organizations have to consider which companies/organizations they hire for services or from which they buy raw materials or office equipment for themselves. To act in an ecologically and socially responsible manner includes also these areas.

The triple bottom line compels for the consideration of economic, social and ecological aspects in their operations. Non-profit organizations may apply a triple bottom line to a certain extent unconsciously. Corporate Social Responsibility could support them to integrate a triple bottom line consciously on a strategic level.

According to the overview of Schmidpeter, Corporate Citizenship and Responsible Lobbying also belong to the all-embracing concept of Corporate Social Responsibility. The question here is if these two concepts could also be transferred to non-profit organizations or these concepts are more applicable to profit-organizations. Corporate citizenship addresses topics where non-profit organizations are typically beneficiary, like donations or investments in regions or corporate volunteering. These social activities should support non-profit organizations to fulfill their mission. It is possible that a huge non-profit organization influences social life in its region for example as big employer. If such a non-profit organization also has an environmental focus in its mission, an
influence could also be possible regarding protection of the environment. Without going into much detail this part of Corporate Social Responsibility might only be partly adapted to non-profit organizations.

Non-profit organizations as associations have three functions, i.e. the service function for members and further stakeholders. Along this purpose, non-profits provide services according to their constitution, e.g. sports clubs provide education in sport. Community building as social function and integration of volunteers are vital functions of associations. With the representation of interests (advocacy), non-profit organizations’ duty is to represent the interest of sometimes minor groups and influence politics if necessary and save availability of special collective goods (Leitner et al., 2008). Responsible Lobbying is also important for non-profit organizations. To get worldwide attention and to achieve the power to influence in politics it is important to co-operate worldwide which huge non-profit organizations practice.

Corporate Social Responsibility is an important phenomena even for non-profit organizations. This chapter shows that non-profit organizations are likely to implement ideas of Corporate Social Responsibility as they already practice parts unconsciously. The overwhelming concept of Corporate Social Responsibility is not transferable to non-profit organizations without any adaptation. It is shown that some special issues within this conceptual frame to understand Corporate Social Responsibility might be of minor interest to these organizations.

CONCLUSIONS AND FURTHER PROSPECT

Corporate Governance and Corporate Social Responsibility are two important concepts and their intertwining has shown up. Despite this fact, all efforts regarding Corporate Social Responsibility are of voluntary nature for profit organizations. Companies can still focus on the sole profit making goal. Unfortunately, it would need some legal pressure to convince profit organizations to apply consequently the triple bottom line-concept. Additional pressure could come also from knowledgeable consumers who preferably would like to buy products from companies who act in an economically and ecologically healthy manner. In contrast to Corporate Social Responsibility, the rules of Corporate Governance are of compulsory nature. Companies have to explain in the appendix of their annual reports why they do not follow certain Corporate Governance rules. The binding character of these rules have definitely supported its far-reaching implementation. Today, within the introduction of some Corporate Governance Codes ideas of Corporate Social Responsibility have been already adopted which might follow in a slight legal pressure to consider also these ideas. It is also Mullerat who understands Corporate Social Responsibility as the Corporate Governance of the 21st century (Mullerat and Brennan, ©2011).
With respect to non-profit organizations this research shows that non-profit organizations are in favour of applying Corporate Social Responsibility due to their mission and their distinctive features. Going through the areas of Corporate Social Responsibility there are a lot of proofs that non-profit organizations already apply elements of Corporate Social Responsibility. The Corporate Social Responsibility concept for non-profit-organizations could be characterized as an enhanced Corporate Governance and the advantage could be that these organizations do not have to adapt a further concept but just to enrich their already installed Corporate Governance. Of course, there is still enough room to elaborate a comprehensive concept of Corporate Social Responsibility for non-profit organizations.

This paper shows that for profit and as well as non-profit organizations the implementation of Corporate Governance and Corporate Social Responsibility is not an either/or-question, it is a question of the level of integration of both concepts.

The character of this scientific paper is a discussion paper. Its function is to open the path for deeper investigations in this field. A further step should be an empirical research to underpin that Corporate Social Responsibility could be a valuable concept for non-profit organizations even some elements might be already applied unconsciously. So far, Corporate Social Responsibility has got craven attention within the scientific research in the non-profit area. A deeper investigation might support the research in this field.

ABSTRACT

This paper aims to be a first approach to the SWOT (strengths, weaknesses, opportunities and threats) matrix, as an analysis tool for knowledge and business planning, in its application to the context of diagnosis for social intervention. It is an instrument that based on a survey of the strengths and weaknesses of an organization can approach planning with greater objectivity in order to face weaknesses and threats. In the same perspective, it can be used in other areas where planning is key of success. The hypothesis presented in this paper is that SWOT analysis in the social field can be a valid instrument in the diagnostic phase, both in an institutional and community analysis or in the study of geographical-administrative spaces, as in situations of family diagnosis.

Keywords: SWOT; Social service; strategy; social diagnosis; social intervention

INTRODUCTION

The text presented is a first approach to the SWOT (strengths, weaknesses, opportunities and threats) matrix, as an analysis tool for knowledge and business planning, in its application to the context of diagnosis for social intervention. It is an instrument that based on a survey of the strengths and weaknesses of an organization can approach planning with greater objectivity in order to face weaknesses and threats. In the same perspective, it can be used in other areas where planning is key of success. The hypothesis presented in this paper is that SWOT analysis in the social field can be a valid instrument in the diagnostic phase, both in an institutional and community analysis or in the study of geographical-administrative spaces, as in situations of family diagnosis. In the former there are experiences that point to the use of this practice (see municipal social diagnoses based on administrative and territorial), but it still appears timidly in the analysis of individual and / or family situations. The health area was one of the first to consider its worth in the family approach to the disease. In the social field, it is considered that, in conjunction with other techniques, the SWOT analysis can be a valuable aid in planning actions aimed at the welfare and development of the family in both economic aspects and personal development, and inter-family relations in the analysis phase of situation and diagnosis, with implications in planning and definition of strategies of action, as well as
in the more fragmented analysis of daily life in the advances and constraints of the families and subjects of the action. But it is worth submitting the SWOT analysis in the social field to the verdict of the method itself.

What strengths weaknesses opportunities and threats does the SWOT analysis present if applied to the social domain? Its strength is the ability to introduce reflection on positive elements presenting the two faces that any situation involves. However, it is the possibility of participation of the subjects in the elaboration of their own diagnosis, even from the collective point of view, which makes it a tool of extraordinary reach in the participation of the populations.

Therefore, it is not only an instrument for diagnosis and planning, but it is also part of the strategies of action in the development and empowerment of the participants. Opportunities are revealed from an operative point of view since the matrix allows an immediate reading and its exchange between different entities and technicians involved in the process. The lack of scientific rigor is often referred to as constraints or threats. This constraint can, however, be minimized or even exceeded in the technical methodological choices and instruments to be applied in its formulation, that is, in context analyzes, and in collection of data and information.

In addition, it can be minimized through the theoretical configuration that feeds them, considering that any diagnosis is captive to the theoretical and ideological options of the professional. In fact, it is the success of the theoretical and empirical dimensions that Guerra (2000) values in the perspective of social diagnosis.

**SWOT ANALYSIS**

*Technique or instrument - the complex differentiation*

The discussion of the instruments and techniques present and essential to the professional exercise lacks the previous discussion of the concept of instrumentality as a field of mediation in which rationality patterns and instrumental actions are processed (Guerra, 2011). Such a conception implies thinking about the theoretical-methodological dimension, ethical-political dimension and technical-operative dimension, as constituents and constitutive of social service. They are, as a whole that allow the interlocution between normative and strategic teleological parameters of professional practice, questioning why, what and how actions can be developed. We will not dwell on the first two dimensions, because according Guerra (2011), it is the instrumental dimension (technical-operative) that has greater visibility in the service of the profession, to the complexity and diversity achieved by the professional intervention as operationalization of the response to the set of demands and requisitions of society.
The discussion of the operationalization leads to the question of technique and instruments, considering the first as the set of procedures deduced from scientific knowledge, which allow apply it (Durozoi, Roussel, 2000). Faleiros (1993) considering the methodology of social work considers that the isolated technical science, theory is just a repetitive practice, isolated, technocratic. On the other hand, the instrument is what serves to perform some work or make some observation, so it is the tool that allows you to apply it in concrete situation. We base the option of this work that, without ignoring the theoretical imperatives underlying any strategic choice, is dedicated to the study to the study of the possibilities of applying this instrument to the professional intervention of the social service, both at the micro level in the intervention with individuals family nuclei And communities, or at a macro level in collective social diagnoses of wide scope.

**SWOT Matrix**

In the field of organizations, the formulation of the strategy implies an understanding of the internal and external environment in which the organizations are inserted, as well as the definition of the future environment in which the organization wishes to be. For Porter (2008) strategy means to consciously opt for the development of a set of activities in order to obtain a certain position in the market. Thus, the strategy is to create a unique, differentiating and valuable position that results from a set of activities carried out by the organization. According to Kotler (2000) well-managed companies are aware of what is happening in their internal as well as external environment.

The strategic planning process is defined between two extremes within the organization, strengths and weaknesses, as well as the opportunities and threats to which they are prone as well as the choice of a strategy in this context (Ansoff, 2007). Thus, the development of a good strategy will depend on the knowledge of the internal and external environment of the organization and its strengths and weaknesses. Only through its analysis an assertive strategy can be outlined.

According to Thompson et al. (2008) the strategy must take into account the strengths, weaknesses and competitive capacities of the company. The SWOT analysis stems from the understanding that the development of a good strategy depends on the knowledge and understanding of the business and the internal and external environments in which the organization is inserted. Thus, the SWOT matrix, also known as the Harvard model, emerged between 1950 and 1960 and allows the analysis of the intrinsic characteristics of the organization, strengths and weaknesses, and extrinsic characteristics, opportunities and threats of the environment in which the organization is implanted. That is, the SWOT analysis collects a set of information about factors internal and external to the organization that, are related to its area of activity and have an impact on it (Pickton and Wright, 1998). The main objective of this analysis is to make the resources and competencies of the internal environment
(strengths and weaknesses) in the value of the organization (Coman and Ronen, 2008) and to identify phenomena and events in the external environment, taking advantage of those that may have Positive effect (opportunities) and mitigating those of negative effect (threats) to the organization (Johnson et al., 2008).

SWOT analysis has become a simple analytical tool given its ability to demonstrate to managers the position of the organization allowing a better analysis of the business diagnosis. In relation to the internal environment, the strengths and weaknesses of the organization must be identified. Strength represents what the organization has as a strong point to face the market, competitors, difficulties, among others, but that is as distinctive as possible to competitors. Strength is controlled by the organization and can also be used to influence the external environment. Generally, a force can be understood as an internal condition, current or potential, capable of substantially aiding the organization’s performance for a long time. With regard to weakness, it corresponds to the identification of obstacles that weaken the organization’s performance, and may refer to an internal question with the possibility of being reversed or attenuated, since it can be controlled by the organization. In short, a weakness can be seen as an internal condition, actual or potential, with the ability to substantially hamper organizational performance.

As far as the external environment is concerned, the environment in which the organizations are inserted, an environment that is not an organization or a group of organizations, but of all the organizations that are in the business. In this environment lies the market that undergoes mutations according to the intentions of the clients and the evolution of the society. Both threats and opportunities reach all organizations alike, but they have different impacts, which can be diametrically opposed according to the level of preparation of each. Opportunities apply equally to all organizations in the market, but those that are better prepared can benefit better and faster from them. The analytical tool then allows the organization to perceive the imminence of a change in the market and to have a high probability of obtaining advantages from it, preparing for it.

Opportunity lies outside the control of the organization and is what the external environment offers, that is, it is an external situation, current or potential, which, if used, can contribute, to a high degree and for a long time, to the achieve the objectives or to improve the performance of the organization. Regarding the threat, it is also beyond the control of the organization and can cause serious damage if it stands in the way chosen and has the potential to undermine the organization's performance if it is not removed. The threat corresponds to a current or potential situation present in the external environment, which, if not properly removed or maintained at a distance, can significantly harm the achievement of objectives or the organization's performance for a long time.
In order for the SWOT analysis to produce the desired effects it is necessary that the factors to be included in the matrix represent the reality observed in the most reliable way possible, since it is from these that an analysis is made on the internal and external environment of the organization. The conclusions should highlight which issues are most relevant to the future development of the organization. This is a practice that requires the discipline necessary to establish a commitment to the development of a robust and fundamental strategy for the organization’s performance. There are several ways and methods of applying this analysis tool. Johnson et al. (2008) propose assigning a score of +5 to -5 that aims to make the relationship between the environment and the organization’s strengths and weaknesses. Johnson et al. (2008) report that positive values indicate in the case of a force that it will help the company to overcome a problem resulting from an atypical environmental change or that a weakness can be compensated for by this change. On the other hand, negative values indicate that strength is reduced, or that weakness may prevent the company from overcoming the problems associated with that change.

SWOT analysis being performed correctly can be a powerful catalyst for the planning process, but if done incorrectly it will be a great waste of time for the company as well as other important resources (Ferrell and Hartline, 2005). However, SWOT analysis and its application also present problems and disadvantages, including lack of objectivity, dispersion propensity and lack of precision in the classification of strengths, weaknesses, opportunities and threats. In addition, the SWOT analysis also has the propensity to be too direct, and there is sometimes no consistent result in terms of explanatory content (Johnson et al., 2008). Another limitation arises from the difficulty in creating and implementing the concrete measures resulting from the analysis, as well as the inexistence of cause and effect relationship between the variables of analysis, making this model with few evaluation methods in the changes introduced in the medium and long term, either Strengths and weaknesses (Coman and Ronen, 2008).

In conclusion, the SWOT analysis is a tool for strategic decision making, which presents several alternatives and solutions for decision making, as well as detailed diagnoses on factors related to the operational activity, being used based on the resources available in the attempt to maximize, empower and reap the greatest competitive advantage (Hamidi and Delbahari, 2011).

THINKING ABOUT DIAGNOSIS IN SOCIAL INTERVENTION

The centrality of social diagnosis and the reference to its global character was expressed from the beginning of the profession. Considered by one of the founders of the profession as accurate as possible knowledge of the social situation and personality of a certain needy (Richmond, 1917, 1950), social diagnosis is the concern of assessing social realities aiming at them to intervene is their objective.
This requires knowledge of all the elements that, although may seem insignificant or dispensable, looking at themselves, can, when taken together, shed light on the case, in particular, with respect to social work, satisfying the question of how to proceed to place a needy person in his or her rightful position in society (Richmond, 1917, 1950). It is this perspective also found by Vaisbich (1978) in the systematization of the thinking of several authors on the social diagnosis. Thus, Hamilton (1940) defines diagnosis as thought directed to the nature of the problem and its causes. Holis (1965) states that in the diagnosis the technician seek to assess the client's ability to use the various types of treatment in Social Work Case to overcome their difficulty (Vaisbich, 1978). On the other hand Greenwood (1955) points out the urgency of establishing diagnostic typologies that allow that, based on certain factors observed in the problem situation, it is correctly placed within an already established typology.

Despite the attempt of a certain standardization, Greenwood points out the need to consider the unique character, or in what differs from others of its type (Vaisbich, 1978). The weight of some of the concepts used by the authors referenced, little cited in current time, shows its wear and tear on the evolution that the social service profession has set in motion from its origin to nowadays. However, the approach to diagnosis is constant and significant as something that requires the knowledge of the situation in question considering causes and effects that leads to an action directed to the problem and the characteristics of the subjects. The dynamic character of social diagnosis, by the dynamic force of reality, is already visible in the origins and remains to this day. According to Richmond, there is no doubt that a diagnosis can and should be reviewed at all times (Richmond, 1917, 1950) and Helen Perlman (1965) considers that the social worker needs to know the dynamic and multifaceted nature of the problem presented by the customer. In a very pragmatic way, it is essential to identify the various types of problem that exist within the same situation, so that the social worker's action is planned and not only based on mere impulses and attempts, gathering, analyzing and organizing all the facts concerning the person, the problem and the situation (Vaisbich, 1978). More recently, Idáñez and Ander-Egg (1995) also address the dynamic nature of diagnosis that must be open to incorporate new data and information, new adjustments derived from new relationships and interdependencies that are established from available data or from new data that are being obtained. As a new category, Faleiros (1993) shows the complexity of the process and its political dimension, referring that what is called diagnosis is not an isolated task of pure data collection, but of elaboration and placement of strategies for a change in the relation of forces facing the problem. In conclusion, Guerra (2000) sums up more modern thinking by stating that what is at stake, when we speak of diagnosis, is the scientific knowledge of social phenomena, is the ability to define interventions that reach the causes of phenomena and not their apparent expressions. Referring to the diagnosis in its more comprehensive
version of the analysis of wider territorial contexts, the author says that a good diagnosis ensures the adequacy of responses to local needs and is fundamental to guarantee the effectiveness of any intervention project (Guerra, 2000). Synthesizing, in all cases of individual diagnosis, collective family in general, this presupposes the interaction between needs / vulnerabilities and potential / resources, opportunities and threats. Thus, the SWOT matrix, whose usefulness we intend to refer to in this article, appears in this author.

The diagnosis in Social Work

The intervention's fundamental phase varies according to different authors. For example Ader-Egg (1995) considers in the diagnosis:

- The nature of the problem or need - analyze the different dimensions to answer the question - What is it? What is the problem?
- The magnitude of the problem or need - degree or extent of the problem, persons affected, frequency and distribution.
- The seriousness of the problem or necessity - the danger of them.

Guerra (2000) states that since diagnosis are the first step in planning the intervention, it includes three operations that may be of different intensity: pre-diagnosis, diagnosis and prioritization. Pre-diagnosis is the first contact with the situation and / or subjects involved. De Robertis and Pascal (2007) systematize the diagnosis in three initial moments of the intervention as follows:

1) Placement of the problem or demand, starting point of any diagnosis to answer the question of what is and by what route reaches the professional?

2) Analysis of the situation is the moment of collection and systematization of the information regarding the elements necessary to understand the problem. It involves equating social relations in that context; the knowledge of the medium institutions services and other alternatives directed to the problem; and the identification of public policies (social and other) that may come into play in addressing the issues identified.

3) Preliminary and operative or diagnostic evaluation. The first can be born immediately when the problem is set, or require a longer time of exploitation, arising in the sequence and development of the situation analysis. The operative or diagnostic evaluation is the most advanced result and is already aimed at defining the intervention project, setting priorities and other context variables. Based on the interpretation of Guerra and De Robertis, a non-contradictory but rather complementary perspective, it is argued that it is in these phases that the use of the SWOT matrix will be useful as a way of systematizing the varied information and data collected and its analysis in a reflective perspective with theoretical foundation.
THE SWOT MATRIX AS SYSTEMATIZATION AND CENTRAL AXIS OF MICRO ANALYZES OF SOCIAL INTERVENTION

Taking the family reality as the basis of the exercise, the SWOT matrix can work in similar ways to those applied in business and / or institutional analyzes. In this process, therefore, it is essential not only to introduce the daily life of the nuclear family, such as the close context of the extended family, the work of society and the state, which can represent weaknesses, strengths, threats or opportunities. The state of relations between family members may be the support in adversity, as it may set a new threat.

The fact that the family establishes bridges with the surrounding environment, that is, being more open or closed to the outside, can mean more or less opportunities for social and institutional relations work. But also the outside environment can pose potential threats or opportunities. In social intervention the main objective of the SWOT matrix is to lead the technician / researcher to discover the positive side of the situation and the subjects involved, without neglecting the potentially perverse effects for a prevention or correction perspective.

But as we said earlier, when referring to virtues, in a process of social intervention the SWOT analysis can become not only an instrument of analysis but also itself, in its dynamics, a factor of transformation and awareness and therefore extremely efficient to achieve strategic objectives. Particularly in collective processes, Montero (2004) considers that participatory diagnosis is an organized, collective, free and inclusive process, where there are several actors, activities and levels of commitment, which is guided by shared values and objectives, whose implementation allows Collective and individual transformations. Although very wide, also in the individual or family diagnosis, such dynamics can happen and constitute a process of awareness, which enables it to enter into the historical process as a subject, avoiding fanaticism and inscribes it in the search for its affirmation (Freire, 1987). However, the main objective is undoubtedly the possibility of considering as forces the existing variables that represent the positive aspects that can come either from the image, from the competence or the lived experiences, or from the ambition, namely:

- Personal social and professional skills developed throughout life, both in terms of training and experience
- Existence of cohesive family group
- The own resources (economic of personal and familiar relations and others)
- Motivation and ambitions
- The age factor
• Health (the good state)
• The good image
• Education and / or vocational training
• Insertion into belonging groups

The verification of these conditions, in whole or in part, will allow the foundations of anchoring of new projects or the recovery of others, with the certainty that the best positioned will be important in the decisions and choices that have to be made.

With regard to weaknesses, some are the antonym of forces, but when well considered and assumed by the self, they can be reversed in the intervention process. It is necessary to identify the one that is easier and immediate to solve, for example to improve the visual aspect (positive stimuli are also important in the intervention), as well as the one that proves to be a determinant of all others, but that reveals to be a more time-consuming solution (Academic qualification or vocational training). Examples are:

• Sickness or existence of some type of disability
• Shyness and other personality traits that prove to be hindering positive socialization
• Low education level
• Low self-esteem, lack of interest and lack of investment in oneself
• Existence of violent environments, both individual and in broader spaces
• Carelessness in personal image

Opportunities are external forces that can influence positively, may be narrow or broader. For instance:

• Reopening of a relationship in a situation of rupture
• An unexpected placement or possibility of entrepreneurship
• The assignment of a house, new or more adequate to the needs of the family
• Inclusion in a support group
• The existence of services that guarantee needs (health, education, cultural, etc.)
• Proximity to other groups and services
• Good relationship with services
• The announcement of new measures of social policies that promote future benefits
Threats are external forces capable of overturning or hindering good intentions and positive conditions. They may be national, regional or local. They correspond, at the outset, to the negative direction of the opportunities, but may have other compositions such as:

- Social and/or political instability
- Changes in social policies
- Lack of services of support and/or social responses

These should be identified and monitored during the intervention in order to minimize the risks and hazards affecting the subjects.

*How to formulate SWOT analysis*

The first step is to use other techniques and/or instruments with different functions to obtain information and/or collect data: questionnaires, interview or focus group, reports, home visits, consultation of official and/or credible statistics. These are important elements in view of the more individual or collective dimension in which the intervention will take place. It will be useful to technically master the tree of problems and objectives and the analysis of social networks (Fialho et al., 2015). At this stage of the process it is also appropriate to use the genogram and the ecomap to better clarify and visualize the relations between the family elements and the exterior. In a second phase it is necessary to choose one of several models available for SWOT analysis and start to fill the fields not randomly but according to intentionalities. Fialho et al. (2015) advise for social intervention the priority filling in weaknesses or weaknesses. Considering the centrality of the problem in a social intervention, this is the more pragmatic perspective, but we must not forget that the forces that are the starting point for intervention.

**CONCLUSION**

In the process of analysis and synthesis, it is essential to be able to read the reality and the interpretation of the phenomena in question and the relations between them, either on the part of the responsible technician or the team in the case of a more comprehensive diagnosis.

Because of its origins in management and business planning, the SWOT analysis seems to be more focused in the social field for the domain of entities and organizations that provide services and social responses to a given population, but it has proved to be appropriate in the social study of geographic-administrative spaces.

The present proposal puts the SWOT analysis in the axis of individual and/or community diagnoses, where, due to its characteristics and requirements of procedures, it can prove to be an important
instrument for planning and action. It is essentially based on the daily experience of professionals, rather than on the study of the rules and results of their application, they justify bringing it to the fore.

RESTORING LEGITIMACY IN THE AFTERMATH OF CORPORATE SCANDALS: A MULTIPLE CASE-STUDY ANALYSIS ON CSR INITIATIVES

Florio, Cristina; Sproviero, Alice F.
Department of Business Administration, University of Verona, Verona, Italy

ABSTRACT

Corporate scandals undermine integrity and reputation, in that generating a legitimacy gap. Through a multiple-case study analysis, this paper provides qualitative evidence on the CSR initiatives undertaken by Multinational Enterprises (MNEs) in response to CSR-related scandals, in order to restore their legitimacy to operate. We consider four scandals in the apparel industry that “hit the headlines”, namely Walmart, Moncler, Nike, and H&M. We classify CSR initiatives according to the dimensions of corporate behaviour framed by Sethi (1975) and interpret them through the lens of the legitimacy theory. Our findings show that all MNEs undertook several CSR initiatives, primarily acting on ethical norms, operating strategies and social accountability. They tended to issue or revise code of conducts, develop new relational approaches with the suppliers, and publish the CSR report, while neglected or made limited reference to the external assurance of CSR reports. Some MNEs also accepted investigations by Non-Governmental Organizations (NGOs) on their initiatives. Besides such common behaviours, some differences arise, especially with respect to the MNEs attitude towards the refusal or admission of their responsibility in the scandals. Our study confirms previous arguments suggested by CSR literature by providing evidence that MNEs shape both the internal and external environment to make it more favourable to ethical behaviours, and rely on social and environmental accountability to pursue legitimacy, even in a peculiar situation like a corporate scandal. The study contributes to the scant but growing literature on CSR in the aftermath of corporate scandals.

Keywords: Corporate Social Responsibility (CSR), corporate scandals, CSR initiatives, ethical norms, CSR report, assurance, multiple case-study, apparel industry.

INTRODUCTION AND RESEARCH OBJECTIVES

Corporate Social Responsibility (CSR) as the integration of social and environmental concerns in business operations as well as in the interactions with stakeholders on a voluntary basis (CEC, 2001)
has gained increasing importance in the economy and the society. This matter of fact concerns especially Multinational Enterprises (MNEs), as business entities which conduct business operations in various countries through their subsidiaries and affiliates (OECD, 2011). Indeed, MNEs are constantly overseen and evaluated by shareholder, consumers, suppliers, governments, Non-Governmental Organization (NGOs) and other stakeholders (Andersen and Skojett-Larsen, 2009). Ultimately, stakeholders legitimise companies to operate, eventually assuring economic survival to the most sustainable, correct and transparent ones (Adams, 2004; Deegan, 2002). As legitimating strategies, CSR initiatives undertaken by MNEs may be pursued by assuming a defensive, reactive or proactive attitude. Such attitudes shape the corporate behaviour toward different dimensions, such as ethical norms, operating strategy, and social accountability (Sethi, 1975).

The occurrence of a corporate scandal, i.e. any situation (legal dispute, accident, or an ethical scandal that could be attributed to a company) that mines the integrity or reputation of a company (Sims, 2009), generates a legitimacy gap. Corporate scandals are usually brought on by adverse or negative media attention, generate public scrutiny of organizational, managerial and communication practices, invoke discourses about systemic change, and problematize firms’ legitimacy (Kuhn, 2003). In such situations, MNEs need to restore their credibility as economic players and may activate new CSR initiatives to recover their legitimization to operate. Corporate scandals may therefore stimulate reactive CSR policies and renew the company approach towards one or more dimensions of behaviour.

Consistently with such premise, this paper provides qualitative evidence on the CSR initiatives undertaken by MNEs belonging to the apparel industry in response to corporate scandals that “hit the headlines”, like those of Walmart, Moncler, Nike, and H&M. More specifically, we investigate whether the selected MNEs enhanced their CSR after the scandal and which specific dimensions of behaviour they strengthened. The study is grounded on the legitimacy theory (Deegan, 2002) and makes reference to the framework by Sethi (1975) to define the dimensions of behaviour. Through a multiple-case analysis, it aims at contributing to the scant but growing literature on CSR in the aftermath of corporate scandals (Fombrun and Foss, 2004; Sims, 2009; Lungu et al., 2009).

The paper is structured as follows: next paragraph offers a theoretical background about CSR initiatives and their legitimization power, especially following corporate scandals. The further paragraphs present the research design and discuss the findings from the case-studies analysed. Finally, main findings are discussed under the lens of the legitimacy theory and some concluding remarks are drawn.
THEORETICAL BACKGROUND

Legitimization power of CSR

Enhancing CSR strategies has become an unavoidable and undeniable part of MNEs activity, being those strategies highly required and evaluated by the stakeholders which, ultimately, have the power to legitimize company survival (Sethi, 1975). According to the legitimacy theory, there is an “unspoken social agreement” between the society at large and the firm that legitimise the latter to operate. Several business case arguments for CSR practices are presented in the literature. They are linked to the benefits arising from the improved ability of the company to attract consumers, investors and employees. Cause marketing, corporate philanthropy, and disclose of information are some reported examples of CSR activities aimed to enhance corporate legitimacy and reputation (Carroll and Shabana, 2010).

Companies’ attitude toward legitimization, and CSR is no exception, may be defensive, reactive or proactive (Sethi, 1975). van Staden and Hooks (2007) underline that many studies on corporate environment reporting find evidence of the reactive approach, meaning that companies publish environmental information in reaction to some event or crisis facing either the company or the industry. According to Sethi (1975, p. 60), “legitimization involves not only the type of corporate activities, but also the process of internal decision making; the perception of external environment; the manipulation of external environment—physical, social, and political—to make it more receptive to corporate activities; and the nature of accountability to other social institutions in the system”. In the search of legitimization, companies may therefore act on the side of ethical norms, operating strategy, social accountability, reduction of social and governmental pressures, and philanthropy (dimensions of behaviour according to Sethi, 1975).

This study aims at investigating the corporate behaviour to retrieve legitimacy in response to a situation of corporate scandal. The focus will be on different CSR initiatives pertaining to the dimensions of behaviour above listed.

CSR initiatives: an overview

Despite its increasing relevance, CSR maintain a voluntary nature. Each MNE may therefore freely shape CSR strategies accordingly to the needs and expectations of its stakeholders, while managing the specific social and environmental risks implicit in its core business (Bartlett and Ghoshal, 1989). CSR initiatives are therefore differentiated in their nature and scope. We briefly summarize below some relevant initiatives for our study.

Lungu et al. (2009) underline that MNEs are involved in complex business-integrity issues and shall respond to multiple requests from shareholders and other stakeholders in different markets with different regulations and governance systems. Mackenzie (2007) emphasises the role of boards of
directors in ensuring that companies maintain/improve their reputation for high standards of business
cconduct and attention to the impact of business operations on the community and the environment. He
shows that in large UK companies boards define policies and standards, monitor compliance with
them, and create ad-hoc committees which review CSR issues and reporting, identify non-financial
risks, monitor risk management, and oversee philanthropic activity. Referring to the apparel industry
and the “sweatshop” concerns along the supply chain, Emmelhainz and Adams (1999) underline the
need to develop specific standards of employee welfare to which suppliers must adhere (i.e. code of
conduct). Moreover, they suggest that supplier compliance with standards be monitored, e.g. through
on-site visits and plant inspections, and call for enforcement policies to secure effective responses in
cases suppliers violate the code of conduct.

Kolk (2008) stresses the role of CSR reporting in reducing information asymmetry between economic
actors and their stakeholders, as well as in adding credibility and reliability to the social and
environmental initiatives undertaken. According to CorporateRegister (2013), honesty and
transparency in communicating the social and environmental impact of business operations, including
sharing bad news and detailed data, help building a solid reputation as responsible firm and generate a
series of benefits closely related to the firm imagine, such as attract investors and workforce, obtain
consumers’ loyalty and influences their consumption decisions. Clarkson et al. (2015) argue that
companies that are more responsible and upstanding have greater interest in disclosing and
communicating their strategies and results to the public.

Finally, external assurance on CSR reports is recognized as a mean to strengthen their reliability and
increase confidence that the communication strategies are transparent. Peters and Romi (2013) and
Alon and Vidovic (2015) maintain that, through external assurance of CSR reports, companies with
upstanding CSR initiatives and a valid internal CSR department aim at gaining better reliability and
strengthen their reputation of responsible enterprises. Among others, Manetti and Becatti (2008) argue
that the main benefit of external assurance is to strengthen the positive effect of CSR reporting and
filling the credibility gap between the firm and its stakeholders, by reducing the information asymmetry
and agency costs. In such regard, Perego and Kolk (2012) suggest that stakeholders tend to award
responsible firms with higher trust, as long as the assurance is provided by professional and
independent assurors. Finally, Cho et al. (2010) and Clarkson et al. (2015) suggest that investors may be
willing to pay a premium for the companies obtaining external assurance, especially when the latter
relies on precise sustainability indicators or when remuneration policies are linked to CSR
performance.

CSR and corporate scandals
In the aftermath of the well-known corporate scandals of early 2000s (e.g. Enron, Arthur Andersen, Worldcom), Fombrun and Foss (2004) find three principal responses that emerged from boardroom discussions to corporate ethics questions: the infusion of ethical principles and values into corporate cultures, the appointment of chief ethics officers, and the adoption of stricter ethical guidelines and codes of conduct. The authors show that big companies increasingly base ethics initiatives on a values-based approach, so that the stated principles may be readily applied and shared with suppliers and other stakeholders. The importance of improved compliance procedures and board oversight is also underlined.

Sims (2009) explores the issue of rebuilding corporate reputation following ethical scandals and maintain that, if managed properly, the damage to the organization’s reputation can be minimized, without leading to sustained reductions in market capitalization and earnings. This view portrays media as a social-control agent, whose role gains relevance in the social construction of wrongdoing in case of a scandal (Clemente and Gabbioneta, 2017). Indeed, the corporate scandal per se is defined as a highly mediated event that causes public disapproval (Thompson, 2000), is originated from a challenge to existing norms and needs a remedy (Entman, 2012). With respect to the latter point, van Wensen et al. (2011, p. 72) argue that a suitable corporate reporting is a crucial element to obtain “a social ‘license to operate’ and the mitigation of criticism from external stakeholders and NGOs”. Moreover, they regard the scandals in accounting, environmental performance and human rights as one possible motivation at the basis of the increase in ethical considerations (reactive attitude), which produce a strong impact on the image of businesses among the stakeholders. Consistently, Arvidsson (2010, p. 340) argues that corporate scandals provide “a perfect hot-bed for CSR”, regarded by managers “as a means to decrease mistrust and restore stakeholders’ confident in management teams”. Her findings suggest that the increase in CSR communication started as a reactive approach to the corporate scandals aimed at restoring the stakeholders’ damaged confidence and trust.

As emerging from the above review, existing literature on CSR in the aftermath of corporate scandals is mainly focus on CSR reporting, while other initiatives are almost neglected. Our study contributes to the understanding of a broader range of CSR initiatives through the research design described below.

Table 1, CSR initiatives to restore legitimacy in the aftermath of corporate scandals
RESEARCH DESIGN
With the aim of providing qualitative evidence on the CSR initiatives undertaken by MNEs in response to corporate scandals we adopt a multiple case-study approach. The focus on MNEs is motivated by the fact that they are socially more observable and more exposed to public scrutiny (Arvidsson, 2010), therefore they may experience greater pressure to act—and react—in a desirable way after a scandal. We select four MNEs operating in the apparel sector which were involved in scandals of social and/or environmental impact in the last two decades. In the selection process, we consider both the media attention to the scandal and the relevance of its damage in reputational terms by referring to press articles and television reportages. As a result, the MNEs under analysis are Walmart, Moncler, Nike, and H&M.

Relying on secondary sources like corporate websites, newspapers and news releases, annual and CSR reports we identify the CSR initiatives developed by MNEs in order to restore their legitimacy. As a framework of reference, we classify CSR initiatives according to the dimensions of behaviour described by Sethi (1975), slightly revised as listed in Table 1. To interpret our findings, we adopt the legitimacy theory argument, according to which a company achieves legitimacy by operating within the norms and expectations of the society (the so called “social contract”). Legitimacy theory allows to motivate how companies behave and engage in voluntary activities in order to achieve (or restore, in case of scandal) legitimacy (van Staden and Hooks, 2007).

FINDINGS
In this section, we briefly describe each scandal and the CSR initiatives developed by each MNE as a reaction to the scandal itself. Table 1 provides a summary of the findings, by classifying CSR-related initiatives according to the dimensions of behaviour framed by Sethi (1975), properly adjusted to our purpose.

Walmart and child labor

Walmart Stores Inc. was established in the US in 1962 and exponentially grew till becoming the largest supermarkets chain in the world, even in 2016. In 2005, Walmart was accused of child mistreatment in two factories in Bangladesh where children earned wages for less than 50 dollars per month. After the news release, under the pressure of NGOs, workers and consumers’ protests, Walmart began a deep renewal in terms of business sustainability. In accordance to existing business policies, Walmart broke up commercial relations with Bangladesh vendors responsible for the mistreatment. In 2006, the company issued the first CSR document (called Report on Ethical Sourcing) with reference to the year
of the scandal. In the report, Walmart claimed it ceased trading with 141 suppliers as they employed child labor and listed in detail the results of the audits carried out directly on the suppliers’ sites, the kind of violation and the geographical area where it was found. In addition, the company renewed its commitment to implement further monitoring and verification measures for its suppliers. Walmart develop operating strategies aimed at increasing the use of renewable resources and minimizing production and packaging waste. Huge investments in innovation, technology and CSR are declared. In 2009, in collaboration with the NGO The Sustainability Consortium, Walmart launched the Walmart Sustainability Index that helps retailers and suppliers to improve products quality and sustainability, integrate sustainability into the business of buying and selling merchandise and the whole supply chain, and reduce costs. Walmart prepares CSR reports according to the Global Reporting Initiative (GRI) guidelines, but it does not submit them to external assurance. Walmart transparency and social responsibility is appreciated by US consumers, who, in 2016, have chosen it as the most reliable mass merchandiser retail store (Business Wire, 2016).

Moncler and the plumage

Founded in France in 1952 and established in Italy in 1992, Moncler S.p.A. is a luxury brand specialised in the winter clothing production. On November 2, 2014, the Italian TV program Report aired a special investigation on some of Moncler plumage suppliers in Hungary and Moldova, blaming them to implement procedures not compliant with the European legislation. In particular, the program showed how plucking was done live (illegal practice) and through methods that cause animals injuring. Moncler was therefore accused of using poor quality and low price plumage, obtained through brutal methods, and not labelling the supply chain, as other brands already did. Immediately, the company denied any involvement, stating that all feathers used by the company came from suppliers contractually obligated to ensure compliance with the principles of animal protection, as reported by the Moncler Code of Ethics. Meanwhile, the press and animalist associations (including the Italian Antivivisectionist League) condemned Moncler, also supporting their allegations with the fact that the Italian apparel company did not release a CSR report. A few months after the scandal, Moncler’s general manager and two board members resigned. However, the company denied any link between this change and the scandal. In 2015 Moncler created a Sustainability Unit and appointed the Control, Risk and Sustainability Committee. As for the operating strategies, the company established a Down Integrity System and Traceability (DIST) protocol for supplier certification, to be completed by 2016. Moncler also relies on external audits for about a quarter of its suppliers. Moncler reaffirms its responsibility for the information contained in the labels of its products and its commitment to pay careful attention to the origin of fur and plumage.
However, up to date the reference to the geographic location of its suppliers remains vague and identified only at the continent level. In 2015, the MNE released its first CSR report, of which several pages are dedicated to the feather production line and the standards it must adhere to. Curiously, the scandal is even not mentioned. Since the beginning, Moncler submits its sustainability report to external assurance, although in a limited form.

*Nike and the “sweatshops”*

Nike Inc. was founded in 1962 in the US and owns one of the best-known sport brands in the world. Since the 1990s several “sweatshop” charges were imputed to Nike, especially in Asian countries. Among them: in 1992, the denounce of miserable wages paid to Indonesian workers; in 1996, child mistreatment in Pakistan for the production of balls and very low workers’ wages in China, Vietnam and Indonesia; in 1997, abuses of women workers in Vietnam; in 2001, punishments and mass layoffs of Mexican workers who were protesting for unacceptable working conditions. In August 1998, the CEO called a press conference to present the initiatives aimed at addressing the exploitation of labour in Asian countries, also through collaborations with NGOs for educational and humanitarian issues, and at implementing new and more reliable ways of monitoring and inspection within supplier factories. Again, three years later the human rights NGO Global Exchange published a report titled “*Still waiting for Nike to do it*”, denouncing the inertia and false promises by top management. Eventually, Nike began developing a new approach to its productive chain, by reinforcing the Supplier Code of Conduct and cultivating new relationships with its suppliers, based on mutual collaboration, open communication and joint problem solving. It established a wide range of monitoring forms of its socio-environmental impact, including collaborations with NGOs and specialized agencies, dialog with stakeholder groups, and assignments to external auditors. CSR initiatives in the field of operations were active campaigns to increase the minimum wage in the host countries, improve the hygiene and safety of its plants, and increase the quality and sustainability of its products paying attention to the environmental impact. In terms of accountability, Nike began to openly and transparently report the issues it faced, especially with reference to its suppliers. Since 2005 it publishes a report containing a list of all suppliers, inclusive of registered conditions (including abuses, poor hygiene and security systems, and remuneration policies) and the results of the on-site controls carried out. The company realised the first two CSR reports in 2000 and 2001, then stopped for some years. Only since 2004 CSR reports are issued on an annual basis, provide extended explanations of the reported data (even when negative), and are drafted according to GRI guidelines and the principles of the UN Global Compact. Nike does not submit its report to a comprehensive external assurance, but the management seem willing to obtain external assurance in the next years.
Finally, in 2003 Nike donated $1.5 million to the Fair Labor Association (FLA), an active group in controlling production processes and protecting human rights, which is composed by NGOs, universities and other stakeholder groups.

**H&M, child labor and factory security**

Hennes & Mauritz AB, known as H&M, was founded in 1947 in Sweden and is one of the largest clothing multinationals, borne under the idea to produce fashion at affordable prices. This strategy is the engine of H&M success, but it has caused the MNE involvement in numerous scandals related to the use of low-cost labour in the Asian regions. Among the numerous allegations addressed to H&M, the followings had the greatest media coverage: in 2007, the company was accused of collaborating with a cotton producer in Uzbekistan exploiting child labour in plantations; in 2011, in a Cambodian factory producing for H&M around 300 workers fainted in the workplace, in a week, due to chemical fumes, poor sanitation and malnutrition; in 2013 a couple of factories collapsed in Cambodia and Bangladesh, with more than 1,000 victims (BBC News, 2013); again in Bangladesh, over the past decade inhumane working conditions, low wages, and the lack of security in production plants were reported. H&M seems to invest in CSR initiatives in response to this series of scandals. In 2012 H&M developed a Code of Conduct for suppliers. The following year was a turning point, since the company took a number of strategic initiatives in social and environmental issues, including “provide for fashion conscious customers” and “be ethical” among the major corporate commitments. In the same year it also published its *Roadmap to a Fair Living Wage* on the efforts of the *Clean Clothes Campaign*, a global alliance dedicated to improving working conditions and empowering workers in the global garment and sportswear industries. In 2012 H&M introduced incentive measures for the most responsible suppliers and H&M launched its *Conscious Collection* within a heavy ethical and eco-sustainable campaign to offer high-end environmentally friendly pieces, with the aim of obtaining all cotton from sustainable sources by 2020. In May 2013, the company signed an agreement on the risks of fire and health in Bangladesh, promising to perform renewals in order to secure the H&M apparel manufacturing factories. Another declared commitment is to implement initiatives to achieve minimum wages by 2018, however to date no agreements or negotiations have been promoted with host countries. As for social accountability of corporate actions, H&M publishes the list of suppliers on its website since 2012. The company published its first Sustainability Report in 2002, i.e. before the occurrence of the scandals. Looking to the reports realised since 2012, positive and praiseworthy tones are adopted, although not supported by equally positive data. Explicit references to the scandals about working conditions in the textile production are almost absent. Since 2012, H&M submit its CSR reports to external, limited assurance. While in 2012 the indicators under external control were limited
to the supply chains, materials used, and energy consumption, the scope of control has gradually expanded afterwards, including assurance on materiality, stakeholder engagement, emissions, the use of renewable energies, the reuse and recycling of materials, and, ultimately, the risks of fraud or corruption. Overall, CSR initiatives undertaken by H&M were highly appreciated and the latter is now included in the Dow Jones Sustainability Index and the FTSE4Good Index. CSR report of 2013 was ranked first in the section “Openness and Honesty” of the CR Reporting Awards assigned by Corporate Register, a global online directory of corporate responsibility. Finally, following the agreement on workplace safety in Bangladesh, H&M has allowed some NGOs to evaluate the state of progress of the project and to issue specific reports on the point. In September 2015 and January 2016, the reports underlying the company being in lag. Also, the Clean Clothes Campaign initiative acknowledged that some steps have been taken, but require more effort. In 2013 H&M gave rise to a philanthropic initiative through the creation of the H&M Foundation.

DISCUSSION AND CONCLUSIONS

The findings about the four case-studies highlight that, to restore legitimacy after the scandals they incurred into, all MNEs undertake CSR initiatives by acting on multiple dimensions of behaviour at the same time or in a short time period. Some similarities and recurring tendencies may be underlined with reference to specific initiatives.

Most MNEs tried to regulate better the relationships and the behaviour of their suppliers, which were often the real protagonists of the scandal. Indeed, MNEs face high business risk due to their engagements with independent suppliers and vendors, which can hardly be controlled. To favour ethical behaviour, most MNEs formulated or revised the code of conducts, especially for the suppliers-related norms. They also adjusted operating strategies by breaking up or changing the approach to trading relations, by requiring supplier certifications according to suitable protocols, by investigations on site, and/or by providing incentives to the most responsible suppliers. These initiatives are aligned with the suggestions made by previous literature on the “sweatshops” concerns along the supply chain in the apparel industry (Emmelhainz and Adams, 1999; Mackenzie, 2007). Monitoring the supply chain through a number of governance and managerial mechanisms is regarded by MNEs as an effective reaction to restore their legitimacy after heavy scandals. More attention was also dedicated to CSR investments and collaborations with NGOs at different levels, and in some cases philanthropic initiatives and commitment to build better work conditions on the host countries.

A second common element is that all MNEs become more accountable of their corporate actions in terms of CSR. Some companies published the list of their suppliers of the website. Most of them
started issuing the CSR report in the year after the scandal, as only one MNE already prepared it. All MNEs adhere to qualified guidelines for their CSR reports and progressively extend the CSR content. It could be the case that, as a communication tool, CSR reports are perceived as an effective initiative to respond quickly to the needs of a wide range of stakeholders. This is consistent with the role assigned to CSR reporting by existing literature (Kolk, 2008; van Wensen et al., 2011). However, only two MNEs submit the CSR report to external assurance, choosing a limited form only. Despite the potential assigned to such CSR initiative by professional associations and previous literature (a.o., Manetti and Becatti, 2008), this mechanism is not yet widespread and regarded by corporations as an effective tool to restore legitimacy in case of scandals. This perception may be due to the technical nature of the assurance process in situations in which more “visible actions” may be preferred. However, the lack of external assurance on CSR report might give rise to the suspect of impression management or greenwashing strategies implying the information power of CSR reports.

A third common aspect is that all MNEs undertook several actions on the side of regulation, governance system and operating strategy. Besides being the advocates of such actions, some MNEs also looked for a cooperation with NGOs and accepted different forms of investigations by NGOs on their operating strategies. The approach to accountability tends to be different, however, as MNEs prefer to exert an active role, avoiding external assurance or accepting it only in a limited form.

Some differences may also be noticed from the findings of the multiple case-studies analysed, especially with respect to the attitude assumed by MNEs towards the refusal or admission of their responsibility in the scandals. The first attitude is adopted by those companies that were accused of more than one scandal in the analysed period. Indeed, Nike and H&M make many justifications for getting rid of their responsibilities in their CSR reports. Conversely, when the scandal is directly and uniquely linked to a specific irresponsible corporate behaviour, either geographically or temporally (Walmart and Moncler), there is a prompt admission of guilt, followed by the implementation of new CSR initiatives according to the expected reactive attitude.

Overall, we found evidence that besides selecting to strengthen some types of CSR activities instead of others, MNEs shape both the internal and external environment to make it more favourable to ethical behaviours, and rely on social and environmental accountability. In such regard, our findings confirm the arguments put forwards by Sethi (1975) on legitimization, even in more recent times and in a peculiar situation like a corporate scandal.

To conclude, this paper highlights that MNEs assume a resilient attitude in response to CSR-related scandals. The relevance of CSR activities to restore the legitimacy to operate, when the latter is compromised by adverse events, is clearly demonstrated in the multiple initiatives undertaken in most of the dimensions of behaviour, and especially ethical norms, operating strategies, and social
accountability. Only the aspect of external assurance of CSR report is results to be neglected. Further studies might investigate the perceived value of the assurance statement by the various users of the CSR report, so as to clarify whether MNEs attitude towards this tool is due to its recent introduction and evolving nature and/or to a lack of business culture able to gain its potential benefits. Moreover, further studies may explore the reasons behind the gap between CSR initiatives declared but delayed, as well as the reactions of stakeholders in such cases.

SUSTAINABLE BUSINESS MODEL INNOVATION: AN OPPORTUNITY FOR THE FOOD INDUSTRY

Franceschelli, Maria Vittoria¹; Santoro, Gabriele²

¹University of Milano Bicocca, Milan, Italy
²University of Turin, Turin, Italy

ABSTRACT

This paper investigates the way in which a food firm can develop business model innovations taking into account the importance of social and environmental issues. To answer to our research question “how food firms can develop a sustainable business model innovation?” we have studied an Italian pizzeria implementing the single case study methodology. We contribute to extant research introducing the concept of sustainable innovations within the business model’s literature. We conclude that within the food industry, the development of sustainable business model innovations is particularly important because the industry is itself linked with nature and human respect.

Keywords: business model innovation; sustainability; food.

INTRODUCTION

The business model is essential for a firm given that it concerns the way in which a product or a technology is commercialized and how it creates value (Chesbrough and Rosenbloom, 2002). Studies suggest that firms should reconfigure the business model in one of more elements in order to compete and re-shape the value proposition (Chesbrough, 2010). In fact, business model innovation guarantees higher returns compared with product of process innovation (Massa and Tucci, 2013).

In the same way, environmental-friendly activities have been integrated within the strategic management (Aragon-Correa and Sharma, 2003; Sharma and Vredenburg, 1998) because also sustainability is considered a key factor to reach the competitive success (Ameer and Othman, 2012; Mass et al., 2014). Therefore, it seems logical that environmental thinking should be included in the business model, and in particular, should be the object of business model innovations.

Especially, the food industry is particularly competitive and many business model innovations have been developed so far (Amit and Zott, 2010) taking into account environmental and social aspects.

For “sustainable business model innovation”, we mean the Osterwalder’s business model configuration that focuses its attention on environmental and social aspects.
Despite this, academic literature does not seem so abundant in this regard (McCarthy et al., 2016). This paper intends to fill this gap by answering the following research question: “how food firms can develop a sustainable business model innovation?” To reach this goal, this work applies the case study methodology, by studying a small firms producing pizza through a sustainable and innovative business model, according to Osterwalder’s business model configuration.

**THEORY DEVELOPMENT**

*Business model and business model innovation*

The business model of a firm is important as it regards the way in which a product or a technology is commercialized and create value (Chesbrough, 2010). In fact, a product or a technology itself does not create value without an effective and valuable business model (Chesbrough, 2010).

More specifically, a business model is the way in which the value proposition is articulated, the target market is identified, the revenues mechanisms are defined, as well as the structure of the whole value chain (Chesbrough and Rosenbloom, 2002). Similarly, a business model can be defined as the logic according to which a firm operates and creates value for stakeholders (Casadesus-Masanell and Ricart, 2010).

The business model configuration of Osterwalder (2004) considers other two main elements, namely the cost structure, generated by key resources, partner network and key activities, and the revenue flows, generated by client segments, client relationships and distribution channels. All the elements within this business model configuration hinges on the value proposition which is the core of the firms’ activities.

This and other business model configurations provide managers with a strong tool to develop alternative business models to cope with the increasing competition.

In fact, business model can be also considered a tool used in contexts of uncertainty in order to compete and re-shaped the offering (Tell et al., 2016). In this case, a business model innovation is achieved. Thus, it is an improvement of one or more elements of the business model (Osterwalder and Pigneur, 2010). It allows managers to connect innovative products and services to a valuable proposition; in turn, the business model may be also a source of innovation itself (Massa and Tucci, 1999). In detail, business model innovation refers to the activity of designing (creating, implementing, validating) a new business model (Massa and Tucci, 1999). Moreover, a business model innovation can be achieved by new formed firms or by incumbent firms by a business model reconfiguration (Massa and Tucci, 1999). In this regard, a business model innovation is especially valuable in times of...
crisis and high competition because it provides firms with a way to avoid direct competition and discover Blue Ocean (Kim and Mauborgne, 2014).

Business model innovation in food industry

The food industry is considered mature and slow growing by some studies on literature (Sandven and Smith, 1993; Costa and Jongen, 2006; Rama, 2008; Hou and Mohnen, 2013). Other studies suggest that the food industry is an important part of the European economy (Costa et al., 2016; Tell et al., 2016).

Some changes from a socio-economic point of view are posing challenges to food firms, calling for new innovative and creative business models. In fact, customers can easily access information about products and require both more product variety with specific dietary and customized facets (Costa et al., 2007) and more healthy food that does not affect the natural environment and human health. These factors have increased the pressure on food firms to be more innovative.

For these reasons, more and more firms operating in the food industry are experimenting innovative business models to compete in the market (Jolink and Niesten, 2015), especially the smaller firms who traditionally do not have the resources and capabilities to growth. Despite this, most of the studies on innovation in the food industry have tackled the issue concerning how improve product innovation and therefore business model innovation is neglected (Ulvenblad et al., 2014). Conducting a systematic literature review on innovation in food industry, Tell et al. (2015) found that food industry articles are primarily qualitative, empirical studies that focus on one or a few companies (i.e. case studies), and the specific focus on business model is lacking, especially for smaller firms.

Sustainable business model innovation in food industry

There has been an increasing interest in sustainable business model. This concept is used in reference to environmental and social aspects as corporate social responsibility, business sustainability, sustainable agriculture, food security and safety, and eco-system services. In fact, firms increase their consideration of the aforementioned aspects in their business models (Birkin et al., 2009) showing the strong interconnection between them.

For example, McCarthy et al. (2016) found that Chinese consumers are turning towards certified food for health reasons and are sceptical about genetic modification (GM) food.

Previous research shows the positive effects of green practices and a sustainable business model, but in particular how innovation is the means by which firms improve a sustainable development performance (Hart and Milstein, 1999; Hart and Sharma, 2004; Porter and van der Linde, 1995a, 1995b,
Senge and Carstedt, 2001). Innovation is regarded as a panacea for sustainable development (Hall and Wagener, 2012: 183).

Despite the lacking of studies on business model innovation in food industry, Bossle et al. (2016) indicate that food firms engage in eco-business model innovation for internal and external factors. The most important internal factors are the human resources followed by environmental managerial concern and environmental capability. In turn, collaboration is the most important external factor followed by normative pressures and environmental regulations. Moreover, the authors suggest that government support is a deficient in adopting an eco-business model innovation.

**METHOD**

To answer to the research question “how food firms can develop a sustainable business model innovation?” we have applied the case study methodology. In fact, it seems particularly suitable to answer to the “How” and “Why” questions (Yin, 1994) and to study innovation in food firms (Tell et al., 2015).

In order to achieve our aim, we have structured the research methodology in three phases (Stake, 1995). During the explorative phase, we have collected secondary sources as news from social media or television or newspaper, database and web site. The main scope of the explorative phase is to collect the most important data for the development of this work. In particular, we have first studied the topic, making a review of the existing literature on the three main topics: business model innovation, food industry and sustainability applied to business. In fact, according to the previous studies, the literature review has the ability to accomplish the same aim of the real-life context (George and Bennett, 2005; McKeown, 2004; Yin, 1994).

Studying newspaper, website and other secondary sources information, we have identified few target firms. Among others, we have chosen Pizza (Pseudonym for privacy reasons) as the main representative firm in the food industry regarding a sustainable business model innovation.

During the second phase we have collected primary data. To do so, we have first sent a questionnaire composed by thirteen structured questions based on level of measurement (5 point Likert scale) and asking the availability to be interviewed. The primary data source was the semi-structured interviews with the founder, now also CEO, of the firm. He invited us to visit the restaurant personally. Therefore, our data collection consisted of several primary and secondary data sources: phone call, face-to-face meeting, email, questionnaire, internet and media coverage of the firm. The triangulation...
of data helped us to improve the completeness of information (Eisenhardt, 1989) and the degree of correctness of our findings (Jick, 1979). The analysis of the collected data was the last phase.

It seems mandatory to describe the activity and the features of Pizza.

Pizza was founded to provide a quality delivery-pizza. In fact, as the founder explained, every Wednesday he and his friends used to have pizza. However, every time they were disappointed by the taste, ingredients and quality. Therefore, they have decided to create a new business based on the production of digestible and light pizza made by only semi-wholemeal organic flour. The selection of ingredients is particularly important. In fact, they use only fresh, seasonal and Italian products. Furthermore, they have implemented primary and secondary activities based on the respect of the nature and the importance of healthcare. For example, they use only biodegradable products (as cutlery, glasses and napkins) and sustainable facilities to not produce CO2 (as a electric oven and electric delivery-bikes).

We believe that, thanks for its characteristics, Pizza is a unique, representative, leading case (Yin, 2003).

**GREEN BUSINESS MODEL INNOVATION IN THE PIZZA CASE**

Pizza is a very new firm, which started its activity in April 2016. This aspect is particularly relevant for two reasons. First, because the founder had the chance to develop the business model from scratch. In fact, the founder (which is also the CEO) is an engineer that had previously worked as project manager. Second because the business model innovation was done during a time of crisis (Kim and Mauborgne, 2014). Therefore, implementing the food activity, the founder has paid particular attention to the business-economic aspect: *certainly, the economic part cannot be set aside, it is crucial* – Pizza CEO.

In line with this, analyzing the business model of Pizza, we have found sustainable/innovative aspects for each of the business model points (Osterwalder, 2004). Therefore, the discussion of the case study stresses the innovative and/or sustainable aspects of each of the 9 element of the business model.

The innovative business of Pizza is focus on a specific client segment. This identification was made a priori. In fact, focusing on the particular kind of food, not a “normal pizza” but a healthy, light and a kilometer zero pizza, the CEO decided to focus on 25 to 50-year-olds and families (in particular mothers with young sons), so people who pay attention on the food quality *seen not only as the taste but as a selection of ingredients. This for them is the predominant element* – CEO Pizza. Several are the reasons behind this choice. First, he decided to focus on who are health-conscious because they are willing to
pay more for a high quality product. For this reason, he decided to not to include very young clients, as high school or college student that are not prepared to pay higher price. Because you can pay only by card, he said that he decided to exclude low-cultural or not digitalize person that do not have credit card.

Linked to the segment, is the relationship that the firm can have with its clients. In fact, we have already said that these types of clients are digitalized, that means that are supposed to use technologies and social media. Thanks to their propensity to use high-tech, Pizza can have reliable and affordable feedback on its activity. People can express their opinion on social media as Trip Advisor, Facebook, Twitter, Instagram and so on. In fact, “network involvement” is considered one of the main determinants of greenness of innovation (Triguero et al., 2014). Therefore, Pizza can establish a relationship with clients, and can use the customer’s comments as opportunities to get closer to their preferences and improve their business. Social media has evidenced that initially clients come because of the “Idea of a different pizzeria”, not because of the product but for the idea for the pizza to zero impact, and for the project "one pizza for one tree". In short, due to the fact that it is conceptually more similar to a company that to a simple restaurant. Later, what clients stress is the quality and taste of the product.

Pizza has two main distribution channels: takeaway delivery and eat-in restaurant. Both of them are characterized by sustainable innovation. The takeaway channel is made by bicycle or electric scooter, which is coherent with the “sustainable activity and ideology” and you can pay only online using credit card. This innovative choice was made to avoid that the delivery man has to waste time waiting for cash and the change: he must open his jacket to take the wallet and he probably will not have the exact change, and if it rains all things will get wet, with the result that waste time and other pizzas get wet- Pizza CEO. The takeaway delivery channel is both innovative and sustainable. Obviously it is linked with the client segments, that we have discussed above.

The second distribution channel is the eat-in. Pizza has a small restaurant in which you can have a pizza. All the cutlery, glasses and napkins are biodegradable. Walls are covered with “sustainable quotes” to get the attention of customers on the importance of zero impact activities and the importance of implementing sustainable innovations. These aspects are examples of environmental orientation of Pizza in Eco-innovativeness (Triguero et al., 2014).

In line with the previous elements, Pizza revenues flows are lower than a “classic pizzeria”, because it does not cover part of the potential clients: we do not have the revenue of a normal pizzeria because we have half of their clients (because of age and cultural level) and, of course, our market is already smaller –Pizza CEO. Revenue flows exclusively came from credit card or online payment that made all of them traceable.
Now we can discuss of the costs structure of Pizza. Some costs structure are higher than those of competitors are, but they are necessary to ensure the sustainability of the business model. In fact, some ingredients and resources, that are seasonal or biological or zero kilometre, have higher cost but are necessary for the business model of the firm and for the quality of the products. Nevertheless, the fact that most of the ingredients are “zero kilometre” or national means that on the one hand the environmental impact is reduced, on the other hand the ingredients cost is higher. Another element of cost is that all the machineries used are “at zero impact”. This is a very innovative element in a food company, especially in an “Italian high quality pizzeria” where it is usually use traditional wood oven. Obviously, the technology and the innovativeness of an electric appliances and machineries lead the increasing of cost structure.

Summarizing, high cost structure is necessary to validate the sustainable business model innovation.

Linked with the cost structure, there are the key resources. In fact, resources selection is fundamental in the whole business model of Pizza. In particular, the firm uses only national, seasonal and DOP ingredients (guarantee by Italian regulation), such as semi-wholemeal organic flour. This guarantees the quality of the products. As we already said, most of the ingredients are local. This aspect has two main implications: first Italian local ingredients are considered good and high quality, second it is a sustainable strategy because it avoids emissions due to large distance transportations.

Moreover, in line with the sustainable view of Pizza, all the machineries are electric in order to avoid CO2 emissions, and the energy used comes from renewable sources.

But there is more: within the restaurant are used biodegradable cutlery, glasses and napkins for both the customers and the cooks in order to decrease the environmental impact of the production and offering processes. This is a particularly sustainable innovation. In fact, as the Pizza’s CEO said, most of the restaurants that follow sustainable strategy use only few biodegradable object. Instead, all the tools, as glassed, napkins, cutlery, tablecloths and so on used in the restaurant are environmentally friendly. Obviously, having all these organic products is more expensive, but if you do not mean that you are implementing eco-innovations as a marketing activity, not as a real part of your mission and your business – Pizza CEO said.

Partnerships are becoming a cornerstone of many business models (Osterwald and Pigneur, 2010: 38). In line with this concept, partnerships are seen as essential in the Pizza business model. In particular, the firm collaborates with Eden Reforestation Projects in order to devolve part of the revenues in favour of the reforestation. For each pizza sold, one tree is planted. This creates a great impact on the social responsibility of the firm, and creates an engagement with a customer who is therefore indirectly responsible for the reforestation of the world.
Furthermore, several partnerships are conducted in the online distribution channels. Pizza has three key partners in this regard, one of which is very strategic. On the online platform of this partner is possible to order a customized pizza, increasingly widespread phenomenon among consumers. The delivery service, made by Pizza’s partners, is provided by electric transports such as electric scooters and bikes.

To produce a healthy-light-innovative-sustainable pizza, Pizza implements few key activities. For example, the dough is very slow in order to make the pizza light and savoury. The recipes are developed based on seasonal ingredients in order to ensure the freshness of the products. These activities are crucial for the success of the product. The innovation of these activities lie in the total coherence with the sustainable values of each activity.

**IMPLICATIONS AND CONCLUSIONS**

Given the increasing competition in the food industry, the business model as a strategic tool is essential, although has been little used in food literature, especially in food services and pizzerias and in simple configurations such as the one presented by Osterwaler.

The food industry, especially restaurants, is very fierce and often it is difficult to expand or grow internationally. However, famous cases (such as Starbucks, McDonald) demonstrate that restaurant players, who have succeeded a national or international level, are the ones who have implemented a completely new business model. Our case has developed a business model that has focused on sustainable innovation, and is a unique example in Italy.

This research adds to the literature on the food industry, analysing the possible development of sustainable business model innovations. In fact, little attention was paid on this aspect that is particularly important in a business that is constantly changing as the food industry.

In fact, we are considering essential goods. Consumers are questioning every day on their consumption choices, and increasingly want to be updated on product quality and on firm’s business model choices. In a world that is pointing more and more to sustainable development, we believe that sustainable innovation is a winning strategy to reach the business success, especially in the food industry that is closely linked to sustainability from nature and human health point of view.

Therefore, we can conclude that within the food industry, the development of sustainable business model innovations is particularly important because the industry is itself linked with nature and human respect. In fact, environmental and social respect is fundamental to reach the business success, and it is strongly linked with innovation: *companies will have to develop innovative solutions. That will*
happen only when executives recognize a simple truth: Sustainability = Innovation (Nidumolu et al., 2009: 12).

To do so a very precise business model is needed. This is another important contribution of this study: many previous works on business models do not use specific patterns to describe the business model of the analyzed cases. We have analyzed every single element of the business model configuration of Osterwalder (2004). We believe that this methodology can give a better and more precise overview of the business model.

ABSTRACT

The article presents the results of the research of Kazakhstan national pharmaceutical complex (NPhC) development in the modern system of international relations. The best practices of the world development in the field of pharmaceutical industry on the example of China and India (countries with emerging markets) were investigated. Based on the statistical data and comparison with achievements of emerging markets we assume that existing model of NPhC of Kazakhstan (country with transition economy) is not adequate to new conditions. The purpose of this paper is to estimate the level of Kazakhstan NPhC international development on the base of authors’ methodology and offer the strategy of its future development in order to be integrated into the global pharmaceutical market. The traditional methodology approach is focused on a quantitative analysis but it is not enough. Therefore, we propose the qualitative approach (on the base of interviews). Regression model lets us to study the main factors and trends of the future development. In the final part of this paper the main elements of the strategy of internationalization (recommendations for the road map) for the national pharmaceutical complex of the Republic of Kazakhstan were formulated.

Keywords: pharmaceutical industry, global pharmaceutical market, emerging market, national industry complex, internationalized reproduction processes, GVCs, Republic of Kazakhstan

INTRODUCTION

The process of globalization brings to the forefront new problems of sustainable development of the national economy in the modern system of world economic relations. The Republic of Kazakhstan is one of the countries whose national economy is of particular interest for researchers. The country has already integrated into the world economy system and has achieved some success, including: 56th place in the ranking of the life level (among 142 countries), 79th place – according to the global
innovation index. However, the share of the natural resources export from Kazakhstan remains high (about 85% in 2015), 45th place in the global competitiveness index (in 2015).

At the same time we know that the global players in the world economy are not only countries, TNCs, integration groups, etc., but in the globalizing world, new players are emerging, i.e. clusters, industrial regions, technology parks, internationalized reproduction processes (global value chain), etc. Our hypothesis is as follows. A system of production, scientific-technical, investment and other entities (units) has created a national pharmaceutical complex (NPhC) in Kazakhstan. Despite the fact that Kazakhstan belongs to the countries with transition economies the level of the NPhC development under the conditions of the new architecture of the world is not low. The global pharmaceutical market is going through a change of leadership and Kazakhstan has the opportunity to be integrated into the global pharmaceutical reproduction process along with other emerging markets. The further development of the national pharmaceutical industry on the base of the new strategy will allow the country to overcome natural resources dependence, to improve the international competitiveness of the national industry in the field of pharmaceutics.

The development of such strategy should be based on international best practices. In pharmaceutical industry it is especially demonstrated by the emerging markets – India, China. So, the experience of internationalization of pharmaceutical companies is presented in this paper. The aim of the paper is to evaluate the current level of the NPhC international development of the Republic of Kazakhstan in the system of modern world interactions (in the field of pharmaceutics) and clarify the strategy (offer some recommendations) for its further economic development in accordance with the features of the globalizing world.

**BRIEF LITERATURE REVIEW**

A lot of theories are devoted to the problem of the word and national economy development. The Kazakhstan scientist Husainov emphasizes that “the national economy acquires a new quality in the modern era, ... the country is simultaneously under the influence of two processes: autonomy (sovereignty), on the one hand, and integration (cooperation), on the other hand” (Husainov, 2012). A lot of scientific articles focus on the different aspects of the national industry activity. National industrial complex (NIC) as a set of the different enterprises, firms, companies is the subject of the world economy (along with TNCs, international organizations, etc). So, the NIC development is based both on the classical theories of the world economy and the alternative theories and a new concepts. Classical theories (the theory of the international trade, international business, internationalization) consider such aspects as the comparative advantages, international competitiveness, national security, openness of the economic system, etc.). For example, Porter investigates this problem through the
prism of the international competitiveness (Porter, 1998). It is a well-known theory. Let us investigate unknown concepts especially those which reflect the characteristics of developing countries, emerging markets. For example, the infant industry theory is especially important for the developing countries at early stages of industrialization, emerging markets. The infant industry argument is largely based on Frederick List’s writings and focuses on the government support (Mehdi, 2000).

However we need a newest concepts because “national economies and their industrial complexes as a subjects of the world economy acquires a completely different quality in modern conditions (in a globalizing world)” (Rodionova, 2016). Traditional theories can’t answer new questions and explain the contradictions. For example, inconsistency is present in the scientific judgments of the scientists: on the one hand, countries operate as independent elements of the world economic system, but on the other hand, there is the erosion (disappearance) of the boundaries between their economies. Alternative theories and new concepts give us such answers. Firstly, it is geoeconomics (geo-economics). As a new paradigm geoeconomics explains that we are talking about the elimination of “economic borders” but the “territorial boundaries” remain intact, reproduction processes come beyond the national boundaries (Jean & Savona, 1997). National economics and their structures under the circumstances of globalization have developed new orienting points to be included into the world economy sphere: one of the main new global players is internationalized reproduction processes which generate the borders of economic activity and within the framework of these processes the world income is formed (Frolova & Frolova, 2015). Geoeconomic approach lets us offer the complex of indicator in order to assess the level of the international development of the national industrial complex (the kind of goods form in export contract, the place in “technological pyramid”, etc.).

But the production process in the modern world has become more fragmented and we have to explain the theory of production fragmentation. According to Kierzkowski, Chihelkova and some others “internationalization and globalization have also led to fragmentation of production and global activities... production process is divided into various activities which are placed in the different places in the world” (Chihelkova, 2014). So, now it will be better to study industrial development through the prism of the global production networks or global value chains (GVCs). The value chain approach has firstly been used in the field of industrial development as a process of structural transformation. For many countries, especially low-income countries, the ability to effectively insert themselves into GVCs is a vital condition for their development” (Gereffi, 2011). The global value chain comprises “the full range of activities that are required to bring a product from its conception, through its design, its sourced raw materials and intermediate inputs, its marketing, its distribution and its support to the final consumer”. Global production networks or global value chains (GVCs)
constitute important opportunities for developing countries to become part of the global economy (Gereffi, 2011). A lot of scientists investigate the different aspects of the GVC. Among them are: Gereffi (management within a value chain), Porter (the structure of a GVC), Kierzkowski (“smile curve economics”), Wallerstein (commodity chain), Ferraris (management, services including logistic).

There are some differences between internationalized reproduction processes and GVC and we must take them into account:

- two types of the links in the structure of a GVCs: forward linkages in GVCs and backward linkages in GVCs;
- concept of a value chain has been used to analyze the international trade and contribution of each country (main indicator is add value);
- different groups of the risks and factors for involving into the internationalized reproduction processes or participation in the GVCs for the developing country firms (for example, developing countries could remain providers of a low-value primary materials, the risk of remaining in low value added positions within the chain).

Conclusions of the traditional and new theories are important for us. So, we have to combine the classic and new approaches. For example, we can offer such additional indicators as “the depth of the involvement into the GVC”, “the length of the GVC”, etc.

In accordance with these theories and concepts we can offer the new methodology for the assessment of the national industrial complex international development.

**METHODOLOGY**

Assessment methodology of the international economic development for any object provides a large number of algorithms (options). Their advantage is to systematically evaluate the quantitative aspect of the industry or market development. But the industrial complex includes industrial and commercial enterprises, logistic and marketing firms, etc. Among the disadvantages of the methodology we highlight the neglect of the analysis (both quantitative and qualitative) of other chains of the investment-reproduction processes. We offer to assess the level of the international economic development of the national industrial complex (NIC; for the pharmaceutical industry case – NPhC) in accordance with the following steps. The result of this procedure will show us the depth of the NIC’ integration into the world economy system and the orientation for the further development.

**Stage 1. Quantitative general analysis of international activities of the NPhC.** For its implementation we use a set of traditional indicators, taking into account the indicators of the present stage of the world economy development.
1.1 Assessment of the operation of the NPhC (foreign trade aspect): industry level. For the assessment we use the traditional indicators that characterize the foreign economic activity (both in the context of the world economy system and integration unions): volume (changes in the volume) of production and sales of pharmaceutical products in the country; contribution of the pharmaceutical industry in the GDP; volume of import and the share of imported pharmaceutical products in the total consumption; volume of export of pharmaceutical products; index of the openness, etc.

1.2 Calculation of the traditional indicators for NPhC: business unit level. There are well known indexes such as the index of internationalization, index of transnationalization, index of network spread etc. We propose to calculate them for the NPhC' entities (units, companies). In other words, the NPhC' index of internationalization is equal to the sum of these indices for the enterprise units.

1.3 Forming the base for the comparison and comparison of the national characteristics with the best foreign practices. Firstly, the base of comparison is the performance of the global market and industry. Secondly, the benchmark for comparison is the emerging markets achievements. For the pharmaceutical market there are countries as India, China and Russia. Key indicators for comparison are: a share in pharmaceutical world production, a share in world exports of pharmaceutical products, the level of internationalization, etc.

1.4 Identification of the main factors that affect the development of the national pharmaceutical complex (NPhC) using mathematical methods. All factors of the regression model are divided into five groups:

- macroeconomic indicators ($E_1$ – GDP, % to the previous year, $E_2$ – the share of pharmaceutical industry in GDP (%);
- market indicators ($K_1$ – the share of domestic producers in the market (%); $K_2$ – the number of people employed in the pharmaceutical industry);
- investment indicators ($I_1$ – investments in the pharmaceutical industry (%); $I_2$ – the share of foreign investments in the pharmaceutical industry( %);
- innovation indicators ($T_1$ – the share of innovative enterprises in the pharmaceutical industry (%); $T_2$ – the share of innovations in the pharmaceutical industry (%).

Stage 2. Qualitative analysis (assessment) of the level of the international activities development of the NPhC at its constituent entities (primarily, enterprises). Only quantitative analysis of the NPhC integration into the world economical system is not enough because of the lag of statistics which does not reflects the essence of the changes. Qualitative analysis allows us to eliminate this disadvantage. To do it, we recommend using a technique of the geo-integrity index ($I_{gi}$) (Frolova, 2011; Frolova and Frolova 2015) because the above mentioned geoeconomic concept (Jean and Savona, 1997) has shown that the traditional indicators for the analysis and assessment of the NPhC international development level...
need to be supplemented by individual specific indicators, which reflect the features of its spatial development and operating in the global geoeconomic space. However, it was designed for the country level and this index calculates a rating for the country. So, firstly, it is necessary to adapt it to the conditions of the industry sector. The other words, the components of the formula must be adapted to the level of national industrial complex. Secondly, existing index reflects the peculiarities of the internationalized reproduction chains (geoeconomic chains). But as we noted above, there are distinctive features between the internationalized reproduction chains and GVCs. Thus, the existing index needs to be adapted to the conditions of the GVC. In this case the formula takes the following form:

\[ I_{gi} = \frac{I_1 + I_2 + I_3}{3}, \]

- \( I_1 \) – this subindex reflects the model of international economic relations and includes such indicators as involvement into the international division labor; the depth of involvement into the internationalized reproduction pharmaceutical process (system) etc.;

- \( I_2 \) – it reflects the kind of the local system in the context of the national industry (pharmaceutical) complex and includes such indicators as location of «head-quarters» of the biggest pharmaceutical TNC in the country; the level of decision-making: participation in management of the world pharmaceutical industry; membership in the international pharmaceutical Committees, Founds, Allies; etc.;

- \( I_3 \) – it reflects the level of the technological development and includes such indicators as the kind of goods form in export pharmaceutical contract; the depth of raw materials pharmaceutical manufacturing, etc.

In order to estimate this index you have to interview experts. The information base for calculation of the index components responds to the survey questions (table 1). The table is filled by directors and top managers of NPhC companies. Such an indicator as "the model of the country's participation in the profits of the company" allows answering the question: what part of dividends remains at the site of localization of the enterprise for the national economy (territory) development. Feature of the geoeconomic model of international economic relations is to sell products in countries not participating in the production process. So the indicator "the share of products allocated for implementation in the partner country (left in the country of origin) in the total volume of export" allows identifying the type of the model. The questionnaire is designed in order to reveal (clarify) the essence of the index components (for the future management decisions). For example, in order to make the value of the indicator "the participation of the NPhC in the global income" high, the company should to use two contracts in its activity (simultaneously): the commercial contract of
delivery of the goods (operational level) and the agreement to receive dividends from the project (strategic effect).

Question Answer

Is the company a member of national and international professional associations (enumerate)?

How do you estimate the recognition of the national commodity brand in the world?

What is the commodity form of your products?

What percentage of the country’s participation in the gross profits of the company?
- share of national capital in the ownership capital;
- share of profits for the payment of dividends;

What is the ratio of domestic and foreign components (in average for all levels of the investment and reproduction chain)?

What is the share of foreign equipment?

Table 1. The questionnaire (fragment)

Next, the researchers define the value of the index \(I_{gi}\) components on the basis of the following scale (Table 2).

<table>

Table 2. The rule for experts (fragment)(Frolova, 2011)

Also we offer such indicators as the “the depth of the involvement into the GVC”, “the length of the GVC”, “the participation in the world income redistribution”, “the level of the availability of brand-holder status”, etc.
RESULTS AND DISCUSSION

According to this methodology we have estimated the level of the NPhC international development (the case of the Republic of Kazakhstan) in the modern world interactions system (in the field of pharmaceutics).

Stage 1.1. The assessment of the operation of the NPhC on the base of the traditional indicators that characterize the foreign economic activity is presented in the table 3 (the data for this table are taken from the Committee on Statistics of the Republic of Kazakhstan).

<table>
<thead>
<tr>
<th>Indicator</th>

</tr>
<tr>
<td></td>
<td>98.0 (2015)</td>
</tr>
</tbody>
</table>

Table 3. The current parameters of the pharmaceutical industry and market of the Republic of Kazakhstan (fragment)

This table presents that contribution of the pharmaceutical industry in GDP is low (0.08 %; the share of the natural resources export from Kazakhstan is about 85% in 2015). These results support the conclusion that the country's economy is oil-dependent and needs to diversify; the increase of production of the pharmaceutical products in the country is 21.75 % per year (so we can conclude about the rapid development). The increase of import is 1.6 % per year but this situation is not good because the share of imported pharmaceutical products in the total consumption more than 60%.

Stage 1.2. For this stage we have selected large pharmaceutical enterprises with foreign investment (capital) of the Republic of Kazakhstan. There are five Kazakhstan pharmaceutical companies only. These companies and SME don't have foreign subsidiaries. So the indexes of internationalization, transnationalization, network spread are zero. At the same time these Kazakhstan pharmaceutical enterprises are the participants of the GVCs and according to the above mentioned GVC-theory we can identify national internationalized pharmaceutical networks as “backward linkages” in GVCs.

Stage 1.3. The pharmaceutical industry of India and Chine (countries with emerging markets) demonstrate best practices. In this paper we want to show the peculiarities of the internationalization of national companies. Firstly, some facts about Indian company. In 1984, the Indian scientist,
entrepreneur and philanthropist Dr. K. Anji Reddy founded a pharmaceutical company Dr. Reddy’s Laboratories, which later became a leading international company. It is the third Indian company in the world for the production of pharmaceutical products. Subsidiaries of Dr. Reddy’s were opened in 25 countries. The table below (table 4) shows some of them (Frolova and Abdurahmanova, 2016; Dr. Reddy’s. Official site).

<table>
<thead>
<tr>

</tbody>
</table>

Table 4. Subsidiaries of Dr. Reddy’s and its specialization (fragment)

One of the leading pharmaceutical companies in China is Qilu Pharmaceutical. It focuses on developing, manufacturing and marketing of generic drugs and active pharmaceutical ingredients in the therapeutic areas of Oncology, etc. The brand value of Qilu has been built on the basis of high quality products and high standard services, ranging from research and development, manufacture of APIs and finished dosage forms, packaging and global commercialization. Qilu Pharmaceutical has eight manufacturing sites for chemical synthesis, genetic-engineering, fermentation, etc. with global presence in North America, Europe, Latin America, Asia, Africa and the Middle East (table 5) (Frolova and Abdurahmanova, 2016; Qilu Pharmaceutical. Official site).

<table>
<thead>
<tr>
<th>Name of subsidiaries (Year of the foundation)</th>
<th>The type of activity</th>
<th>Location (country)</th>
<th>Specialization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qilu Pharmaceutical Co., Ltd. (Hainan)</td>
<td>production</td>
<td>China</td>
<td>it specializes in the manufacture of lyophilized powder for injection of oncological products</td>
</tr>
</tbody>
</table>
Qilu Pharmaceutical production (Neimenggu) Co., Ltd. (2006) - It is the biggest producer of avermectin in the world. It makes antibiotics on a large scale.

Qilu King-pharm production Pharmaceutical Co., Ltd. (1987) (2009) - It produces over 16,000 tons of antibiotic active ingredients. It produces animal health products and insecticides and over 60% of its products are exported.

Table 5. Subsidiaries of Qilu Pharmaceutical and its specialization (fragment)
The full table 5 presents us the following results:

- the production process has a high degree of fragmentation;
- the pharmaceutical companies have a lot of foreign subsidiaries and high level of internationalization (60-80 %);
- the company focuses on all levels (links) of the production chain especially the one with the high level of add value (clinical studies, marketing, investment, etc.);
- the global production chain is stretched (extended), the length is equal to 12 according to our calculation;
- the areas of the subsidiaries localization are the national clusters.

Stage 1.4. Regression model lets us identify main factors that affect the development of the national pharmaceutical complex (NPhC). According to methodology all factors were divided into five groups. The data for all variables are taken from the Committee on Statistics of the Republic of Kazakhstan (table 6).
Table 6. Data for the regression model (fragment)

<table>
<thead>

<td>85</td>
<td>95</td>
</tr>
</tbody>
</table>

As a result, we obtained some models. The regression equation can be presented as follows:

\[ Y = -8,42 + 2,58K_1 \]

This means that increasing of the share of domestic producers in the Kazakhstan pharmaceutical market on 1% can provide the increasing of the volume of production on 2,58 bln. national currency (tenge).

For the second group factors we have received the following regression model (index of correlation is 0.9):

\[ Y = -116,94 + 0,422 I_1 + 2,03 I_2 \]

The regression equation for innovation factors with index of correlation \( r_{YI_2} = 0,93 \) can be presented as follows:

\[ Y = -26,12 + 1,57T_1 \]

The above mentioned GVCs-theory and "smile curve economics"-concept show us that such links of the global value chain as investment, scientific, innovation provide the maximum of the add value. According to the regression model we can see that such factors as the share of foreign investments in the pharmaceutical industry \( (I_2) \), the share of innovative enterprises in the pharmaceutical industry \( (T_1) \) are the main factors that affect the development of the national pharmaceutical complex of the Republic of Kazakhstan.

Stage 2. For the qualitative research we have selected large pharmaceutical enterprises with foreign investment (capital) of the Republic of Kazakhstan. 72 top managers have completed the questionnaire. We have processed them in accordance with the scale of values and obtained the following parameters of the index and its components:

1. \( I_1 = 0.05 \). Causes (explanation): raw materials is supplied by foreign investors, a foreign investor as the owner of the company receives the income after the sale of pharmaceutical products, finished products are sold (exported) to the "third" countries (non-participants of the reproduction process). They are the CIS countries: Kyrgyzstan, Turkmenistan, Uzbekistan, etc.
2. \( I_2 = 0.16 \). The highest value is the component "the strength of cooperative ties". We can explain it by the fact that Kazakhstan signed several Agreements in the field of medicine, healthcare, pharmaceuticals, including agreements between the countries of the Eurasian Economic Union (EAEU).
3. Igi=0.13. The reason is the production of generic drugs (80-85%) but not the original pharmaceuticals and the low level of the GDP per capita.

Thus, Igi =0.11 or 11% (maximum 0.1 or 100%). It means that the NPhC of the Republic of Kazakhstan as the object of the World Economic Cooperation is included in the system of international relations, but the level of such inclusion (the depth) is low – 11%. For comparison: for Italian industry Igi=0.56 (Frolova and Frolova, 2015), for Czech Republic Igi=0.40 (Frolova, 2011), for Russian industry (on the example of Ural region) Igi=0.30.

The results of the analysis let us offer the following main elements of the strategy for the future international development of the national pharmaceutical complex of the Republic of Kazakhstan (recommendations) in accordance with the best world practices (Chine, India etc) and geoeconomic concept:

- Creation of a national pharmaceutical cluster and increase the competitiveness of national pharmaceutical products;
- Increase of the national share in the share capital of pharmaceutical companies in the context of the requirements of the national economic security (national strategy "Kazakhstan 2030);
- Creation of a strategic national pharmaceutical company;
- Creation of the foreign branches in the CIS countries (sequentially, according to the links of the extended internationalized investment-reproduction process);
- Increase of the national participation degree in the links of the global value chain with maximum added value;
- In order to make the national model of the foreign economic relations (on the example of NPhC) adequate to the conditions of the current global environment, it is necessary for Kazakhstan to increase the values for all components of the calculation index (or links of the GVC); but on the other hand, it is necessary to limit the degree of the openness of the national economy in the context of the requirements of the national economic security and national strategy "Kazakhstan 2030".

CONCLUSION

Our hypothesis is that the level of the NPhC international development under the conditions of the new architecture of the world (with new global players) is not low and Kazakhstan has the opportunity to integrate into the pharmaceutical products market along with other emerging markets. But based on the statistical data and comparison with achievements of emerging markets we assume that existing model of NPhC of Kazakhstan (country with transition economy) is not adequate to the
new conditions. We can formulate the following theoretical and practical results of the Kazakhstan NPhC research:

- the Republic of Kazakhstan has already integrated into the world economy system but the level of this integration is low both in the system of traditional and modern indicators; at the same time the potential of the internationalization is good;

- qualitative analysis and comparison with the best practices let us clarify the strategy for the further economic development of the NPhC in accordance with the features of the globalizing world; the main recommendations are: creation of a national pharmaceutical cluster and a strategic national pharmaceutical company, increase of the national participation degree in the links of the global value chain with maximum added value, etc.;

- we have already adapted methodology to the conditions of the modern world economy and global players' demands and add such qualitative indicators as “the depth of involvement into the IRC(process) – system”, “the participation in the world income redistribution”, the level of the availability of brand-holder status”, etc. But the world architecture is changing every day so in additional to the classic theory (international trade, international business, international competitiveness) new theoretical concepts appear. According to some of them, “the global economy is increasingly structured around global value chains (GVCs) (Gereffi, 2011). So, it is very important to calculate the degree of the national participation in the global value chain on the base of the newest methodology.

Because of the good potential of the Kazakhstan pharmaceutical industry the new strategy will allow the country to improve the international competitiveness of the national industry in the field of pharmaceutics.

BRAND HATE: A QUALITATIVE STUDY ON THE EXTREME NEGATIVE EMOTION TOWARD THE BRAND

Gharbi, Dorra; Smaoui, Fatma
Marketing Department, Institut Supérieur de Gestion (ISG)- Tunis University- Tunisia

ABSTRACT
This paper aims to explore the concept of brand hate among consumers in an emerging country: Tunisia. Brand hate is the extreme negative emotion toward a brand which has an impact on both the consumer attitude and behavior. Researchers have recently begun to take an interest in this concept, as a manifestation of recent postmodern phenomenon such as anti-consumption and consumer resistance behaviors. A qualitative study is led based on in-depth interviews in an emerging country context. Main findings suggest that utilitarian factors, identity factors, cultural and ideological factors explain brand hate. Moreover, the seller behavior is pointed out as a relevant driver of brand hate. In terms of outcomes, our results suggest that brand hate can lead to behaviors like complaining, negative word of mouth, boycott and avoidance.

Keywords: brand, brand hate, negative emotions, identity, cultural, seller, emerging countries.

INTRODUCTION
Emotions are one of the defining forces in our lives; their importance lies in their ability to direct our actions and reactions (Zeelenberg and Pieters 2006; Kähr et al., 2016). In marketing, researchers were interested in the influence of emotions on consumer behavior and on the consumer-brand relationship (Bagozzi et al., 1999, Fournier, 1998). An abundant literature has been devoted to the impact of positive emotions toward the brand: Brand attachment, brand love, brand affective engagement, etc. (Carroll and Ahuvia, 2006; Alba and Lutz, 2013, Smaoui and Tmessek Behi, 2011). Nonetheless, consumers can also express negative emotions toward brands such as disappointment, detachment, anger or sadness (Mai and Conti, 2007; Romani et al., 2012). In some cases, these negative emotions can turn into hate. Brand hate is an extreme negative emotion that can have substantial damaging consequences on the consumer-brand relationship (Zarantonello et al., 2016). Recently some researches started to shed light on this concept (Romani et al, 2012), but nonetheless so far, this concept has been underexplored despite its potential severe managerial consequences. Indeed, consumers who feel hate toward a brand may harm the brand reputation and image. Their behaviors
may vary from passive actions such as avoidance to more active and hostile ones like negative word of mouth, brand boycott (Klein et al., 2004) or even brand sabotage (Kähr et al., 2016). These forms of activities are more frequent and relevant in the era of digital economy and social networks as consumers’ empowerment has developed through the Internet. We can find for example anti-brand web sites or Facebook pages, where hate for the brand is openly expressed and explained within a community gathered and bounded by the hate for a brand (Kucuk, 2007).

Current research on brand hate is conducted mainly in developed countries (Zarantonello et al., 2016; Romani et al., 2012, Dalli et al., 2006) where brands are meeting severe market competition conditions and high consumer requirements. Anti-globalization and anti-consumption movements are also growing in these countries as a result of a loss of confidence in the present word order and in the consumption society (Klein, 2000; Iyer and Muncy, 2009). Emerging countries experiment different market conditions and different consumer consciousness toward brands and consumption (Burguess and Steenkamp, 2006). In such a context, consumers are still asking for mass consumption products. Brands, particularly western ones, are considered as important social status markers (Batra et al., 2000; Touzani et al., 2015). It seems interesting then to explore brand hate phenomena in this specific context: Do consumers in emerging markets experience brand hate? How? What are the reasons behind such a negative emotion? What possible consequences can be induced by brand hate? The objective of the present paper is to gain a better understanding of brand hate, its specificities, antecedents and consequences in an emerging country context: Tunisia.

LITERATURE REVIEW

Brand hate concept

Although scholars are becoming more interested in this topic, literature on brand hate is still scarce. Ben-Ze’ev (2000) and Rempel and Burris (2005) view brand hate as a stable and intense negative emotion regarding a brand. In line with the previous definition, Bryson et al. (2013, p. 395) define brand hate as “an intense negative emotional affect towards the brand”. According to Johnson et al (2011) brand hate is mainly represented as a strong opposition resulting in the need for revenge that can be explained by an anterior negative experience.

Salvatori (2007) found that brand hate can be caused by negative attitudes related to negative experience with the product, while Alba and Lutz (2013) found that brand hate occur when the consumer is a “hostage” of the brand, in other words when the consumer cannot switch from a brand to another either because the brand represent a monopoly or due to a high price of transfer. Grégoire et al. (2009) describe hate as a desire to revenge or to avoid the brand, which may lead to two different behaviors, in the first case the customer aims to punish the brand and to damage it and in the second
case consumer feels the need to cut off any contact or interaction with the brand. Romani et al. (2012) view brand hate as a negative emotion related to brand dislike, more specifically they view it as the extreme form of brand dislike. We will retain the most recent definition of brand hate (Zarantonello et al., 2016) whom describe it as the most intense and consequential negative emotion consumers may feel toward a brand.

**Antecedents of brand hate**

Though the literature on brand hate is limited some antecedents have been pointed out. Grégoire et al (2009) find that consumer dissatisfaction with the brand represents an important antecedent of brand hate. Byrson et al (2013) suggest that consumer dissatisfaction with service, country of origin, and negative stereotypes are potential antecedents of brand hate within the luxury sector. Negative reference group, some moral factors like monopoly resistance and corporate irresponsibility are identified as antecedents of brand avoidance by Lee et al. (2009). White and Dahl (2006) focus on dissociative reference groups as a reason to avoid some products. Moreover, disidentification was found to be the foundation for deep and meaningful opposition to brands (Wolter et al.,2015). Kucuk (2008), on the other hand, identifies negative double jeopardy as an antecedent of brand hate; he suggests that brands that are very much loved by consumers are often the ones hated the most.

**Outcomes of brand hate**

According to Hirschman (1970) the reaction of a consumer when a brand fails to attempt the level of his/her expectations, can be expressed through the “voice” (expressing the satisfaction through negative word-of-mouth) or the “exit” (cut up the relationship with the brand by stop purchasing it). Boycott is identified as another outcome of brand hate (Krishnamurth and Kucuk, 2009). Zarantonello et al. (2016) found that brand hate is an antecedent to four outcomes, complaining, negative word of mouth, protest and patronage reduction/cessation. Finally, brand hate or dislike can lead to an extreme reaction, brand sabotage, which is a “deliberate behavior by consumers or non-consumers who have the dominant objective of causing harm to brand” (Kähr et al., 2016).

**METHODOLOGY**

The purpose of this study is to explore and to get a deep understanding of the brand hate phenomena in an emerging market context. We adopt a qualitative approach since it is the best suited to respond to our objective and to gain a better understanding of the nature of a cultural phenomenon (Stake, 2010). Semi-structured in-depth interviews were led among nineteen (19) respondents from different backgrounds, age (from 19 to 55 years), gender (11 women, 8 men), location and social status. We give the respondents the choice to choose one or multiple brands they hate, and then we asked them to
discuss four themes: their relationship with brands in general, their negative brand experiences and feelings, their description of brand hate, the factors explaining this brand hate and the consequences. Various brands were chosen relating to diverse sectors: fashion wear, cosmetics, telecommunication brands, cars, etc. Interviews lasted between 40 mn and two hours. They were entirely recorded and transcribed. Data was analyzed using the content analysis approach (Krippendorff, 2012).

Once the interview done and totally transcribed, the first step was to rapidly browse through the transcript and to then read one by one all the interviews transcribed to take notes to get to understand the interviews as a whole and to be introduced to the data collected.

The second step was coding. The first thing to do was to label the pieces seen as relevant to the topic, the ones explicitly stated by the participant as relevant or important or the one stated previously at the literature and cited by the interviewer. The third step was creating themes by first resembling codes that had the same signification, the codes were putted together in various sub themes, ensuring in this way a complete analysis of the information collected and the final step was to label each theme found.

**FINDINGS AND DISCUSSION**

*Ways of expressing brand hate*

Participants used multiple ways to express hate toward a brand: facial expressions, body language, tonality and words of anger, frustration and hate. Many interviewees first talked about brand avoidance before talking about brand hate, the transition from one state to another is accompanied by a noticeable change in facial expression. When speaking about hate, the participants become more focused and were more detail oriented. When describing their feelings toward the brand, interviewee’s facial expression indicates sadness, anger and disgust, which are the basic primary emotions that describe hate. Their voice tonality changed all along, many did use a sarcastic and angry tone while basically for almost all the interviewees the tone became more firm. Their body language does change from time to time and they became more agitated using sometimes their two hands to deliver the information. The experience that lead them to brand hate still affect them when they talk about it; they become either emotional, angry or sad all of the sudden. It’s interesting to note that two interviewees despite all mentioned that they don’t feel hate toward any brand. They said that they don’t bother with forming negative emotions; whenever a brand made them feel uncomfortable or unsatisfied they reject it all the way, not putting a lot of effort in hating it.

*Love, hate dilemma*

Some interviewers were balanced between desire and hate and seemed to have an internal conflict with what they feel toward the brand, they wanted to boycott a brand but couldn’t and were
frustrated at the fact that they couldn’t resist their attachment to it: “I did boycott it for a while before consuming it again I don’t know what they are putting in it that make it so damn addictive, I can’t resist it.” (male, 25 years, Coca Cola). This interviewee wanted to boycott Coca Cola, because according to him it is a symbol of the USA hegemony, but failed because he find it irresistible. Belk et al. (2003) explain that desire and disgust can sometimes be very close to one another. Furthermore, Grégoire and Fisher (2008) have already discussed brand love as an antecedent of brand hate. Some interviewees faced an internal dilemma between attachment to a brand and hate. They were loyal customer before hating the brand after being disappointed due to a bad experience.

Antecedents of brand hate

The different reasons cited as leading to brand hate can be grouped into four main factors: utilitarian factor, identity factor, ideological-cultural factor and seller behavior factor.

**Utilitarian factors**
- Poor performance
- Aesthetic insufficiency
- Value exchange
- Food favoritism

**Identity factors**
- Self concept:
  - Undesired self
  - Negative reference group
- Brand consciousness and social status

**Country effect:**
- Animosity
- Financial patriotism
- Local/foreign brands

**Consumer resistance**

**Religious factors**

**Seller**

**Brand hate**

**Outcomes**
- Boycott
- Complaining
- Avoidance
- Negative word of mouth

*Figure 1. BRAND HATE, ANTECEDENTS’ AND OUTCOMES*
Utilitarian factors

Utilitarian meaning refers to the different attributes of a product that concerns efficiency, convenience and value exchange (Dittmar and Pepper, 1992). Our results suggest that four antecedents of brand hate are utilitarian factors: poor performance, value exchange, aesthetic insufficiency and food favoritism. Poor performance was mentioned by some respondents they talked about poor quality, low durability and inability of the product/service to deliver its performance promises. Aesthetic insufficiency is related to the appearance of the brand; Lee et al. (2009) indicate that appearance can be an indicator of the brand functional efficiency. “I hate the color and all, yellowish red, diarrhea green, blowfish purple, eukhh it is just a big Nooo” (female, 25 years, Hannibal TV, a local TV channel). Food favoritism (Lee et al., 2009) concerns a phenomenon where people reject food brands associated with value deficiency (contaminated and harmful, cheap brands, etc.). Some female interviewees in the mid thirties with children were very concerned with their kids’ health and mentioned that they hate some brands because they represent a risk for their children’s health. However they couldn’t avoid those brands all the time because of their kids’ preference. Value exchange deficit is another utilitarian factor leading to brand hate. Some respondents perceive certain brands as representing an unacceptable cost to benefit trade-off (Lee et al., 2009) “I hate Zara! It is a scam; they are mocking us in every possible way: they sell mediocre clothes at a super expensive price. Zara in Europe is nothing but here (in Tunisia), they consider it as a great brand,” (male, 37 years, Zara).

Identity factors

Individual’s identity results from his interaction with himself, with other individuals, and with different groups within a society. The self and society are bonded and a person understands reality through his social interaction (Jenkins, 2014).

• Self concept and the undesired self: As defined by Gardner et al. (2005) “The self is a relatively stable set of perceptions of who we are in relation to ourselves, to others and to social systems”. To that matter our findings suggest that two factors standing behind brand hate are related to the self concept: undesired self and dissociative reference group. Undesired self is defined as the emergence of negative emotions when the perception of the consumer of himself does not match the brand (Lee et al., 2009): An interviewee describes her feelings toward the fashion brand Zara as follows: “I mean everything made me feel uncomfortable, the mannequins in the store and in the shop windows, how tall and skinny they were while I am here all chubby and short, I felt not in the norms I felt not fitting I felt so fat (…..), every time go to any “cool” store here all the cool kid and arrogant people buy I feel sick” (female, 20 years, Zara). The participant above talked about how she felt not in the norms. Mainly her hate for the brand is the result of how she perceived herself in that context.
• **Self concept and the dissociative reference group**: dissociative reference group is a group with whom the individual does not want to be associated. Some people tend to avoid brands that are not congruent with their self concept (Grubb and Grathwohl, 1967; Sirgy, 1982). Dissociative reference group may, according to our findings, lead to brand hate “I hate Bershka I think it is vulgar and I am sorry, people who wear from Bershka are of a vulgar kind and does not have the slightest taste,… it is impossible that I can be like that” (female, 24 years, Bershka, fashion wear). Or “I hate it, I consider it as degrading to the man image and I think it is actually for gays so, No I won’t purchase anything from there” (male, 25 years, Bershka)

• **Brand consciousness, social status and brand hate**: Throughout our analysis the second most cited word through the interviews beside hate (cited 182 times) is “people” (cited 148 times). Interviewees seem to be particularly sensitive to their social entourage and environment. In fact, social pressure may lead individuals to conform to social image and norms and to lung to a certain statute that may indicate success according to society codes. Brands are recognized to represent a kind of a social status marker or indicator that allows the individual to communicate his social status (Nelissen and Meijers, 2011). Brand consciousness refers to the tendency of individuals to buy well known brands which they believe are symbols of social status (Sproles and Kendall, 1986). Our findings reveal that some respondents are in continuous research of a certain social image and use brands as a symbol that communicate their social status. Even if they belong to a low social class, they have a tendency to buy well known and expensive brands. Nelissen and Meijers (2011) explain that in order to enhance their status, people from different social classes purchase luxury brands, associated with wealth and high status. The analysis of respondents discourse reveal that interviewees who are brand conscious may hate brands because they associate them with low social status “I hate Palmarium, I think I didn’t visited it since my 8 years old, I never purchase from there, take a look at people who go there, I don’t know them but I can recognize them in the street, they are what we call “jboura” (kitsch person), they are vulgare and belongs to certain social class. I purchase from three places: Zara store, Mango and may be Stradivarius store.” (female, 24 years, Palmarium, a Tunisian shopping center). Though from a lower class, this participant purchased from “expensive”, occidental and well known brands, motivated by the desire to be seen as belonging to an upper social class

**Ideological, moral and cultural factors**

Country of origin, consumer resistance and religious background represent ideological, moral and cultural factors that explain brand hate.

• **Country of origin**: country animosity, financial patriotism and local/foreign brand are different faces of country of origin factors related to brand hate.
As suggested by Lee et al (2009) animosity occurs when dislike and hate for a country extend to the hate for brands originating from that country. Financial patriotism occurs when individuals develop negative feelings toward a brand because it represents a negative impact on their country. Some interviewees express animosity towards certain countries, mainly Gulf state countries and associate them to bad influence on Tunisia and Maghreb countries: “I hate Ooredoo because it reminded me at least two things: that I hate the Gulf countries, they are becoming powerful and they dare and treat the Maghreb countries like s***t, and that Ooredoo took the place of Tunisiana mobile operator brand name when Qatar bought Tunisiana” (female, 32 years old, Ooredoo, mobile operator). The respondent has developed negative association with the brand, translated later into hate for the brand originating from this country. The rebranding of Tunisian into Ooredoo, after Tunisiana was purchased by Qtel, the Qatar operator, was not accepted by many consumers who called for boycott of Ooredoo. Tunisisiana was a beloved brand by a majority of consumers, and this love has turned into hate for some of them (Smaoui and Smiri, 2016).

Some interviewees talked about their love for foreign brands and their rejection for the local one “I wish I never had to purchase Tunisian brands, (...) foreign brands are always better, it is impossible that we can have a Tunisian brand that could have the same quality as the foreign one” (female, 37 years). This can be explained by the complex of the decolonized that, as was suggested by Touzani et al. (2015), is related to the preference of foreign western products in formerly colonized countries like Tunisia, it is a legacy of colonized period.

- Consumer resistance: Considering the context of this study, one concept that was surprisingly present as an antecedent of brand hate was consumer resistance. “when going to Carrefour my mind is all about consuming, I buy things that are not useful , then once I am out ,I ask myself why did I bought so many things that I didn’t need, I feel fooled!” (female, 51 years, Carrefour). As can be seen in the previous quote brands can be hated when consumer feel powerless, when the brand become strong and dominant the consumers feel disempowered, they, become resistant to the brand by actively rejecting it (Cromie and Ewing, 2009; Lee et al.,2009). It also has to do with resistance to mass consumption: “they are selling words they are selling what we call in Tunisian dialect “ri9” ! and people buy, buy and buy without even thinking about it” (male,27 years, luxurious brands). This fits perfectly with the definition of Penaloza and Price (1993) as they describe consumer resistance as being engendered by counter culture attitude and behavior that put in doubt the current capitalist system and reduce consumption.

- Religious factors: Cultural factors along with religious factors appeared in multitude interviews as a valid factor for hating a brand. That was not a surprising finding as the context studied is a Muslim country. The following quotes came to clarify the concept. “Elhiwar, I know a lot of people that are willing to boycott it (...) I look at their shows it contains a lot of dirty jokes, it is disgusting. Do you think it
is normal for us, Muslim people in a Muslim country to watch those television series, or this TV show in a sacred month like Ramadan? What is hiding behind all this!!” (male, 19 years, ElHiwar a Tunisian TV Channel). The interviewee talked about how the values represent by the TV channel (Elhiwar) did not match his Muslims’ culture and values, and he rejected the brand.

**Specific role of seller behaviour in brand hate**

Sales person behavior was the more cited reason leading to hate as expressed by the different respondents (mentioned twenty four times). At the first look, it is the poor performance of the seller that can explain brand hate (bad service, poor information and device), but when analyzing a little more profoundly through the interviewers discourse we can find that the seller attitude is also linked to the consumer undesired self concept.

- **Seller impact on brand performance**: Seller is usually considered as a part of the company performance as it presents a service that is directly tied to the organization. Poor seller performance can sometimes be detrimental to the company’s success. “one of my colleague was very badly welcomed by the Tunisie Telecom company employee, first of all he cursed the telecom operator and swear that he will never fall for whatever they offer” (male, 38 years, Tunisie Telecom). The participant described how the poor performance of the sales force is associated directly with the whole company’s performance as sellers may sometimes be the only direct contact with the company.

- **Seller impact on self image**: interacting with sellers has its impact on how the consumer perceives himself “... and I could see from the seller’s attitude that he was not pleased with that fifty years old man who, from his point of view won’t understand anything. He didn’t even explain me, I felt very uncomfortable, the seller looked at me like if I was not in my place, like if I am too old to learn anything about technology, I saw boredom in his eyes..I felt so down and sad(...) I hated Ooredoo from that day on!” (male, 55 years, Ooredoo). This quote illustrates how sales’ person’s bad service may impact, not only, the whole performance of the company, but may also impact the consumer self image.

**Outcomes of brand hate**

When consumers feel dissatisfied by the brand, they can either exit the relationship with the brand or they can voice their dissatisfaction (Hirshman, 1970). Through our analysis, several consequences of brand hate are identified corresponding to different faces of “exit” or “voice”

**Boycott**

Boycott is defined as “an attempt by one or more parties to achieve certain objectives by urging individual consumers to refrain from making selected purchases in the market place (Friedman 1985, p. 97). When boycotting a product the consumer back off from purchasing a certain item because of an ideological discontent with the organization or country. (Friedman, 1985; Hirschman, 1970). The
following quote illustrates this behavior “Yes definitely, back to the days I decided to boycott it. I felt like they have changed the name of “Tunisiana” to show us that they own us, might be nothing but I hated it really”(women, 51years, Ooredoo). The interviewee talked about a boycott movement that took place when the telecommunication company switched the name of Tunisiana to Oreedoo.(Smaoui and Smiri, 2016).

Brand avoidance

Brand avoidance was the most common reaction to brand hate throughout this study. According to McCullough et al. (1998) brand avoidance is defined as individuals need to cut themselves from any relationship with that brand. Interestingly in most of the interviews brand avoidance came with holding grudge and for a long period “... I didn’t come back to the Ooredoo store indeed and I won’t, I think I am avoiding it without even noticing. So for now, given that I am not a client anymore, I make sure that everyone knows how bad it is, and I don’t miss an opportunity to let people know about how a scam it is and to advice them to go shop somewhere else” (female, 51 years, Ooredoo). As could be seen in the quote, brand avoidance can be accompanied with negative word of mouth or with complaining.

Negative word of mouth

Negative word of mouth occur when consumers have a bad experience with a brand and share it with their circle of friends and family in order to devaluate the brand and to make others revaluate their relationship with the brand (Grégoire and Fisher, 2008; Grégoire et al., 2009). Many respondents expressed their tendency to talk about their bad experience with the brand and recommended people not to buy this brand.

Complaining

Complaining is a usual behavior when a customer is dissatisfied with the brand. Our findings show that brand hate can lead to complaint behavior: “So needless to say that I didn’t kept silent and I went to his boss who forced him to apologize. I didn’t miss the chance to talk badly about my experience in details” (male, 55 years, Mouradi Hotel). Most of the complainers said that they used private complaining to voice their dissatisfaction, meaning that they did complain to the retailer or to the service provider. Nonetheless, complaining online is also evoked by certain interviewees, namely through the social media Facebook, which is very influential in Tunisia. One interviewee even regretted not having a Facebook account to complain about a brand she hated.

CONCLUSION

Throughout this study we aimed to explore the brand hate in an emerging country context, its meaning, its manifestation, its antecedent and consequences. Results were quite interesting and some of them came as a backup of the literature. Findings suggest that brand hate is experienced and
expressed by respondents. Hate may be expressed verbally or/and through body language which furthermore illustrate the intensity of this emotion. Brand hate was found to be distinct and more powerful than other emotions and attitudes like brand dislike, brand avoidance (Lee et al., 2009), consumer resistance (Penaloza and Price, 1993) or anti-branding attitude (Kucuk, S. U., and Krishnamurthy, 2007). Brand love may turn into brand hate, as suggested by Grégoire et al. (2009), in fact extreme intense emotions toward brands can constitute the two sides of the same coin, loyal customers have high expectation of their loved brand, once those expectations are not met disappointment and hate may occur.

Brand hate can be the consequence of four main factors, utilitarian factors, identity factors, cultural and moral factors and the sellers' attitude and behavior. Utilitarian factors, in opposition to symbolic ones can lead to brand hate (poor performance, poor aesthetic and poor value exchange). More interesting findings concern cultural and moral factors. Some respondents expressed anti-consumption and consumer resistance attitudes leading to brand hate, while others evoke some cultural reasons like religious values, country of origin animosity or preference for non local western brands. Such symbolic factors are particularly interesting in the present context. Some of the findings are in line with emerging countries brand literature that suggests that country of origin has an important effect on consumer behavior, that consumers tend to prefer non local brands (Touzani et al., 2015 ; Batra et al., 2000) and that religiosity is an important antecedent to many of Muslims consumer behaviors (Amin et al, 2014). Some other findings are surprising, namely the anti-consumption factor. Indeed, mass consumption is seen as normal and even appreciated in emerging markets, as it is associated with western lifestyle. Some studies mention the desire of emerging countries' consumers to imitate western lifestyle through consumption and the desire to participate into the international community of consumption (Batra et al., 2000; Saffu and Walker, 2006). Our results show that anti-consumption attitudes exist and may even lead to brand hate in this context. Identity factors related to the self concept and social status are identified also as important symbolic brand hate antecedents. Findings indicate that respondents tend to hate brands that are associated to negative self reference groups, or that is associated with an undesired self (Lee et al., 2009). Social status is particularly important in emerging countries (Ustuner and Holt, 2010) and brand represents a significant social marker. In his quest for social statute as was found in our results, consumers may reject and even hate brands that he sees as a threat to his desired social statute.

Seller's attitude and behavior represent a surprising key factor behind brand hate as it was not mentioned before as a primordial reason behind brand hate in the emerging brand hate literature. It represents a significant contribution of this research. Finally, finding shows that four behaviors can be engendered by brand hate: complaining, boycott, negative word of mouth, avoidance and rejection,
This came as a support to the marketing literature (Alba and Lutz, 2013; Bryson et al., 2013; Gregoire et al., 2009; Johnson et al., 2011).

In terms of managerial implication it is interesting to understand why a consumer may feel such an intense and negative emotion toward the brand. Identifying the factors behind hate help managers build strategies and put tactics in order to help preventing the damages that can be caused to the company due to brand hate. The most important managerial implication that companies in the Tunisian context should pay attention to is sellers’ behavior. Tunisian companies should focus on seller’s training and motivation to deliver a professional and respectful behavior. In addition managers should pay close attention to the main group that their company is targeting in order to avoid any association with a negative reference group and to prevent any confusion with the targeted group.

COST DEPLOYMENT IMPLEMENTATION: A CASE STUDY

Giovando, Guido; Crovini, Chiara; Venturini, Stefano

Department of Management, University of Turin, Turin, Italy

ABSTRACT

The paper deals with modern managerial and accounting tools and specifically with cost deployment, a key pillar into the World Class Manufacturing programme designed by FCA. After presenting a Literature review on the topics of World Class Manufacturing, Managerial accounting and Cost Deployment, which addressed this study, the work sets methodological framework of research, underlining the gaps in the current Literature, which provides few evidences of the actual results and benefits of a cost deployment system.

The research was conducted through a case study presenting the implementation of a cost deployment system into a large manufacturing firm in the North-West of Italy, analysed through the steps suggested by FCA.

Data collection was carried out in collaboration with the operations controller of the plant. Several semi-structured interviews provided more evidences to support conclusions.

This company was chosen because the implementation of the cost deployment tool was on an early stage, this made possible to follow-up the entire process.

The present research helps understand the effectiveness of this tool, which supports manufacturing firms in reaching higher levels of quality, output and overall efficiency in their production systems.

In addition, the paper gives evidence of the benefits tracked by controlling thanks to the System even at an early stage of development and underlines the major differences with the theoretical framework set in previous studies.

Keywords: Cost Deployment, World Class Manufacturing, Management Accounting, Cost Accounting, Case Study

INTRODUCTION

Historically manufacturing companies have striven in order to achieve a competitive advantage either reducing costs or having different products from competitors.
Ford’s assembly line marked a crucial step toward a more efficient industry model from the British one of the late Nineteenth Century and helped America gaining a Manufacturing hegemony that lasted more than 60 years.

The USA lost their leadership during the Eighties though, due to lack of innovation in their production systems and to a more challenging economic scenario.

As a matter of fact, Japanese Manufacturing model gained popularity during the second half of the twentieth Century: many studies pointed out how Japanese producers had been able to reduce costs, increase efficiency of their equipment and have less quality defects at the same time.

As the secret of Japanese success was unveiled, western manufacturers began to adopt those production techniques that, by the end of the Eighties, were gathered together under the phrase “World Class Manufacturing”, meaning the achievement of a state-of-art level both in logistic and productive cycles.

Nowadays lots of different companies adopted and customized World Class production models introducing different tools, reporting standards and best practices: FCA introduced its own Production System in the early 2000s, comprehensive of a specific “Cost Deployment” practice.

This tool was developed alongside a Japanese guru on the matter and aims to link the plant efficiency and quality performances to transformation costs, identifying wastes and losses.

Moreover, Cost Deployment developed by FCA provides tools to set priorities in choosing the improvement projects into the plant, based on a benefit-loss analysis and on the economic return calculation.

Finance and controlling area become the engine of the improvement helping the management into its decision process.

The Company chosen for the case study is part of a large American conglomerate and produces brake pads in its Italian plant.

In 2014 the new Management decided to adopt the World Class Manufacturing Programme developed by FCA. In the following period the first activities related to the Improvement programme began and in late 2015 a first cost deployment edition was prepared as well.

The paper focuses on this company as the Cost Deployment method was at very early stage of development and it was possible to observe a proper implementation through all its steps.

Focusing on such an early stage helped the research understanding what the main implications of the tool are and how the organization responded to the new system.

At the same time this allowed to provide a judgement on the results brought by Cost Deployment pillar.
The research presents some limits: first of all, it represents a single case study and the generalisation of results should be further tested by comparing this case with other companies.

Furthermore, this first sep might be useful to build a more complete theoretical framework on the topic. The remainder of the study is organised as follows: in paragraph 1 a brief literature review is presented, in section 2 methodology and research design are described, paragraph 3 instead presents findings, while comments and discussion follow that section and finally the conclusions are presented.

1. LITERATURE REVIEW

“World Class Manufacturing” phrase was coined by several authors referring to the set of practices in operations management that could lead any manufacturer to an excellence level (Hayes and Wheelwright, 1984; Schonberger, 1982, 1986). Many of these practices were adopted from Japanese manufacturers who originally developed them.

Starting from those studies, others discussed the possibility to achieve simultaneously different competitive advantages through the adoption of World Class Manufacturing Flynn (1996; 1999). On the other hand, Womack et al. (1990) depicted birth and rise of the Toyota Production System (TPS) and studied the reasons behind its success. Yamashina (1995; 1996) focused on a peculiar aspect of Japanese manufacturing strategies, total productive maintenance.

As FCA decided to develop its own World Class Manufacturing programme, many researchers studied it during the last decade: for example (De Felice et al. 2013) focused on a concrete case study in one of FCA’s plants; Chiarini and Vagnoni (2014) tried to make comparisons between the Fiat Auto Production System and TPS highlighting similarities and major differences. They underlined the innovation of fully developed set of managerial practices that allow to involve the entire organization.

Cipriani et al. (2014) investigated the impact of the introduction of a World Class Manufacturing programme in terms of cultural changes inside the company. At the same time, they carried out a survey involving the plant workforce.

Several researchers dealt with the topics of cost accounting and management accounting investigating the birth and the evolution of these matters (Scott, 1931; Littleton, 1933; Garner, 1954).

Armstrong and Hopper (1991) offer an interesting analysis concerning the role of labour cost in the development of management accounting systems.

Moving forward, Johnson (1981) underlined new emerging tools in cost and managerial accounting such as Activity Based Costing and Balanced Scorecard.

Chan (1993) provided evidences of Activity based Costing describing the implementation of an ABC system into a context other to manufacturing as a hospital.
Despite these new methods developed by companies and researchers, Johnson and Kaplan (1987) highlighted how managerial accounting lost its relevance and Cooper and Kaplan (1988) argued that cost accounting could potentially provide misleading results. Kaplan (1984:1; 1984:2) argued that Managerial accounting systems should have gone towards a better understanding and representation of Manufacturing performance. In this sense, Jazayeri and Hopper (1999) provided a case study about the relationship of the Management Accounting system and a World Class Manufacturing programme.

Yamashina (2000) highlighted a rather similar concept and first introduced a new method named “Manufacturing Cost deployment” in order to achieve a better measurement of operations performance (Yamashina and Kubo, 1999; 2002). Their method embraces the typically Japanese concept of continuous improvement; it does not only help managers to identify costs associated to losses and wastes but it also provides rational criteria to choose new investments in the plant. In this sense, also Vikram et al. (2015) underline the benefits that a lean strategy can bring to an organization.

Cost deployment became a breakthrough and several companies adopted it: FCA decided to customize its own system into a general World Class manufacturing framework (IlSole24Ore, 2010). Silva et al., (2013) studied FCA’s cost deployment system; Garbe and Olausson (2014) provided a similar case study based on a plant of Volvo group.

Kirkham et al. (2014) investigated how companies assess and choose the improvement projects in relation to their size.

Recently, Posteucă and Zapciu (2015) discussed a method implemented to reduce the potential losses of new products already during the development phase. Their method shares many similarities with cost deployment techniques.

Moreover, Carmignani (2017) showed an application Cost Deployment as part of a “Scrap Value Stream Mapping” process.

This research fits into this framework and, in particular, it focuses on providing tangible results of an early developed cost deployment system, which is also described in its implementation.

2. METHODOLOGY

Research design

The case study describes the implementation of cost deployment inside a large manufacturing plant in the North-West of Italy. The plant is a part of the Italian branch of an American conglomerate since the eighties. The core business of the plant is the production of brake pads. Around 700 workers are involved in operations and the productions of brake pads.
The choice was made because one of the authors had the opportunity to spend several months in the plant alongside the controller: this represented the starting point of our analyses, this topic will be carried over comparing the findings of this paper to results of different companies, firms and plants. In addition, the choice is motivated by the fact that cost deployment was on an early stage of development.

The case study was built analyzing different areas of the company and their involvement in implementing cost deployment pillar.

This was necessary as many areas take part in the cost deployment system although the controlling area had a preeminent role due the knowledge of financial items.

Given these premises, data were collected interviewing managers and directors from operations, maintenance, quality, technologies and logistic areas. In addition, a collaboration was established with the controlling manager of the plant who was in charge of the cost deployment pillar. This helped understanding and following up the entire process. By the end of the research period it was possible to observe the output of the system implemented.

Data collection and procedure

The case study was conducted over a period of nine months from June 2016 to February 2017. During this time, semi-structured interviews of an open-ended nature represented the main method of the research.

Many departments of the plant were involved in the research as they were collaborating with the industrial controller in order to implement a cost deployment edition.

At the same time the continuous collaboration with the plant controller made possible to carry over an in-depth analysis on the procedures and tools adopted by the method.

Main goals of the present case study are to understand how the cost deployment method is implemented and what are the main results over the period, assuming that differences from the model developed in the early 2000s may emerge.

Moreover, the study aims to formulate research questions by problematizing some dominant assumptions in existing research (Davis, 1971). In particular, the main research questions are the following:

- **Research question 1**: how is a cost deployment implemented in an actual plant and what are the main differences compared to the theoretical framework set by Yamashina (2002)?
- **Research question 2**: what are the main short-term results and the main critical aspects?

This approach would support a more reflective-scholarly attitude (Abbott, 2004) and consider a different epistemological approach.
In this case the epistemological approach is that of induction because it finally helps reach a verdict and elaborate a theory that derives from a number of testable consequences that have been verified. The focus was set on this topic because few authors until now studied the results that a proper cost deployment system can bring even in short term. Silva et al. (2013), for example provided an example of the implementation process but they did not examine the actual benefits in terms of cost reduction.

3. FINDINGS

The interviews carried out through the entire organization and the continuous collaboration with the industrial controller helped understanding how the entire cost deployment process was implemented in the plant.

First, it is necessary to underline that cost deployment is part of a larger programme called “Fiat Auto Production System” which requires the adoption of a set of methodologies to reach a “World Class” level in manufacturing.

Twenty pillars compose the entire programme, divided into ten defined as technical and ten defined “managerial”.

The ten technical pillars are:

- Safety – which aims to enhance the safety and hygiene level in the plant in order to reduce work related injuries;
- Cost Deployment – a proper tool to understand the economic value of wastes and losses in the production process and to reduce them;
- Focused Improvement – which attacks wastes and losses starting from the analyses carried out by cost deployment pillar;
- Autonomous Activities (split into Workplace organization and Autonomous Maintenance) – which aim to reduce productive cycles through a more ergonomic workplace and reduce breakdowns thanks to activities carried out by operators;
- Professional Maintenance – its first goal is to prevent breakdowns and take them to level zero;
- Quality Control – which aims to reduce quality defects;
- Logistics and Customer service – a set of practices to reduce the working capital and optimize the logistic flow;
- Early equipment and Product Management – which aims to integrate the design of products, equipment and assembly lines inside the plant;
- People Development – its main goals are to allocate human resources and manage know-how inside the company;
- Environment.
The ten managerial pillars are: Management Commitment; Clarity of Objectives; Route Map to WCM; Allocation of Highly qualified people to Model Area; Commitment of the organization; Competence of Organization towards improvement; Time and Budget; Level of detail; Level of Expansion and Motivation of operators.

These managerial pillars have a key role in involving the entire organizations, from the top management to shop floor and clarifying the objectives that everyone in the plant has to achieve.

On the other hand, each technical pillar has peculiar tools and practices to accomplish its tasks. Moreover, seven phases of implementation – defined as steps – compose every pillar.

As figure 1 shows, the steps are divided into reactive, preventive and proactive: as more experience is acquired by the organization, more detailed actions can be undertaken to prevent wastes and losses.

![Diagram showing the seven steps of the Technical Pillars](image)

**Figure 1. The seven steps of the Technical Pillars. Source: De Felice et al. (2013)**

Cost Deployment – as formalised by FCA – makes no exception and follows the same path of implementation of the other pillars through those seven steps. A matrix is prepared as output of (almost) each step.

The FCA method presents many similarities with the method first implemented by Yamashina and Kubo (2002), and some new peculiar features.
Hereafter this section deals with implementation of the method undertaken to understand which part of the costs in the plant are associated to wastes and losses.

A key success factor for an accurate cost deployment is an exhaustive data collection that forms the data base for all the analyses. We had the opportunity to understand how data collection is carried out in the plant:

- Efficiency losses on machinery and equipment are collected in real time thanks to the information system linked to machineries and equipment;
- Scraps are registered automatically from the machines (presses, grinding machines...) but the causal attribution (i.e. the reason of the scrap) is done by operators at the end of each shift;
- Breakdowns are registered at the end of every shift, in addition to that Emergency Work Orders (so-called EWOs) are filled in describing all the breakdowns;
- Not added value activities are estimated by the technical department;
- Energy losses are measured on the model areas;
- Absenteeism and labour defections are register by Human resources department.

The first step of cost deployment requires the definition of the transformation cost, i.e. the costs associated to modifications of the product in the assembly line.

Consequently, the transformation cost includes direct labour, part of the indirect labour (e.g. maintenance engineers), some variable overheads (e.g. utilities), some fixed overheads.

On the other hand, other costs are excluded: for example, the cost of direct material, the administrative and general expenses.

Thanks to this first step, the cost deployment pillar is able to understand which part of the total costs in the plant contributed to the productive process and create added value: about 25% of the total costs in the plant was included into the WCM perimeter. The remainder (excluded) were mostly due to direct material and Administrative expenses.

As the transformation cost is defined the pillar can move on: the second step required the construction of the “A-matrix” and a first analysis on the losses inside the plant.

More in detail, the A-matrix represents the allocation and the severity of those losses in the plant.

In fact, the A-matrix is fulfilled twice: first of all it is given an assessment about the severity of the losses (so-called “A-matrix” quality), then it is calculated the occurrence of the same losses in the assembly line thanks to data collection (so-called “A-matrix” quantity).

After this step, the organization becomes aware of the places where most of the losses occurred and which were the worst: in particular breakdowns, quality defects and scraps revealed to occur more often.
So, it was possible to prepare the third step and the B-matrix which allows to study the relation between causal and resultant losses, i.e. how a loss can influence the rest of the production process and cause more losses in terms of production delays, scraps and so on.

At this stage, losses analyses are complete and it is possible to start the attribution of a cost element to each of these losses.

Therefore, the fourth step began and the C-matrix was prepared. Starting from the results of the previous steps it had been possible to link resultant losses to the respective causal losses.

After that, thanks to the elaboration of cost drivers and more in-depth analyses, it was possible to transform each loss into a cost.

The output of this step is a matrix that allows to understand how much of the transformation cost is lost or wasted. The amount individuated was about 45%.

Most of the losses inside the plant were due to breakdowns (27% of the total), not-value added activities (23%), quality defects (16%).

Thanks to a detailed data collection the C-Matrix reveals the allocation of the losses regarded as costs:

- On every single line;
- On every machine;
- divided by type.

This step represents the foundation of the following analyses and gives a first glance at the prioritization of measures and projects applicable to reduce losses and gain efficiency.

The fifth step requires to develop the so-called “D-Matrix”. This tool utilizes the loss stratification as a starting point to define the projects and to set priority level.

Causal losses from C-Matrix are analyzed and related to the possible tools to eliminate them, to the KPIs that are going to improve thanks to the projects and to the easiness of each project.

These are then summarized by an ICE (Impact-Cost-Easiness) analysis. Every project received a score based on:

- the impact it potentially had in terms of loss reduction (cost savings);
- the cost – or the investment – of the project itself (e.g. an improvement project may need new tooling);
- the easiness of the implementation of the project itself.

This ICE analysis stands in line with what observed by Kirkham et al. (2014) about large manufacturing firms and the methods to set priorities of interventions.

When D-Matrix was completed, it identified enough projects to reduce by 9,4% the entire transformation cost through loss reductions.
As mentioned the plant had by that moment a proper priority level to undertake losses reduction actions in an economically sound logic.

Moving on to step six, E-Matrix is prepared. This matrix is filled in with the projects actually implemented in the plant during the period.

Project cards are prepared to keep track of the several projects started during the year. Every project is linked to its project card, which contained information about:

- the type of project and its progress (thanks to the PDCA cycle);
- the type of loss attacked and the related KPIs;
- the authorizations of the plant director and the plant controller.

The project card mechanism allows controlling area to keep all the projects under control and to prepare a first forecast of the yearly savings.

More than one hundred projects were carried on during the period and the (yearly) saving forecast was set at 8% of the transformation cost.

The remainder step concluded the cost deployment process. The last two matrices (F-matrix and G-matrix) compose step number seven.

F-matrix collected all the savings coming from the projects started and concluded: again, project cards flow revealed useful to estimate those savings.

The controller could check monthly the status of every project undertaken (Plan-Do-Check-Act) and certify the savings calculated from the KPIs associated.

In fact, once the savings were certified by controlling area, they were entered in the F-matrix.

By the end of the year, F-matrix covered 7.8% of the transformation cost.

The second matrix of step seven represents the budget for the forthcoming year. It collected different types of saving, specifically coming from:

- carryover of project that are meant to last over the year;
- expansions and extensions of on-going projects in different areas and replicable in others;
- new projects that aim to reduce losses not yet attacked.

The savings expected for the coming period were about 8.3% of the transformation cost.

The cost deployment process does not stop after the loop is completed, but starts again to investigate more in-depth costs trying to individuate on hidden wastes and losses.

This activity requires more detailed data collection, analyses and collaboration from every part of the organization.

Usually the cost deployment pillar re-starts from the fourth step, editing C-matrix and so on. Some of the matrices, e.g. E-matrix and F-matrix, are updated monthly.
4. CRITICAL COMMENTS AND DISCUSSION

As showed by Silva et al. (2013), the implementation took place through the seven steps: each step gave as output a quantitative analysis of the data collected and elaborated.

The process showed some peculiarities compared to the conceptual framework designed by Yamashina and Kubo (2002): the implementation of step 6 and step 7 allows to track actual savings and make forecasts for the periods to come.

In this sense, the method observed in the case study, showed some improvements compared to the one described by Garbe and Olausson (2014) too, as G-Matrix was implemented.

Cost deployment revealed to be a useful tool in the plant.

The main advantages of this method are:

- a more effective and conscious control of the cost items related to the productive process;
- an involvement of the controlling area which is forced to pay more attention to all the departments (and pillars) involved in World Class manufacturing programme;
- the economically driven choices of the projects through the cost-benefit analysis;
- a continuous control over the improvement projects carried out in the plant and a better calculation of the savings.

As showed in Findings, the benefits from projects implemented thanks to priorities given by cost deployment in an economic sound logic were consistent.

In addition to those cost benefits, Cost Deployment can make all operators more aware of the impact they have on the productive process. Giving cost values to losses registered magnifies every reduction in terms of breakdowns, scraps and so on, helping them to understand that they are giving a tangible contribution.

A key success factor is, therefore, the involvement of the organizations: the case study supports findings by Cipriani et al. (2014). WCM pillars are often underestimated by many figures in the organization at an initial stage of development.

This revealed to be one the most critical aspect of the implementation, as many workers did not understand the importance of the methodology.

5. CONCLUSIONS

The research involved an in-depth study of cost deployment implementation in a large manufacturing plant: the paper presented the characteristics of the World Class Manufacturing programme that includes it, described the process through its steps and observed the results.
Findings underline differences between the method adopted by the company observed – in line with the implementation described by Silva et al. (2013) –: the theoretical framework set by Yamashina (2002) had been updated and enriched with new tools to choose rationally the improvement projects and keep them under control.

The methodology can be adopted by manufacturing firms willing to improve their understanding of cost dynamics inside the plant and to identify more clearly waste and losses.

In recent years indeed cost deployment practices improved, allowing remarkable results in terms of cost benefits, as the paper proves.

This last element helps underline the limitations for the present study. First of all, it focuses only on one specific plant: further analyses will be conducted in the future, by comparing this case with other firms.

In addition, empirical results might help elaborate a new conceptual and theoretical framework that might have important practical implications for managers and entrepreneurs.

Researchers and academics may also find interesting elements to develop and further the study on the topic.

SUPPLY CHAIN CONNECTIONS AND THE TRIPLE BOTTOM LINE IN THE GLOBAL WINE INDUSTRY

Golicic, Susan L.¹; Signori, Paola²; Flint, Daniel J.³

¹Dept. of Management, Colorado State University, Fort Collins, CO, USA
²Dept. of Business Administration, University of Verona, Italy
³Dept. of Marketing & Supply Chain Management, Haslam College of Business, the University of Tennessee, Knoxville, TN, USA

ABSTRACT

Objectives. This research examines relationships between supply chain connectedness and components of the triple bottom line (environmental, social and financial sustainability).

Methodology. The study is based on Stakeholder Resource Based View. The authors use a mix of qualitative methods. The context is the wine industry, and data are collected from 100 companies of six countries across the globe.

Findings. Results suggest that higher levels of supply chain connectedness is related to higher degrees of focus on sustainability dimensions (TBL).

Research limits. This study relied on practices discussed by respondents to categorize companies on high or low sustainability and high, medium or low supply chain connections; it is likely there are more than these levels and further exploration into this (quantitative) could tease out what those are.

Implications. Only a few wine businesses are truly sustainable from the TBL perspective; thus strong supply chain connections may be necessary for most to achieve the TBL. The supply chain and connections among the parties may provide a means to drive this further into the industry.

Keywords: sustainability, triple bottom line, supply chain, stakeholder resource based view, global wine industry, grounded theory.

INTRODUCTION

Sustainability and practices to improve it are becoming increasingly important to global business. Sustainability is often defined at the macro level as meeting the needs of the present without compromising the ability of future generations to meet their own needs (UN Documents, 1987). It has developed into a critical topic for both supply chain scholars and industry due to the impact that supply chain practices can have on implementing the “triple bottom line” (TBL) perspective and...
improving the environmental, social and financial longevity of organizations. Indeed, recent research has demonstrated that it contributes to organizational performance in many ways (e.g., Godfrey et al., 2009; Golicic and Smith, 2013; Husgafvel et al., 2015).

Given the opportunities available and the role supply chain management (SCM) plays in global business, an important unanswered research question (RQ) is: what is the role of the direct supply chain (i.e., the connected companies) in the implementation of the TBL? We chose the global wine industry as the context in which to answer this question, as the industry is an ideal example of the ever changing business world, and to understand if there are differences of approaches in different countries.

It is becoming increasingly competitive creating the need for stronger marketing and supply chain management practices (Flint et al., 2016). Wine producers now understand they cannot be successful on their own. Additionally, sustainability is imperative in this industry. Using the stakeholder resource based view (SRBV) as a theoretical foundation and a grounded theory approach, this study begins to explore the role of the supply chain in pursuit of the TBL in the global wine industry.

BACKGROUND

The Stakeholder Resource Based View (SRBV)

The SRBV is based on the resource-based view, which suggest that the accumulation of valuable, rare, inimitable and non-substitutable resources is the basis of enterprise competitiveness (Barney, 1986; Newbert, 2007; Wernerfelt, 1984). It realizes the firm as a bundle of combined resources and capabilities that develop competencies. One of the areas of resources and capabilities most difficult to replicate is that associated with human and relationship capital (Hunt, 2000). The SRBV underlines the importance of managing stakeholders as valuable resources that in turn give the organization a strategic edge over rivals (Sodhi, 2015). It argues that all stakeholders, such as suppliers, employees, and customers, need to be managed in order to capitalize on their respective routines, resources, and capabilities as a means to achieve better performance (Gold et al., 2009). This suggests that the parties in a supply chain may be positioned to drive major impact in highly competitive industries (Hult et al., 2008).

Sustainability and Supply Chain Management in the Wine Industry

All three dimensions of the TBL impact and are impacted by the wine industry - businesses in this industry are trying to profitably create and sell an agricultural product that is regulated. Thus, sustainability has been prevalent in food industry research over the past decade (Beske et al., 2014); however, much of that has focused specifically on environmental sustainability (e.g., Flint and Golicic, 2009; Forbes et al., 2009; Silverman et al., 2005; Flint and Signori, 2014) or what the concept means (e.g., Carter and Rogers, 2009; Lahneman, 2015; Szolnoki, 2013). There have been a few studies exploring
sustainability comprehensively as the TBL within the wine industry (e.g., Pullman et al., 2010; Santini et al., 2013); however, these have neglected the role of the supply chain to date.

There is a growing body of work as it relates to sustainability and SCM (e.g., Ahi and Searcy, 2013; Ashby et al., 2012; Blome et al., 2014; Carter and Easton, 2011; Golicic and Smith, 2013; Sarkis, 2012; Seuring and Muller, 2008; Srivastava, 2007); however most of this focuses on a single dimension. There have been attempts to bring initiatives aimed at all aspects of sustainability into alignment (e.g., Carter and Rogers, 2008; Pagell and Shevchenko, 2014; Winter and Kneumeyer, 2013), but again, these are largely conceptual. Recently, there has been some empirical work in the wine industry examining managerial philosophies with respect to sustainability and managing the supply chain (Signori et al., 2015; Golicic et al., 2017), but even these works pick apart the three dimensions of sustainability. Thus the current research attempts to fill the gap in the current research by empirically examining the role of the supply chain in the implementation of comprehensive view of sustainability – the TBL.

**METHODOLOGY**

For this research, we adopted aspects of ethnography, grounded theory and phenomenology in data collection and interpretation and followed accepted procedures. The ethnographic aspects included observation, interviews and artifact collection within clusters of wine regions around the globe seeking norms of behavior, assumptions, roles played by actors, and meaning making (Arnould and Wallendorf, 1994). The grounded theory aspects involved the same data collection aspects along with coding processes that helped to explain social processes in which participants were engaged as they tried to solve problems in their everyday lives (Glaser, 1992; Mello and Flint, 2009; Randall and Mello, 2012). The phenomenological aspects focused on the interviews specifically where we sought what it meant to be a wine maker, winery marketer and so forth (Thompson et al., 1989; Thompson, 1997).

This study sample examined 100 wine businesses of various age and size in fourteen regions of six countries, through interviews with owners or managers, marketing collateral, and photographs, and observations operations over a period of seven years. In particular, this research sample includes: 22 companies in Australia (Margaret River, Perth, South Australia, Swan Valley); 8 in France (Bordeaux); 11 in Germany (Pfalz, Rheingau); 22 in Italy (Tuscany, Veneto); 6 in New Zealand (Canterbury, Marlborough); 31 in USA California-Oregon-Washington (Carneros, Modesto, Napa, Sonoma; Willamette Valley; Columbia Valley, Walla Walla).

The convenience and theoretically driven sample was selected based on practices they described on their website (e.g., sustainability, innovation), through personal contacts, and emergent conceptualizations as data interpretation unfolded in order to ensure variability in the sample and refine interpretations. During open interviews practitioners discussed their sustainability practices and
their direct supply chains; respondents indirectly evaluated their companies on high or low sustainability and high, medium or low supply chain connections. As a consequence, one hundred direct supply chains have been studied through the lens of the business in focus. All documents were scanned for interpretation, and all interviews were audio-recorded and transcribed verbatim. Both phenomenology and grounded theory rely on open coding at the word, phrase and sentence meaning-unit level to build themes and categories from interview text. Several hundred open codes were collapsed into concepts that became themes (in phenomenology)/categories (in grounded theory) that were subsequently related to one another through axial coding. To address our specific research question, we also content analyzed the findings to quantitatively categorize each business on the three dimensions of sustainability and their level of supply chain connections (Harris, 2001).

Three researchers well-trained in qualitative research shared interviewing responsibilities, and all interpreted the data, coming together regularly to reconcile interpretations. Quality criteria followed accepted processes in the grounded theory tradition (Lincoln and Guba, 1985). We next present findings from our initial exploration into our research question.

RESULTS AND DISCUSSION

The TBL in the Global Wine Industry

Based on the data at the time in which they were collected, we categorized all of the businesses as either low or high on financial sustainability, environmental sustainability and social sustainability. These categorizations were determined based on information provided by those interviewed and their perceptions of these terms. For instance, if an interviewee spoke about a particular dimension and any company efforts aimed at pursuing it, then they were categorized as high. For example, this Oregon wine producer was categorized as high on social sustainability for explaining their philosophy. “We feel like we have a responsibility for each of the people who are on the vineyard, and there’s a great organization out here that provides healthcare to Oregon’s vineyard workers and their families—and since we’ve opened the tasting room we’ve always given all of our tasting fees to that organization.” If they did not mention sustainability or discussed it negatively, they were categorized as low. As an example, the following quote from a small Australian producer demonstrates how one was categorized as low on financial sustainability. “And all of our work was associated with developing a premium wine. There was no desire to make money as a final objective; the objective was to create a lifestyle in the process of making premium wine.”

Only seven percent (7%) of the companies interviewed were truly concerned about the comprehensive triple bottom line, with high evaluations on all three aspects. An Australian wine producer that had a sustainability manager was not surprisingly categorized as high on all three dimensions. Fifty-one percent were considered to practice two of the three dimensions (46% environmental and financial, 2%...
environmental and social, 3% financial and social), and thirty-seven percent practiced one (30% financial, 6% environmental, 1% social). That left five percent that were evaluated at minimum levels of sustainability. In addition, we tested linear correlations between all variables, the three dimensions of sustainability. We found that none of the three sustainability dimension correlations has a significant correlation at the .05 level or better. So the three sustainability dimensions are independent.

![Graph showing Triple Bottom Line Country means](image)

**Figure 1. Triple Bottom Line Country means**

Reading these results comparing countries’ means (Fig. 1), financial sustainability has the highest scores in every country (mean $\mu_{\text{fin}} = 2.72$ and standard deviation $\sigma_{\text{fin}} = 0.69747$). Social sustainability ($\mu_{\text{soc}} = 1.26; \sigma_{\text{soc}} = 0.67600$) is lower in Italy, New Zealand, USA and Australia, with overall low scores. Environmental sustainability scores ($\mu_{\text{env}} = 2.22; \sigma_{\text{env}} = 0.98041$) are lower in Germany and France.

The position comparison yielded interesting results from the suppliers (e.g., growers, contract winemakers) with respect to sustainability; they were all low on social and high on financial sustainability. Regional differences were detected for Italy (lower than the rest on social sustainability), Germany (lower than the rest on environmental sustainability, but with differences within two German wine regions, Pfalz and Rheingau), New Zealand (low on environmental dimensions, with a great difference in its two wine regions, Canterbury and Marlborough). In the American sample results show many differences between States and wine regions, in particular concerning the environmental dimension. About financial sustainability, it is interesting to highlight that in France and New Zealand all participants were evaluated highly positive.

*Supply Chain Connections and TBL in the Wine Industry*
Participants were asked about suppliers, customers and competitors in the industry. Based on their reference (or lack of) to other companies in their supply chain, we characterized each business as having either low, medium or high supply chain connections (direct, extended and horizontal). For example, many participants did not mention any other companies and largely talked about their practices with no reference to working with others. However, there were various reasons why some have numerous connections. A participant from Veneto, Italy, mentioned working with several other companies in the region in addition to distributors to enable her to access more markets outside of her region (extended supply chain). Several participants in Western Australia and California discussed connections they had made while studying wine making whether in school or working with established winemakers, and most maintained these horizontal relationships. One small owner in the Willamette Valley described, “You name it, I mean [winery] being nearby sends a lot of people, but every winery here: [list of five wineries] sends many people, but they all do; everyone that I know, and I made it a point to get to know everybody.” Overall, 31% demonstrated high levels of supply chain connections, with 44% medium and 25% low connections.

The content analysis comparing the sustainability and supply chain connection categorizations demonstrated linkages between pursuing higher levels of the TBL and supply chain connections. Testing linear correlations between all variables, i.e. the three dimensions of sustainability as well as supply chain and TBL, we discovered that when a firm is supply chain focused it is likely to be social sustainability focused as well, no causality implied (Pearson correlation $\rho_{sc,soc}=.328$, $p$-value=.001). Moreover, firms that are supply chain focused are likely to also be TBL focused, on all 3 dimensions ($\rho_{sc,tbl}=.240$, $p$-value=.016). Thirty-eight percent of those companies that were high on two or all three sustainability dimensions had high supply chain connections with 79% at least medium (5 of the 7 pursuing the TBL had high connections).

A winemaker in New Zealand described stronger supply chain connections because they were working together to minimize their carbon footprint throughout the chain. In fact, many of the companies in this region and in Oregon pursuing environmental sustainability understood that they needed to work more closely with supply chain partners in order to be successful. A manager at a South Australia producer noted that the company executives participated in a consortium with other producers and that they worked on sustainability, “...these guys, the owners, they’re the people who meet. They’re discussing topics they’re not required to and I’m sure that sustainability is of equal interest to them.” One the other end of the spectrum, 31% that were low on two or all three sustainability dimensions had low supply chain connections with 79% no higher than medium.
Both categorizations were compared across countries (Fig. 2), position in the supply chain, the size of the organization, and the year in which the data were collected. Across time, the categorizations seem to be consistent with the exception of social sustainability. The interest in this particular area is growing, and our data supported this. Interestingly, most of the organizations with high levels of connections were smaller producers whereas many of those with low connections were larger companies. Geographically, in Australia nearly half of the participants had high levels of connections relative to the rest of the sample there.

CONCLUSIONS AND IMPLICATIONS FOR THEORY AND PRACTICE

This research set out to explore the role of the supply chain in implementation of the TBL. The main research question (RQ) was: what is the role of the direct supply chain (i.e., the connected companies) in the implementation of the TBL? Our findings supported a link between higher levels of supply chain connections and pursuit of higher levels of sustainability. Though the comprehensive TBL was not prevalent in the wine industry, 58% of our sample pursued at least two of the three dimensions, and of these 38% had high connections and 79% at least medium level connections in their supply chains. Some of the participants described working with supply chain partners specifically to implement sustainability practices. Thus, strong supply chain connections may be necessary for most to achieve a solid TBL. This may not be a surprise; however, because there are not many companies that have truly
achieved a powerful TBL. This study does provide empirical evidence of a means through which to achieve it, particularly in the wine industry.

Per SRBV, stakeholders are valuable resources that can help a company achieve the performance they desire (Sodhi, 2015). Our research supports this theory as it demonstrates that higher levels of connection among supply chain parties (i.e., stakeholders) may contribute to the implementation of the TBL. This line of theory also argues that resources and capabilities can make a company more competitive (Barney, 1986), and since human and relational capital are resources that are among the most difficult to replicate (Hunt, 2000), these connections may not only provide the resources and capabilities to achieve the TBL for businesses in the wine industry, they may also provide a means of differentiation vis-à-vis competitors when so many are moving toward sustainable practices.

The data for this study were collected over seven years. It would be interesting to update the data to see if regions where data were collected earlier (e.g., New Zealand in 2009) had changed their sustainability philosophies and/or levels of supply chain connections. The study was exploratory and relied on qualitative data. We also content analyzed the findings to quantitatively categorize each business on the three dimensions of sustainability and their level of supply chain connections. We relied on practices discussed by respondents to categorize companies on high or low sustainability and high, medium or low connections; it is likely there are more than these levels and further exploration into this (quantitative) could tease out what those are. Ideas offered from the results should be formulated into hypotheses and tested to better determine the links among the concepts – for example, do the connections drive a focus on a TBL or are they a result of pursuing the TBL? The TBL is growing in importance in this ever-changing business world, and it has been receiving increasing attention in the wine industry. To date, only a few wine businesses are truly sustainable from the TBL perspective. However, the supply chain and connections among the parties may provide a means to drive this further into the industry.

DATA DRIVEN MARKETING FOR GROWTH AND PROFITABILITY

Grandhi, Balakrishna; Patwa, Nitin; Saleem, Kashaf

SP Jain School of Global Management

ABSTRACT

Purpose: In the current business environment, more uncertain than ever before, understanding consumer behaviour is an integral part of an organization’s strategic planning and execution process. It is the key driver for becoming a market leader. Therefore, it is important that all processes in business are customer centric. Capturing, categorizing, warehousing, mining, analysing and making sense of data is a real-time challenge for all marketers. Organizations embracing digitization are seeing Big Data getting bigger. Investments are being made in IT infrastructure, Internet of Things, machine learning and artificial intelligence in business decision-making. Marketers need to harness big data by engaging in Data Driven Marketing (DDM) to help organizations choose the ‘right’ customers, to ‘keep’ and ‘grow’ them and to sustain ‘growth’ and ‘profitability’. This research examines DDM adoption practices and how companies can aim to enhance shareholder value by bringing about ‘customer centricity’ through better use of data.

Design/Methodology/Approach: An online survey conducted in 2016 received 180 responses from junior, middle and senior executives. Of the total responses 26% were from senior management, 39% from middle management and the remaining 35% from junior management. Industries represented in the survey included Retail, BFSI, Healthcare and Government, Automobile, Telecommunication, Transport & Logistics and IT. Other industries represented were Aviation, Marketing Research & Consulting, Hospitality, Advertising & Media and Human resource.

Among the respondents, 34% represented companies with less than $30 million in annual revenues, 15% between $30 - 50 million and $50 - 100 million, 32% between $100 - 500 million, and the remaining 19% with $500 million and above in annual revenues. In terms of company size, 60% were companies with 1 - 500 employees, 13% with 500 - 1000 and 26% with 1000 and above employees. The survey was done in Dubai which represents a blend of several global economies and hence, can be generalised.

Findings: Success of DDM depends upon how well an organization embraces the practice. The first and foremost indicator of an organization’s commitment is the extent of resources invested for data driven marketing. Respondents were divided into four categories;
Laggards, Dabblers, Contenders, and Leaders based on their ‘current level of investments’ and ‘willingness to enhance investments’ soon.

‘Leaders’ are from Retail, Banking & financial services, transportation & logistics and Telecommunication sectors. The major sources of information are point-of-sales data, social media and other published sources. They use data to understand what and why customers are buying, what their consumption patterns are and what makes them satisfied or dissatisfied. ‘Dabblers’ are players who have realized the importance of data and have just begun to incorporate it in their marketing in a limited way. ‘Contenders’ are far more regular in using data for measuring and taking marketing decisions. ‘Laggards’ are at the other extreme when it comes to using data for customer analysis.

Practical implications: The results of the study offer interesting implications for managing the growing sea of data. An iterative and incremental approach is the need of the hour, even if it has to start with baby steps, to invest in and reap the fruits of data driven marketing. The intention to use any system is always dependent on two primary belief factors: perceived usefulness and perceived ease of use, however attitudes and social factors are equally important. Investments in the right people, infrastructure and processes early on can result in better marketing due diligence and contribute to higher return on marketing investment, necessary to sustain an organization’s growth and profitability.

Originality/Value: All organizations, irrespective of size and sector, need to engage in data driven marketing for customer centricity. In this era of digitalization, a marketer needs to wisely handle the volume, velocity, variety and veracity of data. Roger’s diffusion of innovation theory identifies factors leading to the adoption of innovation by both individuals and organizations. The theory argues that willingness and ability to adopt depends on awareness, interest, evaluation, trial and adoption (Rogers, 2003). There is a dearth of knowledge with regards to who is and is not adopting DDM, and how best big data can be harnessed for enhancing effectiveness and efficiency of marketing budget. It is, therefore, imperative to build a knowledge base on DDM practices, challenges and opportunities. Better use of data can help companies enhance shareholder value by bringing about ‘customer centricity’.

INTRODUCTION

Customers’ Growing Power:
The fundamentals of marketing will always be the same, despite the changing forces that shape the future of marketing. Technology connects the world, but customers resist standardisation and prefer individualization. The modern-day consumers are sophisticated, knowledgeable, and powerful. The ever-changing consumer buying behaviour requires identifying the right audience and understanding their buying patterns (Kotler and Keller, 2012). Owing to technological advancements, digitalization and marketing analytics - especially data mining- have become invaluable tools and should be viewed as equal components of the marketing research toolkit (Hauser, 2007).

Consumers no longer pay attention to brand communications that are irrelevant. They now demand individualization i.e. messages directly tapping their latent needs. Various studies aim at constructing models on how customers think, feels and chooses one among the alternatives short-listed. They endeavour to learn and understand the customer’s response to sales promotion techniques, social, political, cultural and psychological factors (Solomon 1995). It is of paramount importance for marketers to use the abundance of available data to engage customers contextually and consistently to enhance customer experience (Gordon, 2013). In present times managers will need a workforce with different skill sets than in the past - a workforce that is equipped enough to handle consumer analytics and other relevant analytical tools (Hofacker, Malthouse, & Sultan, 2016).

Marketers’ Growing Challenge:
User behaviour and marketing strategies are both going on separate tracks, and there is a dire need for alignment (Gresper.com, 2014). With the advent of digital media, the marketing function needs to understand its target audience better by examining their digital interactions. Rich data, if harnessed well, can provide unparalleled insights for sending the right message to the right consumer at the right time. Thus, data analysis by way of Data Driven Marketing (DDM) can result in firms gaining valuable insights on consumer behaviour (Bhandari, Singer & Van der Scheer, 2014).

One of the most comprehensive studies on the changing marketing environment conducted by IBM revealed technology as the driving factor of pervasive change. The study involved face-to-face interviews with more than 1700 CMOs worldwide, spanning 19 industries and 64 countries. The five biggest challenges identified by the CMOs were: data explosion, social media, the growth of channel and device choices, shifting consumer demographics and financial constraints (IBM, 2011). The study also revealed that more than 60% of the CMOs felt they were unprepared to tackle these challenges, indicating a desperate need to change the approach.

For a customer-centric approach, three main methods namely; connect, collaborate, and convert model are used (Marketingtechnews.net, 2014). This new wave of connecting contextually to build a lasting
and profitable relationship with customers is pushing marketers to keep pace with technological advancements. Marketers can engage in data driven decision-making and marketing to improve effectiveness and optimize their return on marketing investment (ROMI). A deeper understanding of classical and data Analytics helps businesses make better and more informed decisions (Agrawal, 2014).

2.0 LITERATURE REVIEW

What is Data Driven Marketing?

It is the process of collecting complex data through online and offline channels, analysing them to understand the psyche and purchasing patterns of a consumer, thus helping the marketing team develop a strategy that is highly personalized for connecting with the target audience. As companies trend towards utilizing data to strategize and anticipate customer needs, there is an unanimous assent and an important role that technology plays to build predictive models. These models can help organisations establish customer centric processes to bring customers on board. Data has the potential to help identify needs and influencing factors at each stage of the consumer decision-making process. Data driven marketing techniques focus on the analysis of internal and external data, and integration of this information to help the development of products and services. This process ensures richer contexts for consumers, assists in the acquisition of new customers and retention of current clients. Eventually, this approach can lead to cost avoidance or cost reduction, and an increase in the company’s productivity and efficiency. The scope and ability of Data Driven Marketing (DDM) are such that it can change the entire paradigm of marketing.

Neuromarketing and predictive analysis are the upcoming trends in understanding the buying patterns of consumers (Salesbrain.com). Similarly, DDM strategies have extensive application in B2B sectors as well. Essentially, this can help in achieving the overall goals of any organization (Gresper.com, 2014). In the last decade, the use of neurophysiologic data to measure marketing ROI and brand equity has led to a paradigm shift in data driven marketing. Neuroscience data is being increasingly referred to as the new “scanner” data (Venkatraman et al., 2012). There has been an increasing trend in traditional market research firms entering this space, such as Nielsen Research investing in NeuroFocus, and in the number of neuromarketing companies offering proprietary neurophysiologic toolkits (Well, 2010).

What is driving DDM and what is inhibiting it?

The winterberry group and Global DMA carried out an ambitious research project collaborating with marketing and advertising associates around the world to understand how data driven marketing is changing the industry. A whopping 92.2 % of panellists said that DDMA (Data Driven Marketing and
Advertising) had become a significantly important part of their marketing strategy (Braverman S., 2015). The major point highlighted by global panellists was the concept of customer centricity. Panelists across the spectrum mentioned that to advance DDMA, the flow of investment into the area needs to increase. On the other hand regulations on DDMA, for example on collecting consumer data, do not seem to have much of an impact on its growth. Only 24.8% of the associates mentioned it as a factor that inhibits the growth of data driven marketing (Kumar, V. et al., 2013).

Analytical tools help understand the next "would be" consumer buying pattern (Rooney & Jennifer, 2014). Insights derived from such analysis are then used to direct, optimize and automate the decision-making process. Data, text and web mining techniques are some of the key contributors to making advanced analytics possible and eventually achieving business goals (Bose, 2009). Social media has helped in giving marketing a new dimension. It has not only reduced costs, but is also far more effective than traditional marketing. There is a great volume of data coming through social media. However, this advantage comes with a few challenges.

One of the challenges is information chaos. Different forms of data from different sources need to be archived and analysed. With huge amounts of data, managers might not be able to differentiate between the potential customers and general audience (Schulze, C. et al., 2015). Another struggle is the issue of identifying the right metrics and keeping track of them. The improvement of technology has paved the way for inexpensive data storage. However, this poses a threat to data security. Companies are in the era where protecting consumer data is vital. Failure to do so results in loss of consumer confidence. Data driven marketing is accompanied by challenges which involve optimization, accurate use of data and ROI (Neil Davey, 2015). The challenges involving accurate use of data and working across various platforms need to be resolved in the future for the better use of DDM (Daniil Karp, 2015). There is a need to close the gap between mere collection of data and organizing that data for putting it to use.

According to a Forbes survey of 331 executives, including presidents and vice presidents of various fields, the greatest challenge is the training offered to employees in DDM skills (Forbes.com, 2015). There is a lack of professionals, skilled enough to synthesize and use such large amounts of data. To target customers in today’s fast paced world, it is necessary for marketers to use digital media tools like online advertising through social media, extracting personal information of a customer through mobile, etc. (Rohm, A. et al., 2013).

Effective DDM is possible only by building a creative team of marketers with sufficient knowledge of digital advertising and new concepts such as real-time marketing. There is a need to hire the next generation of professionals with a blend of right brained and left brained skills. With the advancement
of technology, the future role of CMOs in organizations should also evolve (Fitzgerald, M., 2015). Chief Marketing Officers in the organization should be working along with IT and other departments to make effective use of Big Data. In fact, the age of digital disruption has given rise to a new concept of Chief Marketing Technologist (Scott & Laura, 2014). In many large corporations CMOs are being replaced by CMTs in response to the growing convergence of IT and marketing.

On the other hand, the benefits of DDM increase customer engagement thereby increasing sales revenue of the products. With the help of data, driven marketing companies can be customer focused (Deevi, S., 2015). In a survey conducted with 1506 executives in marketing and communication sectors, most of the respondents agreed that DDM helps in increasing customer acquisition and customer retention (Renilde De Wit, i-scoop.eu). This in turn increases the efficiency and the return on investment. DDM helps in creating a more personalized experience based on different parameters namely income, age, gender, location, purchases, etc. (Eleventygroup.com, 2012).

3.0 RESEARCH METHODOLOGY

Sample Size
A survey was conducted in 2016 and received a total of 180 responses from junior, middle and senior executives. Industries in the survey included retail, BFSI, Healthcare and Government, Automobile, Telecommunications, Transport & Logistics, IT, Aviation, Marketing Research, Consulting, Hospitality, Advertising & Media and Human Resource. 34% of the respondents represented companies with less than 30 million in annual revenues, 15% from companies with 30 – 50 million and 50 – 100 million in annual revenues, 32% of the respondents from companies with 100 - 500 million in annual revenues, and the remaining 19% represented companies with 500 million and above.

With regards to size of the organizations, 60% of the respondents belonged to companies with 1– 500 employees, 13% belonged to companies with 500 – 1000 employees and 26% belonged to companies with 1000 and above employees. Of the total respondents 26% were from senior management, 39% from middle management and the remaining 35% from junior management.

Research Design
The survey was conducted with an online questionnaire. It was divided into three sections to capture the needed information. The first section focused on capturing demographic and organizational characteristics to profile the participants and the organisations they represent. Questions in the second section were adopted from the marketing metrics book “The Definitive Guide to Measuring Marketing Performance” (Farris et al., 2010). These questions focused on understanding use of data for marketing decisions, using a 10 point Likert scale. The final section comprised of questions to
measure the current and proposed level of expenditure on data collection and data analytics practices in the organizations. This information was then analyzed using Descriptive Analytics.

4.0 FINDINGS AND ANALYSIS

4.1 Survey Findings

For this study, four distinct categories were identified i.e. leaders, contenders, laggards and dabblers (Forbes Insights, 2015). Respondents were assigned to one of these categories based on their ‘current’ investment in DDM and their ‘proposed’ investment in DDM in the foreseeable future. Organizations currently employing data analytics for most or all of their marketing and hoping to continue in the future, i.e. their current and proposed investment is high, are defined as “Leaders” for this research. Organizations with low current investment but with aspirations of high investment are categorized as “Contenders”. Organizations which have invested in DDM but are skeptical about continuing the same for the future are termed as “Dabblers”. Organizations that are yet to initiate DDM are categorized as “Laggards”.

The Data Driven Marketing Continuum

As digitization evolves and the sea of data gets larger, different organisations in different industries will get affected differently depending on whether they have ‘leaders or laggards in senior marketing positions (Friedrich, R, 2011). Data driven marketing’s success depends on the approach the marketer towards data. Every company can become a data-driven marketing success by investing resources in infrastructure, systems and expertise. Organizations that are “leaders” in data-driven marketing
possess far higher levels of customer engagement and market growth than their “laggard” counterparts (Jones, 2017).

Respondents in the ‘Leaders’ group were allocating more than 25% of their current marketing budget to DDM and intend to allocate greater than 25% of annual marketing budget in the future. ‘Contenders’ and ‘Dabblers’ are those with investments in the range of 5% to 25%, but with varying likelihood to increase in next three years. ‘Laggards’ have investments lower than 5% and show a low inclination for increasing it in the future. In the present research, the respondents were identified as follows: Leaders 23%, Contenders 6%, Dabblers 46% and Laggards 25%. The four categories are represented and profiled as follows:

**Figures 1: Shows the % of respondents in different categories**

**Laggards** do not believe in data. They neither collect data nor plan to do so in the future. They are unaware of the importance of data driven marketing and are yet to understand its power and potential, resulting in problems of customer loyalty, customer engagement, and market growth. The companies falling in the Laggard category employ a manual marketing effort with employees acting on their own. Departments are in different silos with little connection or coordination. Projects initiated, if any, are outsourced resulting in questionable quality of data delivered. Everything is conducted on an informal basis without any direction, budget or funding.

**Dabblers** are players who have realized the importance of data and have just begun to incorporate it in their marketing in a limited way. However, they lack the skill or vision to see returns. They plan digital marketing perhaps at the sales level or within customer service departments. They neither integrate nor share data or processing capabilities with other channels. They use social media for data collection but do not examine it critically. They allocate limited funding or staff time for this cause. No formal budget is available.

**Contenders** are players who are far more regular in using data for measuring and taking marketing decisions. They invest in building digital marketing expertise across the team. The core aim is to bring customer-facing channels together with common data and applications. Proper training is provided to
the staff to manage these processes under the supervision of a Chief Marketing Technologist for a Digital Marketing Program. Marketers make use of various forms of engagement—such as mobile, web, social, video, and make their digital marketing more focused and responsive to market needs. A formal budget allocation and proper metrics are used to evaluate marketing activities initiated. Leaders are players who are inclined towards analytics and strive to take data-driven decisions. They are Digital savvy as all their marketing decisions are based on data. Data is shared across channels freely and consistently with real-time feedback making the campaigns highly effective. Marketing function engages in tailor made efforts to cater to customer needs. Formal metrics are used and constantly refreshed and realigned. Comprehensive training is provided to staff not only to engage in digital marketing and stir innovation but also to manage these processes. They build specialized teams focused on optimizing digital marketing efforts to enhance their impact on the business. A Chief Digital Officer is appointed to lead the effort while CEO, CFO or SVP of Marketing is brought on-board for initiating and running a Digital Marketing Program. Leaders allocate adequate budget to this program. They use data to build more complete and contextually relevant customer profiles to effectively target their media. There is reliance on cloud-based technology that includes solutions across marketing goals. Leaders actively embrace personalization in mobile and display ads. Most of the companies leading in this practice have higher levels of customer engagement and market growth than their ‘laggard’ counterparts. As shown in figure 2 below, Data Driven Marketing is widely used and has achieved results for customer analysis, customer satisfaction, product analysis, web analytics and sales force productivity. The other sources of information are the point of sales data, social media and published sources.
Organizations belonging to the ‘Leaders’ category are primarily from retail, banking, transportation/logistics and telecom industries (Fig. 3). These are primarily customer-focused industries using data from different sources to understand and serve customers better.
Leaders are the highest users of data for taking almost all-marketing decisions. Both big and small organizations need to understand their customers well, and data-driven marketing can help grow their customer base and satisfaction.

Figure 3: Representation by sector
(Note: they add up to more than 100% due presence in multiple sectors of some)
4.2 Data Analysis

Laggards

The companies that fall into the laggard’s category employ manual marketing efforts involving employees acting on their own (62%). 26% of respondents do not use Big Data at all. According to the survey conducted, 48% of respondents who fall into the laggard category are from middle management, followed by senior management (38%) and then junior management (17%). 47% of the respondents falling in the laggards category represent organisations have an employee base of less than 50.

Majority of the laggards are from retail, government and automobile sectors. The major sources of data about customers are Social Media (19%), Point-of-sale data (18%) and Published data (17%). Laggards follow a very scattered pattern for data collection. Major challenges in using big data for marketing analytics in laggard’s organization are: support for the cause of marketing analytics, availability of data for marketing analytics, a variety of data necessary for marketing analytics, the speed of availability of data, availability of hardware and software platforms and skill set/expertise for marketing analytics.

Figure 4: Extent of Data Driven Marketing decisions
According to the survey, 44% of respondents who fall into the dabblers category are from middle management, followed by senior management (33%) and then junior management (23%). 34% of the respondents falling in the dabbler category have an employee base between 100 – 500 employees and 27% of the respondents falling in the laggard category have an employee base above 500. The majority of dabblers are from the retail sector. The major source of data about customers comes from Point-of-sale data (20%), Published data (19.6%) and Social Media (19.6%). They follow a very erratic pattern for data collection.

Major challenges in using big data for supporting marketing analytics in the Dabblers category of organizations is the availability of data for marketing analytics, variety of data necessary for marketing analytics, speed of availability of data for marketing analytics, availability of hardware and software platforms, funding for marketing and skill set/expertise for marketing analytics. A company in the Dabbler’s category employs manual marketing efforts with employees acting on their own (59%). Projects are outsourced and the quality of data delivered is questionable.
Contenders

According to the survey, 50% of respondents who fall into the Contenders category are from middle management, followed by senior management (30%) and then junior management (20%). 40% of the respondents in the contender’s category have an employee base between 100 – 500 employees and 20% have an employee base above 500. The majority of Contenders are from Healthcare, Technology, Retail, and Government. The primary source of data about customers comes from Point-of-sale data (25%), Published data (30%) and Social Media (12%).

Contenders regularly use analytics for driving most aspects of the business. They act as change agents, positively disrupt the status-quo and are ready to invest in building digital marketing acumen across the team. In these organizations, efforts are
under way to bring customer-facing channels together with common data and applications. The staff is trained to manage these processes. Automation is promoted, and integration of various forms of engagement—such as mobile, web, social, video, etc. is implemented. Digital marketing campaigns are more focused and responsive to market needs. Metrics to measure and evaluate marketing activities are adopted to continuously optimize marketing programs.

Figure 7: Challenges faced by Contenders for DDM

Leaders

Survey results indicate that 48% of the respondents in the leaders category are from middle management, followed by senior management (35%) and then junior management (17%). 48% of the respondents in the leaders category have an employee base of 500 -1000 or above. 22 % of the respondents within this category are medium to small players. Majority of leaders (59%) are from the retail, banking &
insurance and transportation & logistics sectors. The major sources of data about customers are Point-of-sale data (20%), Published data (19.6%) and then Social Media (19.6%).

![Figure 8: Challenges faced by Leaders for DDM](image)

**STUDY IMPLICATIONS**

Organizations need to work towards aligning their processes, capabilities, infrastructure and talent to realize the full potential of marketing analytics. Though data-driven marketing brings in a new perspective to businesses, a healthy balance between analytics and decision maker’s intuition is the key to success. Leaders and Contenders who use data for being customer-centric marketing need to listen to the voice of the customer to gain insights which data alone cannot capture.

Contrary to the leaders and contenders, many companies are still dragging their feet i.e. Dabblers and Laggards. Such players need to build data-driven expertise and initiate pilot projects i.e. starting small and then rolling it out later. An iterative and incremental approach is the need of the hour, even if it has to start with baby steps, to invest and reap the fruits of data driven marketing.

Organizations need skill, expertise, funding, tools and technology as DDM is still at a nascent stage. Employees need to be trained and motivated to take part in data driven initiatives. It is essential to
bring about a cultural shift in the organization. The biggest challenge is to bring all the scattered data to a single platform so a complete picture of customers and their needs can be understood, to provide a seamless experience for growing customer equity and brand equity.

LIMITATIONS AND CONCLUSIONS

Limitations:
As a result of the storming digital age and the development of analytics, the process of decision-making has gained significant importance. Judgment and intuition too are critical to the process. Choosing an appropriate action cannot be done strictly on a rational basis. But the irony of the digital age is that instead of humans guiding and instructing the machines, the machines now advise humans in taking the decisions. Another challenge of explosion of data and related field of analytics has resulted in a dearth of data analysts. 74% of the companies are unable to recruit data scientists. The main reason for this imbalance is a scarcity of statisticians seeking analyst jobs. The corporate world is struggling to seek employees who can analyze and interpret big data simultaneously.

Security and Trust add a new challenge; the biggest concern is protecting the avalanche of data while also leveraging it for strategic decision making. Unfortunately, the information stored is highly vulnerable to cyber-attacks and breaching. Thus, there is a probability that any information provided to a third party could be leaked, resulting in distrust amongst customers or competitive disadvantage. Companies often do not have the appropriate platform to collect and manage data across the entire organization. This makes it difficult for the enterprise to work with huge volumes and high velocity of data for real-time analysis.

Another issue is the difficulty in seamlessly transferring data behind firewalls in a secure fashion for cloud computing. Accenture and Siemens have developed a Smart Grid Field to focus on services provided for data management and integration. Lastly, data collecting tools are imprecise at many times; this is a major concern for social media companies intending to gather valuable insights from the huge amount of big data.

Conclusion:
A study published by the Darden foundation suggests that the road map for implementing marketing analytics requires companies to look at three things: Organizational structure, organizational change and the analytics process itself (Paul W. & Rajkumar V., 2014). Before any program is implemented, it is imperative that there is clarity on what DDM is expected to achieve. Once the organizational structure is deemed fit to support the program, it is equally essential to look at the culture of the organization. Additionally, efforts must be devoted towards combining data and heuristics.
The research results show that better-performing companies are characterized by a more sophisticated analytical planning process. Lower-performing firms should realize and acknowledge this competitive advantage and identify ways how to integrate business analytics into performance management of organization (Hauser, 2007). Educational institutes of higher learning can play a major role by internalizing analytics into their overall curriculum to meet the demands of world that’s already immersing in digitization (Klatt, Schlaefke, & Moeller, 2011).

SOCIAL MEDIA, GENDER AND BRAND LOYALTY TOWARDS LUXURY FASHION BRANDS: ECONOMIC CRISIS IN SOUTH EAST EUROPE

Gubatova, Zlatina; Kapoulas, Alexandros; Cheng, Ranis

1Management School, South East European Research Centre, an International faculty of the University of Sheffield, Thessaloniki, Greece
2Business Administration and Economics Department, City College: International faculty of the University of Sheffield, Thessaloniki, Greece
3Management School, The University of Sheffield, Sheffield, UK

ABSTRACT

The research explores gender and social media role for building brand loyalty among Generation Y consumers. This is further augmented by studying the economic crisis impact on luxury consumption in Romania, Bulgaria and Greece. The research objectives are: 1) Explore gender differences in luxury fashion consumption among Generation Y consumers; 2) Explore gender differences among Generation Y in building brand loyalty towards luxury fashion brands through Social Media and 3) Unearth luxury consumer behaviour in SEE given the economic crisis. Qualitative interpretative methodology: focus groups, in-depth interviews and on-site questionnaire investigation, is considered appropriate for providing more vivid picture of luxury consumer behaviour in the selected countries.

Findings reveal that while the intrinsic product aspect is important, males emphasized on traditional in-store environment and females highlighted the positive purchase experience and brands’ story. There is a shift from males’ independent nature to feeling of belongingness and respect for luxury’s dream factor. Analysis of economic crisis showed that generation Y consumers value the prestigious traits of luxury fashion brands, emphasizing on value for money. This contradicts the belief that the economic crisis urged them to turn to counterfeits. The present research surpasses prior studies by exploring males and females who belong to Generation Y. Specifically, advancement in academic knowledge stems from studying economic crisis and social media impact on building brand loyalty in South East European countries.

Keywords: Social Media, gender, brand loyalty, luxury fashion, South East Europe, economic crisis, generation Y
INTRODUCTION

Brand loyalty has been extensively studied in marketing literature (Jacoby and Kyener, 1973; Aaker, 1991; Oliver, 1999; Gambetti et al. 2012; Harmeling et al. 2015) and later in SM (Hawkins and Vel, 2013; Arya and Srivastava, 2015). SM reshaped the manner brands communicate with customers (Deloitte, 2016). However, the question is: what happens when luxury, defined by tradition and heritage, meets SM? Even though luxury fashion brands have long resisted the adoption of SM, being afraid of diluting their exclusivity, change in consumer behaviour and impact of the economic crisis forced the notion that SM is indeed the seal necessary for enhancing customer-brand relations (Judson et al. 2012).

Further, despite the increased academic interest in gender differences, research is needed to grasp the impact of gender in consumer behaviour (Levy and Loken, 2015). These findings are yet to be explored with Gen Y online consumer (Nadeem et al. 2015). Henceforth, the main question of the study is: What is the role of SM among Gen Y males and females in building brand loyalty towards luxury fashion brands in SEE economic crisis context?

THE CONCEPT OF LUXURY

Deriving from Latin etymology “Luxus” is considered the root of the term “luxuria”. It refers to “any intense desire or craving for self-gratification” (Corbellini and Saviolo, 2009, p. 20). From this perspective luxury has two opposing meanings: lux or luxus, viewed as splendour or light and luxuria being associated with the negative concept of sin, wicked and excess (Cristini et al. 2017). A core characteristic that marks luxury from other product categories (necessities) is that consumers derive positive emotions from the luxury experience.

Globalization impact is evident in new consumer segments from various geographies (Liu et al. 2016), who are in pursuit of different values from the luxury experience (Sauer and Teichmann, 2013). As a result, luxury brands stumbled upon a realization that establishment of brand loyalty is of paramount importance for their long-term success (Kim and Ko, 2012).

BRAND LOYALTY TOWARDS LUXURY BRANDS

Brand loyalty is defined as “[…] a measure of the attachment that a customer has to a brand” (Aaker, 1996, p. 39) and “[…] it occurs when favourable beliefs and attitudes for the brand are manifested in repeat buying behaviour” (Keller, 1993, p. 8). The key point is that a loyal customer and a satisfied customer are two different terms (Kabiraj and Shanmugan, 2011). Owning luxury brands implies significant financial investments. Luxury brands also offer status elevation to their owners. Hence, consumers ought to demonstrate higher brand loyalty towards these brands, as opposed to regularly purchased ones.
Since perceived quality and customer service are key brand building activities, consumers would likely develop strong brand loyalty towards luxury brands (Jung and Shen, 2011). Brand credibility, perceived value, and prestige are important facets of strong brands (Baek et al. 2010). Hence, because luxury brands encompass more symbolic meanings, consumers assign greater importance to the purchase of luxury and the effect of trust-loyalty link is augmented (Hur et al. 2014). Essentially, confidence in brands’ image, thorough brand knowledge, trust, brand credibility and emotional attachment are strong predictors of brand loyalty. Although the discussion about brand loyalty is not exhaustive, it is also important to understand the paradox when heritage meets social.

THE PARADOX: SOCIAL MEDIA AND LUXURY BRANDS

The distant approach that luxury brands exercise (Okonkwo, 2010) is on the opposite of the digital world nature, characterized by availability, easiness and accessibility (Kapferer and Bastein, 2012). A major crux of the debate, thus, is how an industry defined by heritage and conventional way of storytelling can transmit its DNA to succeed in today’s reality of increasingly digital consumer (Wells, 2017). Then again, SM users are not always actual customers, because this channel does not allow for the same intimacy levels (Ang, 2011). However, through SM platforms consumers can share their product and service experiences, allowing fashion brands to apprehend consumer attitudes and boost customer-brand relationships (Nadeem et al. 2015). Additionally, whilst brand excellence is a pivotal facet of luxury fashion, brands must undertake sustainable strategies to convey their old story in new ways (Cristini et al. 2017) to build brand loyalty.

Social media and brand loyalty towards luxury fashion brands

Initially perceived as a ‘gimmick’, Instagram quickly proved useful platform for showcasing new collections, offering customers a lifestyle (Roderick, 2016). Another trend in SM usage is to gain inspiration for ideas (Deloitte, 2016). It is no wonder luxury fashion brands have acknowledged the potential of Pinterest as a digital stage for showcasing their products (Doran, 2012). Other constructs such as entertainment, interaction, customization and e-WOM also contribute for engaging consumers in honest and friendly dialog (Kim and Ko, 2012). Thereafter, online brand-customer interaction, customer-to-customer communication, brand recognition and constant brand exposure are core pillars of brand loyalty (Choi et al. 2016; Godey et al. 2016).

THE ROLE OF GENDER

A core driver for males’ luxury consumption is perceived brand exclusivity, an exquisite piece of art that helps the consumer to broadcast his status and stand out from the crowd (Roux et al. 2017).
Conversely, women’s nature to boost their body appearance through self-verification of the self-concept triggers them to display luxury brands as a signalling system to other women (Wang and Griskevicious, 2013). Creating a personal style and public image are essential steps in the process of fashioning a social identity for women (Appleford, 2016). Nevertheless, growth in males’ apparel market (Shabat, 2015) and males’ increased demand in terms of customized clothing indicate increased fashion consciousness among male consumers (Lertwannawit and Mandhachitara, 2012). Existing literature also demonstrates gender differences in SM behaviour. Endorsing to their interdependent nature (Melnyk et al. 2009), women seek interpersonal connectivity, self-discovery and maintaining their existing relationships in social networking sites (Haferkamp and Papadakis, 2012). Hence, females hold more favourable attitudes towards one-to-one communication, emotional and social-experiential aspects of the shopping experience. On the other side, male consumers are concerned with the functional product appeals (Levy and Loken, 2015). Hereafter, compared to males’ pragmatic purchases, females use the Internet for social support, and place higher value on e-WOM (Folse et al. 2012). Apart from gender, age is also an important aspect in marketing studies, as both are concerned with understanding the consumer perspective (Lee and Workman, 2015).

**GENERATION Y LUXURY CONSUMERS**

Focus of the study is placed on “Peter Pan Generation” (Bolton et al. 2013, p.16), born in the period 1981-1999, currently experiencing their 20s and 30s (Nadeem et al. 2015). Whilst not representative for the richest of the rich (Truong, 2010), with their growing purchase power and increased expenditure on luxury brands (Kradisching, 2015), this cohort will achieve the largest share of the consumer market (Yeoman and Beattie, 2006). Being greatly brand and fashion conscious, these consumers are regarded as “the future of prestige” (Galloway, 2010, p. 2). The effect of these factors makes the study of Generation Y consumers even more important in the context of the challenging economic environment (Giovannini et al. 2015).

**THE CASE OF SOUTH EAST EUROPE**

Forecasts indicate that between 2017-2019 the sales of luxury goods in Bulgaria will grow with 2.4% (Conlumino, 2015). With respect to Romania, even though in 2017 GDP growth will be lower than 2016, +3.76% (Statista, 2016), the luxury market has good prospects for bringing back its past days of glory. Further, there is also society pressure for certain appearance and Gene Y perception of luxury as a sign of success, high standards, and expression of self-esteem (Zaharia and Zaharia, 2015). As of Greece, the luxury...
goods sector is expected to be the second largest in the group of specialist retailers, with 19.5% market share (Conlumino, 2015). Moreover, whilst the economic crisis forced some consumers to turn to counterfeits, there is still a consumer segment that stays truly loyal to their favourite luxury fashion brands (Priporas et al. 2015).

In addition, what triggers the interest in this research is Generation Y purchase motives, besides their parents’ motives (Shea, 2013), is that they represent a huge percentage of SM users in the region (Statista, 2016), as presented in table 1.

**RESEARCH METHODOLOGY**

A limited number of studies in luxury consumption (Eng and Bogaert, 2010; Jiang and Cova, 2012; Radon, 2012; Choi et al. 2016), SM and its impact on brand loyalty (Heinonen, 2011; Palmer and Huo, 2013; Alon et al. 2014) are performed using the inductive method. As academic literature lacks understanding regarding SEE luxury fashion consumption, it is essential to obtain profound understanding of people's experiences, perceptions, feelings and desires (Calder, 1977). The most outstanding avenue for future research, namely: “To perform luxury research, it also is necessary to analyse consumers’ own perceptions, rather than insights from managers of luxury companies or marketing gurus, especially if those sources tend to propose a single, personal view of luxury” (Kapferer and Laurent, 2014, p. 19) captures the core purpose of the present study: uncover details about a phenomenon about which little yet is known and understand individual customer views.

**Focus groups and triangulation**

The research exploited the advantages of focus groups for exploring wider range of perspectives to gain initial understanding on the research topic (Byers and Wilcox, 1991). The main study will rely on triangulation to reduce the risk of presenting findings with intrinsic biases (Joslin and Müller, 2016). Triangulation will be achieved through individual in-depth interviews, followed by exit (on-site) questionnaire investigation. Individual in-depth interviews will aid more profound understanding of participants’ experiences and views, considered significant for the research (Hunt, 2011).

**Sample**

Selection criteria for both studies are based on non-probability purposive sampling to secure sample cohesion for populations defined by rarity (Lucas, 2014). The researcher cannot opt for generalizable
statements, as selected samples are not representative for the wider population segment (Orrange, 2003). Purposive samples are useful in exploring certain phenomenon by grasping similarities and differences between different groups’ viewpoints (Brotherson and Goldstein, 1992). Pilot study took advantage of segmentation (Krueger, 2000), dividing participants in two focus groups per country: males and females. Each group consisted of 5 participants, making a total of 10 participants per country.

Data collection and analysis

Data collection was initiated by asking the Head of BAED for approval to visit classes of Undergraduate and Postgraduate students in each of the countries. Additional consent was asked from local Program Coordinators in Romania and Bulgaria. After reviewing questionnaires, students were approached via their university e-mail or personally during class breaks, inviting them to participate in focus groups. Analysis followed coding and thematic categorization, and deployed the long-table approach.

FINDINGS

Customer desires

The materialistic characteristic of consumers triggers them to purchase luxury brands to achieve happiness (Sung et al. 2015). Likewise, young Greek females’ desire is routed in the positive emotion from luxury fashion consumption (Diaconu, 2015) and perception of luxury as light (Kapferer, 1997). A prominent example is: “‘It sparkles […] It’s that shine, they are shining. Yeah…that’s it, it’s the shine […] I like more the feelings, it’s joy to…shop” (GS13, female, 19). One Romanian female’s view surpasses current knowledge on luxury consumer behaviour (Okonkwo, 2010): “[…] I buy more the philosophy of the brand than the brand itself […] There are many good brands, luxury brands that make bags. But the point of difference is that you buy their story, the way they communicate, the way they act with you, they trick in the store and so on […]” (RS29, female, 28). This indicates admiration towards brands’ history, tradition and philosophy (Corbellini and Saviolo, 2009; Thakur and Kaur, 2015). Contradictory to Cross and Madson (1997) and Levy and Loken (2015), Greek males endowed characteristic of the “bewitched consumer” (Dion and Arnould, 2011, p. 32). Some examples include: “[…] makes you feel like you are part of something…you are part of their club…you are part of their consumer, the consumer experience […]” (GS8, male, 20) and “…A part of their club, a part of their family […]” (GS7, male, 19).

Gender differences in Social Media brand exposure

Romanian males demonstrated sufficient respect for luxury brands’ “dream” (Seringhaus, 2002, p. 5): “I also think that excessive marketing can even bring down the status of such luxury brands because they are supposed to be something special […] I mean a brand that is certainly luxury should have this oral, like you
want to touch them […]” (RS24, male, 23). Another surprising comment came from Greek males, who emphasized on a core luxury trait: one-to-one communication. It contradicts the belief that females place higher value on this aspect (Levy and Loken, 2015): “Much more prefer the offline approach. I would appreciate it more because online is much more impersonal […] I don’t like that. If I go to the store, and if you help me much more appreciated, much more” (GS8, male, 20).

Romanian female’s statement challenges the belief that consumers can fall under the spell of luxury brands only after personally experiencing the brands’ magic (Okonkwo, 2010). Precisely: “[…]after seeing a movie…made by Lagerfeld, the one with Cara Delevingne and Pharrell for the new collections, the one inspired by Sissy story […] for me that succeeded in transmitting more emotion and more customer experience than going into a shop and buying a perfume or a scarf from Chanel […]” (RS31, female, 24). It goes beyond association of luxury stores’ association with temple (Dion and Arounld, 2011), to recognize SM as a valuable platform for conveying brands’ story (Cristini et al. 2017) to achieve emotional brand attachment (Walz et al. 2012).

Social media impact on brand loyalty

In contrast to existing knowledge (Godey et al. 2016; Choi et al. 2016), Greek females’ statements indicated SM is unlikely to affect their brand loyalty, as they already possess solid brand knowledge (Kradisching, 2015). For instance: “You know the brand” (GS11, female, 20; GS12, female, 20). Whereas Bulgarian females outlined e-WOM: “I think that this type of activity like sharing your brand experience with others would affect their brand loyalty […] when you share your opinion in Social Media you actually change the views of other people […]” (BS16, female, 18), Romanian females elaborated to include videos, WOM, brand evangelists and the value of trust (Aaker, 1991; Hur et al. 2014). One view that captures the group’s discussion refers to: “[…] Actually that’s how brands should use Social Media: as a kind reminder for their loyal customers […] it’s important to address to your loyal customers and maybe I think your loyal customers will be ambassadors for your brand […] But it’s about trust, it’s about testimonial recommendation, personal recommendation” (RS29, female, 28).

SM can be employed for persisting the experiential element of in-store environment (McDonald, 2016). Instead, Greek males insisted on quality, personal service and personal interaction (Kim et al. 2016). Finally, unconventional for their independent nature (Cross and Madson, 1997), Bulgarian males outlined brand and community belongingness and brand consistency: “And also what the brand stands for…what are its values, how it makes people feel being part of […] It’s part of like…if Kanye West wears the Gucci jacket and you buy the same Gucci jacket then you kind of get to be part of his…it’s not
a real group...but you get to be part...closer to his level, like you are buddies now [...]” (BS19, male, 19).

THEORETICAL CONTRIBUTIONS AND CONCLUSIONS

The first objective explored Gen Y gender differences in luxury fashion consumption. Existing literature looks at cross-cultural differences in Western Balkan countries with no specific focus on gender and young consumers (Mehmedovic and Agic, 2015), compares Generation Y consumers and Baby Boomers (Diaconu, 2015) or is conducted among Romanian female consumers (Raluca et al. 2012; Ciornea, 2014). Prior research reveals young consumers’ interest in the product aspect (Kim and Brandon, 2010) and lower attention to purchase experience (Shukla et al. 2016). Findings contradict what seems to be current knowledge. While participants emphasized on the intrinsic aspects, male consumers acknowledged terms as family and club, increased fashion consciousness and joy. Females outlined shine, joy and brands’ story.

The second objective explored Gen Y gender differences in building brand loyalty towards luxury fashion brands through SM. The research contributes for better comprehension of consumer beliefs (Kim and Lee, 2015) and SM brand relationships (Han et al. 2010) in three aspects. First, studies in SEE neglect SM impact on luxury fashion brands. However, it appears that luxury brands’ participation in SM is a match made in heaven. This is evident in respondent’s admiration for Chanel online videos. Second, while findings comply with existing literature on males’ lower interest in SM and pragmatic online purchases (Folse et al. 2012) it sheds light on one interesting aspect. Findings reveal males’ aspiration for the luxury dream factor as opposed to females’ quest for increased brand availability. The third finding challenges established knowledge on males’ independent nature (Cross and Madson, 1997; Levy and Loken, 2015). That is, men brand loyalty is dependent on sense of family and community belongingness.

Finally, the third objective was to unearth economic crisis impact on SEE luxury consumer behaviour. Two main implications emerge from pilot study findings. First, economic downturn boosted consumer desire to show-off, demonstrate prestige and success (Jones, 2016). However, prestigious traits of luxury brands were acknowledged, but the show-off aspect received a negative “feedback”. Yet, the crisis’ sociological impact among genders remains open to debate. Second, findings reveal that both male and female participants have concern about receiving value for money. This contradicts current knowledge regarding increased counterfeit purchases in Romania and Greece (Chiriac, 2013; Priporas et al. 2015). All these topics will be explored further in greater depth in subsequent investigation stages in this longitudinal study. This will depict significant customer insights about
social media, gender and economic crisis impact on brand loyalty towards luxury fashion brands.

ABSTRACT

Considering the expected increase in the participation in higher education costs by students and their families, this research aims to examine this phenomenon, taking into account the counterparts provided through governmental social aid, given to the neediest students, enabling universality of the access to higher education to the population (Trow, 1973, 2005).

Johnstone (2004) provides a meaningful contribution for the discussion on new forms of financing the Public Higher Education (PHE). He argues the need for fundraising, which should involve the patronage-philanthropy, the investigation and research at the request of the companies, and other solutions as well, such as the sale of products from higher education organizations sources and also the rental of spaces.

The main objective of this paper is to critically discuss the evolution of the financing of Portuguese higher education in public institutions (funding), within the European Union higher education framework, focusing on the most recent trends. More specific objectives include identifying existing sources of funding, together with the analysis of national and international trends in terms of cost sharing in higher education, through the distribution of impacts among different types of direct and indirect players of the higher education sector: government, taxpayers, students and families.

This paper resumes a set of issues that not only are being inadequately tackled, but, worst, are becoming a chronic going on concern, jeopardizing the future and potential of the PHE organizations and periling the accessibility of the population to higher education, therefore curtailing a very significant universal right that modern society considered to be safely granted.

Keywords: Public higher education, higher education costs, funding, financing models, tuition fees, cost sharing.
INTRODUCTION

The choice of the research topic of this paper, related to the funding and financing of Portuguese higher education organizations, within the scope of the European Union framework, comes from the fact that the authors have been professionally connected to the field of education for over 10 years, and up to two decades even. One of the authors, being acting in the financial area of a professional high school, has never agreed to the financing model applied to the sector, favoring the function of mere budget payer to the detriment of rational management. In fact, the main objective of public management is 100% budgetary implementation, thus avoiding future budgetary reductions. Together with the remaining authors, active professors performing in both the university and in the polytechnic systems, not only at the public sector, but also, at times, in the private sector, the blend of expertise was made, allowing a comprehensive examination about the sector.

Another relevant point that justifies this paper is the gap that exists in literature, which is particularly blatant to Portugal and other European countries, as noted by several authors (e.g. Cerdeira, 2008; Cabrito, 2002), therefore adding attractiveness to deepen the discussion on the funding and financing of higher education organizations.

The current trend, since the introduction of tuition fees, has been cost-sharing among all actors involved in higher education financing (Cerdeira, 2008). A new trend in the diversification of higher education funding concerns new alternatives to funding (budget or funding), which will increase the role of academic research and research project, increasing competition among organizations for available funds, and therefore reducing dependence on public budgetary funding.

This is the main reason for the emergence of the Universities-Foundation phenomenon, as pointed out by Moreira (2011). This paradigm, well-known in several Anglo-Saxon countries, such as the United Kingdom with its charities, allows the higher education institutions to grow faster and in a more balanced manner, broadening its funding base, while introducing a new organizational model in the universities universe.

Concurrently, considering the expected increase in the participation in higher education costs by students and their families, this research aims to examine such costs, taking into account the counterparts provided through governmental social aid, given to the most needy students, enabling universality of the access to higher education to the population that really wants to benefit from it (Trow, 1973, 2005). In the paradigmatic case of Portugal, despite the frequency of higher education remains below the European Union (EU) average, and even below the Organization for Economic Cooperation and Development (OECD) average, Cerdeira (2008), found it has gone from a mere rate of 6% in 1985/86, to a significant rate of 27.3% in 2003/2004. According to Trow’s (1973, 2005)
classification, the elite higher education frequency stage, with only less than 15%, was more recently overcome by the mass higher education stage, with 15% to 50% frequency. Nevertheless, Trow (1973, 2005) stresses that these levels are still far behind from the aimed universal access, which considers frequency levels over 50%, and are still to be met by most developed countries. One of the issues, referred by authors such as Cerdeira (2008), is that the main difficulty in increasing the participation rate in higher education is due to the high abandonment rate up to upper secondary level, which naturally prevents the progression of higher education.

The main objective of this paper is to critically discuss the evolution of the financing of Portuguese higher education in public institutions (funding), within the European Union higher education framework, focusing on the most recent trends. More specific objectives include to identify existing sources of funding, together with the analysis of national and international trends in terms of cost sharing in higher education, through the distribution of impacts among four different types of direct and indirect players of the higher education sector: government, taxpayers, students and families.

HIGHER EDUCATION: MASSIFICATION AND FINANCIAL ISSUES

The pertinence of the issues related to the financing of the higher education system comes from the combination of several key national and international factors, such as:
- The significant increase in the frequency of higher education in recent decades;
- Significant increase in public funding to the Public Higher Education (PHE) as a result of the sharp increase in demand;
- Financial budgetary issues, such as the case of Portuguese State budget crisis and consequent IMF interventions in Portugal (1977, 1983 and 2011);
- Introduction of quotas, ‘numerus clausus’, on accessing the higher education in order to slow down the abrupt growth of candidates;
- Limitation of hiring of teaching and non-teaching personnel in the through plafonds and ceilings;
- Adoption of the cost-sharing model in the financing of higher education. In the Portuguese case, introduction of tuition fees in 1992, forcing the students and mostly often their families to participate in the financial sharing of their own academic education (cost sharing);
- Introduction of the Bologna Process (1999) across European Union countries. In the Portuguese case its implementation started in 2006. In addition to the objectives set out in the official implementation document, such as the harmonization of academic degrees, or the creation of a system of credits (ECTS), it is also aimed to foster cooperation between institutions and researchers. Last but not least, a
new division of the higher education model is casted, combined into two distinct phases: the first of the degree (typically 3 years) and a second degree of post-graduation (2nd and 3rd cycle);

- Diffusion of the UK model of enhancing private financing of the public higher education sector (Charities). In the Portuguese case, the main landmark was the creation of the Foundation Status for Portuguese Universities (2007), with the subsequent conversion of 3 institutions to the the foundation status, the ISCTE (Institute of Labor and Enterprise Sciences), University of Porto and University of Aveiro. Other institutions would later follow, such as University of Minho.

![Figure 1. State expenditure on education in Portugal: budget implementation in million euros (DGO/MFAP, Pordata, 2011)](image)

As shown in Figure 1, costs with education in Portugal became significantly higher since democracy was a reality with the III Republic. The entrance in the EU also certainly helped to increase this expenditure figures.

In Figure 2 below, one can observe the results of the massification of higher education frequency in Portugal, especially in the last 30 years (Alves et al., 2010). Coupled with the reduction in public participation, it has originated a greater requirement of financial management of both University and Polytechnic Institutions (Cerdeira, 2008). This situation is somehow magnified by imposing a vague policy on access to the PHE as Figure 2 shows, consequence of the emergence and consolidation of Private Higher Education.
The growing demand of PHE, prompted the introduction by the Government, of new models of financing, more restrictive, to prevent, in some ways, the abrupt growth of signings of teaching and non-teaching staff. In 1992, were returned to the tuition fees, existing in a way since 1941 (Figure 3), but without updating, through which students and their families support a part of the costs of universities. With the reintroduction of tuition fees in Portugal, public institutions, home to what Johnstone (1986) means of cost sharing (cost-sharing) between the State, taxpayers, students and their families.

In 1993, arose a new funding formula, checking-in the year of 1996 a brief interruption of tuition fees (Cerdeira, 2008).

Figure 2. Students enrolled in higher education: total and by educational subsystem (DGECC/MEC – DIMAS/RIDES, Pordata, 2017)

Figure 3. Milestones in PHE (Authors’ compilation)
Recently, with the adoption of the Bologna process for Universities and National Institutes there has been a reduction of the financing, by the time reduction of the courses. Some authors consider an overlap of interests of Economy on education (Amaral et al., 2004). The first Cycles are shortened to 3 years allow the State to reduce public funding of PHE, while transferring a greater financial responsibility to students and families to the frequency of the second and third cycles.

The current trend of cost sharing (cost-sharing) originated from the need to diversify the financing of PHE, which allows to maintain or increase their activities, reducing the dependence on the State. This is the main reason, pointed by Moreira (2011), to the rise of the universities-Foundation, which allows the institution to grow, your amplification-based funding, while at the same time introduces a new Organizational Model in Universities.

In this work it is a critical analysis of international studies available on the subject, based on the documents of Johnstone (1986). Afterwards, will be analysed the supply of bills of PHE, followed by your comparison with existing State budgets for the periods under review.

### EVOLUTION OF THE FUNDING OF HIGHER EDUCATION IN PORTUGAL

In recent years there has been a decrease of public participation in the institutions of Public PHE (table 1), even when there is a slight increase in your frequency (Figure 2).

</table>

Analyzing in detail the Table 1, a stagnation of funding of PHE in Portugal can be observed. Effectively we found that including the total value of the funding in 2012 is, at current prices, less than the amount transferred to the institutions in 2000.

![Graph showing the evolution of funding of PHE through the State budget](image)

Figure 4. Evolution of higher education Funding, through the State budget (current prices). (Authors’ compilation). Unit: Euros

This evolution can be seen in the figure 4, allowing us to assess development similar to the funding level, both with regard to what is available to universities, whether the one that is provided to Colleges and other institutions of PHE.

If we add to this analysis an index to correct the effect of inflation (table 1), we see a sharp decline in public funding of PHE in 2012 in comparison for 2000 by more than 27%.

![Graph showing the evolution of funding of PHE through the State budget](image)
Figure 5. Evolution of higher education Funding, through the State budget (constant prices-2012 Base). (Authors’ compilation). Unit: Euros

![Cost of students](image)

Regarding the figure 5, it is clear the significant reduction of the funding institutions. This led institutions to carry out expenditure higher than the initial budget (Cerdeira, 2008), in the years 1999, 2001, 2002, 2006 and 2007.

Figure 6, however, allows us to observe the management costs per student, depending on the number of students enrolled (MEC, 2015). The study was presented at the request of the Portuguese Ministry of Education, in order to develop a new funding model of the PHE and introduces the public cost in terms of the average number of students enrolled. We stress the clear economies of scale of larger institutions, with more than 5,000 students and also the blue line that allows us to show the average cost that will serve as a basis for the new funding model of the PHE in Portugal.

**ACCESSIBILITY TO HIGHER EDUCATION**

With the update of the value of the tuition fees in 1992 (Figure 2), a value that remained unchanged since 1941 (1,200 $00), Cabrito (2002) and Cerdeira (2008) warn of the problem of accessibility and equity of students in PHE. Equity in access to higher education intends to put all students wishing to attend the same level regardless of financial standing of their own or their families (Cerdeira, 2012).
As regards the accessibility to the PHE, we can consider two aspects, the generic capacity to attend the PHE and the financial capacity to pay the costs of your frequency (Cerdeira, 2012), by students.

* 1 € = 1,32515 dollar, according to OANDA Conversor, 31/12/2010

The notion of accessibility to the PHE can be complemented by the careful examination of table 2, where we note that Portugal offers a cost per student very high. But if we compare this cost with the median income Portuguese in 2010, we see a very big effort for students can study in these institutions, having only to Australia, USA, Japan and Mexico a higher relative weight. When we see that in 2010, a student who study in PHE supports costs represent nearly 80% of the median income in the country at the same time, we realize that access to accessibility can be concerned.

Table 3: Annual expenditure per student by purchasing power parity (PPS), in primary education (ISCED 1), 2nd and 3rd cycles and Secondary Education (ISCED 2-4), and higher education (ISCED 5-6), based on constant prices, for years 2000, 2007, 2008 e 2009.
The table 3 presents the annual expenditure per pupil in public and private education institutions on measures as the central, regional and local Authorities, families and other private bodies (non-profit organizations and companies) spent per pupil/student. Annual expenses include personnel costs, current expenditure and capital expenditure. The indicator was calculated by dividing the total amount of the annual budget by the number of full-time equivalent students at the level of education concerned.

The annual expenditure numbers were converted into purchasing power standard (PPS) to eliminate the differences in price between countries and deflated by GDP price index (base year 2000). The PPS...
is expressed in Euros. The GDP price index for main components, was used to calculate the expenditure at constant prices.

When we see that in 2010, a student who study in PHE supports costs represent nearly 80% of the median income in the country at the same time, we realize that access to accessibility can be concerned by the difficulties that this same student can feel, even with the support of the family, to bear the financial burden of is education.

**SOURCES OF FINANCING PUBLIC HIGHER EDUCATION**

The funding of PHE in Portugal presents many challenges, some of them already explained, such as the decrease in public funding of public institutions, the problem of accessibility to the PHE for financial reasons, the slowdown in the number of students who access the PHE, and let's see now another problem which relates to the current financial crisis across Europe and with higher incidence in Portugal.

Analyzing the report drawn up by the European Commission (2013), it is possible to check and compare the evolution of spending on education in the European Union. We can see a parallel between the countries most affected by the crisis (southern Europe), noting a reduction of investment in PHE, generally speaking.

Figure 7. Evolution of the weight of the State budget and from own resources in public higher education institutions.
Source: Cerdeira (2008, 2012)
The reduction of public funding will not be unrelated to the current crisis in our country, but also the ideological liberal nature option, how would you rate Cerdeira (2012). Naturally this funding
reduction, that from 2005 to 2012 reached 20.5%, forces universities to look for other sources of funding to allow bridging the public disinvestment. How can we check for Figure 7, the weight of the State budget revenues of public state, has declined a lot, going from 95% in 1989 to 62% in 2008.

Against this background, the ways of financing the organizations had to be rethought in a very short space of time, therefore encouraging, or forcing, the institutions to strengthen their own revenues with new forms of financing, often requiring creativity in doing so. In relation to tuition fees, the institutions have a legal limit of your maximum value (the maximum value for the 1st cycle is currently € 1,065.72) and have yet to meet the accessibility referred to previously, you can define the number of students who access the PHE.

CONCLUSIONS

This paper discussed the evolution of public funding allocated to Universities and Polytechnics, as well as the challenges to bridge the necessary reduction of PHE from governmental financial support, which is critical for the survival and maintenance of PHE within reach of the whole population, ensuring the desirable accessibility. The study presented here is part of a broader study, an ongoing work, which aims to perform an in depth analysis, in addition to the situation depicted in this paper, of the costs incurred by students of this level of education and compare them with the situations in other countries.

With the research made, we could corroborate the need for identifying new ways of financing the PHE in the scope of the reduction of public participation in the financing of the institutions, by the means of patronage-philanthropy, investigation at the request of companies, or the sale of products and the rental of spaces (Johnstone, 2004).

This paper also corroborated the trends identifies by Trow (1973, 2007), namely in what is concerned with the universal higher education and subsequent massification tendency. The massification of higher education frequency in Portugal, especially in the last 30 years (Alves et al., 2010), and in particular the institutions of Public Higher Education, led to a greater financial need for the government to finance many more students. This financial pressure has been reduced with the introduction of various measures that Johnstone (1986) baptized of cost-sharing or by calling students and families to increasingly share the financial burden, by helping to funding institutions, with measures such as the increase of tuition fees, or through the introduction of limits on the recruitment of human resources in the institutions of (PHE), or with the introduction of the Bologna process in 2006, which reduced the time students would take to obtain their degrees, by reducing the degrees curricula, and therefore reducing the resources needed. This significant decrease of public funding of
public institutions forced (PHE) to seek other forms of financing and funding. If financing by the Portuguese State budget in 1989 had a coverage of 95% of PHE budgetary needs, such ratio would be significantly reduced to only 62% in 2008 (Cerdeira 2008, 2012). Furthermore, more recently, analyzing the evolution of funding from 2000 to 2012, a reduction of public funding by more than 27% is observed (constant prices, 2012 base).

In relation to the financing available to PHE, the tuition fees continue to contribute importantly. Nevertheless its value remains conditional upon the political-governmental rule, which determines its maximum value, as it bears in mind the principle of accessibility. If accessibility is not ensured, that means a setback, going back to a public elite PHE status, which, on the other hand can generate a further reduction of tuition revenue, by the resulting lower number of students attending the higher education, and by an increase of students’ abandonment due to financial reasons (Cerdeira, 2008).

We have identified also a unmoving growing concern with the implications of the strong reduction in the number of students, as well as increasing levels of abandonment, with consequent losses for the ability to collect due payments (MEC, 2015), which subsequently causes a significant reduction in revenue from tuition and other fees, which leads to a rise of underutilisation of resources and underutilization of material resources (sub-capacity of rooms and equipment).

In resume, the issues referred throughout in this paper are not only being inadequately tackled, but, worst, are becoming a chronic going on concern, jeopardizing the future and potential of the PHE organizations and periling the accessibility of the population to higher education, therefore curtailing a very significant universal right that modern society considered to be safely granted.

ACKNOWLEDGEMENT

This work was financially supported by the research unit on Governance, Competitiveness and Public Policy (project POCI-01-0145-FEDER-006939), funded by FEDER funds through COMPETE2020 - Programa Operacional Competitividade e Internacionalização (POCI) – and by national funds through FCT - Fundação para a Ciência e a Tecnologia.

EMERGING-MARKET FIRMS’ CROSS-BORDER ACQUISITION COMPLETION: INSTITUTIONAL IMAGE AND STRATEGIES

He, Xinming; Zhang, Jianhong

1Durham University Business School, Ushaw College, UK
2Nyenrode Business University, The Netherlands

ABSTRACT

This study investigates the negative effect of the home country’s institutional image on emerging-market multinationals’ acquisitions, and how they can increase their acquisition completion by overcoming this effect. We propose that their foreign acquisition is more likely to complete if (1) the acquirer has an international footprint - it has inward internationalization experience or it acquires through overseas subsidiaries, and (2) it enters institutionally close markets. Using longitudinal data of 13,259 acquisitions between 1996 and 2012 by firms from ten major emerging economies. We empirically test our hypotheses. The findings have important implications for scholars, policymakers and managers.

Keywords: emerging-market multinational, institutional image, foreign acquisition completion, country of origin, international footprint, FDI location.

INTRODUCTION

Emerging markets (EMs) have not only become major foreign direct investment (FDI) recipients, but also important contributors of 39% of the global FDI outflow (UNCTAD 2014b), forming a critical element for global economic recovery from the recent downturn, and growth (Sauvant et al. 2010). Multinationals from these markets conducted 56% of world cross-border mergers and acquisitions (M&As) (UNCTAD 2014b), as exemplified by several high-profile overseas takeovers as developed-economy multinational enterprises (MNEs) divested during the recent economic crisis, such as the purchase by Petronas (Malaysia) of Progress Energy Resources Corp (Canada) for US$5.4 billion, the acquisition by Sinopac Group (China) of Petrogal Brasil Ltda (Brazil) for US$4.8 billion and the purchase of Energias de Portugal SA (Portugal) by China Three Gorges Corp (China) for US$3.5 billion (UNCTAD 2013).

A major leapfrog trajectory (Luo and Tung 2007), acquisitions are EM multinationals’ (EMMs) favorite FDI mode (Buckley et al. 2014). However, their overseas acquisitions achieve less success than the global average (Peng 2012), despite tending to bid higher (Hope et al. 2010). Explaining drivers of
M&As by emerging markets and their outcomes forms a critical task in understanding today’s international investment landscape (Li et al. 2016). Past M&A research has mainly focused on factors that lead to post-acquisition performance, thereby giving very limited attention to how acquisitions are completed (Dikova et al. 2010; Li et al. 2016). In this paper, we focus on EMMs’ international acquisition completion, following a growing literature (e.g. Dikova et al. 2010; Li et al. 2016).

Acquisition completion is very important as the first step of M&A. As Dikova et al. (2010) note, although in some particular cases it might be more beneficial to terminate an acquisition deal than proceed with a purchase that could cause dramatic future losses, most firms usually strive for an ultimate deal completion. According to Li et al. (2016), there are at least three reasons for acquirers to complete an acquisition deal fast. First, the acquiring firm bears upfront costs in identifying targets, choosing advisors on legal, finance and accounting issues, and releasing important information about its strategies for the acquisition. Second, it also incurs opportunity costs by forgoing other acquisition chances. Third, abandoning the deal forms a breach of contract and can result in a heavy penalty and damage to the firm’s reputation and creditability.

Most of prior studies draw on factors from finance, corporate governance and management literatures to investigate acquisition phenomena in the context of developed countries. For example, these studies document a number of factors that have an impact on acquisition completion such as target company size (Hoffmeister and Dyl 1981), target management resistance to acquisition (Holl and Kyriazis 1996), managerial ownership (O’Sullivan and Wong 1998), deal structure (Branch et al. 2008), termination fees (Calcagno and Falconieri 2014; Officer 2003), information asymmetry between acquirers and targets (Dikova et al. 2010; Muehlfeld et al. 2012), and state ownership of acquirers (Li et al. 2016).

Although research has begun to investigate the very important influence of institutional environments that FDI is subject to (Peng et al. 2008), more insights from the institutional theory (Dikova et al. 2010; Zhang et al. 2011) and for EMMs, the driving forces in global FDI, are pivotal in tackling the puzzle. EMMs tend to suffer from certain disadvantages in international business. For instance, they lack famous brand names, superior technology and managerial experience (He et al. 2013; Wang et al. 2014); they also tend to be victims of a negative national and institutional image (Bartlett and Ghoshal 2000; Child and Tsai 2005; Cuervo-Cazurra and Ramamurti 2015; Luo and Tung 2007; Moeller et al. 2013). Home country image can influence positively or negatively the perceptions of stakeholders in a host country (Kostova and Zaheer 1999; Moeller et al. 2013; Zaheer and Zaheer 2005), which we suggest influence the ease/difficulty of how foreign investors gain legitimacy in the host countries, and thus impact the acquisition completion. For example, as the European Union Chamber of Commerce pointed out, European companies would opt to be taken over by another European/US company rather than a Chinese one (China Daily, 2014). Given their increasingly important role in...
global FDI, whether EMMs receive the negative effect of institutional image on international takeovers and how they can tackle this effect to increase their overseas acquisitions remains unanswered. Thus, this research seeks to explore the effect of EMMs’ institutional image and their strategies to address it for FDI completion, and to provide implications for policymakers in home and host countries, researchers and managers.

Drawing on the strategic response theme of institutional theory (Barney et al. 2001; Peng 2003), and the springboard perspective (Luo and Tung 2007), we fix these gaps by exploring two strategies that are adopted by EMMs to enhance acquisition completion, which represents the most basic goal in international acquisitions (Muehlfeld et al. 2012): their international footprint and FDI location. First, EMMs can expand their home base to increase international reputation and experience, generate collaborative networks, and improve institutional image. This strategy consists of two methods. EMMs can develop international experience and reputation through inward internationalization learning with foreign players (Child and Rodrigues 2005); they can also set up subsidiaries in foreign countries to carry out international purchasing. Second, they can choose institutionally similar countries as their acquisition targets (68% of the acquisitions in EMs were from other EMs (UNCTAD 2014a)).

This research contributes to the literature in three ways. First, it enriches the institutional image literature (e.g. Kostova and Zaheer 1999; Moeller et al. 2013; Zaheer and Zaheer 2005) by examining its effect on foreign acquisition completion. Past acquisition completion research has ignored this important institutional aspect (Dikova et al. 2010). Expanding into other countries, MNEs confront the liabilities of being foreign. Their institutional image forms extra cognitive and normative challenges from local investors, regulators, consumers and other stakeholders for foreign organizations to gain legitimacy (Chattalas et al. 2008; Kostova and Zaheer 1999; Li et al. 2016; Scott 1995). The simplified perception of EMMs, especially in more developed countries, can be negative, given EMMs’ shortage of critical resources (He et al. 2013; Wang et al. 2014), and home country’s institutional voids (Luo and Tung 2007). This institutional image creates additional difficulty for EMMs in fulfilling overseas takeovers. As a fresh attempt, we address this knowledge gap by empirically testing the influence of institutional image on EMMs’ acquisition performance.

Second, it adds to the EMM FDI literature by theorizing and testing how EMMs tackle the liability of institutional image to increase foreign acquisition completion. Noting the serious institutional image effect, prior research does not address this effect on FDI from emerging markets, especially the overseas purchases of businesses, or the solutions by EMMs to overcome the liability of institutional image. Thus, this research represents a valuable effort to shed light on this line of enquiry, adding to the institution and EMM FDI literature. It also adds to the acquisition performance literature, which is
largely limited to post-acquisition or post-merger outcomes but not completion (Buckley et al. 2014; Dikova et al. 2010; Zhang and He 2014). Therefore, it would provide meaningful performance implications and normative value to researchers and managers.

Third, it extends the recent development of the “home base” perspective (Zhou and Guillén 2015). The “home base” perspective suggests that the home base, a combination of countries where a firm accumulates operational experience, provides better prediction of firm internationalizing behaviors than does the home country. However, this concept suffers from shortcomings. For example, it overlooks the knowledge/experience that a firm can develop via inward internalization (e.g., exporting and outsourcing, OEM, and joint venture), and that foreign partners transfer to and share with it (Child and Rodrigues 2005). Our research extends the home base perspective by considering and incorporating these factors into the construct, offering a more complete analysis of the role of the home base in the firms’ international expansion.

**THEORY AND HYPOTHESES**

Emerging economies have become important contributors to global FDI (UNCTAD 2014b). Multinationals from emerging markets favor foreign acquisition over greenfield as an entry mode (Luo and Tung 2007; Peng 2012; UNCTAD 2014a-b), because this provides rapid ownership of sought strategic assets or entry to new markets (Buckley et al. 2014; Wang et al. 2014). However their overall acquisition completion rate is below the global average (Peng 2012). There are multiple reasons for the relatively low likelihood of completion. Generally, international acquisitions are risky, as the completion may be influenced by target volume (Hoffmeister and Dyl 1981), target management resistance (Holl and Kyriazis 1996), managerial ownership (O’Sullivan and Wong 1998), deal structure (Branch et al. 2008), termination fees (Calcagno and Falconieri 2014; Officer 2003), and information asymmetry between acquirers and targets (Dikova et al. 2010; Muehlfeld et al. 2012).

International acquisitions are particularly associated with challenges due to “liability of foreignness” (Eden and Miller 2004). This challenge refers to differences in institutional forces including national culture, customer preferences, and business practices; they are exacerbated impediments to MNE legitimacy (Kostova and Zaheer 1999), and successful acquisition and realization of strategic objectives (Aybar and Ficici 2009). The acquirer’s lack of experience with implementing acquisitions, organizational inertia in absorbing the target, and prior absence in the target country may inhibit the benefits of acquisition and also the confidence of the stakeholders in the target country. Additionally, misidentification of asset complementarities, complications in target assessment, and informational...
asymmetries may also have adverse effects on purchase success (Dikova et al. 2010). These challenges cause serious problems with acquisition completion and post-acquisition integration.

There are reasons specific to EMMs as well. From an internal perspective, EMMs are known to have poor governance and accountability (Luo and Tung 2007), and lack famous brand names and superior technology (He et al. 2013; Wang et al. 2014). Their disadvantages partly originate from EMMs and their home countries’ late entry into international competition (Wang et al. 2012). EMMs lack critical international experience and managerial competence needed to organize global activities, and professional expertise in functional areas such as international accounting, finance, marketing, and law. A home country’s underdeveloped strategic factor markets also constrain both an EM firm’s access to managerial expertise, and its ability to develop sophisticated technologies; and build global brands, or organize complex manufacturing operations (Tolentino 2010; Wang et al. 2012). As a result, many EMMs find that international expansions via acquisitions do not readily translate to value (Aybar and Ficici 2009).

Below we present our hypotheses (summarized in Figure 1).

**Figure 1. Summary of Hypotheses**

Institutional Images and Acquisition Completion

From an external perspective, EMMs tend to be victims of a negative institutional image (Buckley et al. 2007; Luo and Tung 2007; Moeller et al. 2013), or discrimination effect (Cuervo-Cazurra and Ramamurti 2015). Institutional image is a stereotype-driven attribute that links the product/organization to positive and/or negative emotional associations with particular nations (Chattalas et al. 2008).
Institutional image is a part of country image. Its effect, in the form of country-of-origin (COO) effect, has been addressed in marketing literature (e.g., Balabanis and Diamantopoulos 2004). In marketing, country image refers to the picture, the reputation, the stereotype businessmen and consumers attach to products of a specific country under the influence of representative products, national characteristics, economic and political background, history and traditions (Nagashima 1970). The concern is whether the “foreignness” of products/brands will make them less preferable to customers in different countries due to consumer ethnocentrism, holders of which tend to show higher levels of domestic bias and are less favorably disposed toward foreign products (Balabanis and Diamantopoulos 2004). Empirical studies indicate robust support for such an effect (Peterson and Jolibert 1995).

The application of COO has been extended from products to people and organizations in international contexts. For example, Zaheer and Zaheer (2005) assert that based on stereotyping, certain nationalities may be trusted to greater or lesser extents in certain countries. Kostova and Zaheer (1999) suggest that organizations can face ‘legitimacy spillovers’ from their COO - from perceptions of the legitimacy of the institutional context that they are embedded, and of other organizations that they are seen to be related to or connected with. In the context of international acquisition, this means that buyers from certain countries may be perceived as more or less legitimate in a specific country, depending on the overall legitimacy of the COO of the international acquirer in the target country (Zaheer and Zaheer 2005). Although students like Noorderhaven & Harzing (2016) suggest this effect is rooted in the influence of culture and institutions of the home country, their focus is on how this effect influences MNEs’ activities, rather than how it is perceived by stakeholders in the international environment.

As institutional frameworks are the key forces that impact firms’ behaviors and outcomes in international business (Peng et al. 2008), in this paper we focus on the impact of institutional image, which is defined as the picture, the reputation and the stereotype stakeholders attach to organizations of a specific country that carry domestic heritage, or “liabilities of origin”, under the influence of national background, especially institutional characteristics (Bartlett and Ghoshal 2000; Kostova and Zaheer 1999). Like COO (Sharma 2011), institutional image has normative associations such that a positive evaluation of organizations from a certain country may be perceived as an endorsement of its policies, practices, and actions, and vice versa.

The institutional image perception by local entities such as investors, regulators, consumers and other stakeholders forms part of the host country’s institutional environment that foreign firms confront (Chattalas et al. 2008; Scott 1995; Sharma 2011). According to North (1991, p. 97), institutions are formal and informal “humanly devised constraints that structure political, economic and social
interactions”. Institutions consist of three pillars: regulative, cognitive and normative (Scott 1995). Multinational firms face divergent local institutional, economic and cultural conditions in host countries. The differences in institutions between home and host countries create international firms’ liability of foreignness (Zaheer 1995). For firms from EMs that expand into international markets, one form of the liability of foreignness is the local stereotyped perception of their characteristics, in the form of an institutional image effect. Firm reputation is one of the informal institutional constraints on MNEs (Dikova et al. 2010). The institutional image is both a cognitive process and a normative process (Chattalas et al. 2008; Scott 1995; Sharma 2011). The perception EMMs receive from host countries, especially the developed ones, can be more or less passive exerting additional pressure on these organizations (Luo and Tung 2007). From the institutional thinking, an institutional image effect can be due to the stereotyping of the host country as a simplified way in cognitive psychology of dealing with a lack of information about the foreign entity through categorizing on the basis of cognitive structures like schemas and stereotypes. According to Kostova and Zaheer (1999, p. 73-74), the host country legitimating environment often has less information to assess a foreign entity, resulting in suspicion toward and scrutiny of the latter. This also leads to the use of stereotypical assessments that may arise from long-established, taken-for-granted assumptions in the host environment regarding this entity from a particular home country.

Expanding into overseas markets, the institutional image of an organization’s home country can influence its acceptance by host country stakeholders, that is, the public, competition, customers, business partners, etc. (Zaheer and Zaheer 2005). Institutional image is a badge representing the investing firm’s background/history to host country stakeholders, signaling favorable or unfavorable information (Moeller et al. 2013). This effect will influence not only EMMs’ after-entry operations (Wang 2013), but also their pre-acquisition process. Investing organizations may not be welcomed by local people and/or businesses, in addition to the difficulty caused by gaps in understanding cultural variations present in the external and internal environments, or liability of foreignness (Moeller et al. 2013). The predisposition of a host country’s constituents toward acquisitions by foreign companies due to their institutional image exerts positive or negative effects on takeover success.

Consumers in developed markets perceive products and brands from less developed countries negatively and equate them with low quality and price (Aulakh et al. 2000). Moreover, investors from emerging markets are especially attributed with passive “domestic institutional heritage … that are permeated by the domestic institutional environment and carried over in host countries” (Wang et al. 2014, p.5). The institutional image of EMMs is often negative partially due to domestic institutional constraints. EMMs’ corporate governance is broadly considered weak because emerging markets generally do not have healthy stock markets yet or developed market economies free from
relationship-based governance, and are often subject to frequent government intervention (Cardoza et al. 2016; Luo and Tung 2007). EMMs may even be considered as their governments’ instruments in the host countries, creating suspicions, concerns and resistance from local stakeholders (Zhang and Ebbers 2010). Therefore, EMMs suffer from weak brand recognition and poor country image. There are widespread concerns among foreign stakeholders and the public about the accountability, transparency, and trustworthiness of EMMs and their home countries; hence, they are reluctant to invest in relationship building with emerging market investors (Wang et al. 2014). As Wang et al. (2014) note, even famous EMMs can be victims of such a stereotyped effect. As a result, having better institutional image perceptions is vital for acceptance in host countries and for international purchase completion.

We use the perceived institutional quality of the investing nations to proxy the Institutional image of the EMMs, which is derived from the World Bank’s Worldwide Governance Indicators (WGI). This set of measures comprehensively reflect survey respondents’ perceptions of the quality of six dimensions of governance: voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption (Kaufmann et al. 2010, p. 4). Based on the above discussion, we have the following:

H1: EMMs’ overseas acquisitions are less likely to complete if their home country has poor institutional images.

EMM Acquisition Strategy and Completion

We are interested in seeing how EMMs can tackle their institutional image disadvantages in international expansion through overseas acquisition, their major market entry method (UNCTAD 2014b). We systematically examine EMMs’ internationalization strategy and market selection strategy, which are under these firms’ control to study their roles in improving acquisition completion. We draw on the strategic response theme of institutional theory (Oliver 1991; Peng 2003) and the springboard perspective (Luo and Tung 2007) to develop hypotheses.

The strategic response theme of institutional theory (He et al. 2013; Oliver 1991; Peng 2003; Xu et al. 2004) suggests that firms will respond to institutional challenges by deploying resources and formulating strategies accordingly. Although institutions form pressure on social players for conformity, convergence and isomorphism (North 1990; Peng 2003), businesses can react actively and differently to address the challenge depending on their resources and capabilities (He et al. 2013). For example, Oliver (1991, p. 146) suggests that firms’ “responses to institutional pressures are not assumed to be invariably passive and conforming across all institutional conditions”. Kostova and Zaheer (1999) posit that MNEs’ legitimacy establishment in foreign markets is subject to both external
institutional complexity and organizational characteristics (e.g. visibility and size of the MNE, legitimacy of other parts of the MNE). Following this logic, we argue that to address the challenges derived from a lack of resources and a negative institutional image, EMMs can improve their legitimacy and then increase likelihood of acquisition completion through pooling resources and developing strategies such as having an international footprint and carefully choosing the FDI location.

The springboard perspective also provides an important approach to understanding emerging market organizations’ rapid internationalization and M&As (Luo and Tung 2007). This line of thinking suggests that EMMs use international expansion as an efficient way to seize strategic assets and market opportunities and to avoid domestic institutional and market voids. It also systematically highlights the reasons for EMMs to “spring” in great detail. This perspective offers the research a comprehensive view of the attributes of these organizations and their domestic environments, and motivations of and reasons for their rapid international expansion.

Below we extend the strategic response theme and the springboard perspective by proposing two strategies that can help EMMs to “spring” successfully. We hypothesize that EMMs can develop several strategies to respond to the challenge derived from the relatively unfavorable institutional image as presented in H1, such as having an international footprint and choosing their FDI location, for a greater likelihood of acquisition completion.

**International footprint and acquisition completion**

Building on the institutional theory (e.g., North 1990; Oliver 1991; Peng et al. 2008) and Luo and Tung’s (2007) springboard perspective, we advance the idea that EMMs can develop a strategy to overcome their institutional image disadvantages for acquisition completion. The springboard perspective maintains that firms from emerging markets intend to use international expansion in a systematic way to compensate for their resource and image deficiencies. We identify two particular strategies that can help EMMs to increase their international experience base, mitigate the liability of origin, and increase foreign purchase completion. The first is having an international footprint in terms of inward internationalization (having cooperative arrangements with foreign firms at home) and external internationalization (having overseas subsidiaries to learn firsthand). Learning from prior acquisition experience is crucial for MNEs to enhance acquisition performance (Dikova et al. 2010; Muehlfeld et al. 2012). However, many EMMs without prior acquisition experience can benefit from other valuable international involvement experience.

An international footprint provides a crucial platform for EMMs to develop an understanding of and react to the institutional environments entailed in overseas acquisitions. We propose that EMMs’ international footprint both directly increases acquisition completion and helps offset the effect of
their home countries’ poor institutional image. Institutional theorists suggest that an MNE’s familiarity with the institutional profiles of the environments will make it easier to make sense of all of its environments and to respond appropriately to their legitimacy requirements (Kostova and Zaheer 1999). Firms obtain legitimacy by becoming “isomorphic” with the institutional environment by means of adjusting organizational forms, structures, policies, and practices to be similar to those institutionalized in their environment. Given the complexity and variety of institutional environments and the differences among these environments, achieving legitimacy through isomorphism becomes a difficult task, especially for EMMs that suffer from resource/capability constraints. They can adapt to local environments based on “the organizational experience in dealing with legitimacy issues and expertise in scanning different institutional environments, identifying important legitimating actors, making sense of their legitimacy requirements, and negotiating with them” (Kostova and Zaheer 1999, p. 72).

Inward internationalization refers to an EMM’s participation in cooperative arrangement, such as exporting and outsourcing, OEM (original equipment manufacturing), ODM (original design manufacturing), OBM (original branding manufacturing), strategic alliances or joint ventures (JVs) with international companies at home (Wang et al. 2014). Although the recent home base perspective suggests that the home country loses relevance when an MNE expands its home base (Zhou and Guillén 2015), we should not ignore the benefits acquired from working with foreign partners at home. EMMs can learn from the inward internationalization process before they invest abroad (Luo and Wang 2012).

This cooperative experience enables EMMs to learn about international standards, practices and management from global players who transfer technological and organizational skills, allowing them to move forward, undertaking outwards internationalization sooner and on a greater scale (Luo and Tung 2007; Luo and Wang 2012; Thomas et al. 2007). Working with foreign organizations and participation in global value chains are particularly helpful in overcoming issues of market information and uncertainty, and in developing knowledge in production, distribution, marketing, and management (Child and Tsai 2005). EM enterprises have gathered considerable technological and process management skills, unique capabilities and learning skills, and financial and operational assets through the cooperative arrangement with foreign parents (Luo and Tung 2007; Luo and Wang 2012). Arrangements such as exporting and importing, OEM, ODM and OBM provide EM firms the opportunities of achieving scale economy, and of obtaining reputation in manufacturing excellence. Equity-based cooperative alliances and JVs bind EM firms even more closely to their foreign partners (Luo and Tung 2007). These can offer a spillover effect to effective transfer resources and diffuse information to local partners, not just in terms of production and distribution, but also in other areas.

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
where internationally competitive standards must be achieved (Gu and Lu 2011). EM companies in which foreign investors have an equity stake generally have better corporate governance quality for FDI decision making (Bhaumik et al. 2010). MNEs are interested in those EM firms that have capabilities including partnering abilities (Shi et al. 2014).

According to the organizational learning literature (Cardoza et al. 2016), the pool of experience and knowledge accumulated from this internationalization process not only influence EMMs’ attitude toward cross-border acquisition (Deng 2009), but also provide them capabilities to identify ideal acquisition targets and cooperation partners, understand institutions in target markets, and implement business activities overseas, all of which are imperative in overseas acquisitions.

In addition, EMMs equipped with prior inward experience tend to have a better reputation for having international experience and an understanding of international practices (Child and Rodrigues 2005; Wang et al. 2014). They can benefit from the legitimacy spillover effect that inward internationalization can generate (Adkisson and McFerrin 2014; Kostova and Zaheer 1999). When an EMM bids to buy into a new foreign market, the local stakeholder groups may lack sufficient information and knowledge about this foreign new comer; their initial perception of this EMM player may arise from their stereotype of the home country of this EMM, quite often the institutions of it. On the other hand, stakeholders seek inference from relevant sources about the bidders (Adkisson and McFerrin 2014; Kostova and Zaheer 1999). The EMM acquirer’s cooperation experience with foreign organizations can serve as a reference for this purpose to improve its legitimacy. This spillover effect may reduce the liability of foreignness of an EMM bidder and compensate the difficulty caused by the negative institutional image of its home.

Based on arguments above, we propose both direct and moderating effects.

**H2a:** EMMs’ overseas acquisitions are more likely to complete if they have inward internationalization experience.

**H2b:** EMMs’ inward internationalization experience positively moderates the relationship between the poor institutional images of EMMs’ home countries and their acquisition completion.

An international takeover can be undertaken by either an EMM’s units from home or by an overseas subsidiary. Based on the logic of the home base perspective (Zhou and Guillén 2015), and the springboard perspective (Luo and Tung 2007), we propose that foreign acquisitions through EMMs’ foreign subsidiaries are more likely to succeed.

International operations in locations including the home country provide valuable exposure to varying institutional and business conditions, forming a home base which reaches beyond the home.
country (Zhou and Guillén 2015). When firms invest and operate abroad, they gain and accumulate experience in a number of foreign countries and expand their home base from home country to several countries. The original home image may become less visible and influential (Cuervo-Cazurra and Ramamurti 2015).

Internationalization also serves as a springboard for EMMs to overcome home-based disadvantages (Luo and Tung 2007; Wang et al. 2014). Foreign investment including acquisition itself may mitigate an EMM’s disadvantage in brand awareness and international reputation (Luo and Tung 2007). Foreign subsidiaries tend to enjoy high autonomy as a strategic mechanism to overcome the EMM’s weaknesses in managing globally-dispersed businesses and its home-country disadvantages (Wang et al. 2014). First, operating overseas compensates for EMMs’ disadvantages in brand awareness, technological development and managerial experience (Child and Tsai 2005). EMMs see the value of moving operations to advanced countries to escape discrimination towards their home origins (Cuervo-Cazurra and Ramamurti 2015). According to Wang et al. (2014), subsidiaries differentiate themselves administratively from home countries and from parents, and undertake practices to establish local legitimacy. Foreign subsidiaries enjoying delegated autonomy dissociate themselves from the parent company to decrease the risk of poor corporate governance at headquarters impeding legitimacy at the subsidiary level (Wang et al. 2014). Additionally, they hire local talent as senior executives, who work to provide domestic knowledge and connect in the role of “offshore champions” (Bartlett and Ghoshal 2000). As a result, EMMs’ foreign units can increase accountability and improve transparency, therefore raising the units’ reputation and trustworthiness with local stakeholders (Luo and Tung 2007). Those subsidiaries serving as international acquirers may be further distanced from their home origin and parent organization, thus finding it easier to gain legitimacy in the acquiree’s nation.

Second, foreign subsidiaries help to exploit housed resources and gain access to local knowledge (Gubbi et al. 2010). They learn by searching, experiencing, integrating and developing knowledge from a wider range of sources. As a result, operating overseas is a strategic mechanism to fix EMMs’ lack of foreign experience and corresponding unfamiliarity with how business should be conducted outside the home (Wang et al. 2014). This role of a subsidiary is especially relevant to EMMs seeking to purchase further in overseas countries. Through prior international experience as foreign investors, firms gain important knowledge about customers, markets, cultures and governments that in turn facilitates future international expansion (Thomas et al. 2007). Operating in overseas environments also means organizational experience in tackling legitimacy issues and expertise in examining different institutional environments, identifying important legitimating actors, understanding their legitimacy requirements, and negotiating with them (Kostova and Zaheer 1999). Understanding of
and experience in dealing with institutional multiplicity and complexity in international operations help EMMs to identify ideal acquisition targets, price deals more realistically, conduct negotiations more confidently, and communicate with local stakeholders more effectively. Experience in executing acquisitions, organizational inertia in absorbing the target, and prior presence in international markets may help complete cross-border acquisitions more easily (Aybar and Ficici 2009).

H3a: EMMs’ acquisitions are more likely to complete if they are undertaken by EMMs’ overseas subsidiaries.

H3b: EMMs’ overseas subsidiaries’ undertaking of foreign acquisitions positively moderates the relationship between the poor institutional images of EMMs’ home countries and their acquisition completion.

**FDI location and acquisition completion**

Another strategy of increasing foreign acquisition completion is to select the FDI location. When internationalizing through overseas acquisitions, EMMs face multiple country targets. From institutional theory, this means multiple institutional environments, each presenting its specific set of regulatory, cognitive, and normative domains (Scott 1995). The structure, composition and legitimacy requirements of these institutions typically vary across national environments (Kostova and Zaheer 1999). Therefore, the distance in institutions between the home and target forms an influential factor upon MNEs’ location choice strategy (Buckley et al. 2007). Such impact has seen mixed results in the literature (Tihanyi et al. 2005). Recent scholarship suggests that this influence is dependent on particular conditions (Conti et al. 2016). In the case of cross-border acquisition, the institutional distance between the home and the host can influence both the difficulty of correctly understanding local institutional requirements, and the degree of adjustment required (Berry et al. 2010). It will be easier for a firm to understand and adjust to the legitimacy requirements of a country that is institutionally similar to its home country. The pressure for compliance with host-country rules and laws that a foreign acquirer cannot easily understand may make a deal more costly to finalize, or even jeopardize its completion (Dikova et al. 2010).

Therefore, EMMs need to carefully choose their acquisition location for greater likelihood of completion. We suggest that purchases in institutionally close countries are more likely to complete. More than two-thirds of cross-border M&As by EMMs are directed at developing and transition economies (UNCTAD 2014b), whose institutional quality level is relatively low. Some 43% of BRICS outward FDI stock is in neighboring developing countries in Latin America and the Caribbean, East Asia, South Asia and transition economies (UNCTAD 2013).
The regulatory, normative, and cognitive institutional profile of a host country forms the pressures that foreign investors confront (Kostova and Zaheer 1999). International investors usually comprehend and adjust with more ease to an institutional environment similar to that of their home country, and the pressure for compliance with a host country’s institutions can obstruct deal completion (Dikova et al. 2010). MNEs are faced with fewer challenges in establishing legitimacy in countries with less institutional difference from the home country (Kostova and Zaheer 1999). Pressures that are directed specifically against EMMs are likely to be strong in countries where the dominant ideology promotes a free market economy and have more developed institutions (Meyer et al. 2014). Such countries organize their economies around markets and open competition among firms. The efficiency of markets is secured by institutions that promote free market and, in particular, private property rights, transparency in business relationships, and the protection of private shareholders (Wang et al. 2014). In such a context, governments are normally not directly involved in business. EMMs have experience in dealing with less-developed institutions back at home, where economic freedom is relatively low. They use institutional and business networks to compensate for an inefficient market mechanism (Peng 2003). These firms thus have institutional voids when extending into international markets. Their legitimacy is likely to be challenged because they appear to be inconsistent with the leading local ideology. Their predisposition results in normative pressures, which strengthen the positions of local stakeholders and add costs to the EMM acquirers.

Instead, EMMs can turn to institutionally similar countries, where they can find their institutional image less damaging or even advantageous. Institutional differences can dramatically increase the difficulty of and prolong the time for fulfilling cross-border acquisition attempts, and thus dampen the likelihood for completion (Dikova et al. 2010). Emerging markets present institutional constraints including “institutional voids (e.g., lack of legal protection for property rights, poor enforcement of commercial laws, non-transparent judicial and litigation systems, underdeveloped factor markets, and inefficient market intermediaries) and political hazards (e.g., political instability, unpredictable regulatory changes, government interference, bureaucratic red tape, corruption in public service and government sectors, and extremely discretionary explanation or enforcement of ambiguous laws and rules)” (Luo and Tung 2007, p. 486). Nonetheless, EMMs may find developing economies both more comfortable and easier venues in which to complete acquisitions. Equipped with expertise in mass production through inward and external internationalization experience and easily available technology, equipment, instruments and materials, EMMs are enabled to explore their competitive advantages in other emerging/developing markets, manufacturing technologically standardized products at a lower cost (Luo and Tung 2007). Moreover, EMMs can build an enduring brand reputation in other developing countries by leveraging the institutional image advantage because the
stakeholders in developing countries perceive foreign-made products, from either industrialized or developing countries, to be of high quality (Aulakh et al. 2000). The positive perception from consumers can make entry into these markets via acquisitions encounter less friction from the public. In addition, the governments of these target countries tend to provide favorable treatment to foreign investment in an effort to attract capital and technology (Luo and Tung 2007).

Based on these arguments, we have the following:

**H4: EMMs’ acquisitions in institutionally close countries are more likely to complete.**

**DATA AND METHODS**

**Data**

Longitudinal data (1996-2012) of 13,259 of EMM acquisitions are used to test the hypotheses. To ensure the acquirers investigated are EMMs, acquisitions conducted by the subsidiaries of advanced-country-based MNEs but registered in EMs are excluded from this study. Other types of foreign partnership are included, such as joint ventures and publicly traded companies with minority foreign share. The samples were obtained from the Thomson Financial Merger & Acquisition database. The EMMs in the dataset were from ten major emerging economies: the BRICS (Brazil, Russia, India, China, and South Africa), Argentina, Malaysia, Mexico, Thailand and Turkey. We identify the emerging economies by using the definition and list of IMF. The acquirers were entities registered in one of these emerging economies. To ensure that acquirers were genuine EMMs, we exclude locally registered subsidiaries of multinationals based in advanced countries. These economies are chosen for two reasons. First, they represent the largest emerging markets enjoying rapid economic growth and foreign investment. Even in the recent economic crisis, these economies still achieved decent growth rates. They have all been undergoing economic liberalization in the past two decades, through which they became more integrated into the world economy (Becker, 2014, Hill, 2013). The share of these ten countries in world GDP increased from approximately 12% in 1993 to 20% in 2012. They outward FDI increased steadily in the past two decades, and have become important global investors. Their share of global outward FDI increased from approximately 3.3% in 1993 to 7.3% in 2012. Second, although they are all classified as emerging economies, they also vary considerably from each other institutionally, economically, culturally and technologically. Figure 2 shows the differences and changes of institutional quality of the ten countries in 1996-2012. The representativeness and the differences among them make this group ideal for the study of EMMs’ cross-border acquisitions and the effect of institutions.

---

1 We identify the advanced countries by using IMF’s list.
Figure 2. Institutional quality of ten emerging countries in 1996-2012

Source: authors’ own calculation based on data from the World Bank’s Worldwide Governance Indicators.

The Thomson Financial Merger & Acquisition database offers rich information of deal status, dates of announcement and completion of transaction, and some attributes of the targets and the acquirers such as location, ownership, industry, experience, and advisors. The dependent variable (overseas acquisition completion) and a majority of explanatory variables in this research are derived from this database.

The institution-related variables, including the institutional distance, are derived from the World Bank’s Worldwide Governance Indicators (WGI), a research dataset. The data reflect the views on institutions of a large number of enterprise, citizen and expert survey respondents by survey worldwide; They are based on 32 individual data sources produced by a variety of survey institutes, think tanks, non-governmental organizations, international organizations, and private sector firms (Kaufmann et al. 2010). The WGI index have been widely used in the literature to measure the quality of institutions (Adkisson and McFerrin 2014; Brockman et al. 2013; Langbein and Knack 2010; Lu et al. 2014; Pinar 2015). These perception-based indicators are ideal for measuring our key individual variable, institutional image, perceptions in the mind of people towards a country’s institutions for two reasons. First, they comprehensively include the home country’s institutional conditions, and other elements such as culture and economic conditions, and personal experience and knowledge that can influence the perception (Elliott and Cameron 1994). Second, although WGI index is considered as archival data, they are based on a series of surveys including managerial perceptions which are superior to the conventional archival data (Cui and Jiang 2012).

Dependent variable
Consistent with prior research (e.g., Muehlfeld et al. 2012), we operationalize the dependent variable, Completion, as a dummy variable, which takes a value of 1 if the announced acquisition attempt was completed, and 0 otherwise.

**Key explanatory variables**

We use the perceived institutional quality to capture the *Institutional image* of the EMMs, derived from the World Bank's Worldwide Governance Indicators (WGI). Institutional image stereotyping is a cognitive and normative process as a part of institutional environments (Chattalas et al. 2008; Scott 1995). EMMs are generally labeled as carrying the domestic institutional heritage into the host countries (Wang et al. 2014). Thus the institutional quality of the investing nations forms an important basis for stakeholders' perceptions and labeling of foreign firms (Luo and Tung 2007). WGI represent comprehensively survey respondents' perceptions of the quality of six dimensions of governance: voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption (Kaufmann et al. 2010, p. 4). Due to the high correlation between the six indicators, this study, following previous research (Brockman et al. 2013), measures institutional image by averaging these six indicators into a single broader index. To measure *Institutional image*, we use the reversed score of the WGI. The higher the score is, the poorer the image is. Since the deals we investigate are in the period of 1996-2012, *Institutional image* is a time-varied variable. *Foreign partnership* indicates whether an acquirer from an EM has an equity-based foreign partner. We consider an acquirer as having foreign partnership when it meets at least one of the following three criteria: 1) it is a joint venture with a foreign partner; 2) it is a public company with a foreign parent; or 3) it is a private company with a foreign parent owning a stake of less than 50%. The subsidiaries of advanced-country-based MNEs that registered in EMs are excluded from this study. This variable is coded as a dummy with a value of 1 if the acquirer and its parent/partner are located in different countries, and 0 otherwise.

*Subsidiary acquirer* indicates an acquisition being conducted by an EMM subsidiary that is located outside of the home country. It is coded as a dummy variable with a value of 1 if the acquirer is an overseas subsidiary of an EMM, and 0 otherwise.

We measure *Institutional distance* as the differences in institutional quality between the acquirer and target's home countries. The institutional quality is measured by mean of the six indicators from WGI index. The absolute difference is used in this study.

**Control variables**

Following Zhang et al. (2011), we control for many firm- and deal-specific factors that can influence completion of acquisition attempts as depicted below.
Experience is used to control for the effect of learning experience. It is operationalized as a dummy variable with a value of 1 if an acquirer had past successful international acquisition(s), and a value of 0 otherwise.

Advisor is used to capture whether an international financial advisor was used to influence acquisition completion. It is coded as 1 if an acquirer hired an international advisor, and 0 otherwise. We expect that a deal with an international advisor is more easily completed than one without.

SOE target and SOE acquirer, respectively, indicate whether the two partners in the transaction are state-owned enterprises (code as 1) or not (0).

Target GDP indicates the target nation’s GDP in the year that the acquisition was announced. We use log value in the estimation.

Natural resource indicates if an acquisition target is in the energy, mining, steel, or material industries (coded as 1) or not (coded as 0).

In addition to Natural resource industries (Zhang et al. 2011), we also include other industries coded as dummies such as Retail, Hightech, Manufacturing, Finance, Telecom, Energy, Consumer products and service, Health care, Media, Consumer Staples, Real estate, and year dummies in the estimation.

Estimation techniques

Because the dependent variable is dichotomous, we use logistic regression to analyze the determinants of outcome of acquisition attempts. The logit model is represented as follows:

\[ P(i) = \frac{1}{1 + e^{-\beta X(i)}} \]  \hspace{1cm} (1)

where \( P(i) \) is the probability of acquisition \( i \) being completed; \( e \) is the exponential function; \( X(i) \) is the vector of independent variables, including the key explanatory variables and control variables listed above; and \( \beta \) represents the regression coefficients for the vector of independent variables \( X(i) \).

The explanatory power of the logit model is determined using the likelihood ratio test.

To assess the moderating effects, we use the approach by Friedrich (1982) and Brambor, Clark and Golder (2006), and consider employing a combination of the coefficients’ variance, the covariance of the corresponding variable and interaction, and the value of moderating variable. By doing so, we are able to overcome the limitation of the traditional method that uses estimated coefficient of the interaction terms to judge the moderating effect (Pinar 2015)

Prior to running the regression analysis, we calculate the correlations between the independent variables to check for potential multicollinearity problems. As shown in Table 1, two pairs of variables, Foreign partnership and Subsidiary acquirer, and Foreign partnership and Acquirer institution quality, have high correlation. To avoid multicollinearity problems, we include the high correlated variables in the estimation separately. Another pair of variables, Acquirer institution quality and Subsidiary acquirer, have a high correlation coefficient, but they do not appear in the same model.
Therefore, all the correlation coefficients between the variables in the same model are far below the commonly used threshold of 0.7 (Anderson et al., 1999). In addition, we calculated VIF values for each models used. The result shows that values are well below the cut-off level of 10.

RESULTS

The details of the logistic regression model results are presented in Table 2. As a benchmark specification, Model 1 includes a constant and control variables. Based on Model 1, the first explanatory variable, Institutional image, is entered into Model 2. We further add Foreign partnership into Model 3, and Subsidiary Acquirer into Model 4. Because of a high correlation between Subsidiary acquirer and Foreign partnership, we drop Foreign partnership from Model 4 to avoid multicollinearity.

To test the effects of institutional distance, we add variable Institutional distance into Model 5. Subsidiary acquirer is not in model 3 or 5 due to the high correlation between Subsidiary acquirer and Foreign partnership.

Note: ***p<0.01, **p<0.05, *p<0.05

For each model in Table 2, we report the coefficients, the robust standard error (in order to control for possible heteroscedasticity), the value of the likelihood function at convergence, the likelihood-ratio chi-square and correct prediction ratio. The chi-square statistics are significant at the 1% level across
all models, suggesting that the null hypothesis, in which all coefficients associated with the independent variables are simultaneously equal to 0, is rejected for all models. This indicates a good model fit for all models.

The coefficients of Institutional image (the acquiring nation’s institutional quality) are negative and significant (p<0.01), supporting H1. The coefficient of Foreign partnership is positively significant (p<0.01) in model 3, providing support to H2a. The coefficient of Subsidiary acquirer is positive and significant (p<0.01) in Model 3, consistent with H3a. The coefficient of Institutional difference is negative and significant (p<0.05), as predicted by H4.

To test the moderating effects in H2b and H3b, we include two interactive terms, Foreign partnership*Institutional image in Models 6, and Subsidiary acquirer*Institutional image in Model 7. Using the variance and covariance estimated from Models 6 and 7, we calculate the two critical ranges for the two moderating variables Z: Foreign partnership, and Subsidiary acquirer.

Table 3 shows the results, which indicate that if Foreign partnership takes a value of 0, the marginal effect of Institutional image on the completion likelihood is negative and significant (p=0.01); however, if Foreign partnership takes a value of 1, the marginal effect of Institutional image on the completion likelihood is not significant anymore. This result implies that Foreign partnership reduces the negative impact of Institutional image on deal completion significantly, consistent with H2b.

Table 3 also shows that if Subsidiary acquirer takes a value of 0, the marginal effect of Institutional image on the completion likelihood is negative and significant (p=0.01); however if Subsidiary acquirer takes a value of 1, the marginal effect of Institutional image on the completion likelihood is not significant anymore. This result implies that Subsidiary acquirer reduces the impact of Institutional image on deal completion significantly, as predicted by H3b.

DISCUSSIONS

In this research, we advance research on EMMs’ foreign acquisition completion by considering the negative institutional image these firms face and the two strategies that they can use to overcome these effects.

Based on the experiences of developed-economy MNEs, the existing literature in the area has been established on the assumption that MNEs originate from countries where the institutional image is more or less positive or neutral (Dikova et al. 2010). Accordingly, the existing literature has not considered antecedents of international acquisition completion that are negatively impacted by the institutional image of buyers from emerging markets. We advance the novel idea that EMMs’ international footprint and international market selection may serve as a response to such disadvantages in global competition when expanding internationally. Focusing on the distinctiveness of EMMs, we propose that an international footprint and international market selection assist these firms in overcoming image disadvantage vis-à-vis MNEs from advanced economies. Based on an analysis of 13,259 international acquisitions conducted by MNEs from ten major emerging markets, we find the following: (1) the institutional image effect does work for EMMs’ overseas takeovers, and acquisition completion is negatively associated with inferiority of their country image proxied by institutional quality; (2) EMMs with inward internationalization experience do better at completing foreign takeovers, and this experience reduces the liability of EMMs’ home institutional image from home; (3) EMMs achieve a higher acquisition completion rate when the acquisition is fulfilled by overseas subsidiaries, and this indirect acquisition helps offset the negative effect of EMMs’ institutional image; (4) completion is more likely when EMMs buy in institutionally close countries. These findings are meaningful, and have important theoretical and practical implications.

Implications

Researchers may find our research beneficial in several ways. First, we expand the institutional image and country-of-origin study (Balabanis and Diamantopoulos 2004) into international business by examining its effect on foreign acquisition, an important but previously ignored issue. Due to the disadvantages of lacking critical endowments such as brand names, international experience, managerial competence, and superior technology (He et al. 2013; Wang et al. 2014), and home country’s institutional voids (Luo and Tung 2007), EMMs confront additional “liability of foreignness” (Eden and Miller 2004), which is a negative country image, especially on their institutional deficiencies. This institutional image effect comes from host country’s stakeholders’ stereotyped and negative understanding of foreign products and organizations, which forms cognitive and normative institutional environments that international firms must face. EMMs tend to suffer from their passive country image in FDI (Child and Tsai 2005; Luo and Tung 2007; Moeller et al. 2013). This institutional
challenge forms an exacerbated hurdle for EMMs’ acquisitions and realization of strategic objectives (Aybar and Ficici 2009). We find that the institutional image effect exists and affects the likelihood of international acquisition completion, at least for investors from emerging markets.

Second, we enrich the EMM literature by studying how EMMs can employ strategies to tackle their negative country image to enhance acquisition performance. Using the lens of the strategic response theme of institutional theory (Oliver 1991; Peng 2003) and the springboard perspective (Luo and Tung 2007), we suggest that EMMs can respond strategically to address the institutional pressure derived from their EM origin. Our empirical studies reveal that at least two international strategies can be helpful: making an inward or outward international footprint, and choosing FDI locations that are institutionally close.

Third, this study extends the “home base” perspective, a recent development (Zhou and Guillén 2015). One of the drawbacks of this perspective is the ignorance of the knowledge/experience that a firm can accumulate through inward internationalization and foreign partners transfer to and share with it (Zhou and Guillén, 2014). We extend the home base perspective by highlighting the effect of conducting inward internationalization on increased international acquisition performance at a later stage.

This research also provides strong implications for policy makers and managers in both home and host countries. For emerging economies, outbound acquisition provides wider access to foreign markets, resources, managerial knowledge, and technology. However, the stereotyped impressions held by stakeholders in the hosts, especially in developed countries, toward EMMs and their home countries exert a more or less negative effect on their international expansion through takeovers. Thus the EM governments should improve their image by enhancing institutional quality and effectively communicating with the international community.

At business level, given many EMs’ poor country image that forms a barrier to their companies’ international acquisitions, according to our research, EMMs can actively overcome this barrier by developing international footprint and implementing location strategy. Thus, for successful international expansion, EMMs can join forces with foreign firms for richer experience/knowledge of international operation, to acquire through overseas subsidiaries to extend their home bases and enhance international experience and image, and to buy in less developed countries.

Managers of EMMs should be aware of the challenges of undertaking international acquisitions, particularly arising from their country image. To counter these difficulties for more acquisition completion, they can employ strategies such as building up experience and reputation through internal internationalization and/or purchasing via foreign subsidiaries, and buying into institutionally similar market. Finally, based on our findings, politicians and managers in FDI recipient nations will
be in a better position to identify the strengths and weaknesses of international investors from emerging markets to increase inbound FDI deals closure.

Research limitations

This research is subject to a number of limitations, which can provide opportunities for future research. First, we only use data from the ten major emerging markets. Although we believe these markets cover a variety of economic and institutional development levels, researchers may be interested in acquisitions from a large number of emerging markets, other than these ten, that are increasingly actively participating in international business. Also, having only EM acquisitions limits the ability of comparing these with acquisitions from developed countries. Therefore, future research may expand the scope to generate more integrated results.

Second, in this study, due to limited information provided in the dataset, we focus only on the effects of internal cooperation experience in the form of foreign equity-based partnerships upon acquisition performance. A non-equity partnership with foreign partners may also help EMMs to enhance their managerial skill to operate businesses in international markets, and to improve their credibility and accountability in host countries. Therefore, further research effort is warranted to investigate how and to what extent a non-equity partnership might facilitate an EMM’s cross-border acquisition.

VALUATING RENEWABLE ENERGY INVESTMENTS WITHIN TRANSACTIONS: A COMPARATIVE REVIEW AMONG PRACTITIONERS

Hürlimann, Christian¹; Bengoa, Dolores S.²

¹The Business School, University of Gloucestershire, Cheltenham, UK
²University of Applied Management Studies, Mannheim, Germany

ABSTRACT

The purpose of this mixed methods sequential explanatory study is to learn about the applied valuation processes for RE investments in context of transactions and its dynamics and to identify specific influencing factors and explore corresponding good and best practice approaches and/or improvements among investment professionals in Switzerland and Germany by obtaining quantitative results from a survey of 111 practitioners and then following up with 12 purposefully selected individuals to explore those results in more detail with qualitative data through in-depth interviews. The first quantitative phase identified the classic discount cash flow (DCF) methods, based on the flow to equity (FTE) approach with technology and country specific discount rates based on the WACC approaches and formal risk analysis, but less frequently on Capital Asset Pricing Model (CAPM), as preferred approaches. In the second phase, additional internal, firm specific themes, such as judgemental assessments, grade of comprehensibility and complexity of applied methods, and strategic considerations, as well as external themes, such transaction dynamics and market forces, are introduced to explain the quantitative results. The final discussion of both phases helps increase the understanding of this complex topic and provides valuable insights in this usually hidden procedures. Furthermore, the applied mixed method approach lets explore issues and possible improvements in valuation which would not be possible with a classic quantitative study. Implications and recommendation for further research and practitioners are provided.

Keywords: capital budgeting, cost of capital, asset pricing, risk assessment, risk mitigation, none-traded assets, private equity, renewable energy, practitioners, transactions, Switzerland, Germany, exploratory sequential mixed methods approach
INTRODUCTION

The private equity market to which the considered renewable energy (RE) investments mainly belong is in terms of size, growth and volume of acquisitions at least as important as the public equity market (Ang and Kohers, 2001, Moskowitz and Vissing-Jørgensen, 2002, Initiative-Europe, 2005, Capron and Shen, 2007). However, information about the processes within transactions for such non-traded assets (NTA) are restricted due to confidentiality reasons and are challenging to access. For this reason, applied asset pricing techniques, valuation processes and dynamics within negotiation for NTA remain under-researched and poorly understood in contrast to the research on public traded companies (Petersen et al., 2006, Driessen et al., 2012, Ping et al., 2013). Having said that, green investments in RE production receives currently much attention by the investment community, mostly by utilities and institutional investors (Wassmann et al., 2016) due to the anticipated favourable risk-return profile (Warren, 2014) and the historically low interest rates in most developed countries which makes such investments economically more attractive (Monnin, 2015, Thakkar, 2015). Moreover, there are many investors which were forced to accept impairment losses in some of their RE investments (Shah, 2011). So the questions are “What are the optimal methodologies to come up with fair prices for seller and acquirer of RE investments?” and “What additional factors influence the valuation of RE investments?” While there are many theoretical publications about valuation (e.g. Brigham and Houston (2012) and several empirical studies about the application of methods (e.g. Graham and Harvey, 2001, Brounen et al., 2004), there is much less research about NTA compared to public traded companies (PTC) and about other mostly qualitative factors which influence valuations and transactions. Moreover, the applied valuation methodologies – developed by researching PTC (Damodaran, 2013) – do not appropriately consider all specific characteristics of NTA and RE. Other possible deficiencies include the lack of adequate input data (Petersen et al., 2006) and lack of recognition of sector specific characteristics (Brandt, 2002), unsystematic risks (Damodaran, 2012) and the correlation between project risk and within-firm and/or market risk (Ehrhardt and Brigham, 2016), and the subjectivity of many applied approaches (Cotner and Fletcher, 2000).

Knowledge and understanding of factors influencing traditional valuations and transaction dynamics and additional complementary and/or alternative valuation concepts may help investors in RE to better and more efficiently allocate their investment budgets while improving the quality of investment decisions and decreasing eventually the need to perform extraordinary depreciation of shares or assets. This article reports on the study conducted to better understand valuation process in RE investments and to suggest appropriate improvements to practitioners based on the available theoretical concepts. The purpose of this mixed methods (MM) sequential explanatory study is to learn about the applied valuation processes for RE investments in context of transaction dynamics and other influencing factors.
and to identify corresponding best practice approaches and/or improvements among investment professionals in Switzerland and Germany by obtaining quantitative (QUAN) results from a survey of 111 practitioners and then following up with 12 purposefully selected individuals to explore those results in more detail with qualitative (QUAL) data through in-depth interviews to test and update the established, initial conceptual. In the first quantitative phase, survey data with an online questionnaire are collected from investment professionals in Switzerland and Germany to examine which concepts from finance theory are applied in relation to demographic data and/or other independent variables, as published in Hürlimann et al. (in press). The second qualitative phase is conducted as a follow-up to the quantitative results on a more detailed level with mainly face-to-face interviews to help explain the quantitative results and to explore issues and possible areas of improvements within valuation of RE investments on a global scale with selective German and Swiss investment professionals.

The research is expected to make a valuable contribution to the asset pricing research for NTA, specifically for RE investments. First of all, the research will demonstrate which theoretical concepts are applied in RE investment practice in order that practitioners can learn how firms currently operate, assess risk and apply asset pricing techniques. The development of a conceptual model to estimate project specific return rates, as proposed by Finance Theory (Weston, 1973, Fuller and Kerr, 1981, Titman and Martin, 2008, Ehrhardt and Brigham, 2016) specifically for RE investments will be a second valuable contribution. It will contribute to the field of research and to managerial practice by suggesting improvements and complementary and alternative valuation methods to perform valuations in RE investments. Finally, the research will contribute to practice by offering valuable insights about the organisational and cultural differences in risk perception and risk behaviours of Swiss and German RE investors and other relevant factors influencing valuations and investment decision taking. In doing so, the research is able to delve even deeper into the subject, for example to evaluate how risk mitigation measures and “qualitative and strategic considerations” (Bierman, 1993:24), including the perspectives from the firm’s and investor’s level (Ehrhardt and Brigham, 2016), are taken into account in valuation.

*Having said that, the following research questions (RQ) are addresses:*

RQ: What methods and approaches are applied in valuation of RE investments, and what factors influence valuation and transaction processes? [QUAN]
RQ: Why are certain methods applied in practice, and why are certain methods proposed in financial theory not applied in RE valuation process and within transactions? [QUAL]
RQ: What deficiencies are encountered in valuation processes in practice? [QUAL]

---

1 A detailed literature review is reported elsewhere (Hürlimann and Bengoa, in press).
RQ: What improvements in valuation can be introduced in practice in order to receive more adequate valuation results for RE transaction purposes? [MM]

**Theoretical perspective**

Extensive literature review reveals that the majority of the public theoretical approaches and empirical studies about valuation focuses mainly on quantitative methods and less on qualitative approaches, although the latter is at least as essential in valuation processes (Damodaran, 2012). An integrated framework combining quantitative and qualitative aspects of risk assessment in valuation is proposed by Ehrhardt and Brigham (2016). Focusing solely on quantitative approaches, the literature suggests the usage of projection of future cash flows for investment projects while discussing different forms of discounted cash flow (DCF) based methods and the definition of appropriate discount rates to appropriately consider the time value of money and the involved risk which is mostly derived from the still widely applied capital asset pricing method (CAPM).

**Figure 2: Conceptual framework about valuation and its possible influence factors (own illustration), based on literature review in Hürlimann and Bengoa (in press).**

Based on the performed literature review, a conceptual framework (Figure 2) has been developed as basis for developing the online questionnaire and interview protocols, the subsequent quantitative and qualitative data collection and data analysis phase. This framework serves also as scheme to be tested in this research and to be subsequently adjusted, based on the found results.
METHODOLOGY

Study design

To answer the research questions, the researchers applied a mixed methods approach (Creswell et al., 2003, Teddlie and Tashakkori, 2009, Creswell and Plano Clark, 2011). According to Johnson et al. (2007), the “mixed methods research is an intellectual and practical synthesis based on qualitative and quantitative research; it is the third methodological or research paradigm (along with qualitative and quantitative research)”. It is an approach for collecting, analysing and mixing both quantitative and qualitative data and analysis results at some research stage within the same study (Creswell, 2005).

The rational for applying mixing both types of data is that neither of both types are sufficient to capture the details of the studied phenomena, including the complexity and dynamics of valuation within transactions. The integration of data and analysis in mixed methods, including quantitative and qualitative approaches, includes the combination of elements in such a way not only to optimally answer the research questions, but also necessary to achieve the project goals, thus generating findings which are greater than the simple sum of its components (Bazeley, 2010) and providing a more complete picture of the research problem (Greene et al., 1989, Tashakkori and Teddlie, 1998, Johnson and Turner, 2003). The integration is not just a simple combination of qualitative and quantitative methods: “[…] they may indeed be more deeply intertwined” (Kane and Trochim, 2007:177).

Furthermore, a mixed method approach (Saunders et al., 2009) is applied for an enhanced data collection procedure in order to gather data from a rich set of available source, including survey and subsequent interviews in this research. The use of follow-up interviews after responses to structured surveys is one of the most common data-gathering strategies applied within mixed method research (Bryman, 2006).

In this research, a sequential explanatory mixed method design is applied which consists of two distinct phases that follow each other. The study starts first with the quantitative data collection based on an online survey and subsequent quantitative data analysis with statistical methods conducted in the software SPSS, followed second by the qualitative data collection with interviews and qualitative data analysis within nVivo10 (QUAN → QUAL). As such, the quantitative data and analysis provide an overview of the applied valuation methods in RE investments and some influence factors, worked out from the literature while the qualitative data and its analysis provide the opportunity to dig dipper into the topic with thoroughly selected experts in the research field to explain the results from the previous part, to receive a more profound understanding of the topic and to discuss influence factors, deficiencies, issues and possible steps of improvements.
Each of those two phases have equal priority (QUAN and QUAL). The first time when the quantitative and qualitative phase are connected is at the point when the 12 interview partners are selected out of the survey participants. The interference between the quantitative and qualitative results is performed at the stage of the discussion of the outcome of the complete study (Figure 3).

**Target population and sample**

The target population in this research are active participants in RE investment market in Switzerland and Germany, composed of equity investors in RE, such as utilities, independent power producers (IPP), project developers, fund managers, other financial investors, and financial advisors exclusively mandated by investors, as well as debt financing institutes, i.e. banks, to receive interesting insights and opportunities to compare with – even if questions of discount rate are difficult to be answered by banks. Those professionals hold a senior position within their organisations and are involved RE investment projects in the multimillion EUR scale. In Switzerland, there is no need to create a sample since the majority of the concerned population is known to the research team. In contrast, a study of the whole concerned German population would be impracticable, time consuming and overrun the research budget.
Figure 3: A procedural diagram about the various research activities with the applied explanatory sequential mixed methods approach (adopted from Ivankova and Stick, 2007, Moubarac et al., 2012).

Since an accurate probability determination of the selected participants is not possible, “non-probability sampling” (Saunders et al., 2009:213) is applied for the quantitative phase. The sample is built by consulting participant lists of several major RE conferences in Germany and social media platforms, complemented with snowball techniques based on the survey participants’ network. For the qualitative phase, 12 participants a purposefully been selected from the participants of the survey. In line with the requirements of the selected typology explanatory sequential mixed methods approach, the participants for...
the follow-up qualitative phase have been identified from the previous survey phase (Creswell and Plano Clark, 2011, Plano Clark and Ivankova, 2016) while ensuring at the same time ethical and data privacy requirements in case of matching participants and their data between the different phases (Bazeley, 2010).

Quantitative phase

Data collection

An initial questionnaire has been created based on the extensive literature review (Hürlimann and Bengoa, in press) and findings identified in an exploratory interview phase, including questions asked in the famous studies of Graham and Harvey (2001) and Brounen et al. (2004) since their questions and applied answer scales have proved their validity. However, each of the posed questions have been adjusted and/or extended to match them to the research field. This survey was piloted with additional five experts in the research field and three scholars who provided valuable feedback and led to clarifications, simplification of questions and inclusion of additional brief explanations for certain questions.

The final questionnaire has been prepared in English to be sent to Germany and to all three language areas of Switzerland as online survey, running on the LimeSurvey software. The developed online survey is composed of five groups of mainly closed-ended questions. Firstly, general questions about RE investments were asked, including invested countries, technologies and entry phase in investment. Second group poses questions about risk, including the relevance of risk components in RE investments, materialisation and mitigation of risk. Thirdly, questions about how risk, return and its trade-off is understood within the organisations are asked. Finally, capital budgeting techniques are investigated, followed by questions about estimating cost of capital, before concluding the survey with demographic and control questions. The answer options for those questions are usually Likert type scales, expect for questions about risk, return and its trade-off, risk mitigation and adjustment for risk with specific choices of answers. We sent 328 questionnaire to Swiss and German investors in RE projects, and obtained 111 responses. The overall response rate is 32.8%, considered as high, given the length and depth of our questionnaire, the required time to be able to seriously answer the stated in some cases rather complex questions and the restriction of some investment firms to participate due to confidentiality reasons.

The exploratory interviews and the survey piloting have been performed between April and September 2015, and the subsequent online survey between December, 2015 and March, 2016.

Data analysis
The collected survey data are quantitatively analysed with parametric statistical tests, such as univariate analysis of variance (ANOVA) and independent samples t-test, using IBM SPSS statistics. The purpose of this analysis is to assess the significance of the empirical data about the applied valuation methodologies, risk factors and their priorities, and other dependent variables in relation to demographical factors and selected dependent variables. In addition, non-response bias and the robustness of the results are checked with additional statistical tests, including Pearson $\chi^2$ test, Cronbach’s alpha and Spearman’s rank order correlation. The performed analysis shows acceptable to good internal reliability – in most cases.

**Qualitative phase**

**Interview protocol development**

The content of the interview protocol is based on the quantitative results in the first study phase. The object of the qualitative phase is to explore and elaborate on the statistical results (Creswell et al., 2003) in order to better understand the influence of certain independent variables on the found results and discover additional influence factors relevant in valuation within transactions.

In order to reflect the main results of the quantitative phase with the interviewee, five open-ended questions explore additional features and potentially controversial topics in capital budgeting methods and cost of capital approaches. Three additional open-ended questions explore the influence of uncertainty/risk, risk assessment and risk mitigation and their integration in valuation and/or investment decision. A specific open-ended question aims for understanding the puzzling result from the quantitative phase about the risk components in relation to project stages. Additional open-ended questions investigates the effect of additional influence factors – beside of organisation type, size, leverage, stock exchange listing, project stages asked in the quantitative phase – such as an existing portfolios of the investment company, the integration of synergies and/or opportunities within valuation and/or investment decision taking. The last group of open-ended questions targets at finding encountered problems in valuation processes. Thereby, the issue of having the time value of money and the risk in one input variable, the discount rate, applied within valuation is presented and discussed while introducing the certainty equivalent (CE) approach as a possible theoretical solution for this issue.

**Investment scenarios**

In order to collect additional rich set of data and even deeper insights in the topic, three investment scenarios have been developed based on real investment cases. Prior to the interview, the interviewee received an email with a description about the investment scenarios to be prepared for the interview. The investment scenarios are based mainly on numerical key figures (descriptions and input data for
the valuation) and numerical results of the performed valuation based on the various methodological approaches.

Data collection

The qualitative data collection has been performed by face-to-face interviews (expect two) to gather the richness of each dialog, including following stepwise procedure: (1) providing a written declaration about ensuring data protection and anonymity to each participant prior to starting the interview; (2) audio-taping each in-depth semi-structured interview which lasts about 50 to 70 minutes; (3) verbatim transcriptions by a professional bureau, involving the same transcription for all interviews, literate in financial matters; (4) quality check of each transcription compared with audio material by main researcher; (5) uploading transcriptions to Qualitative Data Analysis (QDA) software as sources while enriching them with additional, collected demographic data, such as type of investor, highest education level, experience in transactions (amount and years).

Qualitative analysis

The applied qualitative data analysis goes a step further than just sorting text responses to particular question by a categorical variable with a spreadsheet and finding for example interesting quotes to be cited. Using specific QDA software, an optimal structural environment is provided to analysis complex responses in most flexible way, enabling detailed coding and even revised coding to additional categories while digging deeper into the responses (interview transcripts), letting emerge new and finer categories to be coded on and revealing new insights and concepts (Bazeley, 2010). QDA software enables “a richer and potentially more valid analysis [...] Variations in responses can be better understood, and anomalies and alternative explanations examined” (Bazeley, 2010:438). The applied QDA software in this study is nVivo10. It is used for data storage, coding to both predefined and emerging categories and the developing of themes (Bazeley, 2010, David and Sutton, 2011).

RESULTS

Quantitative phase

Demographic information

As a summary, descriptive statistics of the demography of the participants are provided. Most participants in the survey are from Switzerland (68%) compared to 32% from Germany. Utilities have the highest survey participant numbers (43%) and the financial advisors (8%) and banks (5%) the lowest survey participant numbers. In addition, the survey sample consist of more small organizations, defined as those organizations with less than 501 employees (58%), onshore wind is the main investment technology focus (41%), most companies have a low leverage (55%), defined as a debt ratio
lower or equal than 40%, and are mostly not listed on stock exchanges (85%). About 95% of the participants have an academic degree while 21.4% have a MBA degree. Nearly half the participants are younger than 40 years (44%) while the majority of the participants are male (89%), and have performed more than ten transactions (58%).

*Applied valuation techniques*

Table 5 provides a summary of the main quantitative findings1 about capital budgeting techniques, basic and specific approaches to determine cost of capital or discount rate and risk assessment approaches.

In addition, risk mitigation measures – essential procedures during project valuation and investment transactions – are evaluated. They are performed by the majority of the respondents, for example by performing internal and external Due Diligences (83.0% / 75.0%), reducing operational risks with

1 The detailed results of the quantitative phase are published elsewhere (Hürlimann et al., in press).
appropriated maintenance contracts (81.0%), arranging for machine failure insurances (69.0%) – in contrast to less frequently applied weather protection insurances (9.0%) – reducing market risks with feed-in tariffs or long-term power purchase agreements (68.0%) and with standardization of procedures (62.0%). Beside of avoiding and transferring risk during risk mitigation processes, the alternative option with risk adjustment in project valuations is done either within the applied discount rate for DCF based methods and/or directly within the appropriate case flows, depending of the considered risk component (Hürlimann et al., in press).

Qualitative Phase

Themes and similarities between phases

Various similar themes and sub-themes emerged in the analysis, as shown in Table 6, although they differ in terms of amount and similarity which is evaluated in more detail in the ongoing research.

Table 7 shows a first interference between the quantitative and qualitative analysis results in which confirmation, discrepancies, new insights and explanation are illustrated for some particularly interesting topics.

Implementation of alternative valuation concepts

Having discussed alternative concepts for valuation, such as the certainty equivalent (CE) method, within the investment scenario, some of the participants understand the need for improvements, but stress the fact that it could not be used as a sole concept in transactions since both the decision-making body and the seller would not be willing to implement or understand it (Table 6). It could however be a complementary concept, used internally, to compare different investments and built the basis for investment preferences when valuating several possible investment targets.

Table 6: Themes and sub-themes, based on the coding of the transcripts.
01.143 NPV more relevant for project developers

Payback period method is only relevant for investment in risky countries
Certainty equivalent method is almost unknown / not used
Certainty equivalent method might be a complementary, valuable concept in valuation

Qualitative approaches:
Judgemental assessments are widely applied in valuation of RE investments (in addition to numerical approaches)
Quality of partners, including their ability and credit rating particularly those with long terms, is a relevant qualitative factor in valuation

Cost of capital or discount rate
Using CAPM with a pure-play Beta factor might become interesting in the future as soon as more RE portfolios (technology wise would be preferred) are traded on stock exchanges
Sellers often set discount rates depending previous transactions and/or information from a market sounding to maximise profit
Required discount rates are set in relation to exit strategies in case of investors with a defined investment period

Risk assessment, mitigation and adjustment
Risk assessment of different risk components in relation to project stages
Risk mitigation and risk adjustments are widely applied

Additional influencing factors
Portfolio effects are not essentially considered in valuation
Possible synergies and opportunities of investment project are interesting to be known, but are not directly considered in valuation within transactions
Market forces and internal investment pressure are key influencing factors in the transactions and correspondingly in valuation
The concept about calculating a value and setting the price has to be distinguished

Conclusion, implications and limitation
The findings show that practitioners mainly apply the established concepts based on DCF methods since it is the accepted concept in transactions by both sellers and acquirers. Less agreement in the RE investment community exists how to set discount rates: various concepts exists from quite sophisticated to more pragmatic approaches. Newer theoretical valuation concepts are not adopted or even neglected, such as the risk adjusted discount rates (RADR) concept or the CE approach. This shows that there is still a considerable gap between theory and practice in RE investment valuation processes which corresponds to findings obtained in previous studies among practitioners on other areas (Gitman and Mercurio, 1982, Graham and Harvey, 2001, Brounen et al., 2004). After having presented quantitative and qualitative and some first integrated results, the research will concentrate on confirming and updating the presented conceptual framework and suggesting possible complementary steps to improve valuation process within transactions.

This quantitative research was limited to a relative small sample of German RE investors. Hence, it might be not representative and generalizable to the whole population. However, applying triangulations, the qualitative study could confirm the found results. As within similar studies (Graham and Harvey, 2001, Brounen et al., 2004), there is an essential reservation to be made. The
research assumes that the participants act as agent of their companies, without verifying if their responses about views and opinions are translated into actions.

DOES EMPLOYEE ENGAGEMENT AFFECT CLIENT LOYALTY IN B2B SERVICES?: A QUALITATIVE STUDY IN THE ADVERTISING INDUSTRY IN SERBIA

Josic, Sinisa¹, Petrosyan, Armine²; Dimitriadis, Nikolaos³

ABSTRACT

The way by which companies retain their clients and the actions they need to undertake to achieve that, has become the focal point of both theory and practice in modern. In this direction, studies increasingly find that employee engagement has become a very important factor for improving client loyalty. However, most of studies focused on B2C markets; studies that in the B2B market, and especially in the marketing industry itself, are both very rare and, sometimes, with inconsistent findings.

The purpose of this study was to provide a deeper understanding of employee engagement and client loyalty, and of the interactions between these two concepts. The study tried to answer three key questions: What is employee engagement and client loyalty in the B2B marketing services market? What are the main drivers that influence employee engagement and client loyalty? In which ways does employee engagement influence client loyalty?

The study has used a qualitative research approach. Twenty respondents in total have been interviewed, top managers, employees and clients of a leading advertising agency in Serbia, member of a global advertising network.

Findings confirmed that employee engagement is very important for success, and that it has got a definite and positive impact on client loyalty. The study has discovered that, maybe surprisingly, client loyalty has a positive impact on employee engagement in return. The paper improves current theory on the links between employee engagement, client loyalty and business outcomes by revealing new aspects of those concepts in the B2B marketing services market.

Keywords: employee engagement, drivers of engagement, client loyalty, drivers of loyalty, qualitative survey, B2B, marketing and advertising services
INTRODUCTION

"Increasing customer retention rates by 5% increases profits by 25% to 95%". (Reichheld and Schefter, 2000). This fact stresses the importance of the renewal of the relationship with existing clients and poses an important question: how can companies retain clients and what do they need to do to make it happen? The answer to this question is especially important in the B2B sector where one client lost could significantly cut revenue and profits. Loyalty is crucial since, according to many studies, client loyalty is one of the most important predictors of long-term profitability (Fairlie, 2011; Moisescu, 2014; Pugh et al, 2002). Even though many studies have examined client loyalty still there is no full consensus about the definition of this concept.

Regarding the drivers of client loyalty, studies usually emphasize the importance of different factors (Beverland et al, 2002; Rauyruen and Miller, 2007; Hesrket et al, 2008; Harste and Richter, 2009; Loury, 2015; Watson et al, 2015; Gerlach et al, 2016; Levin et al, 2016). In a recent study, Kumar and Pansari (2016) have found that influence of employee engagement on client loyalty is significant and have stated that this influence is moderated by employee’s empowerment. According to the same authors this effect is stronger in B2B segment and service companies. However, studies which examine this concept in B2B segment are still rare and findings are not consistent. Therefore, additional studies are urgently needed.

Employ engagement has become a major focal point in management research, and probably one of the hottest topics in contemporary business literature. However, most of the interest is from a human resources and internal corporate culture perspective and not equally enough from a marketing one. Many studies have confirmed that there are a lot of drivers which influence employee engagement. According to Markos and Sridevi (2010), the following drivers are presented in all studies: feeling valued by management, two-way communication between management and employees, management’s interest in employees’ well-being and their professional development. A lot of studies have confirmed that engaged employees significantly influence companies’ performance (Dale Carnegie Report, 2012; Kataria et al, 2012; Aon Hewitt Report, 2013; Gupta and Sharma, 2016) and thus putting employee engagement at the forefront of modern management and marketing.

The contribution of this study for academia is gained through its deeper understanding of two very important concepts that are still not fully defined: employee engagement and client loyalty. The fact that studies which examine B2B sector are rare additionally emphasizes contribution of this study to theory development. The importance of employee engagement and the fact that the key drivers of employee engagement are in essence in financial control of a company, stresses the relevance of these findings for companies and practitioners in the B2B service sector.
The purpose of this study was the deeper understanding of the influence of employee engagement on client loyalty in the B2B marketing service sector, through a qualitative research with a diverse sample at a leading advertising agency, member of a global network, in Serbia. This deeper understanding of the influence of employee engagement on client loyalty was through three main research questions:

- **RO 1:** What is employee engagement and client loyalty in the chosen industry?
- **RO 2:** What are the main drivers that influence employee engagement and client loyalty?
- **RO 3:** In which ways does employee engagement influence client loyalty?

**CONCEPTS: EMPLOYEE ENGAGEMENT AND CLIENT LOYALTY**

Sinai (2013) agrees that there is no specific definition of employee engagement, but for better understanding of this concept she has suggested the following three elements:

- Employee engagement is about an emotional connection an employee has with his/her work.
- Employee engagement inspires the employee to put discretionary effort into his work.
- Employee engagement is directly correlated with organizational performance and business results.

In spite of the fact that many authors have given their own definition of employee engagement, until today there has been no accepted definition of this concept.

According to AON Hewitt Report (2013) there are three attributes (outcomes) of employee engagement:

- **Say** – speak positively about the organization to co-workers, potential employees and customers
- **Stay** – have an intense sense of belonging and desire to be a part of the organization
- **Strive** – be motivated and exert toward success in the job and for the company

In order to fully understand employee engagement and client loyalty concepts and their relations, articles also analyze topics such as: outcomes of employee engagement, drivers of employee engagement, drivers of client loyalty, and influence of employee engagement on client loyalty (Shuck et al., 2011; Kataria et al., 2012). In spite of the large number of studies that examine these concepts, almost all authors agree that still there are no consensus definitions of employee engagement and client loyalty (Schaufeli et al., 2006; Yalabik et al., 2013). On the other hand, all authors agree that there are many drivers that influence employee engagement and emphasize that these drivers are not the same for all employees and that they change during time (Biswas, 2013). Therefore, in theory there is no consensus about drivers of employee engagement as well. In
literature review are also presented some practical models about employee engagement and how it could be managed (Xanthoopoulour et al., 2009). Furthermore, here are presented models of client loyalty, as well as main drivers that influence client loyalty. Several studies have confirmed that employee engagement influences client loyalty (Salanova et al., 2005; Kataria et al., 2012). However, most of these studies are focused on B2C market; studies that have examined B2B market are very rare and some findings are not consistent.

In order to understand influence of employee engagement on organizational performance Kataria et al. (2012) analyze influence of employee engagement on organizational effectiveness. Concept “organizational effectiveness” is defined as “the degree to which an organization realizes its goals” (Salanova and Schaufeli, 2008; Kataria et al., 2012, p. 105). According to Schaufeli et al. (2006) organizational effectiveness has three key aspects: productivity, adaptability and flexibility. Kataria et al. (2012) have stated that there are at least two reasons which link employee engagement with organizational effectiveness. Firstly, employee engagement is critical element for business success. Secondly, engaged employees are more likely to do things which improve organizational effectiveness (Zeithaml, 2000).

Gupta and Sharma (2016) have stated that many studies have found that employee engagement is significantly correlated with organizational outcomes such as: retention, turnover, productivity, customer service, customer loyalty, growth in operating margins, increased profit margins and revenue growth rates. Influence of engaged employees on business results could be summarized in four groups: higher retention, better financial performance, higher customer loyalty and higher profitability (Saxena and Singh, 2015).

METHODOLOGY

This study used a qualitative research approach. Qualitative research is considered as more subjective so one of the main questions is how to gain objectivity (Lawrence and Tar, 2013). Barnham (2015) argues that there are number of approaches which could improve validity of qualitative research, and sample triangulation has been applied here. Thus, three groups of interviewees have been included: top managers, employees and clients.

Regarding the sampling method, purposive sampling has been used. In total, 20 information-rich respondents have been interviewed. Interviewees included in the study are as follows: five top managers, 10 employees and five clients. Only employees who had the most experience and insights into the research topics were included, meaning employees who work in the client service department and have direct contacts with clients. Regarding clients, they were chosen based on the following: the they have a continues contract with the agency, they have been directly involved in the decision making
process for choosing marketing agencies and have continuous contact with the agency. Concerning top managers, they were chosen based on their exposure to clients and to their structural influence in strategically engaging employees in the agency.

FINDINGS AND IMPLICATIONS

Findings support Sinai (2013) description of employee engagement through three elements: brings passion to work, employees go beyond the duty, and directly influence organizational performance. Furthermore, the findings are in line with Fernandez (2007) who distinguishes employee engagement and job satisfaction. However, findings agree with Fernandez that one employee could be engaged even if he or she is not satisfied, but only in the short run. Similarly to Van Beek et al. (2012), findings clearly differentiate employee engagement from workaholism and burnout. Employee engagement is considered as healthy and positive motivational state, while workaholism is described as fully negative which leads employee into the burnout.

According to the findings, engaged employees are: loyal to the company and more willing to speak positively about company, have higher objectives to strive for, have more energy and give maximum to do their job the best as possible. All these findings support AON Hewitt Report (2013) in which is stated that there are three attributes of employee’s engagement: say, stay and strive. However, findings have indicated some other characteristics (outcomes) of employee engagement as well. Moreover, engaged employees are also flexible, open and helpful (willing to help their colleagues).

Table 2. Results on: Main characteristics of employee engagement

Research findings fully support list of characteristics of engaged employees given by Biswass (2013): more productive, open, eager to learn, have better balance work-life, and have better relations with...
colleagues.

According to Gupta and Sharma (2016) employee engagement influences business results in four ways: higher retention, better financial performance, higher customer loyalty and higher profitability. Findings of the study have confirmed that employee engagement positively influences business results in all four ways.

Table 3. Results on: Main outcomes of employee engagement

Research findings agree with Dale Carnegie Training Report (2012) that there are three key drivers of employee engagement: relationship with immediate supervisor, belief in senior leadership, and pride in working for the company. However, research findings have discovered the importance of some other drivers as well: employee’s personality and team. Findings have shown that personality of an employee is one of the most important drivers of employee engagement. Furthermore, this driver cannot be compensated with anything else.

According to Aon Hewitt Report (2013) there are many drivers of employee engagement. In the same report it is stated that these drivers could be grouped into six groups: work, people, opportunities, total rewards, company practice and quality of life. In spite of the fact that findings fully support this model, the importance of employee’s personality as one of the key drivers of employee engagement is not mentioned in this model.

Table 4. Results on: Main drivers of employee engagement
Findings agree with Development International Institute (DDI, 2005) that manager is important for employee engagement and that he or she needs to do five things in order to create engaged employees: align efforts with company’s vision and strategy, empower people and give them more autonomy, promote and encourage teamwork, help people to develop, and provide support and recognition.

Similarly, to the Aon Hewitt Report (2013), research findings have confirmed that drivers of employee engagement are not universal. Additionally, majority of findings support Bersin (2014) that pay (compensation) is “hygiene factor”, not engagement driver. However, some of the findings have emphasized that financial factor is still important driver in Serbia. Additionally, findings have confirmed that drivers of employee engagement change during time.

Findings have described client loyalty as a mix of attitudes as well as behaviors that positively benefit the Agency and in that way supported Watson et al. (2015) definition (p.1) “a mix of attitudes and behaviors that benefit one firm relative to its competitors”. According to the research findings, client is loyal if: continues contract with the Agency, trusts the Agency, considers Agency as a partner, and recommends the Agency to the other companies.

Table 5: Results: How interviewees define client loyalty

Research findings have confirmed what Beverland et al. (2002) have found that proactivity is important driver of client’s satisfaction within Agency-Client relationship. Furthermore, findings have confirmed Watson et al. (2015) list of the most important drivers of client loyalty: commitment, trust and satisfaction. However, according to the findings loyalty incentives are not relevant driver for client loyalty in Agency-Client relationship. Additionally, study has confirmed Harste and Richter (2009) argument that non-economic factors such as satisfaction, trust, reputation and commercial friendship influence client loyalty.

Table 6. Results on: Main drivers of client loyalty
Research findings support Kumar and Pansari (2016) finding that there is influence of employee engagement on client loyalty. Additionally, it agrees with Dale Carnegie & Associates white paper (2012) that engaged employees lead to engaged clients. Furthermore, research findings support Yalabik et al. (2009) argument that employee engagement influences employee’s performance and intention to quit. Moreover, research findings have indicated that employee engagement is very important for client loyalty because: employee engagement improves relationship with the client, improves communication with the client, Agency is more dedicated, and improves quality of products and services. Moreover, study has confirmed findings of Levin et al. (2016) that advertising agencies need to provide all elements related to inter-firm relationship and creativity in order to gain their loyalty.

Table 7. Results on: Influence of employee engagement on client loyalty

In the end, research findings have discovered that client loyalty in return improves employee engagement as well. Employees consider client loyalty as a feedback for well done job and a kind of recognition.

Findings have shown that employees could be engaged even if they are not satisfied. However, this is possible only in the short run, in the long run employee will leave the company. Therefore, for any company it is very important to regularly measure employee satisfaction and to implement programs and initiatives that will keep employee satisfaction on high level. Special attention must be paid on the most valuable people in the company.

This study has shown that “personality” of employee is one of the most important drivers of employee engagement. Therefore, employee engagement cannot be separated from recruitment process. Companies need to develop recruitment procedures that will enable selection of employees who have tendency to be engaged and like certain type of work. Moreover, company should consider rotation of employees in order to find the most suitable position for every employee.

Engagement of one team member improves engagement of the other team members as well. In order to increase engagement of their teams, companies must ensure that in every team there are highly engaged employees. Trainings and education of managers, in order to develop their skills which would enable them to influence employee engagement in a positive way, are very important for employee engagement in the company. Through these trainings managers should become able to: align efforts
with company’s vision and strategy, empower people and give them more autonomy, promote and encourage teamwork, help people to develop, and provide support and recognition.

Top managers influence employee engagement through setting corporate culture, mission and vision of the company. Therefore, top managers need to constantly communicate mission, vision and values of the company and to ensure that all other efforts in the company are aligned with them.

Since drivers of employee engagement are not the same for every department in the company and for every employee, it is important that company clearly identifies the most important drivers in each department. After identification of key drivers in departments, company should develop programs that are tailored according to the specifics of each department. Additionally, research findings have shown that drivers of employee engagement change during time. Therefore, company needs to constantly measure importance of drivers and to implement insights of these changes into engagement programs, manager trainings etc.

Research findings indicate that client loyalty also improves employee engagement. Agencies should use this insight in order to develop joint initiatives with their clients which will improve engagement of teams responsible for these clients. Moreover, through development of joint initiatives agencies will show proactivity, dedication and commitment to the relationship with the client what will additionally boost the client’s loyalty. Additionally, agencies should use positive clients’ feedback in order to internally promote team’s success and to give recognition to the team members responsible for this success.

CONCLUSIONS

The findings of this study have confirmed that practitioners define employee engagement as the readiness of employees to go extra mile to reach company’s objectives. Employee engagement is considered as completely positive concept, without negative consequences. In addition to this, findings have shown that employee engagement is clearly differentiated from negative concepts such as workaholism and burnout.

This study has indicated that there are many characteristics of employee engagement and all of them have positive influence on company’s performance. It has confirmed that main characteristics of engaged employees are: they strive to gain company’s objectives, have more energy, are team oriented and flexible. However, it has revealed some new characteristics as well: engaged employees have higher objectives, they are open, supportive and responsible.

Findings have confirmed that employee engagement has positive influence on all aspects of company’s performance. Moreover, findings support Gupta and Sharma (2016) argument that employee
engagement influences company’s success in four ways: higher retention, better financial performance, higher customer loyalty and higher profitability.

There are many drivers that influence employee engagement and most of these drivers are in control of a company’s management. Direct managers, salary, type of work and team are very important drivers of employee engagement. On the other hand, the study has revealed some other drivers as well: employee’s personality and top management. Furthermore, the study has emphasized that direct manager influences employee engagement in different ways: trusts employees, has open communication with employees, gives feedback, gives recognition for good work, supports employees, gives autonomy to an employee, sets an example and sets clear goals. The study has also indicated that drivers are not universal for all employees and all departments and that they change over time. Regarding the importance of job satisfaction for employee engagement, study has found that in the long run employees must be satisfied with their job in order to be engaged.

The study has also indicated that there are many drivers of client loyalty and confirmed that quality of products and services, quality of relationship between account manager and brand manager, dedication of the Agency, and trust are some of the most important ones. Moreover, the study has revealed some other drivers as well: corporate relationship, client’s organization, that Agency understands client and good communication between a client and Agency. Moreover, the findings support Watson et al. (2015) argument that the most important drivers of client loyalty are commitment, trust and satisfaction. However, study has not found that loyalty’s incentives influence client loyalty in Agency-Client relationship.

Findings have indicated that employee engagement has positive influence on client loyalty. Accordingly, the study supports Kumar and Pansari (2016) argument that there is influence of employee engagement on client loyalty. Additionally, findings have shown that employee engagement influences client loyalty in several ways: improves relationship with a client, improves communication with a client, Agency is more dedicated, and improves quality of products and services. In the end, study has confirmed that client loyalty improves employee engagement. Hence, employees consider client loyalty as a feedback for well-done job and a kind of important recognition.

This study provides several opportunities for further researches. Importantly, this study should be followed with quantitative studies that could test the following conceptual framework and provide a wider generalization of these findings.
Figure 1. Conceptual Framework: Influence of employee engagement on client loyalty based on this study

ON THE ROAD TO MEANING: A THINKING JOURNEY TO SPIRITUALITY IN PROFESSIONAL LIFE

Kay, Avi

Jerusalem College of Technology (Lev Academic Center), Jerusalem, Israel

ABSTRACT

Both research and anecdotal information suggest that there is an increasing interest in spiritual elements of professional activities. While individuals might more often seek out the spiritual via the search for meaning in those activities, they typically lack a clear understanding as to how to achieve that outcome. Thus, the surge in interest in and need for spirituality at work may have debilitating effects on the individual's very sense of spirituality at work. This paper presents a preliminary discussion regarding the possibility of applying a new learning technique, referred to as the "thinking journey," as a means to accomplish that goal. After introducing the technique and its underlying principles, the various characteristics of the technique are described. Following that, an example of a possible "thinking journey" is presented. Finally, possible directions for future applications and research of the "thinking journey" method for the area of spirituality at work are suggested.

Keywords: spirituality at work, business ethics, pedagogy, management education, thinking journey

INTRODUCTION

Howard (2002) suggested that the "explosion" in interest in workplace spirituality was "probably the most significant trend in management since the 1950s" (p. 230). More recent research indicates that the idea of spirituality at the workplace and its individual and organizational benefits continues to surge (Houghton, Neck and Krishnakumar, 2016). One indication of this can be seen in a recent search undertaken by this author on Amazon of the term "spirituality at work" that generated nearly 35,000 results; while a Google Scholar search for the same yielded over 47,000 results - for work done just over the last five years.

However, the rising interest in - and felt need for - spirituality at the workplace may be a mixed blessing. For, in lieu of the possession of tools allowing access to possible spiritual elements of one's professional endeavors, many individuals may only experience a greater sense of frustration in light of the apparent absence of any perceived spirituality in that endeavor. Indeed, noting both the growth in the desire for spirituality and its typical absence from the curriculum, Astin (2004) cogently...
argues that Academia must expend greater efforts to help students develop tools to guide their search for spirituality.

This is not a new thought. For, sources as diverse as the Buddha to Aristotle to the Church Fathers to the conveyers of hadiths in Islam to the ancient Rabbis (or literally "teachers") of the Talmud were all cognizant of the importance of aiding individuals toward their pursuit of "the Good life" in their everyday, professional activities. For example, the Talmud suggests that upon arrival to the gates of Heaven the very first question that an individual will be asked will be whether they have conducted their business activities in an honest and forthright manner.

It is unlikely that the purpose of the above passage was to offer the individual time to "cram" and prepare an acceptable answer to that question. Rather, clearly, the idea was to lead the individual to examine their ongoing activities from the perspective of a "judgment day", and to conduct themselves in a manner that will allow them to arrive at their preferred destination. Regardless as to whether that day of reckoning occurs at the "pearly gates," or a random morning while glancing at the mirror while preparing for work, or looking out at the ocean waves, while contemplating a lifetime of activities and decisions; it will be a moment in which the individual will be taken out of the present to evaluate themselves from a different, and perhaps novel, perspective.

But, how can one best be prepared to assess their professional lives and themselves in a different and novel perspective? One educational approach gaining traction in recent years builds upon the idea that learners should be more active agents in constructing the knowledge they seek (Schur and Valnaides, 2005). This more active type of learning builds upon the classic work of Vygotsky who placed much emphasis on the part played by significant people in the learners' lives via the activities of those individuals, who enhance their learning by selecting and shaping, and thus mediating, the learning experiences of the individual (Turuk, 2008).

This method, which has become known as "mediated learning experience" (Feurstein and Feurstein, 1991, Seng, 2003) calls for the active involvement of an outside agent (i.e. teacher, mentor, coach) to actively mold the presentation of information relevant to a matter in question so as to create a new understanding of the dynamics and context of the matter at hand. Feurstein (1991) suggests that such learning allows "for the development of the very unique human conditions of modifiability, or the capacity to benefit from exposure to stimuli in a more generalized way than is usually the case" (Feuerstein, 1991, p.26).

One way in which this mediated experience can take place is via a "thought experiment" (or "Gedankenexperiment"). The above is a cognitive tool designed to allow one to consider some hypothesis or principle in order to consider their possible consequences. It should be noted that there may not necessarily be any intention - or perhaps even possibility - to undertake actions associated
with the subject of the experiment. Two famous examples of Gedankenexperiments are Schrodinger’
cat (in the area of physics) and the "trolley problem" (in the area of ethics).

The purpose of this paper is to suggest the use of utilizing a thought experiment approach in
the context of spirituality at the workplace. Specifically, this paper will present and apply an approach
called the "thinking journey" (Schur, 1999; Schur, Skuy, Zietsman and Fridjhon, 2002; Schur and
Valanides, 2005), a new methodological tool currently gaining interest in science education, to
spirituality at the workplace. The "thinking journey" allows the individual to look at their reality in
new and novel ways. It is suggested here that the "thinking journey" can assist individuals to identify - if not actually experience - a variety of perspectives on their professional life that will aid them to identify possible elements of spirituality inherent in that endeavor.

THE THINKING JOURNEY: AN INTRODUCTION

A prism can offer the individual the possibility to see the various hidden colors that comprise
the colorless "white light" that surrounds us. It is suggested here that an individual would do well to
seek out a prism through which it might become possible to perceive the various "colors" which make up everyday professional life. The "thinking journey" can serve as that prism.

Schur and Valanides (2005) note that the purpose of the "thinking journey" (heretofore referred to as "TJ") is to allow the learner to experience the learning process in an active and personally significant manner while gaining perspective(s) they did not previously have regarding the matter at hand. For example, the TJ allows individuals to overcome problems of egocentricity in science education (seeing things only from one - their own - perspective) via a mediated journey to faraway places where they have to orient themselves. Along the journey, the individual experiences and assumes multiple perspectives of the subject at hand and the context in which they operate. As such, they gain knowledge both with regard to their own nature and that of the context in which they operate.

Specifically, the TJ is comprised of a set of learning activities that lead the individual to undertake an imaginary journey in order to gain new, novel and sometimes surprising perspectives on both new and "known" phenomenon. In an educational context the instructor may serve as the "tour guide" for that journey, in an organizational setting someone from HR, a coach or mentor may fill that position. In all cases, the "tour guide" sets out an itinerary that necessitates the learner to challenge what is known and possible sources of that knowledge.

With that, individuals ultimately "own" the experience. For, it is the learner who decides what the journey means to them. They are encouraged to ask questions, make comments and build a personal representation of the places visited, as well as, perspectives achieved. In order to free
learners from their own personal perspective, each station on the itinerary is represented via visual representations such as drawings, photographs and video clips through which (and - often - in which) learners are encouraged to view themselves.

THE THINKING JOURNEY: FEATURES AND FUNCTIONS

As noted, the TJ helps individuals overcome problems of egocentricity (seeing things only from their perspective) via a mediated journey to faraway places where they have to orient themselves. As such, it is built upon the premise that the ancient Greek maxim to "know thyself" can best occur if one knows one's world. Thus, the TJ is comprised of a number of features that combine together to provide a type of "out of body" experience which allows - or even necessitates - the individual to view themselves and their reality in a new manner. Following here is a short description of features of TJ pertinent to the area of spirituality at work.

The first feature of the TJ is the "Dialogue" - the communication that occurs at each point along the TJ between the guide and the traveler. That communication is comprised of a verbal and/or written exchange ideas and queries. The latter examining the nature of the place visited and the possible viewpoints, feelings and attitudes of those who inhabit a particular space in the constellation in which the individual operates. Via the process above the individual gradually constructs a new understanding of the place visited and the meaning of that place in their own life and endeavors.

The second feature of the TJ framework are "Pictures." TJ makes extensive use of visual representations as a means to allow the individual to experience and consider their world in a different manner. These representations allow the learner to view the, as of yet unknown viewpoint, that may be inaccessible or perhaps even invisible to them. It also allows for a consideration of phenomenon for which the learner may - as of yet- not possess the language to express.

The next feature of the TJ approach is "Observation." The interactions between guide and learner occur during the observation of visual images presented. Here, the communication is more directed and focused on non-verbal representations of the TJ. Along the TJ the traveler is asked "what do you see in the picture?" As such, it encourages the traveler to reflect upon, comment, question and even doubt their own reality. They may also be asked to consider changes to a visual representation, in order to align it with the other, and often new and personally significant perspectives. Throughout the TJ, the guide offers additional information and questions to further hone the travelers' ability to understand what is (and is not) being perceived.

"Comparison" is, yet, another important feature of the TJ. It is characterized by encouragement offered the traveler to compare what had been previously "known", with new information available. The above may challenge, complement and/or alter the "known." The guide
utilizes the comparison and contrast between previous knowledge about their endeavors and newly available information to encourage the traveler to offer possible new understandings of the former. Further, individuals are challenged to consider what their new understanding may say about the manner in which they view themselves, their world and their place and relationship with the world around them.

Finally, the last relevant aspect of TJ for the issue at hand is "Returning Home." This matter refers to taking the individual back to their current reality. The traveler is asked to compare the features of the place in which "they live" with the variety of other places visited. As such, they gain a new understanding of the panorama afforded by their current reality and the relativity of that reality. The traveler is encouraged to review the stations visited, the view afforded by each and to again consider what they gained by visiting the various stations.

THE THINKING JOURNEY: A POSSIBLE APPLICATION IN SEARCH OF SPIRITUALITY AT WORK

Following is an example of a TJ that can be undertaken with an individual searching for greater meaning in their professional life. The itinerary for this journey will be set by means of the guide questioning the traveler with regard to the nature of the individual’s professional life. The "journey" will start from within, and will include engaging the individual with regard to how and why they arrived at their current endeavor, and how the above may have evolved over time.

Following the above, the individual will be asked to describe the immediate outputs and consequences known to them that result from their current endeavor. After the initial look at the position the individual holds, the focus is shifted toward the consideration of the constellation of actors with whom the individual may interact and/or affect via their endeavors. Here an important element in this process is understanding the various "stakeholders" (Freeman, 1994) affected by or otherwise important to the performance of the individual’s professional responsibilities.

The "typical" stakeholders considered when speaking of professional activities (i.e. customers, employees, colleagues, community, competitors etc.), are supplemented by new and different "stakeholders" that is relevant - if not crucial - when searching for personal meaning. In such a context, these additional "stakeholders" can be a particular religious or ideological perspective to which the individual feels committed, the initial vision the individual may have had of their professional life and goals, the hopes and goals they hold with regard to their ultimate professional status and achievement and the legacy they might wish to leave behind (Wade-Benzioni, Sondak and Galinsky, 2010).
Within the context of this TJ, the traveler is sent both on a journey in space and in time. At each station, they are presented with written and/or visual representations that are meant to serve as stimuli evoking responses allowing insight into how their current professional life; activities, challenges, opportunities, decisions and "products" are viewed by variety of possible "stakeholders" in their lives.

A POSSIBLE TJ

Following is a possible itinerary for the TJ above. It includes a number of possible stations along the way along with a possible script for those stations.

The first station on the journey would be to "visit" customers. Here the guide might present a picture of a group of individuals and say, "Look at the picture of these individuals. They are actually customers who use the product (or service) which you help produce."

- What do they want or expect from that product?
- What role does that product play in their lives?
- What role do you play in realizing the above?
- How do they speak of the product?
- How might you speak about it?
- Is there anything you would like to know about them? Is there anything you might want to ask them?
- Is there anything that you might want to tell them about the product, your part in it or your hopes for it?”

The guide might then ask the individual to suggest changes in the picture and/or supply other images to describe the possible meaning their endeavors have for others (including pictures they create via photography, photomontage, drawing or use of existing photographs, paintings or other images). Finally, the guide can ask the individual to write a postcard (or perhaps, in 2017 - an email) home to themselves about what their endeavor may looks like from the customer's viewpoint.

Another station on the journey can be to the individual as a professional novice. Here the guide presents a picture of individual at different ages prior to and on the threshold of their entrance to the professional world, asking:

- "What does the individual in the picture expect of you and your professional being?”

Global and national business theories and practice: bridging the past with the future
• "What does that individual think of your current professional being? Why?"

• "Can you compare and contrast yourself today with the individual in the picture? What things related to your current professional being are unknown to that individual? Is there something that you might want to share with that individual?

• How might you close any gap between the perceptions of that earlier self and yourself today?

Yet another stop on the journey would lead the individual to confront religious or ideological beliefs that they might hold. Here the guide might ask the traveler to create or source a drawing that represents some religious or ideological belief they hold, asking:

• Can you describe how the drawing relates to the relationship between your current professional being and the expectations of the religious or ideological "truth" to which you aspire?

• What items or elements appear in that drawing? Why?

• Where are you meeting the expectations of that "truth"? What must you do to move closer to that "truth"?

• What is literally or figuratively "missing from the picture" that might lead to a greater sense of meaning at work.

CONCLUSION

At the outset of this paper the author noted the tremendous interest in and need felt by many for a greater sense of spirituality at the workplace. But, it seems logical (and evident) that spirituality just doesn't "happen." By that, it seems clear that one must most likely "seek out" spirituality. It is suggested here that a TJ can help the individual discover and/or facilitate possible elements of their current professional endeavors that may lead to a greater sense of meaning and spirituality at the workplace.

The TJ encourages the individual to be proactive in seeking out different ways to view their current reality. By "visiting" the stations along the TJ, the individual may gain new cognitive tools and another "language" through which they can understand themselves and their experiences. Salkin (1994) has suggested that one of the impediments faced by many individuals seeking spirituality in their professional lives is the lack of an appropriate lexicon by which to describe and compare their various personal, spiritual and professional activities and expectations.
Only a preliminary examination of the TJ and its possible role in augmenting spirituality at the workplace was presented here. With that, it seems that the TJ has the potential to help advance the understanding of - and training in - the area of workplace spirituality. Importantly, it offers a new and novel approach to understanding and enhancing spirituality at the workplace via the application of a tool that has been successful in science education to both broaden the individual’s self-understanding and an understanding of the world in which they operate. Equally important, the proposed method calls upon the active engagement of the individual in a process. It, thus, may likely lead the individual to take ownership over their path to gaining a sense of meaning in their endeavors and the concomitant sense of spirituality at the workplace that might emerge in wake of the above.

REFERENCES

ABSTRACT

“In describing the processes of organizations as political acts, we are not making a moral judgment; we simply are making an observation about a process.”

Bacharach and Lawler, 1980, 2

The study is aimed to advance further understanding of manager’s political behavior which is the practical domain of power in action within the workplace, and to investigate the positive-beneficial dimensions of political behaviour, rather than its destructive aspects. Using qualitative research methodology we conduct individual in-depth interviews with 12 senior managers (6 women and 6 men) across 12 public sector organizations. The interviews were analysed using two key themes – (a) understanding the positive and negative view of organizational politics, and (b) manager’s engagement in political behaviour in the workplace as part of their subjective social-professional experience. The findings have shown that managers adopt and implement the rules of the political game extensively. The roots of political behaviour consists personal ambition to enhance career and self-interest goals, as well as specific organizational goals. Managers engagement in positive political behaviors through the use of tactics and techniques of influence aimed at achieving vary of goals (i.e. accomplish their work, foster legitimate management actions, support their followers, cope with internal conflict and maintain social and professional interactions).

Practitioners and leaders can use our findings first, to understand the ambivalence of political behaviours spectrum ranging from worthwhile-desirable to unwanted-harmful outcomes. Particularly, to distinguish whether perceptions of positive – beneficial political behaviour have a benefit but the ethical behaviour is not doubtful. Second, recognize when to intervene, how or if at all. Managers reasoning, interests and motivations to engage in political behaviour discussed.
INTRODUCTION

Politics in organization is simply a fact of organizational life (Ferris and Kacmer, 1992; Mintzberg, 1983) that remained inextricably intertwined construct for decades (Ferris and Treadway, 2012) and ubiquitous in organizational analysis. Despite repeated calls to eliminate or eradicate it, political behaviour remains an integral part of organization (Ellen, 2014). In this regard, political behaviour like other behaviours, can have dual effect – benefits and cost (Buchanan and Badham, 2008) and simultaneously have the coexistence of positive and negative-constructive outcomes toward the same individuals or organization (Hochwarter, 2012; Kapoutsis and Thanos, 2016). Building on recent studies that advocate positive benefits of political activity in the workplace and have offered more balanced view of that behavior (Buchanan and Badham, 2008; Fedor et al., 2008; Gotsis and Kortezi, 2010; Hochwarter, 2012; Landells and Albrecht, 2015), our goal is to examine the positive and negative roots of manager’s engagement in political behaviour within public sector organizations.

Although, scholars have discussed organizational politics for more than three decades (Ellen et al., 1979; Ferris et al., 2002; Hill et al., 2016; Pfeffer, 1983; Rosen and Hochwarter 2014; Drory and Vigoda-Gadot 2010) and its pervasiveness makes it an important area for organizational researchers (Riley, 1983), significantly, vast body of the study emphasize the negative aspects while focused on the undesirable causes and outcomes (i.e. Chang et al., 2009; Ferris et al., 2002). This tendency has led a prevailing negative conceptualization and measurement of organizational politics (Landells1 and Albrecht, 2016). Hence, many times, the political category consist behaviour or activities that are illegitimate, harmful to the organization or its members or based in self-interest) (Rosen et al., 2009). In other words, politics within the walls of organization described as stepbrother and troublesome effect of others organizational phenomena.

Conceptually, in the literature “far more attention has been given to the self-serving effects of influential others’ political behavior than to the effects political behavior has on other employees.” (Ellen, 2014, 893). These self-serving effects has investigated as generator of low performance, low job satisfaction, loss of commitment, withdrawal (Buchanan and Badham, 2008) as well as employee turnover, absenteeism, and job stress (Chang et al., 2009; Ferris et al., 2002). Moreover this bias has led scholars and managers alike to avoid the debate on the potentially functional and positive aspects for that significance intangible – invisible phenomenon even when they all recognize its real existence as generic component the organizational social fabric.
A complementary approach researchers have suggested, more recently, attempt to consider the potentially functional and positive aspects of organizational politics but without neglecting its toxic effects (Drory and Vigoda-Gadot 2010; Fedor and Maslyn 2002; Gotsis and Kortezi 2010; Hochwarter 2012; Liu, et al., 2010) and to gain more comprehensive glance into organizational politics and its behavioral derivatives (Ferris and Treadway, 2012; Thanos, et al., 2016). For example, research discuss the meaning of political skills that employees need to possess in order to cope with the political environments (see Kapoutsis et al., 2016; Chang et al., 2012), examine various political behaviour individual display in the workplace such as impression management, voice and even helping behaviour, while attempt to secure favorable outcomes and thriving in the workplace (Kimura, 2015). Other have found that political behaviour related to higher productivity, career advancement, higher innovation, and decision making consensus (Fedor et al., 2008; Gotsis and Kortezi, 2010; Hochwarter, 2012; Kurchner-Hawkins and Miller, 2006).

The premise for this study is that organization are cooperative systems of employees working together to achieve purposes as well as political arenas of individuals and group holding various interests (Brass, 2002). As Buchanan (2008, 57) noted: "most managers, if they want to succeed, have to play politics at least part of the time." Thus, based on previous studies investigated the positive-beneficial dimensions of political behaviour, rather than its destructive aspects, we ask to (a) understanding the positive and negative view of organizational politics, and (b) explain manager's engagement in political behaviour in the workplace as part of their subjective social-professional experience.

Considerin g the positive possibilities of leader political behavior

B. PARKER ELLEN III

Our research contributes to organizational politics literature in three principal ways. First, there is significant gap in the organizational politics literature since very little empirical research has explored how organizational members actually view organizational politics (Landells and Albrecht, 2015, 44). Examining pieces of manager’s political nature and behaviors enrich that theoretical discussion. Respectively, Hochwarter (2012, 51) have suggested; "As a logical step in development, scholars may find value in looking beyond the how (i.e., tactics) and what of positive politics (i.e., outcomes) by committing greater attention to the why (i.e., motives, value, objectives)". Second, we respond to a contemporary organizational science scholar’s call to develop a more balanced understanding of organizational politics and mainly to recognize the dual effect of political behavior regard its positive and negative effect at work (Kapoutsis and Thanos, 2016). Consistent to Ellen (2014) noted that "from a theoretical standpoint, more specification is needed. Construct
measurement and empirical testing of the concept will require additional description of the types of positive behaviour." (p. 895). Third, while qualitative research regarding organizational politics remains relatively rare (McFarland et al., 2012) and commonly discuss the negative 'dark side' of organizational politics or dysfunctional aspects of political behaviour (Chang et al., 2009; Ferris et al., 2002; Rosen et al., 2009), our research use qualitative research method suggests more in-depth and comprehensive understanding of manager's positive political behaviour. New qualitative work will contribute to the field (Ferris and Treadway 2012) provide greater contextual information, and “lead to new insights that may not be recognized in existing theoretical work” (McFarland et al., 2012, p.116).

The paper is organized as follows: We present the theoretical literature on individual engagement in political behaviours. We describe the methodology and data collection used of the qualitative procedures. Finally, we analyze our findings and their practical implications.

The reality is that politics are “a principal component of a firm’s social context” (Hochwarter, 2012, p. 31).

THEORETICAL BACKGROUND

The two side of engagement in political behaviour

Drew on the Aristotle philosophical idea, we are by nature political animals. Participation in political behaviour is characteristic of one's DNA (Cheng et al., 2010). Political behaviour in the organizational setting display both positive and negative implication to the observer, to recipients or victims (Buchanan and Badham, 2008). However, primarily, in the organizational politics literature, such political behaviour 'has been cast in a largely pejorative light, with research focusing on its pervasiveness’ (Hochwarter, 2012, 27) and, as a results, neglect and scarcely support for investigating the positive side of politics is recognizes in science (Fedor et al., 2008) and practice (Pfeffer 2010). Following, we discuss the two faces of political behaviour and review the recent support in the literature for the consideration of positive politics.

Forman’s classical definition (1962) describes political behaviour in an organization as behaviour that is not required as part of an assigned task, but has an influencing role, or tries to gain
an advantage. That implicitly of the bad-side of political behavior (Vredenburgh and Shea-Van fossen, 2010) classify organizational politics perceptions as a hindrance stressor (Chang, et al., 2009) and causing strain reactions (Rosen et al., 2009). Respectively, another definition describe political behaviour, as a “‘self-serving’ behavior that is not sanctioned by the organization and that likely produces conflict and disharmony by pitting individuals and/or groups against one another or the organization” (Gilmore et al., 1996, p. 482). Also, studies have investigated it as behaviors that should be avoided in the workplace and include assertive/aggressive self-serving tactics and self-promotion that can produce negative results (Ferris and Kacmar, 1992). In their book, Buchanan and Badham (2008) noted five defining features of political behaviour in organizations: influence, self-interest, damage, backstage, and conflict. Behaviour that demonstrates those five features is categorically political (Drory and Room, 1990; Ferris et al., 2002) and namely viewed as manipulative and purely self-serving. Influence refers to getting others to do or think in accordance with your intention and enhancing one’s power to influence. Self-interest refers to the achievement of individuals’ personal goals rather than organizational goals. Damage explains behaviours that are inconsistent with the organization’s goals wherein individuals act in unfavorable ways and ignoring the organizational effectiveness. Backstage refers to unformal arrangement and deals that employees organized that excludes other people in the organization. Finally, conflict is controversy among employees regard resources allocation, decision making or strategies to achieve organizational goals (Buchanan and Badham, 2008, 12).

Alongside the undesirable aspects of political behaviour, objectively its refers to a wide range of practices that help the individual to get ahead or to exploit resources in the workplace (Dubrin, 2009) and display influence tactics used strategically to meet one’s goals, and include informal activities aimed at promoting self-interest by influencing the thinking, perceptions, or behaviour of others (Hill et al., 2016). Such behaviours are not exclusively destructive influences for all individuals. We argue that, practically, through political activities that connect people under collective idea, needs or goal for the benefit of the organization, individual may gain advantage regard their aims, but, its not necessarily be contrary to the organizational goals or the wishes of their colleagues.

More recently studies and multidisciplinary approach (Fedor et al., 2008; Hochwarter, 2012; Kapoutsis and Thanos, 2016) have called to consider the dichotomous meaning of organizational politics without ignoring its negative effects. That classic definition has been expanded by researchers asking to investigate the positive individual subjective experiences during participation in organisational politics in the workplace (Dubrin, 2009; Fedor et al., 2008; Gotsis and Kortezi, 2010). The idea that organizational politics creates ‘dual effect’ and can be both functional and dysfunctional in individual and organizational terms (Buchanan and Badham, 2008), has become an interest for
researchers who attempt to explore, first, the destructive and positive elements that are potentially constructive and, second, when and where it is a useful tool at the organizational level (Ferris et al., 2007). This glance focuses on distinguish political activity and perceptions that favourably impact individual, group and organization (Buchanan, 2008; Dubrin, 2009). From that perspective, political behaviours definition encompasses both self-serving and benevolent motives in employees/managers' attempts to achieve personal and/or organizational goals (Kapoutsis and Thanos, 2016). Political behaviour refers to "intentional acts from a broad repertoire that may include influence tactics, self-presentation, impression management, voice and helping behavior to manage (create, maintain, modify or abandon) the shared meanings of organizational situations so as to produce desired outcomes that would otherwise be unfeasible" (Kapoutsis, 2016, p. 41). Relatedly, studies have found a positive connection between political behaviours included ingratiation, upward appeals, blocking and sanctions, achieving employee outcomes (i.e. promotion, salary and performance appraisal) (Higgins, et al., 2003) and attaining objective and subjective career success (Kapoutsis, Papalexandris et al., 2012). Others have indicated that leader political behaviour favorably influences subordinate outcomes such as satisfaction, mood and citizenship (Ellen, 2014; Kane-Frieder, et al., 2014). Recently, study conduct an exploratory interviews with organizational leaders have indicated "political behavior is crucial for leaders to provide followers with support... leaders recognize the political realities of their organizational environments and thus routinely participate in politics to provide their followers with performance-facilitating and career-enhancing opportunities" (Ellen, 2014, 894).

Consistent with previous research argue for considering political activity as a principle component of firm’s social context (Hochwarter, 2012) and drew on scholars that have argued for the positive impact of organizational politics (Liu et al., 2010), we argue that employees are engage in political environment and behaviours both to foster their career and to know how to socially act in the workplace. Individuals are motivated to engage in political behaviours only when they believe that doing so helps them achieve valued organizational experience (Liu et al., 2010; Mintzberg, 1983; Treadway et al., 2005). By learning the unwritten rules of the political game, employee recognize and understand the centrality of that phenomenon and how is crucial for them as well for the organization goals. Hence, in the organizational sphere, 'such purposive behaviors, which may range from active to passive engagement, create a context within which employees and managers operate to attain their goals' (Kapoutsis and Thanos, 2016, 310).

Consist with Ellen (2014) that have suggested "although some may argue that leaders’ political behavior on behalf of followers simply is an extension of self-interest, it is possible, if not likely, that these self-interests and collective interests are not mutually exclusive" (P. 894), we argue that display techniques of influence of tactics in the organizational setting is not harmful constantly and managers
can and do behave politically in efforts to foster organizational goals, benefits their followers as well gain self advantage. Further, the main research question directed to understand - how managers in the Local Authorities explain the meaning of positive and negative political behaviour?

**METHOD**

**Sample**

We used theoretical sampling, which refers to a selection method of participants who are deemed to be “particularly suitable for illuminating and extending relationships and logic among constructs” (Eisenhardt and Graebner, 2007, p. 27). According to Creswell (2014), individuals from the initial quantitative sample should be selected for the qualitative follow-up sample. Hence, we conducted semi-structured, face-to-face interviews with 12 managers (6 women and 6 men) from the local and regional councils in Israel.

**Data analysis**

All interviews were recorded and transcribed for clear identification of the codes. Coding the interviews was carried out according to Miles and Huberman’s (1994) procedure: We began by deriving themes extracted from the literature and applying them to the interviews, as relevant. We continued identifying and assigning more themes and subthemes to the interviews as they emerged while reading them. Second, we reorganized the data according to the codes in order to confirm that all the segments with the same code had the same meaning. Third, the codes were named and operationally defined so that their meanings would be clear and would correspond with the conceptual framework. Finally, we grouped the codes into more meaningful units of analysis, especially according to the model variables. We will present and interpret these findings in order to expand on the quantitative results (Creswell, 2014).

**RESULTS**

Interviewees described the various aspects of organizational politics, and especially political behaviour. The interviews' analysis reveal three key themes: organizational goals, personal interests versus corporate interests, and organizational career that motivated the political behaviour. The descriptions of these themes moving the range of positive to the negative political behaviour.

Organizational goals:

Agreement on the goals of the organization and a willingness to pursue these goals is a source of organizational politics. Those who agree with the goals of the municipality or the council will
cooperate and promote its achievement. Conversely, those who oppose the stated goals shall inaction or actively compete against achieving them. The following citations illustrate the two sides of the coin:

"Those who identify with the mayor and his party, trust in them is higher, and they will get more out of the system. If he asks for some social services project, they will do the maximum from political motives and commitment. It goes together. In addition, if the opposite occurs [if you do not identify with the mayor and his party], then you will be less involved. I saw that in the last election. Those that identified with the right (the mayor's from a rightist party), were more 'small minded.' There's a lack of trust on the opposition side" (9)

"My trust in my co-workers is very high, even when it comes to political internal rivals. Ultimately, if we look at everyone in the organization, we have a common goal. Although, everyone chooses a different way to achieve the goals" (4)

Personal interests versus corporate interests:

Political behavior can be used as leverage to promote interests. On the scales are personal interests on the one hand and organizational interests on the other hand. While promoting corporate interests perceived positively as an activity conducive public domain, promoting personal interests perceived negatively as an individual benefit at the expense of the organization as a whole. The following citations illustrate the two sides of the coin:

"My approach is that if the system works, even if there are structural defects, they are subject to change. Trust in the existing system allows me to act in directions that I want, or put pressure places where I can renew, change and do. Similarly, if I want to change politically, to intervene, to speak and to decide otherwise" (5)

"Some people pointing on political people, but they themselves are engaged in politics. If people are engaged in political activity extremely ... and take advantage of the time to promote personal political interests, it is perceived as negative and irresponsible in terms of filling the job at work" (12)

Organizational career:

One of ambitions of many managers is to advance to senior positions during their career. Political behavior is one of the main means to achieve this goal. As opportunities for advancement decreases as
one goes in the organizational hierarchy, the competition has grown. Different political behaviors are not perceived as legitimate by all. The following citation illustrates the two sides of the coin:

"I am always striving for more. I want to advance. I love roles with responsibility…Everyone in the municipality wants to advance. You can advance, if you have vitamin P. If you do not, you can go to million tenders and you will not get the job. Promoting competition will cause mistrust. If there are two candidates, one dirty up the second. There are who compete for a position and still remain friends" (7)

DISCUSSION

The study is part of a new stream of qualitative studies on political behavior. Therefore, the qualitative research method enables to describe, analyze and interpret political behavior and expose the differences between positive to negative politics. Building on recent studies that advocate positive benefits of political activity in the workplace and have offered balanced view of that behavior (Buchanan and Badham, 2008; Fedor et al., 2008; Gotsis and Kortezi, 2010; Hochwarter, 2012; Landells and Albrecht, 2015), the main concern of this study was to address the question - how managers in the Local Authorities explain the meaning of positive and negative political behaviour? The main themes we presented and analysed simultaneously reveal political behaviours, both positive and negative. These themes reinforce the assumption that political behaviours can alternately be perceived as contributing or harming the organization and its employees. The interviews reveal that employees' political perceptions are likely to play a key role in their attempt, effort and actions to promote both personal, team and organizational processes as well for maintain social foundations. These findings strengthen previous argument that perception of positive and negative politics would be separate dimensions of political behavior (Fedor et al., 2008). One of the characteristics of political behaviour, whether positive or negative, is the attempt to gain any advantage. The interviewees examine that managers are motivated to engage in political behavior not only as part of self-service concern and they utilize their political resources, professional skills or status to empower and promote collective interests at the team or organizational level. Based on Ellen (2014), we conclude that these self-interests and collective interests are not mutually exclusive. In this respect, political behavior will be perceived as positive or negative according to the motives that leading this behavior. In general, if the behavior is intended to promote or support organizational interests, such as the organizational goals or decisions, it may be perceived as positive behavior. Behavior may deviate from the organizational norms but yield positive organizational results (Warren, 2003).

In sum, the findings of this study contradict the Mintzberg's approach that political behavior is dysfunctional (1983). From this perspective, what may make political behavior positive is the extent
to which those behaviors are seen as legitimate or consistent with the organizational goals or effectiveness (Fedor et al., 2008). However, when the focal point is achieving personal goals or protecting personal interests that accompanied by unethical behavior, disproportionate and offensive strategies, the behavior will perceived as negative.

PRACTICAL IMPLICATION

"Just because you do not take an interest in politics doesn’t mean politics won’t take an interest in you.”

(Pericles)

Our study has implications for organizational leaders and managers. Two major keys and important insights that can be applied are (a) that most useful intervention is not to try to eliminate organizational politics and (b) that mapping and studying its bilateral attributes (nice and the nasty) in the workgroup context, is inevitable. Broadly, the findings suggest that political behaviour is the practical domain of power and influence in action, becoming more sophisticated through the use of tactics, strategies or techniques of influence. The roots of political behaviour lie in personal ambitions, but there are likely to be differences among individual’s engagement in such behaviour regard their intention, funs, needs and positions.

Trough the complementary lens of organizational politics, we have recognized the ambivalence characteristics of political behaviour included both negative and positive aspects, thus, managers must have the ability to isolate harmful aspects while they are using political means. Leaders and mangers could estimate the extent to which the political means implemented in their organizations are nourishing negative circuits and to eradicate it publicly, clarify and deter. Understanding the limits and types of politics accepted in their workplace is critical. To that end, they should have a clear view of themselves, promoting honest self-reflection and self regulation, must behave with consistency and high level of transparency as managerial example hold political power. Mainly, they must hold themselves to a high ethical standard. Practically, they should allow the use of politics in their workgroup, as part of a natural human behaviour that it can not be avoided, but not as a corrupting means. For example, their positive political behavior included tactics and strategies that can complement legitimate management actions or potentially can help them to embrace their followers in the workplace. Moreover, in order to reduce the dysfunctional possibilities of political behaviours they must have a solid vision of the culture they want to cultivate, the boundaries and reasonable of the use of politics in their workgroup.

From managerial perspective, most managers, if they want to remain, withstand, undamaged and mainly to succeed, have to play politics at least part of the time. Thus, there is a need to be able to exercise and implement personal influence or power rather than rely on professional status or the
authority of management position in the workplace. In intricate circumstances where conflicts and dispute are substantial part of the organizational reality, managers need to demonstrate other strategies, tactics and actions to remove such blockages rather than to act due to their official status or rank.

Finally, the puritan perspective on politics that employees should not get involved at any level since it include 'dirty tricks', unethical actions and is occur in the province of con artists, will be considered as mishandle. Attempting to work against it, or worse, to ignoring it, achieved the opposite outcome - strengthen the negative perception regard political behaviour as self serving value that has harmful and destructive at the organization level. As argued previously, organizations are cooperative systems of employees working together to achieve goals as well as political arenas of individuals holding various interests. One valuable insight is that while the political dynamics vary from one organization to another, from one skilful player to another, leaders and managers awareness and perspective is necessary to recognize when to intervene, how or if at all.

RESEARCH LIMITATION

As with any empirical study, the current study has some limitations. First, the study is based on respondents only from local government. You cannot ignore the structural and organizational characteristics that distinguish these organizations, and may influence organizational politics. For example, by virtue of their function, various government organizations have an impact on local government, and we have to consider the link between the national and local level. Second, the sample includes only 12 respondents. Although qualitative studies usually are based on small samples, yet we must be careful in drawing conclusions. Finally, organizational politics is one of the sensitive issues researching. Although the interviews were comprehensive, we hope that the interviewees answered the questions honestly and that the research does not 'suffer' from social desirability.

FUTURE RESEARCH

Following the strengths and weaknesses of this study, we will offer a number of recommendations for future studies. First, qualitative studies are needed to further expose other aspects of political behavior, both positive and negative. So far, studies have mainly focused on the reasons of political behavior. In order to assess the differences between positive and negative political behavior, it is advisable to examine whether there are different behaviors under each of the dimensions. Second, studies in various sectors, public or private, may expand the knowledge on
political behavior and expose a wider range of behaviors specific to each sector. Finally, without a doubt, qualitative studies may serve as a fertile ground for establishing valid and reliable research measurement for positive political behavior.

REFERENCES

effects of that create division, we have failed to gain a comprehensive understanding of the phenomenon. Specifically, we have not considered how leaders engage in political behaviors to benefit followers. I hope the leader political support construct can provide an avenue for this interesting and under-researched area.

DETERMINANTS OF SPORT COMMITMENT AND PURCHASE INTENTION OF RUNNERS: AN EMPirical EXAMINATION

Koronios, Konstantinos; Kriemadis, Athanasios; Gkatsis, Georgia; Manousaridou, Genovefa
Department of Sport Management, University of Peloponnese, Sparti, Greece

ABSTRACT

Worldwide, activity levels and participation in sports among individuals, have had an increasing trend over the last few years, with leisure activities (i.e., running, climbing, trekking etc) being among the most prevalent types of sport participation. From the abovementioned types of sport, physical and leisure activities have had a tremendous increase in popularity and number of participants, whilst group sports participation percentages have elevated to a lower degree. The results indicate that there is a development of recreational sport participation which has drawn the attention of a growing number of new participants, along with the recruitment of individuals from other types of sport. The most well-known recreational sport activity with participants of all ages, is running.

The aim of this research is to examine the determining factors of runners’ motivation to maintain involvement, utilizing an expanded version of Sport Commitment Model as a theoretical frame of reference, with the addition of the self-congruity variable, in order to explore sport-related consuming behavior of participants. A quantitative method was used for the purpose of this study and a total of 1326 questionnaires were successfully completed and analyzed by means of SPSS and AMOS. The Sport Commitment Model was validated and findings supported commitment to be a predictor of purchase intention and participation frequency of runners. Moreover, self-congruity was found to impact only on participation frequency.
INTRODUCTION

Worldwide, activity levels and participation in sports among individuals, have had an increasing trend over the last few years, with the most prevalent types of sport participation being physical activity, group sports, and leisure activities (i.e., climbing, trekking etc.) From the abovementioned types of sport, physical and leisure activities have had a tremendous increase in popularity and number of participants, whilst group sports participation percentages have elevated to a lower degree (Casper et al., 2007). The results indicate that there is a development of recreational sport participation which has drawn the attention of a growing number of new participants, along with the recruitment of individuals from other types of sport. The most well-known recreational sport activity with participants of all ages, is running. Historically, running is one of the earliest types of sport, rooted in ancient Greece via marathon participation (Pate and O’Neill, 2007). The sport of running has consistently demonstrated stable participation rates and nowadays is experiencing a significant growth in total demand. More specifically, running is among the most attractive sports in Europe with an estimated 50 million individuals running systematically with their annual sport expenditures being approximately € 9.6 billion per year. According to this evidence, running can be characterized as one of the biggest and fastest developing sport markets in the world (Scheerder et al., 2015)

Taking into consideration the substantial financial effect of the sport of running, more thorough research is needed in order to single out the perceived significance level of factors correlated with commitment to running. Several studies in the era of sport management have suggested theoretical models pertaining to sport participation (Brooks, 1994; Milne and McDonald, 1999; Green, 2003; Hughes and Shank, 2005), with the majority of them being too complicated and inadequate to integrate core sport marketing concepts and strategies.

Based on the original (Scanlan et al., 1993), adjusted (Alexandris et al., 2002) and expanded (Casper et al., 2007) sport commitment model, the purpose of the current research is to further explore the above mentioned model, validating the factors that significantly affect commitment to running, as well as to explore its efficiency to affect individuals’ sport consumption behavior. Intensifying runners’ commitment is a crucial task of sport management, given that commitment indicates persistence in a specific activity and relates to circumstances where individuals either wish to, or ought to maintain their involvement. Commitment- relevant results are crucial for the policy makers involved with
the sport industry, as they can be taken into consideration for the formulation and implementation of efficient retention strategies (Casper et al., 2007).

Previous studies have examined sport participant comportment by utilizing variables such as involvement (McGehee et al., 2003), loyalty (Kang, 2002), intention (Hagger et al., 2002) and motivation (Milne and McDonald, 1999). Although it is explicit that more devoted participants will have a greater degree of loyalty to the specific sport activity helping the organization achieve its strategic objectives, along with profitability improvement (Iwasaki and Havitz, 2004), the empirical exploration of antecedent factors influencing individuals’ sport commitment is unclear.

THEORETICAL BACKGROUND

Sport commitment can be delineated as a psychological variable depicting the devotion and determination to maintain sport participation (Scanlan et al., 1993). Social exchange theory provides the dominant theoretical basis for the development of the sport commitment model (Kelley and Thibaut, 1978), which was established owing to the sufficient indications that enjoyment is one of the main participation motives in divergent sport samples (Scanlan et al., 1993). In contrast to previous studies and models, the current model uses the variable of commitment of sport participants as it contributes to a thorough understanding and sport-consistent perspective of this behavior and its subjacent psychological status.

Psychological commitment has been proposed as one of the variables which illustrates the attitudinal element of loyalty and contemplates behavioral loyalty (Park and Kim, 2000; Alexandris et al., 2002). More specifically, sport commitment can be delineated as a psychological status illustrating the eagerness and determination to maintain exercising via a specific program, a specific sport, or via common athletic activities. Intensifying individuals’ commitment is a crucial assignment for sport managers, as according to previous results approximately 50% of the individuals who begin participation in a sport activity withdraw from sport and physical activity in a short time period (Dishman, 2001). The indicated data recommend that studies on commitment related attitudes are crucial for sport practitioners, in order to implement efficient retention strategies (Alexandris et al., 2002).

The sport commitment model presupposes the existence of a variety of antecedent factors which can influence participation variations, such as sport enjoyment, involvement opportunities, social constraints and personal investments (Scanlan et al., 1993). Sport enjoyment can be delineated as an assertive emotional reaction to the experience of sport participation that mirrors generalized sentiments such as happiness, sympathy, and amusement. Researches on sport and leisure motivation evidently prove this variable. It’s extensively supported that committed sport participants are mostly intrinsically
motivated. Happiness, sympathy, and amusement have been found to be crucial motives for taking part in sport (Alexandris et al., 2002).

Personal investments can be characterized as all the personal assets devoted by individuals, involving time, exertion, intensity and money, which cannot be recovered in case of termination of sport participation (Casper et al., 2007). The significance of this variable is correlated with the type of the sport. For certain types of outdoor sport, namely marathon running and cycling, significant expenditure in time, exertion and money for individuals are demanded. On the contrary, other types of sport like basketball and soccer require lower monetary and time investment. Moreover, researches have indicated that time needed for sport is one of the most crucial among the important factors influencing participation (Alexandris et al., 2001).

Social constraints refer to the common anticipations and patterns of participants’ society which generate the sense of commitment to maintain sport participation (Scanlan et al., 1993). According to the previous approach, the higher an individual’s compulsion forced by society to maintain their participation in sport is. There is a similarity between the aforementioned variable and the anticipated social norm construct, which has been mentioned in the theory of reasoned action as well as in the planned behavior theory (Ajzen, 1987). Although social constraints appear to play a crucial role in younger individuals’ participation, as family and companions generally affect their conduct, it is controvertible whether one’s social surroundings affect commitment to sport, among adults. Previous studies, which tested the abovementioned theories in sport context displayed marginal contributions of the social norm of attitudes to the prognostication of sport participation (Alexandris et al., 2002).

Involvement opportunities can be described as appreciated opportunities the presence of which is directly correlated with the continuance of sport participation (Scanlan et al., 1993). More specifically, involvement opportunities can be characterized as all the perceived advantages that an individual obtains via continuing sport participation including companionship, socializing, sport expertise, and physical improvement (Casper et al., 2007). Furthermore, this variable is correlated with the collateral advantages of the continuance of sport participation (Alexandris et al., 2002). Individuals’ expectations about physiological, psychological and social advantages from exercising have been proposed as potential paradigms.

Despite the strong reputation of running, which is one sport enjoyed by all ages, there is a scarcity of studies attempting to quantify the purchase behavior of runners. According to previous researches (Kang, 2002; Hee et al., 2009), one notion which could enlighten individuals’ sport consumption behavior is self-congruity. The self-congruity theory (Sirgy, 1986), hypothesizes that individuals’ decision making is contingent on the degree of congruency amidst their self-concept and the stereotyped image of the individuals considered to be found in a particular condition. In the framework
of sport consumption, previous results (Brooks, 1998; Kang, 2002) support that self-congruity plays a crucial role in an individual’s determination to become involved in sport or exercise participation. However, the applicability of the theory remains understudied and more research is needed for the application of self-congruity in the sport consumption field (Kang, 2002). Although it is reasonable to suppose that an individual committed to sport activity would participate regularly and would be more prone to allocate a higher budget on equipment acquisition, to date, no significant correlation has been proven to be found among the self-congruity variable and sport consumption behavior.

The aim of this study is to develop an expanded version of the sport commitment model in runners’ population, as well as to provide a more comprehensive understanding of the relations among the antecedent factors influencing runners’ participation as well as their sport-related spending. Based on the literature, the suggested model (Figure 1) presents the proposed interactions. All the hypothesized variables are displayed in the above mentioned model. Commitment and Self–Congruence are expected to be positive associated to participation frequency and purchase behavior.

![Figure 1. Sport Commitment, Self-Congruence and Behavioral Intentions Model](image)

**METHODOLOGY**

A quantitative method was used for the purposes of the study and questionnaires were collected from runners who had participated in an international running event (5km and 10km) in Greece. Individuals were enlisted to fill in a web-based survey with the help of the organizing committee of the event, which sent out an e-mail invitation to the participants. A total of 1326 questionnaires were successfully completed and analyzed.
RESULTS

Of the 1326 respondents in our study, 834 (62.9%) were male and 492 (37.1%) were female. The participant’s age varied from 13 to 69 with a mean age of 37.75 years (SD=10.25). The majority of the participants held a bachelor degree (45.5%) while 26.5% had completed post graduate studies. Professionally, half of them (57.4%) were employed in the public or private sector and 21.6% worked as freelancers. In terms of marital status, 51.9% were married or attached, 42.8% were single and 5.4% were divorced or widowed. The monthly revenue was under €1,000 for half of the respondents (57.5%) while 32.7% earned between €1,000 and €2,000; 9.8% earned more than that.

Measures

Sport Commitment Scale (SCS) was measured using Scanlan et al.’s (1993) model as it was modified by Alexandris et al. (2002). As a result, the five scales of SCS (commitment, enjoyment, investment, social constrains and involvement opportunities) were estimated by four items each, on a 5 point Likert scale. Moreover, self-congruity was assessed by eight items on a 5 point Likert scale based on Sirgy et al.’s (1997) work. Finally, participation frequency and purchase intention were measured with one straightforward question each.

Data Analysis

Using SPSS statistical package, data distribution, descriptive statistics and internal consistency analyses were conducted while data were eventually analyzed using AMOS 21. A confirmatory factor analysis (CFA) was carried out to investigate the validity of Sport Commitment Model (SCM) and Structural Equation Modelling (SEM) analysis was performed to study the effect of commitment and self-congruity on participation frequency and purchase intention of runners.

CFA and SEM

The data were analyzed for normality with skewness and kurtosis to be acceptable for the variables; a reliability analysis was also carried out with the following results: Commitment (4 items, alpha Cronbach’s =0.78); Enjoyment (4 items, alpha Cronbach’s=0.82); Social Constraints (4 items, alpha Cronbach’s =0.66); Involvement Opportunities (4 items, alpha Cronbach’s =0.65); Personal Investment (4 items, alpha Cronbach’s=0.62) and Self-Congruity (8 items, alpha Cronbach’s = 0.93). The initial results of confirmatory factor analysis revealed an improper fit. Modifying the model, an item from the sub-scale social constraints and another from the sub-scale involvement were removed as their loadings were poor (0.26 and 0.29). The analysis of the final model revealed an acceptable fit (CFI = 0.93; RMSEA=0.092) and the ratio x²/df was lower than five that is within the acceptable limits (Santi et al., 2014; Byrne, 2010). Finally, correlations among the factors were calculated to support the different constructs.
Moving on to the central analysis, SEM was used to examine the effect of commitment and self-congruence upon purchase intention and participation frequency. Based on Casper’s et al. (2007) extended model, SCM was used to study the relationship among sport commitment, participation frequency and consumption behavior. Moreover, self-congruency variable was included in the present model. The fit indices of the model were acceptable (CFI = 0.98; NNFI= 0.9, RMSEA=0.095) and the ratio x2/df was lower than five. Personal investment, enjoyment, involvement opportunities and social constraints revealed to have an effect on commitment with involvement opportunities to be the most powerful predictor (β=0.69). Moreover commitment was found to be a predictor for purchase intention (β=0.34) as well as for participation frequency (β=0.39). In terms of self-congruity, results indicate a significant effect only on participation frequency (β=0.07, p<0.05).

**DISCUSSION, IMPLICATIONS AND FURTHER RESEARCH**

The aim of this study was to examine the applicability of an expanded version of Sport Commitment Model, based on the modifications made by Alexandris et al. (2002) in runners as well as to study the influence of self-congruity and commitment on participation involvement and purchase intention. The first objective of present study was fulfilled by the model verification; the internal consistency reliabilities of the sub-scales and fit indices of confirmatory factor analysis were sufficient. However, attention should be paid to the two items of the proposed sub-scales that were removed due to poor loading in CFA. Previous studies have supported the SCM but also with some adjustments; especially in terms of social constraints sub-scale (Sousa et al., 2007) and investment sub-scale (Alexandris et al., 2002).

The second objective of the research was to predict runner’s participation and consumption using sport participant commitment and self-congruity theory. The results revealed that commitment had a positive and significant impact on their consumption and participation frequency. This finding is consistent with previous research (Casper et al, 2007) that proposed committed players to spend more money on their equipment, associating monetary values to psychological state and also to play more frequently. However, self-congruity revealed to affect only participation frequency and not the monetary consumption. This finding may also be explained compared to the descriptive statistics of the survey; indeed it has been mentioned that the monthly revenue of our participants was under €1,000 for half of the respondents (57.5%) while 32.7% earned between €1,000 and €2,000 explaining a low income. Previous studies displayed a positive connection between self-congruity and consumer behavior (Sirgy et al, 1997).

This paper revealed personal investment, enjoyment, involvement opportunities and social constraints to have a positive effect on runner’s commitment. Additionally, runners’ psychological commitment...
has an impact on their consuming behaviors and participation frequency while self-congruity was found to be associated only to participation frequency.

The results of this study could provide useful insights to marketing managers as a way to increase consumption through sport commitment. Moreover the linkage between participation frequency and commitment could help managers to understand the reasons athletes choose to participate in particular running events. Increasing involvement opportunities and enjoyment could have a positive impact on athletes’ purchase behaviors. Finally the validation of sport commitment model in runners could present a useful framework for all the parties involved in sports (e.g. coaches).

Nevertheless, the findings were based on a single event. Therefore, more research is proposed to empirically examine the consumers' behaviors among participants in events of various levels of difficulty. Another limitation of this research is the use of single item variables for purchase intention and participation frequency. Furthermore, more research is needed to shed light in differences in terms of lifestyle among participants, which could contribute significantly to their consumer behavior.

ABSTRACT
The paper is devoted to the analysis of development prospects and problems of Eurasian Economic Union of Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan (EEU). It considers integration problems, effects and contradictions of economic integration inside EEU. The main purpose of the paper is to investigate trade effects of economic integration in emerging market of the Eurasian economic union and contradictions of the integration among the participants of this union. The paper shows that the major integration challenge inside EEU is the domination of the redistributive effects over the creative one.

Keywords: economic integration, effects of economic integration, trade, emerging market, Eurasian Economic Union, EEU, creative effect, distributive effect.

INTRODUCTION
Today, the contours of global competition are defined mostly not by economic cooperation of individual states but interaction of various integration associations operating in the global economy. That’s why the most important feature of any such project is a balance of trade effects, which eventually can determine its integration competitiveness in the world economy. It is the inner core of integration project, based on a combination and harmonization of the interests of states, which participate in this project.

Eurasian Economic Union – EEU (started functioning with January 1, 2015) is an international organization of regional economic integration. Previous to this date The Customs Union and The Common Economic Space functioned within the institutional structure of the Eurasian Economic Community (EurAsEC). Thus, the 23-year implementation of the Eurasian integration the project has gone through four stages: 1) Free Trade Area as CIS countries (1993-2010); 2) Customs Union (2010-2011); 3) Common economical space (2012-2014); 4) Economic Union (2015 - Currently).

The Eurasian Economic Union (EEU) comprises 5 member states (such emerging markets as Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan), which are party to the founding treaties of the union. It should be emphasized that the last three stages this integration project took five years, which
certainly indicates the ultrahigh pace of integration processes. It is worth noting that not always in the implementation of such initiatives speed ensures proper quality, as each successive stage of regional economic integration requires states more responsible approach to the coordination and harmonization of their individual interests in the framework of the integration associations, gradually transforming the approach to defending the collective interests of integration association in the system of international economic relations.

The main purpose of the paper is to investigate trade effects of economic integration in emerging market of the Eurasian economic union and contradictions of the integration effects received its participants.

**EFFECTS OF ECONOMIC INTEGRATION: LITERATURE REVIEW**

Economic integration is defined as "the abolition of discrimination within an area" (Balassa, 1961). Economic integration theory “can be defined as that branch of tariff theory which deals with the effects of geographically discriminatory changes in trade barriers” among countries (Lipsey, 1960). According to Machlup (1977) integration is the process of combining separate economies into a larger economic region. Machlup (1977) further argue that integration is concerned with "the utilization of all opportunities of efficient division of labor".

Studies discussing trade effects from the economic integration and explaining the theoretical implications of preferential trade agreements are based on the study of Viner (1950).

In literature we can find two types of economic integration effects:

1. *static effects*;

2. *dynamic effects*.

Static effects can be divided into two effects: trade creation effect and trade diversion effect (Viner, 1950). *Trade creation effect* means the situation when the domestic production of a good in a member country is replaced by the imports of the same good from another member country within the customs union because of the lower cost production.

In its turn, *trade diversion effect* can occur when the imports from a non-member country are replaced by the imports of a member country because of the removal of tariffs between members and the application of common customs tariffs to non-member countries (Jošić and Jošić, 2013). A number of studies have claimed that trade diversion may actually be beneficial in the case of developing countries and markets (Bhambri, 1962; Sakamoto, 1969).
As apposed to static effects of economic trade integration, the less known but much more important are dynamic effects. Balassa (1961) carried out the first systematic survey of economic integration’s dynamic effects. According to him, dynamic effects of economic integration and customs union creation are:

1. **Effects on economies of scale.**

Corden (1972, p.465) firstly introduced the concept of economies of scale into the customs union theory. Economies of scale requires a larger market than is possible within a particular country. As the economic subjects are obliged to be optimal efficient, the economies of scale will depend on the growth of production. Balassa (1961) argued that small markets increase costs, limit the extent of product specialization, reduce competition, and lessen the incentives for technological improvements.

2. **Effects on terms of trade.**

Terms of trade of member countries may improve because they can now have greater bargaining power. Nowadays developing countries and emerging markets are now adopting trade liberalization and deregulation policies, as part of their overall stabilization and adjustment programs as agreed with international organizations. They are now looking at economic integration schemes as an instrument for a more competitive insertion into the global economy and international trade (Rueda-Junquera, 2006).

3. **Effects on competition.**

Access to the customs union and other higher forms of economic integration enlarges the market in comparison to protected trade and gives a producer access to new forms of competition. In other words, the increase in competition among enterprises forces the economic subjects to be more efficient in order to gain a new market share. An economic integration association may be welfare increasing if the partner countries are actually competitive but potentially complementary (Meade, 1955).

4. **Effects on investment and capital formation.**

Some forms of integration (for instance, customs union and other higher forms of economic integration) could enhance the investment from outside investors and provide stimulus to economic growth. Investments are attracted to the most productive and competitive sectors which are able to survive on the market.

Some studies (Baldwin et al., 1995; Dunning and Robson, 1988; Dee and Gali, 2003) introduced the concepts of investment creation and diversion. When investment barriers are removed, investment creation is the case when production is moved from a high-cost source to a lower-cost source in the union (Dee and Gali 2003). Investment diversion occurs when production is moved from a low-cost non-member country to a higher-cost member country of the union (Dee and Gali 2003).

5. **Effects on technological advances (innovations).**
Economic integration can improve technological innovations and progress through R&D programs. Knobel offered an approach to classification of economic integration’s effects and motives on emerging markets (using the case of the EEU) (Knobel, 2015). He divided effects into two groups: creative effects and redistributive effects.

1. Creative effects. The presence of barriers to trade between the two countries produces inefficiency of resource use and reproduction (Egger and Larch, 2008; Pahre, 2008; Gruber, 2000; Manger, 2009; Baldvin and Jaimovich, 2012; Fugazza and Robert-Nicoud, 2010).

   This is due to the fact that trade restrictions, as well as any economic barriers, generate irreversible loss of aggregate social welfare (Basevi, 1968; Baier and Bergstrand, 2004; Siriwardana, 2007).

   In the absence of such barriers various sectors of the integrating countries could produce and sell to each other and to consume large quantities of products. Removing mutual trade barriers releases, and actually creates, the resources which are not made earlier and are distributed among the economic integration participants, thereby increasing their competitiveness (Baldwin and Wyplosz, 2003).

2. The redistributive effects. One or more economic integration members, which are interested in its expansion for whatever reasons (including, perhaps, and non-economic), are attracting new members through the partial transfer of their resources to the integration agreement partners.

   In this case, the other participants are interested in the integration due to the reallocation of resources in their favor (Baier and Bergstrand, 2004).

   Integrated associations benefiting from the effects of the second type (the redistributive effects) are capable to expand and engage new members faster than those based benefiting from the effects of the first type (the creative effects). In this case the distributive effects can offer the integration members the concrete financial benefits in the short term (Knobel, 2015). However, the overall competitiveness of this type agreements is growing much more slowly (or not growing) than the agreements of the first type (Baier and Bergstrand, 2007).

   Creating an additional resource in the integration associations can be considered as an additional source of economic growth, which is especially important in the current conditions. Thus, the strong growth in the Asia-Pacific region in the last 15 years are largely associated with the development of integration processes (Calvo-Pardo et al., 2009).

   On the other hand, there are some contradictions within the economic integration association. For example, the major integration challenge inside EEU is the domination of the redistributive effect over the creative one (Knobel, 2015). Knobel (2015) showed the need in redistribution mechanism inside EEU as a necessary condition for getting the potential positive economic effects of free trade with other countries.
THE EEU INTEGRATION RESULTS: SUMMARY STATISTICS

The analysis of the EEU members’ external trade indicators approves the idea that the creative and redistributive effects don’t appear in this integration union in their pure sense. For example, in contradiction to the fact that some trade barriers are removed, the total export flows of the EEU members don’t grow but even fall down (Figure 1).

Figure 1. Export in goods of the EEU members, mln US dollars

The reduction in the volume of trade between the EEU members in 2015, was less pronounced than the reduction in their total trade volume (Figure 2).

Source: authors’ own calculations on the basis of Eurasian economic commission statistics.

Figure 2. Mutual trade of the EEU members, 2010-2015, mln US dollars
It is important to emphasize that Russia plays a leading role in a mutual trade with all EEU members. The entry of Armenia and Kyrgyzstan into the EEU in 2015 has affected insignificantly the structure of mutual trade due to the small size of their economies. By the end of 2015, a large part of the mutual trade is realized by Russia with Belarus (57%) and Kazakhstan (33.5%). Also Russia interacts most than other partners in the trade with Kyrgyzstan (3.2%) and Armenia (2.8%). Other significant level of mutual trade was reached between Kazakhstan and Kyrgyzstan (1.9 %), and Kazakhstan and Belarus (1.3 %).

The trade with the EEU partners amounts to only 8% of the total Russia’s exports volume, while for Belarus it reaches almost a half (41%) and for Kazakhstan the mutual trade contribution has grown up to 31% (Figure 3).

Source: authors’ own calculations on the basis of Russian Integrated Foreign Economic Portal Data and Eurasian economic commission statistics.

Figure 3. Mutual trade of the EEU members, mln US dollars

The reduction of foreign trade volume became a major factor in the fall in EEU member’s customs revenues (Figure 4). In total Belarus, Kazakhstan and Russia fell short of 45% import customs duties to their budgets in 2015.
It is obvious that the analyzed period of the EEU existence is not long enough for any conclusions and is aggravated by a range of politic and economic factors. However, it is possible to find out certain contradictions in the EEU members integration process.

**ECONOMIC INTEGRATION CONTRADICTIONS IN EMERGING MARKETS: THE EEU EVIDENCE-BASED PRACTICE**

It must be emphasized that strengthening positive effects noted above is very difficult without a coordinated approach of the EEU members to implement trade, industrial and agricultural policy.

«Combine harvester-threshers» case: The contradictory interests of the EEU countries in the implementation of non-tariff regulation tools in the conditions of application of common domestic market protection measures in relation to products from third countries

Trade policy case becomes especially apparent after Russia's WTO accession in 2012. Russia's WTO obligations of binding customs duties became a reason of the question about the mechanisms of the EEU common external customs tariff under conditions of Russia's WTO participation, as the EEU countries to join the WTO independently and obligations made by these countries to the WTO may vary. On 19 October, 2011 the President of the Russian Federation signed the Federal Law № 282-FZ «On the ratification of the Treaty on the functioning of the Customs Union in the framework of the multilateral trading system». Treaty on the Functioning of the Customs Union in the framework of the multilateral trading system was signed on May 19, 2011 and demanded ratification. The treaty was made to promote proper functioning of the Customs Union in the event of the accession of one or more of its members to the World Trade Organization. From the date of accession by any country to the WTO provisions of the Agreement (Marrakech Agreement Establishing the WTO) become a part of the
legal system of EEU. The first to join the country shall inform the other countries and to coordinate actions with them about commitments as a condition of its accession, requiring changes to the legal system of the Customs Union. At the subsequent accession to the WTO of the other country its obligations (taken as a condition of joining the WTO) will also become a part of the legal system of the Customs Union. Commitment actions must be consistent with the rest countries of the Customs Union. Thus, the tariff commitments made by the Russian Federation to join the WTO and the schedule of binding rates also apply to Kazakhstan and Belarus, which were not WTO members in 2012 yet.

Such a situation has lead to certain conflicts of interest in the interaction of the EEU economies. The situation with the market of combine harvester-threshers is very indicative. With Russia’s accession to the WTO the common customs tariff was amended, reducing the size of import duty for HS code 8433 51 000 – «combine harvester-threshers» (the code of the Single Commodity Nomenclature for Foreign Economic Activities of the EEU) from 15% to 5%. Realizing that this situation may swipe at the domestic producers of agricultural equipment, in July 2012 at the initiative of Russian producers – «Rostselmash» (the largest market participant) and Krasnoyarsk Combine Plant (part of Concern «Tractor plants») was launched a safeguard investigation. In December 2012 a provisional safeguard measure (ad valorem duty) was imposed on combine harvesters modules and harvesters in the amount of 27.5%. Analysis of information obtained during the investigation conducted by the Eurasian Economic Commission led to the conclusion that there are grounds for the application of a safeguard measure - import surges and such imports threaten to cause serious injury to the importing member’s domestic industry. The Eurasian Economic Commission decision of June 25, 2013 № 143 imposed a final safeguard duty on modules combine harvesters and harvesters for 3 years. This safeguard duty was imposed for a period of up to 7 March 2016 inclusive in size (percentage of the customs value) in 2013 - 26.7%, in 2014 - 26.2%, in 2015 - 25.7 %, in 2016 - 25.2%.

Following this decision, the events begin to develop promptly, as Kazakhstan has its own point of view on this issue and this view is different from the position of the Eurasian Economic Commission. In Kazakhstan, there are no major manufacturers of agricultural machinery, including harvesters, but Kazakhstan is ramping up production of grain, actively supplying wheat on the EEU single market. However, Kazakhstan does not want to limit itself to purchases of agricultural equipment, including harvesters, in Belarus and Russia, so it blocks the onset of action of the Eurasian Economic Commission decision № 143 of June 25, 2013 and in July-September 2013 there are intensive trade negotiations on finding a compromise solution between the participants of EurAsEC Customs Union.

In October 2013 the Eurasian Economic Commission replaces the duty with the quota to the displeasure of the Belarusian and Russian producers. Kazakhstan is very interested in supplying imported high-tech equipment and in the course of tough negotiations on the liberalization of the combine harvester-
thresher's single market, in fact, achieves the most favorable outcome. In 2014, Kazakhstan is to be able to import 300 combine harvesters from outside the Customs Union, Russia - 424 pieces of equipment. Fixing quotas is to be continued throughout 2015-2016 period. The following year, the Trade Ministry of Belarus on the same principle planned to divide the quota for 2015 - 52 combine harvesters and in 2016 on the territory of the country can be delivered 34 pieces of equipment. Kazakhstan, according to the decision of the Eurasian Economic Commission can import in 2015-2016, respectively, 309 and 204 foreign combine harvesters, Russia - 437 and 288 units of imported equipment.

«Fruit and vegetables» case: The manifestation of the policy of sanctions at the national level under the conditions of implementation of the principles of unity of the customs territory of the Eurasian Economic Union

For effective trade and economic cooperation of the EEU countries is very important manifestation of the policy of sanctions at the national level under the conditions of implementation of the principles of unity of the customs territory of the Eurasian integration project. Russian Federation Government Resolution dated August 7, 2014 N 778 "On measures to implement the Russian Federation Presidential Decree of August 6, 2014 N 560 "On the application of certain special economic measures in order to ensure the security of the Russian Federation". On the basis of this decision until 31 in December 2017 a full ban (embargo) on the import to Russia of agricultural products, raw materials and food, originating in the United States, European Union, Canada, Australia, UK, Norway, Ukraine, the Republic of Albania, Montenegro, the Republic of Iceland and Liechtenstein, on list according to the application (in the version of Russian Federation government decrees N 625 from 25.06.2015, N 842 from 13.08.2015, N 608 from 30.06.2016). In this annex to the Resolution contains a rather extensive list of goods HS groups 02, 03, 04, 07, 08, 16, 19, 21, 25 (the Single Commodity Nomenclature for Foreign Economic Activities of EEU) prohibited from being imported into the territory of Russia, if the country of origin of goods have the country identified in this article. At the same time crucial for the effectiveness of economic and trade cooperation EEU member states in addressing the agreed tasks (coordinated) agricultural policy played by the fact that the embargo is implemented only Russia in the common customs territory of EEU and the other member states did not support this Russian decision. In the absence of customs controls at the borders of the participating countries of the integration association, currently it becomes very critical and creates additional risks for effective trade and economic cooperation. Visually these risks demonstrates the statistics of Belarus exports to the EEU member states in 2015 (Table 1).

Attention is drawn to the rapid growth of exports from Belarus to Russia in 2015 (08 HS group), and the 08 HS group is in the list of goods prohibited from being imported into the territory of Russia, if the goods the country of origin are the countries listed in the Government Decree Russian Federation dated August 7, 2014 N 778. Among these countries, for example, all EU countries, which prior to the embargo is a major supplier of HS 08 (Edible fruit and nuts; peel of citrus fruit or melons) to the Russia Federation. You can assume that Belarus on individual headings can replace European products on a group of 08, but a rapid growth (especially, for example, sub-0805 HS - citrus fruits, the production of which for Belarus is absolutely not typical) makes think seriously about the sources its occurrence. Risks of re-export prohibited for import of goods into the territory of Russia through Belarus remain significant and this fact must be considered when it comes to solving problems of the agreed (coordinated) agricultural policy in the EEU. This situation is of particular importance in the context of realization of import substitution policy in Russia, where domestic farmers, under the protection of the Russian Federation Government Resolution of August 7, 2014 N 778 must step up domestic production of fruits and vegetables. In terms of risk of re-export to neighboring countries that are the EEU members, in the absence of customs borders between the two countries within the Eurasian integration project, to carry out a policy of import substitution at the national level, it becomes more difficult and certainly requires some mutual responsibility of the partner countries.

«Palm oil» case: The harmonization of different tariff commitments of member countries of the Eurasian Economic Union to the World Trade Organization

By 2015, Kazakhstan de jure is not a member of the WTO, de facto this state is working on tariff obligations of Russia to the WTO, but the situation has changed. After joining the WTO in 2015 Kazakhstan within 5 years (the decision of the Eurasian Economic Commission on October 14, 2015 number 59 approved a list of goods - so far only 1347 names) will apply the rates of import customs lower fees as compared to the rate of duty laid down in the EEU Common customs tariff. How this situation will affect the solution of problems within the allocated areas of interstate cooperation, mentioned in this article, can be illustrated by the following example. Under the old rate (up to Russia’s accession to the WTO in 2012), the import duty has been fixed, that is, it was not dependent on its value and amounted to EUR 0.4 / kg for palm oil (HS Code 1511109002 in EEU). Introduced at Russia’s accession to the WTO was the ad valorem duty instead of specific and amounted to - 5%. The implementation period for this tariff commitments to the WTO for Russia was two years and in 2014 the ad valorem rate charged to the palm oil imported in Russia, was reduced to 3%, and it is now operating in the single EEU customs tariff. Based on the analysis of the tariff commitments of Kazakhstan to the WTO and finding 1511109002 EEU HS code in the Decision of the Eurasian Economic Commission on October 14, 2015 number 59, we can conclude that the importation of palm oil into the territory of the Republic of Kazakhstan, the customs duty will be 0%, whereas Russian participants in foreign economic activity will continue to pay import duty of 3% for this raw material. With this in mind, and taking into account the fact that there are more than a low VAT rate in Kazakhstan - 12% (18% in Russia), which is charged with the duty and is part of the aggregate customs payment – price competitiveness of goods produced in Kazakhstan using palm oil as compared to Russian increases. At the same time, Kazakh food products using palm oil which is imported under the preferential tariff rates, the ability to retain the free circulation throughout the EEU customs territory. This situation with tariff obligations of Kazakhstan and Russia to the WTO is the removal of the work of the EEU single customs tariff. Tariff commitments of Kazakhstan to the WTO are more stringent (customs duty rate lower than the tariff obligations of Russia to the WTO), Russia does not want to reduce the tariffs and bring them to the Kazakhstan level, as it will lead to additional lost income of the Russian budget. However, the situation is very dissonant, because the unity of the customs tariff in the EEU for individual commodities are now in fact does not exist, that creates a conflict of national interests in EEU between Russia and Kazakhstan.
CONCLUSION

In empirical research and scientific literature there are many different explanations of the economic integration and its impact on the associated countries. Using Knobel's approach to the economic integration effects classification (Knobel, 2015) we investigate trade effects of economic integration in emerging market of the EEU and the integration contradictions among the members of the union.

In our case, today the EEU union desperately needs a coordinated approach of the EEU members to implement trade, industrial and agricultural policy. Without this approach it risks to become a single market of opposing countries, trying to implement their individual interests in the first place. EEU performs an important function in an attempt to recover broken cooperative relations and «dignify» the structure of foreign and mutual trade in all these states. However, these efforts should be collective and meaningful. Russia, Kazakhstan, Belarus, Armenia and Kyrgyzstan have succeeded in creating the Union, but now that it is here, their major objective is to prove the necessity and viability of this integration to themselves and the entire world.

The investigation of trade effects of economic integration in emerging market of the EEU demonstrates, that there are much more redistributive effects in this project than creative effects. Thus, the analysis of the EEU evidence-based practice shows that competitive advantages for one country at the expense of another integration association member, which can be classified as the redistributive effect of the Eurasian economic integration, are being aimed at maintaining the non-economic objectives (political, geopolitical and others) of Eurasian integration project.

EFFECTIVENESS OF GOVERNMENTAL SUPPORT PROVIDED TO MONOTOWNS IN CIS COUNTRIES

Kreidenko, Tatyana; Sorokina, Svetlana; Adashova, Tatyana

1Department of Regional Economics and Geography, Russian University of Peoples' Friendship, RUDN University, Moscow, Russia
2Department of Foreign Languages, National Research University Higher School of Economics, Moscow, Russia

Keywords: CIS, monogorod (monotown, single-industry town), forming enterprises, strategic organization, governmental support

The emergence and development of monotowns is typical of the process of industrialization in any country of the world. Monoprofile municipal establishments are created as high-performance economic centres. However, in case of economic changes on the market (for example, a decline in demand for products) such settlements face a high risk of social and economic tension. Without risk insurance provided by the state monotowns have to struggle against the emerging problems on their own, whereas the benefits of the production activity at their initial stages are used by the whole country.

The present research aims to identify the principles of assigning settlements to monotowns in CIS (using the cases of Kazakhstan, Russia and Belorussia), to reveal the evolution stages of monoprofile municipal establishments, to define the contemporary industrial and territorial structure of monotowns in Kazakhstan, Russia and Belorussia and their role in the countries’ economy, as well as analyse the economic effectiveness of the governmental support to the development of monotown economy in the post-Soviet territory.

Currently, monopolyn are the most vulnerable points in the economic development of independent states in the post-Soviet territory. It should be mentioned that having been designed in the 18th-19th centuries, the territorial structure of monotowns in the former USSR republics finally formed only in the second half of the 20th century with the help of state regulation.

In the historical context of the formation and development of monotowns in the post-Soviet space, several stages can be identified [5]. The first stage - the stage of mass emergence of monoprofile settlements is associated with the process of industrialization of the 18th and 19th centuries, and is characterized by the appearance of manufactories and ironworks, as well as the centres of rural crafts and light industry in the Russian Empire. The second stage is associated with the period of Soviet industrialization in the 1930s. XX century, when the emergence of single-industry towns was part of the development of the largest territorial production complexes of the USSR. The process was rather slow, first of all, because of the huge scale of individual projects implemented, as a rule, by the
forces of prisoners of the Gulag (who felled wood, mined coal, washed gold and also participated in the construction of many large industrial and transport facilities in the 1930s-1950s). The third stage is the years of the Great Patriotic War (1941-1945), when the emergence of mono-profile settlements (cities, settlements) occurred due to the evacuation of industrial enterprises from Central Russia to other regions, including the Union republics of the USSR. The fourth stage - in the 1950-1980s was associated with the active creation of mono-profile settlements due to the construction of city-forming enterprises in the medium- and high-tech branches of the machine-building complex, chemical production (including defense) and energy (first of all, the city at HPPs and NPPs). The emergence of a significant part of enterprises in this period is the result of the centrally planned economy of the USSR, when the main task was to unify the republics into a single economic mechanism, often without due regard for the economic efficiency of the location of production capacities [9]. As a result, many works and factories were divisions of large plants and factories located in other parts of the USSR. The collapse of the USSR automatically led to changes in the domestic and international markets, to a sharp decrease in demand for domestic products, which helped to close many city-forming enterprises. The fifth stage - from the early 90's.XX century to the present is characterized by a break in economic ties, the closure of most enterprises, and the search for forms of support for single-industry towns.

Thus, the structure of monotowns in the USSR, and then in Russia, has become a rather complex conglomerate of cities varied in size (from cities such as Togliatti, Sayanogorsk, Kostomuksha to regional towns and urban-type settlements), the complexity of production and qualification of residents (from Troitsk and Obninsk to Shumikha and the Island), in the possibilities of marketing products and the competitiveness of production, as well as in the socio-psychological characteristics of the population. The narrow specialization of most cities is, in some cases, the result of their youth. Part of the cities did not have an opportunity to develop other functions, in view of the collapse of the Soviet Union and the subsequent economic crisis.[1]

However, a unified approach to the definition and the criteria for identifying monotowns have not been developed so far. The approaches to the concept ‘monotown’ in the CIS countries vary, they are not legally adopted and do not consider the economic peculiarities of the recent decade. In the CIS republics the definitions of ‘forming enterprise’ are more or less legally adopted in Kazakhstan, Russia and Belorussia. As for the concept of ‘monotown’, it is only adopted in the regulatory legal acts in Kazakhstan and Russia.[3]

As is known, the mono-profile of settlements is defined through the concept of a city-forming enterprise. In the CIS republics, in Kazakhstan, Russia, Belarus and Ukraine, the definitions of the
"city-forming enterprise" have been legislatively fixed in one way or another (Table 1). In addition, the concept of "monotown" is prescribed in the normative legal acts of Kazakhstan and Russia.

Note: The wording is given in the latest valid version of the law.

As a result of the differences in approaches, the estimation of the number of mono-profile settlements, especially in Russia, differs significantly. [1] In the early 2000s, Russian economists referred to mono-profile cities 460 out of 1,097 cities in Russia and at least 1,200 of the 1,864 urban-type settlements in which 24% of the country's population live and up to 40% of Russia's GDP was produced before the financial and economic crisis. The official list of single-industry cities of Russia, approved by the Ministry of Regional Development (edition of July 2013) included 333 mono-profile territorial entities of 60 subjects of the Russian Federation. There are other approaches. So, according
to the data of the scientists of the Expert Institute (Moscow), 467 cities and 332 townships of 76 cities of the Russian Federation can be referred to monocities in Russia (in all subjects except the Altai, Tyva, Ingushetia, Chechnya, Nenets Autonomous District). According to the experts of the NMC "Cities of Russia" (a laboratory for regulating the socioeconomic development of cities and regions of the Institute for Macroeconomic Research), at least 500 out of 1,097 cities and 1,200 of 1,864 urban-type settlements are classified as monoprofile. The same group includes about 400 small monoprofile villages that do not have the status of urban settlements with the population of up to 3 thousand people. At the moment, the number of single-industry cities has significantly decreased in the Russian Federation, the list consists of 319 mono-profile entities. Thus, monoprofile municipalities account for 31.2% of the total number of settlements that have the status of a city, where about 11% of the country's population and almost 15% of the urban population live. Monocities in Russia account for almost 2% of the economically active population and up to 40% of the country's industrial production. [3]

In Belarus, 42 settlements with about 7% of the total population and about 9% of the urban population belong to monotowns. [8]

In 2012, a list of monoprofile settlements was compiled, which included 27 cities from 86 cities of this country. This is a very high indicator (almost a third of all existing cities in Kazakhstan are monoprofile). [3] In Kazakhstan, city-forming enterprises of single-industry towns employ more than 7% of the economically active population, while in the monocities themselves, about 10% of the country's population and about 17% of the urban population live.

Industrial and territorial structure of monotowns in CIS is extremely diversified. However, it is worth mentioning that the majority of multi-profile municipal establishments are small towns with the population of less than 50 thousand people and with the specialization in extracting and processing mineral resources.

Modern branch specialization of single-industry cities of Kazakhstan, one way or another, is connected with the mining industry. 24 settlements appeared as a result of the beginning of the development of oil, gas, ferrous and non-ferrous metal ores, asbestos and phosphorites. At present, the development of 21 monotowns in Kazakhstan is connected with the mining towns. In the branch structure of single-industry towns of Belarus, the number of settlements is dominated by woodworking, the production of building materials, the food industry, peat and peat briquetting industry. And in terms of the population employed in production, the leading industries are chemistry and petrochemistry, and machine building and metalworking. In Russia, mono-settlements dominate with town-forming enterprises of ferrous and non-ferrous metallurgy (36.1%), machine building (24.0%), and fuel and energy mineral resources (12.3%). [3]
In the early 1990s, most of the single-industry settlements of the CIS countries (like other cities) found themselves in a difficult situation due to the disruption of production chains created during the planned economy in the USSR, a significant decline in production, and increased non-competitiveness of products. A high share of non-core assets in the ownership of enterprises resulted in a decrease in the level of socio-economic development of single-industry towns and led to a deterioration in the quality of life of their population. The problems of single-industry towns became particularly acute due to the impact on the country’s economy of the global financial and economic crisis of 2008. [10,11] Three categories of single-industry cities were singled out, depending on the risks of deteriorating their socio-economic situation. In the most difficult situation, 31% and 11% of Russia’s and Kazakhstan’s monocities are located, respectively. Almost 40% of Russia’s monocities have risks of deteriorating the situation (while in Kazakhstan only 19%). In the most difficult social and economic situation, there were cities of raw specialization of the northeastern regions of Russia and the old industrial regions of the Urals and the South of Siberia, specializing in the basic branches of the economy - energy, ferrous and non-ferrous metallurgy, general and medium engineering.[10]

The state’s participation in the development of single-industry towns in Russia is carried out in a variety of passive and active forms of supporting social and economic development.

From the point of view of the support mechanisms, the Russian government has completely abandoned the direct budget financing of mono-city support measures, used during the financial and economic crisis of 2008-2009. (Table 2)

Small and Medium Enterprises Support”) | Insurance for export credits and investments
---|---
State Specialized Russian Export-Import Bank (Joint-stock company) | Finance support and guarantee for the Russian non-resource export (to meet exporters’ varied needs of financing export transactions and supporting export activity)

The most effective is the activity of Vnesheconombank and the non-commercial organization “Fund for Development of Monotowns” established in October 2014. [2] In general, Vnesheconombank provided support in 48 mono-towns for the period from 2011 to 2015 and achieved the following results:

- Reduction in the average level of registered unemployment from 2.69% to 1.88%;
- Creation of 122 thousand additional permanent jobs;
- Attraction of extra-budgetary investments in the amount of 458.05 billion rubles.

The Mono-Grove Development Fund in 2015 received approvals regarding 25 monotowns located in 17 regions of Russia. The volume of the Fund’s commitments to co-finance the expenditures of the constituent entities of the Russian Federation and the municipal entity amounted to about 5 billion rubles, and the volume of attracted investments in the single-industry town was supported by a subsidy of 8 billion rubles. [12]

Another new mechanism for supporting single-industry towns is the creation of territories for outpacing socio-economic development (TOP). This tool is focused on creating zones - the locomotives of growth and directly appeals to the Chinese experience of the revival of problem areas, based on an integrated combination of finance, investment, innovation and land policies.

It should be noted that the effectiveness of the application of reorganization and recovery procedures of bankruptcy in Russia has always been higher for strategic enterprises (these are federal state unitary enterprises and open joint-stock companies whose shares are in federal ownership and which produce goods (works, services), which are of strategic importance). Such enterprises, as a rule, are state-owned and produce products aimed at ensuring the security and defense capability of the country. [14]

In July 2016, the Council for Strategic Development and Priority Projects under the President of the Russian Federation singled out 11 national projects, the implementation of which has a strategic status for the state. One of these strategic areas is the modernization of single-industry towns. This will solve the problem of the lack of interconnections and coordination of policies to support single-industry towns and socio-economic policies of the country as a whole, both at the level of development of planning and program documents, and at the level of state strategy. In order to implement it fully, the main objectives of the project were formulated: diversify the economy of...
single-industry towns; create conditions for attracting investments and developing business; create new jobs; make monotowns comfortable for life.

The national project "Modernization of single-industry towns" covers 319 cities in 60 regions of the Russian Federation in all eight federal districts. A large-scale program should show the first results in the nearest future. Under the leadership of the Chairman of the Government of the Russian Federation DA Medvedev, specific target indicators of the program "Integrated Development of Monotowns" were defined. Until the end of 2018, the project should: create more than 200 thousand jobs, not associated with the city-forming enterprise; Attracted investments in fixed assets in the amount of 317 billion rubles; Significantly improved the quality of the urban environment.

In Kazakhstan, activities to organize the support of single-industry towns developed within a certain logical continuity. A serious deterioration of the economic situation, on the one hand, sharply reduced the state resources used for the recovery of single-industry towns, and on the other hand, increased the risks of deterioration of their economic situation. In these conditions, in 2015, a decision was made to integrate various programs into a single program that combined such programs as "Affordable Housing-2020", "Housing Utilities Modernization Program for 2011-2020", "AkBulak", "Program Development of single-industry towns for 2012-2020" and Regional Development Program. Such a combination made it possible to exclude a number of overlapping issues (for example, the development of engineering communications). Microcredit, grants and other opportunities for state support of business are now included in the program "Business Roadmap-2020".[7]

The problems of monotowns are very serious. There is a need for a significant increase in the effectiveness of governmental support allowing for the real social and economic situation in the monoprofile municipal establishments.

The priority goal of the governmental support targeted at modernizing monotowns is diversification of monotowns' economy, creation of alternative jobs, attraction of investments. The main forms of support to the social and economic development of CIS towns are the method of targeted programme ('Programme of Monotowns Development for 2012-2020' in Kazakhstan) as well as the performance of development institutes such as State Corporation "Bank for Development and Foreign Economic Affairs (Vnesheconombank)", OAO Russian Venture Company - the Russian government's fund of funds and the development institute of the Russian Federation, OAO Rosinfocominvest - 'Russian investment fund for information-communication', RUSNANO Group, non-commercial organization 'Monotowns Development Fund'.

The analysis of specialized institutes' performance and the effectiveness of governmental programmes leads to a conclusion about the necessity of increasing the effectiveness of governmental support at all the stages from the development of legally adopted criteria for the status 'monotown',
which are to take into account not only formal indicators but also the actual social and economic situation in monoprofile municipal establishments, to determining the priority investment projects supported in monotowns.

Kazakhstan has a higher degree of continuity in the mechanisms of state policy. While in Russia there is a constant change in the criteria for the allocation of single-industry towns - the objects of state support, there is no clear administration of the activities of the state apparatus in this direction, there is a significant number of poorly coordinated operators and financing channels; the share of cities receiving specialized support in the total number of this type of settlements is extremely small.

The analysis of the work of specialized institutions and the effectiveness of government programs make it possible to conclude that there is a need to increase the effectiveness of state support measures, from developing legislatively fixed criteria for obtaining monotown status, taking into account not only formal signs, but also the real socioeconomic situation in single-profile municipalities and up to Determination of priority investment projects supported in single-industry towns.

The cities of both Russia and Kazakhstan act primarily as a passive object of state support. Thus, in Kazakhstan, the development of integrated plans for the development of single-industry towns is directly implemented by regional executive bodies with little involvement of municipalities. In Russia, local self-government bodies are more actively involved in the development of I&C, but in this case, the limited local resources and powers do not allow taking full responsibility for the development of the territory.

INTEGRATED REPORTING AND PREPARERS’ ACCOUNTABILITY: A MATTER OF CONTEXT

Lai, Alessandro; Melloni, Gaia; Stacchezzini, Riccardo

Dept. of Business Administration, University of Verona, Verona, Italy
Norwich Business School, University of East Anglia, Norwich, UK

ABSTRACT

This research explores view(s) of corporate accountability that are implicit in integrated reporting (IR). The empirical setting features a global insurance company that pioneered IR in its 2012 annual financial report. Several in-depth interviews with the IR “preparers” from this firm depict how its IR has been built, as well as the contextual conditions underlying the decision to shift from financial reporting to IR. The results also reveal the predominance of investors’ (vs. stakeholders’) accountability, particularly in reference to addressees of corporate accountability in the IR. This paper offers new insights for literature dealing with corporate reporting and accountability in a novel, integrated reporting setting.

Keywords: Integrated Reporting, Accountability, Investors, Reporting preparers.

AIM AND THEORETICAL FRAME

This paper seeks to respond to calls for case research on integrated reporting practices (de Villiers et al., 2014, de Villier et al., 2015, Perego et al., 2016) by empirically exploring the implementation of integrated reporting (IR) by an Italian listed insurance company operating worldwide. The company, Assicurazioni Generali S.p.A. (hereafter, Generali or the Company), is a pioneer of IR, in accordance with the project established by the International Integrated Reporting Council (IIRC) in 2011. It joined the IIRC pilot programme in 2012, actively participates to two IIRC business networks (i.e. insurance network and national network of Italian IR adopters), and has already published three annual IRs (2013, 2014, and 2015) that adopt the international Integrated Reporting Framework (IIRF) principles issued by the IIRC (IIRC, 2013).

A number of studies offer in-depth assessments of IR practices (e.g. articles published in 2014 in the Accounting, Auditing and Accountability Journal special issue on integrated reporting), but to the best of our knowledge, no previous research has empirically investigated the view(s) of accountability that...
are embedded in the process of IR preparation. We therefore aim to analyse the discourses of IR preparers (i.e. persons responsible for and/or daily involved in the preparation of the IR) on the IR implementation.

According to the IIRC, IR should enhance accountability and stewardship for a broad base of capital (IIRC, 2013). With its focus on multiple “capitals” (e.g. human, natural, social) and other non-financial subjects, IR may offer accountability to a wide plethora of stakeholders. However, critics question the possibility that IR can cover stakeholder accountability (Brown and Dillard, 2014; Flower, 2015; Thomson, 2015). The primary focus of IR on capital providers’ information needs could mean that it does not necessarily address the decision-making and accountability needs of stakeholding publics (Brown and Dillard, 2014). Compared with the Global Reporting Initiative, the IIRC’s proposals are “remarkably regressive,” with a strong investor bias and possibilities only for “investor accountability,” and no attempt to discuss issues around corporate sustainability (Milne and Gray, p. 25). In other words, if IR is intended to discharge the duties of accountability for the responsibilities most closely connected to the investors, its potential to help stakeholders understand nonfinancial impacts and hold managers accountable for them may be constrained (de Villiers et al., 2014). We empirically address this issue and explore how IR preparers come to select corporate accountability content, by reasoning about the subjects disclosed in the IR (i.e. what), the language used (i.e. how), and the IR addressees (i.e. to whom).

In turn, we describe how the “production” process for the IR text (here, the process of determining what is said and not said and who will be addressed by the report) depends on the organizational context and, more broadly, the reporting context in which the text gets produced, acknowledging the “inseparable relationship between the text and context” of organizational reporting and communication (Tregidga et al., 2012, p. 226). The socio-linguistic approach depicted by the linguist Teun A. van Dijk led us to avoid interpreting the context as an “objective” social variable and instead suggested the consideration of subjective mental constructs that define and give relevance to such context (Van Dijk, 2006, 2008 and 2009). We take inspiration from this approach and focus our empirical analysis on understanding how the view(s) of accountability that are implicit in IR preparers’ discourses are influenced by their interpretations of the contexts in which the preparation of the IR text takes place.

**METHODOLOGY**

For the discourse analysis underlying this research (Gill, 2000; Jørgernsen and Phillips, 2002; Van Dijk, 2009), we rely on in-depth interviews with managers and employees of the Company. The interviews were developed to discern not only the motivations for the decision to adopt IR but also how IR...
The IR itself is a report that is largely informed by a principle-based framework and thus is flexible in terms of its specific content (IIRC, 2013).

The interviews took place in dedicated meetings with the authors or following IR presentations offered to various panels (e.g., public presentations, insurance group meetings, university presentations to students, televised debates). The interviewees received extensive information about the research purpose, and their privacy and anonymity was carefully respected, especially when citing the content of their speech to other interviewees and Company members. The authors obtained permission to record the interviews digitally and use these responses for research purposes. If interviewees requested that we delete selected portions of their delivered answers, we did so. The interviews also were manually transcribed in the language in which they took place (English or Italian).

Recognizing concerns about the methodological rigour and subjectivity of discourse analyses (Grant et al., 2001; Hardy, 2001; Phillips and Hardy, 2002), we took several steps to ensure subsequent traceability of the research method. The transcriptions of the interviews were coded according to a general coding framework underlying the research. The coding criteria captured three main accountability contents to be investigated (Ezzamel et al., 2007; Fowler and Cordery, 2015): the subjects inserted and explained in the IR (what), the language of the IR (how), and the intended addressees of (the messages contained in) the IR (to whom). We collected all sentences that referred to each of these three issues, independent of the interviewees, then relied on further distinctions that we developed to classify them into more specific, homogeneous topics. Some of the issues evident in the interviews appeared to be linked in intertwined messages, such that discourses about two or more issues were present together. We tried to disentangle the intertwined discourses related to multiple issues, to better detail each of the main issues associated with the accountability content.

Finally, we coded all the sentences referring to two themes (“text” and “context”) to clarify the preparers’ cognitive processes for constructing the text while also considering the social context in which it was produced (Van Dijk, 2009). In this phase, we investigated three types of additional sources: (a) the “text” in the form of IRs produced by the Company for the 2012 to 2015 financial years; (b) secondary sources pertaining to the “context” (information about the organizational structure and governance system of the Company, the insurance sector, and the IIRC); and (c) previous research on corporate reporting and accountability issues. This step improves comprehension of the views shared within the Company by the IR preparers.
PRELIMINARY FINDINGS AND RESEARCH CONTRIBUTIONS

The analysis shows that the view of accountability embedded in the preparation of the IR is investors’. Specifically, the choice of subjects in the IR focuses primarily on financial and strategic issues rather than nonfinancial or sustainability questions. In addition, the discourses of IR preparers stress that the IR (i.e. text) reflects several contextual factors: complaints from investors and capital providers about the complexity of traditional annual reports; a lack of interest among shareholders in “soft” (narrative or nonmonetary) sustainability information; and the separation of financial and sustainability units within Generali. In this respect, the empirical analysis reveals the preparers’ reasoning regarding accountability content and how this process depends on their interpretation of the context(s) in which the IR is “produced”. Finally, empirical evidence sheds light on the dominance of investors’ accountability, as the primary addressees of accountability in the IR.

With this empirical stance, this article responds to calls for more case research on IR implementation by highlighting the role of practitioners in informing the text. Previous research mostly describes the role of organizational and institutional factors in the IR adoption process (e.g. Frías-Aceituno et al., 2013a and 2013b; Lai et al., 2016; Vaz et al., 2016). The present study elucidates the need to pinpoint the mediating role of preparers in terms of how the report is prepared—particularly with reference to how these actors consider the organizational and reporting contexts while writing the text.

This paper also can contribute to the debate about the relationships between IR and accountability. Previous research has investigated how IR may allow companies to provide accountability for subjects that have not traditionally been addressed by financial reporting (e.g. value creation process, sustainability, capitals) and what classes of stakeholders may benefit from IR (e.g. investors, other stakeholders) (Adams, 2015; Flower, 2015; Milne and Gray, 2013). These prior studies have been more conceptual in nature, addressing relationships in terms of how the IIRF might inform the content of accountability provided by companies; the present study instead offers a field-based investigation.

Finally, this article contributes to the more general debate about the future of corporate reporting. Regulators, practitioners, and academics increasingly are involved in discussions of how to improve corporate reporting (e.g. KPMG, 2012; EY, 2013; Deloitte, 2015; PwC, 2015). The “meanings” and “means” of “better” reporting also continue to come under scrutiny (Sunder, 2016; Beattie, 2014). This contribution to the debate testifies to how practitioners, and preparers in particular, are working to improve corporate reporting and why they consider IR “better” than more traditional forms of external reporting (e.g. financial reports). In this respect, this study intercepts the academic discussion about the “narrative turn” in accounting practice and research (Beattie, 2014). More broadly, it addresses the call for more (interpretative) research on corporate reporting practices and practitioners (Hopwood, 2000; Young, 2006; Huikku et al., 2016).

HOW INTEGRATED REPORTING MEETS THE INVESTORS AND OTHER STAKEHOLDERS’ INFORMATION NEEDS

Lai, Alessandro; Rossignoli, Francesca; Stacchezzini, Riccardo
Dept. of Business Administration, University of Verona, Verona, Italy

ABSTRACT

The external corporate reporting is currently debated both in the professional and the academic contexts, given the misalignment between information provided by companies and real information needs from investors and other stakeholders. Such misalignment seems to be reducible by the integrated report, as proposed by the International Integrated Reporting Council (IIRC). Such report, that is already mandatory in some countries, is raising rich interest from scholars and practitioners: several companies around the world are already preparing their integrated report.

The research is aimed to verify whether and how such report can really contribute to the corporate reporting and to the relationships among the people belonging to the corporate environment. Along this way, the research is aimed to answer to the following research question: how integrated report favours the alignment between corporate reporting and stakeholder’s informative needs?

In order to answer such research question, qualitative and quantitative approaches will be jointly used to analyse: a) the investors and other stakeholders’ information needs; b) the companies behaviour related to the integrated report preparation; c) the reactions of investors and other stakeholders to the first integrated report initiatives; d) the role of standard setters and regulators in encouraging the institutionalization of the integrated report and the gradual alignment of the integrated report to the stakeholders’ needs.

The most relevant scientific impact is related to the identification of the interaction processes and the reciprocal influence among actors involved in the regulation, preparation and use of the integrated report within the reporting environment.

Keywords: Integrated Report; Investors; Corporate reporting environment; Sustainability reporting; Non-financial information
SCENARIO FOR INVESTIGATION

The corporate reporting is the main way through which companies communicate their performance to stakeholders.

Such tool is currently debated both in the professional and in the academic context. The “traditional” corporate reporting is unsuitable to provide information about company strategy, future perspectives and the social and environmental impact of the company activity. The social, environmental and sustainability report is often criticized to be just a window dressing, unsuitable to truly represent company’s efforts towards social responsibility.

The misalignment between information provided by companies and the real information needs from investors and other stakeholders is palpable, since the latter are more and more sensitive to complementary information that complete the financial ones. Standard setters and regulators are working to fill such gap. Some examples are: the International Accounting Standard Board (IASB) project related to the narrative disclosure within the financial statement, the Global Reporting Initiative (GRI) projects related to the sustainability disclosure, the United Europe Regulation about the non-financial disclosure, etc. All these initiatives taken together are laying the foundations to renew the boundaries between mandatory and voluntary disclosure and to make the financial disclosure converge toward the non-financial one (that is the sustainability one).

The project about the integrated reporting coordinated by the International Integrated Reporting Council (IIRC) seems to be suitable to enhance the convergence process and alignment between corporate reporting and information needs of investors and other stakeholders. Such project aimed to stimulate companies to communicate their value creation process joining information related to: governance, strategy, business model, different “capitals” (financial, human, productive, social and relational, etc.), performance, risks and future perspectives.

Several companies around the world are already voluntarily preparing the integrated report in addition to the firms that have to prepare it mandatorily (i.e. South-African public listed companies). For many companies the integrated report is already part of the institutional corporate communication and it is presented and discussed with investors and stakeholders.

EXTANT STUDIES

Since the original initiatives of integrated report, the international literature and specifically the accounting one, put great interest in such report. Several aspects have been explored, at least conceptually, and there are many call for future researches (Busco et al., 2013; de Villiers et al., 2014).
A debated issue is related to the integrated report goals and, in particular, the sustainability contents. Critics argue that the IIRC has gradually changed the framework objectives following investors’ needs and ignoring stakeholders needs (Flower, 2015) and that the integrated report has nothing to say about sustainability (Milne and Gray, 2013). Other scholars assert that, given the IIFC guidelines, the integrated report can anyway enrich the sustainability disclosure and the integration between internal and external disclosure (Busco et al., 2013; Adams, 2013 and 2015; Eccles and Krzus, 2010).

Some researchers have investigated determinants of the integrated reporting adoption, explaining it in relation to institutional factors (Jensen and Berg, 2012; Frías-Aceituno et al., 2013), industries features (Frías-Aceituno et al., 2014) and corporate governance characteristics (Frías-Aceituno et al., 2012). Furthermore the integrated report adoption has been linked to the needs of external legitimization towards the analysts (Lai et al., 2014a). A recent study (Reuter and Messner, 2015) has highlighted the lobbying activities forcing the IIRC initiatives.

Some scholars have analytically investigated the integrated reporting content of the companies participating to the IIRC project. Some analyses have stressed the alignment process of the reports towards the IIRC guidelines with specific focus on the: sustainability disclosure (Lai et al., 2014b), business model (Melloni et al., 2015; Lai et al., 2015), intellectual capital (Melloni, 2015) and risks (Melloni and Stacchezzini, 2013). Further analyses have examined the organizational implication of the report adoption (Busco et al., 2013; Stent and Dowler, 2015).

To the best of our knowledge no previous studies have explored how the integrated report contributes to satisfy the growing and different information needs of investors and stakeholders. In particular, the literature has not yet studied whether and how the integrated report can impact on the relationships among three categories of actors within the reporting environment: 1) companies and their managers; 2) investors and stakeholders (among them analysts); 3) regulators and standard setters. This work aims to fill such gap, highlighted by several special issues of outstanding international journal.

**RESEARCH AIM**

The research analyses the integrated report role within the recent redefinition of the boundaries between mandatory and voluntary disclosure and of convergence between financial and sustainability disclosure.

The aim is to understand the impact of such report on the reciprocal interdependence relationships among the decisions of the main actors within the reporting environment. The objective is expressed
in the following research question: *how the integrated report favours the convergence between corporate report and information needs of the stakeholders?*

**METHODS**

The research embraces three levels of analysis. The first level is the “individual” one and consists in the analysis of the individual behaviours and perceptions of people constituent the corporate environment. The second level is the “relational” one and it analyses how the integrated report changes the relationships among different subjects. Such relationships are caught in case of meeting and debate among the different subjects and in the consequences of their behaviours. The third level of analysis is the “total” one: it provides a summary of the integrated report impact on the corporate environment.

Qualitative and quantitative approaches will be jointly used to analyse each level of analysis: the former will be used to investigate analytically the individual actors behaviours and the relationships among them; the latter will be used to analyse widely the behaviours of different subjects. In detail:

a) Qualitative approaches aim to identify case study to be deeply investigated, through interviews to individual subject and focus group where different actors categories are jointly involved. We plan to interview the main subjects operating within the IIRC and top managers (CFO, CEO, etc.), managers and directors (administrative director, investor relator, etc.) of pioneer companies in the integrated report, partners and managers of consultant companies and external audit companies, etc. Empirical evidence on the field in addition at public and private documentation will support the case study development. The study will be carried out within proper critical and interpretative frameworks.

b) Quantitative approaches will be used to collect data – trough survey, content analysis of public and private documents, database – and to elaborate them with proper statistic methods. The survey will be aimed to catch actors perception related to: i) the degree of misalignment between corporate reporting and stakeholders’ information needs; ii) the integrated report ability to reduce such misalignment; iii) the most relevant information categories in reducing such misalignment.

Qualitative approaches will be used in a contained setting: the research field is the Italian and UK corporate environment, such as to deeply study the integrated report of Italian and UK companies as well as the impact of them on the relations among the subjects belonging to such context. The case studies will be aimed to provide empirical evidence of the integrated reporting impact on the relationships between the preparers and their main stakeholders.

Quantitative approaches will be used on a wide setting, in order to collect information about the main disclosure profiles from the integrated reports currently available all over the world.
Quantitative approaches will be used in a smaller research field to provide an interpretation of the integrated report impact on the Italian and UK corporate environment. For example, we will code the information subsumed in the available integrated report and we will correlate such information to the perceptions and/or evaluations of the analysts in order to identify eventual relations between the information provided in the integrated report and the analysts’ perceptions.

The innovativeness of the research at the methodological level is related to: i) the joint use of qualitative and quantitative approaches and the application of them to analyse a corporate reporting tool that is still unexplored compared to the traditional and ii) the direct and joint involvement of different categories of subject pertaining the corporate environment. While the extant literature has given priority to analysis focused on single categories of subjects, this research will make different subject meet and debate during focus groups.

EXPECTED FINDINGS AND RESEARCH IMPLICATIONS

The analysis is expected to highlight:

– The information needs of investors and stakeholders in terms of what are the information categories that are judged as to be the most relevant in expressing their own consensus (or dissent) referring to the companies activities and performance;

– The companies’ behaviour referring to the integrated report preparation. The analysis will show: a) the reasons leading to choose to prepare the integrated report; b) the integrated report content, respect to the IIRC guidelines and to the information needs of investors and stakeholders; c) the organizational implications related to such adoption, verifying what are the company areas involved in the report preparation; what is the involvement and support degree of the top managers, what are the internal and external distribution channel for the report, what is the support provided by consultant and external auditors, and so on;

– The investors and other stakeholders’ reaction to the first integrated reporting initiatives, with a focus on the way in which investors and other stakeholder, among them the analysts, perceive and evaluate the disclosure exposed in the integrated report, verifying the satisfaction degree towards the first attempts of integrated report. Such analysis allows to verify whether the integrated report currently available are suitable to satisfy the growing information needs of the stakeholders and what are the gaps still remaining;

– The role of standard setters and regulators in stimulating the institutionalization process of the integrated report and the gradually alignment between the integrated report and the information needs of the stakeholders. The analysis will show: a) what is the room that the integrated report is
about to conquer within the reporting environment, even as an effect of the lobby activities; b) the IIRC initiatives in order to stimulate the dialog with and between companies and potential users of the integrated report.

The research results have relevant scientific implications for the international literature, in particular for the accounting one. It enriches the extant literature at least in the research fields analysing: a) the voluntary disclosure quality and the managerial choices based on such disclosure, even to verify the extant of impression management strategies and, generally, of external legitimacy; b) the relevance that investors and analysts assign to non-financial information; c) the organizational implications of social and environmental reporting; d) the impact of standard setters and regulators initiatives on corporate behaviour and on the consultant and external auditors activities; e) the lobbying activities related to the initiatives mentioned before.

The most relevant scientific impact is related to the goal to identify the processes of interaction and reciprocal influence among subjects that, within the corporate reporting environment, are involved in the regulation, preparation and use of the integrated report. We think that the assessment of such relations can provide a significant progress in the accounting studies and can stimulate further researches about the role of the corporate reporting in the organizational and socio-economic context.

The research has implications even for multiple subjects and for future practical developments. Such research allows standard setters and regulators to understand the companies’ behaviour and the reaction of investors and other stakeholders with reference to the IIRC project. Furthermore, it can let managers and other company actors know what are the main initiatives related to the integrated reporting in addition to the competitors or benchmark companies behaviour. The research allows even to let the investors know what is the real value added that they can get from the integrated report reading.

PRICE AVAILABILITY OF CAR RENTAL AS AN ALTERNATIVE OF CAR OWNERSHIP

Leontyeva, Yulia; Mayburov, Igor

Ural Federal University named after the first President of Russia B.N. Yeltsin, Russia

ABSTRACT

The article considers the issues of the availability of car rental in urban areas in different countries. An overview is done of scholarly work on the factors influencing people's decision whether to own and use a car. A conclusion is made that apart from the factor of cost the decision is shaped by the availability of alternative modes of transport. The authors prove that it is necessary to create an all-encompassing system of public transport that would provide alternative modes of transport, including taxis and car rental that target customers who are not prepared to give up personal cars. It is proven that the availability of car rental could serve as an alternative to car ownership for a certain part of people living in urban areas. The authors analyze types of car rental services and considers different levels of availability of the services to different categories of customers. The authors propose a method of conducting a comparative analysis of the availability of car rental services. The subject of the research is car rental services in three types of cities. The authors picked the cities with a high, medium and low intensity of private car use. The study assesses the cost of car rental in each city type under identical parameters of car brand and rental period and timing. A conclusion is made that there is a substantial difference in affordability and actual availability of car rental services. The authors substantiate an assumption that a wide range of car rental services and their affordability can be a significant alternative for city dwellers who do not use a car regularly. The article argues that car rental is not developed enough in Russian cities and analyzes factors that lead to the Russian cities lagging behind in adopting a systemic approach to the provision of such services. The aim of the research is to assess the availability of rental car and to establish the service availability factor as a crucial element of transport policy in urban areas that seeks to diversify modes of transport.

Keywords: Car rental, affordability, car ownership, index of replacement
INTRODUCTION

Widespread car ownership has resulted in many urban agglomerations sliding into total dependence on cars in the 20th century. Such dependence brings about a constant increase in combined vehicular traffic on city roads. Automobile dependence makes it more difficult to fulfil economic, social and recreational functions of cities. In the long run, automobile dependence can be tackled by developing various modes of public transport. Most cities have already realized that it is necessary to switch from unimodal transport systems dominated by private cars to multimodal transit systems that successfully utilize multiple modes of transport.

The main task of long-term transport planning is building intermodal transport systems in cities. An intermodal transport system is a multimodal system in which the integration of various modes of transport leads to higher efficiency of each one of them and enables passengers to make intermodal transfers easily (Vuchic, 1981). Consequently, the main difference between an intermodal transport system and a multimodal one is the integration of multiple modes of transport with different functions.

The integration of various modes of transport is a very complicated, time-consuming and costly process. The process usually requires network coordination of the entire transport system. This includes the provision of transfer facilities, coordination of the schedules of main and feeder lines, construction of a single route network that covers the entire agglomeration, use of through fares and universal fare cards, utilization of a single information environment for all modes of transport, a unified website and image of the transport system.

When building an intermodal system it is extremely important to forge a common pricing policy for all participating modes of transport. The right prices should drive a shift in consumer preferences toward the use of the most efficient modes of public transport. At the same time, the price of an urban trip must get higher the more customized the service is. The approach implies that fares that are charged for using more efficient modes of transport with bigger sitting capacity must be lower than the price of travelling by less efficient modes of transport. This pricing regulation is implemented by means of an appropriately designed system of transport related charges.

Pricing regulation will make it possible to balance the urban transport system. Reaching a balance is important for intermodal systems that are composed of multiple modes of transport.

A well-balanced intermodal transport system is the one that has a balance between the demand for and supply of various modes of transport that provide for transporting a maximum number of passengers to all points and other activities per unit of time. In a well-balanced system all modes of transport are balanced and coordinated in such a way that different intermodal journeys inflict different monetary
and temporal costs, yet every mode of transport must perform the role that it is best suited for technically and functionally.

Modes of transport that hold an intermediary functional position between the car and mass transit play a special role in transportation systems. The list of such modes includes taxi cabs, small buses operating without a regular schedule (jitneys), small buses operating on flexible routes and on-call, carpooling, vanpooling, car rental. All these modes of transport come under an umbrella term called “paratransit”. Ideally, prices of paratransit services should be formed in such a way that they are higher than public transit fares, but lower than the cost of traveling by car. Some agglomerations employ organizational and pricing measures to encourage usage of paratransit services. For example, they are entitled to free parking or exempt from tolls; taxi cabs might be allowed to use lanes that are off-limits to private cars; there are also incentives promoting car rental, carpooling and vanpooling.

Car rental offers a significant functional advantage. The consumer rents a car exactly when he or she needs it. The car is not idle and does not occupy a parking spot. Car rental is a good alternative to owning a car for a number of prominent categories of consumers who use automobiles occasionally.

Some believe that car rental is mainly targeted at tourists visiting a city. However, car rental has recently been given a new impetus thanks to the growing popularity of various forms of rental services targeted at city dwellers: car rental with a driver, 24-hour car rental, carsharing etc. Each form of car rental has its own niche in the transportation choices of city dwellers.

Urban transportation policy should make car rental more accessible through the development of relevant services. Ensuring the affordability of car rentals is an essential part of that. Making car rental services available and affordable can significantly reduce car ownership rates in urban agglomerations.

The aim of the research is to assess the availability of rental car and to establish the service availability factor as a crucial element of transport policy in urban areas that seeks to diversify modes of transport.

1 LITERATURE REVIEW

A bulk of theoretical work published in the 1960s (Buchanan, 1964; Leibbrand, 1970; Smeed, 1961) analyze space requirements of automobiles and public transport in the urban environment. Those studies were the first to identify vehicle saturation limits in cities. Reuben Smeed was one of the first European researchers to raise the key issues of demand side management by means of introducing adequate road tolls.

Hibbs proved that deregulation of transport leads to disintegration of services (Hibbs, 1986). The importance of assigning an active regulatory role to transport policy was later recognized not only by...
the opponents, but also by the advocates of transport system deregulation. Vuchic and Pickup showed that disintegration of urban transport systems was one of the main causes of passengers’ rejection of public transport options (Fawkner, 1995; Pickup, 1991; Vuchic, 1986).

Morlok argued that the connection between the privatization of transport system and the level of integration (disintegration) of transport services was not so straightforward. Retaining a central coordinating body during the process of privatization can lead to positive effects of privatization. Privatization will allow for cost savings in the urban transport system without affecting the integration of the transport services provided by various operators, including private ones (Morlok, 1987).

Homburger pointed to the need to make sure that public transport services are provided by a single city agency or by an “umbrella” structure that pools all city transport operators. Transport services might be consolidated in a single control center by encouraging municipal and private transportation companies to sign special agreements on the creation and operation of shared transport hubs, adoption of a joint tariff and coordinated schedules. Vuchic cites the case of Verkehrsverbund (transit federation) – an alliance of transit companies – as an example of successful consolidation that was implemented in several European cities. Transit federations plan and coordinate the operation of all modes of city transport, accumulate revenue and redistribute it among operators according to an agreed formula reflecting the operating costs of the operators (Homburger, Vuchic, 1972).

Pucher and Hirschman proved that the level and structure of public transport fares have a significant impact on the appeal of public transport. Innovative methods of fare collection make a big difference, too. The level and structure of transit tariffs must strike a balance between generating maximum revenue for companies and attracting the maximum number of passengers, which is the main objective of public transport (Puscher, Hirschman, 1993).

Newman et al. argued that highly efficient public transit systems are an essential prerequisite for building well-balanced transport systems in medium towns and big cities, and for their recovery from total automobile dependence (Newman, Kenworthy and Robinson, 1992; Pucher, Hirschman, 1993).

Vuchic substantiated the price level that keeps public transport attractive to potential passengers. The level of fares is not constant; it depends on the characteristics of each urban agglomeration, such its size, population density, social conditions etc. Another major factor influencing the level of tariffs is the quality and cost of competing transport services (Vuchic, 1981).

Vuchic proved that comparative analysis of the relationship of performance and investment costs should be conducted for the entirety of modes of transport. The entirety covers a vast range of various transit systems – from paratransit systems that are most effective in servicing small volumes of
dispersed travel demand, to LRT, metro and suburban railroads that make it possible to transport large volumes of passenger traffic that are typical of transport networks and major transit corridors in the biggest agglomerations (Vuchic, 1981).

We have not found any studies investigating the issues of price formation and price regulation of paratransit and, more specifically, of car rental.

2 METHODS

We conducted our analysis of the affordability of car rental services using the following methodology:

(1) Twelve countries located in different parts of Eurasia were picked for the analysis. The selection includes Northern European (Norway, the Netherlands), Central and Eastern European (Hungary, Poland, Czech Republic), Western European (France, Germany) and Southern European (Spain, Italy) countries, as well as Turkey, Russia and China. The countries differ drastically in terms of their economic development, population size and density, road and transport infrastructure. A comparative analysis was done of the capital cities of the countries, under urban conditions.

(2) The cities were grouped according to their ranking in the TomTom Traffic Index (Table 1).

<table>
<thead>
<tr>
<th>TTIF</th>
<th>Cities with moderate road congestion:</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 – 30 %</td>
<td>Amsterdam (Netherlands), Prague (Czech Republic), Budapest (Hungary), Berlin (Germany), Madrid (Spain)</td>
</tr>
<tr>
<td>30 – 40 %</td>
<td>Oslo (Norway), Warsaw (Poland), Paris (France)</td>
</tr>
<tr>
<td>Over 40 %</td>
<td>Rome (Italy), Istanbul (Turkey), Moscow (Russia), Beijing (China)</td>
</tr>
</tbody>
</table>

Table 1: Groups of cities for analysis

Increase in overall travel times when compared to a Free Flow situation. For example, a Congestion Level of 36% corresponds to 36% extra travel time for any trip, anywhere in the city, at any time compared to what it would be in a Free Flow situation. The TomTom Traffic Index figures are based on speed measurements from TomTom’s historical traffic database. These speed measurements are used to calculate the travel times on individual road segments and entire networks. By weighting based on the number of measurements, busier and more important roads in the network have more influence than quieter, less important roads. This makes the statistics match the user experience of people driving in the cities.
(3) The cost of car ownership was determined using the findings in the LeasePlan CarCost Index 2016 that is compiled by Lease Plan Corporation (Netherlands) (https://www.leaseplan.com/news/2016/2/5/leaseplan-carcost-index-the-netherlands-is-the-most-expensive-country-for-motorists-czech-republic-listed-as-cheapest/). We converted the index into the cost of car ownership per two weeks.

(4) We calculated the cost of renting cars in the mid-market segment for two weeks by drawing on quotes by four major car hire companies: Hertz, Avis, Sixt and Europcar. The average cost of car hire was determined as the mean of the rates quoted by all four companies, excluding the most expensive and the least expensive deals in the country being considered.

(5) As an integral measure, we propose a new index of replacement that characterizes the possibility of substituting car rental for car ownership. The index can be abbreviated as IR (Index of replacement). It is calculated as the ratio of the cost of renting a car (RC) to the cost of owning a similar car (CO) over the same period of time (t):

\[ IR = \frac{RC_t}{CO_t} \]

The higher the index, the less affordable are car rentals in the city, and consequently, the more difficult it is to substitute car rental services for car ownership. The lower the index, the more affordable car rentals are in the city. Consequently, the affordability of rent-a-car services should form a considerable alternative to car ownership in the city.

(6) The analysis utilized Eurostat data on car ownership levels. It has to be noted that car ownership levels were analyzed by country, so applying them to the capital cities implies a high degree of approximation.

3 ANALYSIS OF RESULTS

The results of the analysis of the affordability of car rentals in various cities are shown in Table 2.

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
Table 2: Analysis of affordability of car rentals in various cities

The obtained results demonstrate a weak inverse correlation between the index of replacement and car ownership levels (correlation index 0.15), which indicates the poor impact that the affordability of car rental services currently has on car ownership rates. There is also a very weak direct correlation between the index of replacement and traffic density (measured by the TomTom Traffic Index) (correlation coefficient 0.12).

The proposed index of replacement will make it possible to rank cities and countries by car rental affordability:

Cities (countries) with highly affordable car rental services. These are cities (countries) where the index of replacement is below 1 (IR≤1). Consequently, in such cities the price of renting a car is lower than the cost of owning a similar car over the same period of time. Among the cities that were analyzed high affordability of car rental is found in Madrid and Beijing.

Cities (countries) with a medium level of car rental affordability. These are cities (countries) where the index of replacement ranges between 1 to 2 (1<IR≤2). In these cities (countries) the price of renting a car is comparable or is slightly higher than the cost of owning a similar car during the same period of time. A medium level of car rental affordability is exhibited by Amsterdam, Rome, Berlin, Oslo, and Paris.

Cities (countries) with a low level of car rental affordability. These are cities (countries) where the index of replacement is over 2 (IR>2). In these cities (countries) the price of renting a car is substantially higher than the cost of owning a similar car during the same period of time. A low level of car rental affordability is exhibited by Istanbul, Warsaw, Budapest, Prague, and Moscow.
CONCLUSION

Urban transport policy should improve the availability of car rental by developing relevant services. Ensuring the affordability of car rentals is an essential part of it. The affordability of car rentals is an important factor creating acceptable alternatives to car ownership in urban agglomerations for individuals who take occasional or seasonal trips.

A statistical evaluation of the level of affordability of car rental services does not reveal a significant correlation with car ownership rates and traffic density. A more precise correlation might be found by a further study into the dynamics of the relationship between the affordability of car rental and car ownership levels over a period of time.

The index of replacement can have an application in compiling a new international ranking of cities (countries) by car rental affordability. The ranking can be based on the index of replacement that is described in this work. Such a ranking can be useful to tourists, municipal authorities, owners of car rental companies, and city dwellers.

HOW CUSTOMER EXPERIENCE ATTRIBUTES INFLUENCE CUSTOMER SATISFACTION AND ONLINE BANK CREDIBILITY

Loureiro, Sandra Maria Correia¹; Sarmento, Eduardo Moraes²

¹Instituto Universitário de Lisboa (ISCTE-IUL) Business Research Unit (BRU/UNIDE)
²ISEG (Lisbon School of Economics & Management, Lisbon University), ULHT and ESHTE

ABSTRACT

The banking sector has been focused its attention towards attracting Generation Y since they have consolidated as a huge force with powerful spending power which will unavoidably rival with Baby Boomers’ market dominance. Thus, this article analyses customer experience of Generation Y and its effect on customer satisfaction and bank credibility.

Empirical evidence, based on primary data from an online survey (550 questionnaires were spread over a two-month period in 2016 but only 205 were usable and completed) reveal that the customer experience attributes (mainly executional excellence and reputation) have a positive relationship on credibility and satisfaction. In addition, “Value for money”, “Getting things right the first time” and “Put the consumer first” emerge as the most importance attributes for Generation Y in experiencing the bank.

Keywords: Customer experience, Generation Y, Credibility, Satisfaction, Banking sector.

INTRODUCTION

In a progressive global and competitive world, banks must innovate and create different strategies to succeed. However, searching for competitive advantage through product differentiation in the banking sector is extremely difficult since products and services may be quickly copied thus forcing banks to find new ways and opportunities of identifying and developing relationships with customer and enhancing positive feelings about them. The banking sector is a consumer-oriented service industry, and their success increasingly depends on the quality of the consumer service provided, as well as the overall customer’s satisfaction.

Under this context, relationship marketing turned to be a critical aspect to corporate banking success. Today’s customers demand a high level of experience from banks, which, if fulfilled, could result in significantly improved customer satisfaction, and potentially retention levels (Putnam, 2012). Furthermore, since brand experience is the outcome of an attribute, the information processing in which consumers are engaged rationally and emotionally, it is extremely important to engage all
senses and to evoke emotional as well as an intellectual reaction towards a brand (Brakus, Schmitt, and Zarantonello, 2009).

Generation Y (Gen Y) is considerably less likely to have positive experiences, compared to all other age groups due to the high expectations they have toward banks’ digital capabilities. Gen Y is far more interested in using mobile banking compared to other age groups, placing additional importance on the development of this channel (Capgemini and Efma, 2016). Under this context, customer experience may be an emerging opportunity in the new horizon of experience economy since it is expected that customers with positive experiences may be three to five times more likely to purchase additional products (Capgemini and Efma, 2015).

Prior studies with bank institutions revealed a gap because they didn’t properly analyze which stimuli of online bank experience could influence the emotions and the behavioral intentions positively. Therefore, the research question is: which stimuli from bank experience attributes can influence customer satisfactions and credibility of Generation Y (or Gen Y)?

This article is organized into three parts. The first one gives the theoretical background which aims to contextualize the research. Then we present the method and results, In the end, the conclusions and implications.

THEORETICAL FRAMEWORK

Experience conceptualization
In an era of relationship marketing where marketers focus on the development of long-term relationships, the understanding of how consumers experience a brand is crucial for the meet such marketing goals. In the marketing literature, the concept of experience has been investigated in different contexts, recently, a concept has been presented that spans across these various contexts: the concept of brand experience (Zarantonello and Schmitt, 2010). In addition, Nysveen, Pedersen, and Skard (2012) consider both customer and brand experiences to span the context - and life cycle-specific experiences.

Since brand experience can be seen as the outcome of an attribute which consumers are both rationally and emotionally engaged, when creating a brand experience, the key is to engage all senses and to evoke emotional as well as an intellectual reaction towards a brand. In other words, it can be defined as subjective, internal consumer responses (sensations, feelings, and cognitions), as well as behavioral responses evoked by brand-related stimuli, are part of a brand’s design, identity, communication and packaging strategy. They can take various forms and range from colors, sounds, haptics, to logos with special typefaces and designs, slogans with a high recall value or brand characters in the form of mascots (Brakus, Schmitt, and Zarantonello, 2009).
The degree to which companies can create a certain experience for customers depends on their ability to make use of all these brand stimuli in a favorable way (experiential marketing), and marketers see consumers as rational and emotional human beings concerned with achieving pleasurable experiences. Marketers can create different types of experiences for customers: sensory experiences (sense); affective experiences (feel); creative cognitive experiences (think); physical experiences, behaviors and lifestyles (act); and social-identity experiences that result from relating to a reference group or culture (relate) (Schmitt, 1999).

Brakus, Schmitt, and Zarantonello (2009) propose a framework with five experience dimensions that are responsible for the creation of brand experience as follows: sensory, affective, behavioral, and intellectual. Brand experiences can positively affect consumer satisfaction and brand loyalty, as well as brand associations (particularly brand personality). Brand experience is empirically distinct from other brand and customer-focused concepts including brand attachment, brand involvement, and customer delight (Zarantonello and Schmitt, 2010).

Mosley (2007) argues that product brand experiences are simpler than service brand experiences, as services require a higher level of interpersonal complexity and relationship quality and therefore, the relational dimension of experience is highly relevant in the service sector.

Customer experience in banking sector

The concept of customer experience appeared in marketing studies in 1982 by Holbrook and Hirschman and became generalized in marketing literature by Pine II and Gilmore in 1998. Nowadays, creating and delivering superior customer experience has become one of the prime objectives of organizations.

Customer experience may be defined as the internal and subjective response customers have to any direct or indirect contact with a company in a way that creates a memorable event (Pine II & Gilmore, 1998). Direct contact generally occurs in the course of purchase, use, and service and is usually initiated by the customer. Indirect contact most often involves unplanned encounters with representatives of a company’s products, service or brands and takes the form of word-of-mouth recommendations or criticisms, advertising, news reports, reviews and so forth (Meyer and Schwager, 2007). In other words, Customer experience is the user’s interpretation of his or her total interaction with the brand (Ghose, 2007).

In considering customer experience, it is appropriate to consider two perspectives of consumer behavior: (i) the traditional “information processing and decision oriented” perspective that suggests that customer is engaged primarily in goal-directed activities such as searching for information, evaluating available options and deciding whether to buy a particular product or service or not (Frow and Payne, 2007) and (ii) the “experiential” perspective. This view of consumption has broadened this
perspective considerably and includes the flow of fantasies, feelings and fun where such behavior may not necessarily be the goal (Payne, Storbacka, and Frow, 2007) but needs to be seen from both an information-processing approach that focuses on memory-based activities and on processes that are more sub-conscious and private in nature (Holbrook and Hirschman, 1982).

The nature of service encounter and kind of service provider do an essential function because the customers not just purchase the service delivered by the business, however, purchases “experience” from that business, too. The main reason to work on the experiences of the banks’ customers is that the prosperity of any bank depends upon its number of existing customers (Garg, Rahman, Qureshi, and Kumar, 2012). For services, it has been demonstrated that the creation and delivery of an emotion-rich experience provide brand differentiation and influences sales, consumer loyalty, and promotion of the brand (Morrison and Crane, 2007).

In studying of customer experience factors in banking, a customer requires convenience at its every contact point with the organization as regarding the location of the bank, available parking facilities, speed, hygienic environment and alike (Jain and Bagdare, 2009). According to (AHP) approach, the factor “convenience” possesses maximum weight it shows that though customer takes cognitive decisions regarding “monetary aspect” but still requires “convenience” in every aspect while dealing with the organization. In addition, employees, online functional elements, and servicescape possess distinctively higher weights than the other factors such as service process, marketing mix, customer interaction and online hedonic elements (Garg, Rahman, Qureshi and Kumar, 2012).

The research’s results about banking by Hardeep Chahal and Kamani Dutta study revealed that core service experience comprising cognitive, affective and behavioral factors is most significant dimension followed by relational experience and sensory experience dimensions. The cognition items affecting banking customer experience include knowledge of bank products, competitive interest on loans and information sharing. Bank managers when respect customer’s time and give special attention to knowledge, speed and service process, can generate positive behavioral experience. Similarly, affective items in the core service factor include problem handling, responding quality, aesthetic, and empathy, which have a significant impact on creating customer experience in banking sector. Behavioral characteristics affecting customer experience include concern and caring attitude, prompt customer service and error free bank services (Chahal and Dutta, 2014).

Customer Satisfaction

Customer satisfaction refers to “a person’s feelings of pleasure or disappointment that result from comparing a product’s perceived performance (or outcome) to their expectations” (Kotler and Keller, 2006: 144) and can generally be described as the full meeting of one’s expectations (Oliver, 1980).
Research indicates that satisfaction primarily consists of cognitive (include disconfirmation and expectations, perceived performance, equity, performance, fulfillment and price acceptance/willingness to pay) and affective variables (include emotional measures, post-purchase, word of mouth, arousal and pleasure) (Fraering and Minor, 2013).

The banking sector has been undergoing changes triggered by regulatory, structural, and technological factors, which make keeping customer satisfaction more difficult. Developing and maintaining customer satisfaction is important particularly in the service sector because that will lead to loyalty, increasing in profits through repeat patronage, less price sensitivity, and positive word-of-mouth (Foscht, Schloffer, Maloles and Chia, 2009).

Bank customer satisfaction is a hot topic of current scientific research. In response to the negative impact of the recent financial crisis of 2008, consumers have become very sensitive to all aspects of commercial bank activity. A satisfied customer remains loyal and to keep him a company requires five times less effort, time, and money than to get a new one (Belás and Gabčová, 2014). Customer “retention” relies on the quality of the relationship and the experience, which the customer has with their bank. Thus, creating satisfied, happy customers is crucial to maintaining their long-term loyalty (Baumann, Elliott, and Burton, 2012).

Nevertheless, various studies showed that even satisfied customers switch their bank if another one offers them a better product because even though loyal clients have a more intense, emotionally based connection to their bank and are consequently more resistant to competitor banks’ offers satisfied customers may quit their banks due to objective factors, e.g. conditions of products, price or distribution channels reliability determine their satisfaction and also subjective emotions and experiences that are getting more and more important (Murugiah and Akgam, 2015).

If the bank exceeds the expectations of their clients, positive conditions for their loyalty are created. Understanding customer loyalty requires understanding customer satisfaction first (Fraering and Minor, 2013).

According to Chavan and Ahmad (2013) there are eight important attributes of satisfaction in banking: paying individual attention to each client, personnel behavior inducing customer trust, attractive bank equipment, zero fees for issuing checks, zero error records, the possibility of online banking, security of transactions, helpful staff, and readiness of staff to answer to customer requirements regardless of occupancy. From a transaction-specific attribute, customer satisfaction is dependent on nine different factors: tangibility, e-fulfillment, convenience & availability, accuracy, responsiveness, empathy, promptness, personal assistance (Chavan and Ahmad, 2013). Furthermore, in online banking service, it was added the following factors that affect customer satisfaction: perceived quality of the service, perceived value, and customer expectation (Unyathanakorn and Rompho, 2014).
The older the customer, the greater the intention to remain with their bank for a longer time because most of the attention in terms of acquisition/customer retention should be placed on the segment of young, high-income customers, as they are the ones most willing to change banks (Baumann, Elliott and Burton, 2012).

When comparing older bank customers to younger ones, it was found that older customers are more loyal to their bank, more confident on the notion that their bank offers the best deal, and more satisfied with the preferential treatment they receive from their banks. Older customers are often seeing the perceived value in a bank’s effort to recover services than are younger customers. On the other hand, the younger the bank customer is, the higher he/she perceives the availability and attractiveness of alternatives. Younger bank customers are more likely to end their relationship with their present bank and are less loyal and less satisfied with the services they get from their banks than the older customers. Older customers are more likely to have a higher perception about the satisfaction derived from their bank service, and the difficulty of switching to other banks (Tesfom and Birch, 2011).

**Brand Credibility**

Brand credibility has two main components: expertise and trustworthiness (Wernerfelt, 1988). Thus, brand credibility is the believability of the product information contained in a brand, which requires that consumers perceive brand as having the ability (i.e., expertise) and willingness (i.e., trustworthiness) to deliver continuously what has been promised (brands can function as signals because if and when they do not deliver what is promised, their brand equity will erode). In other words, “Brand credibility” is defined as the believability of the product position information contained in a brand, which depends on the willingness and ability of firms to deliver what they promise (Erdem, Swait, and Valenzuela, 2006).

Erdem et al. (2006) study demonstrated that credible brands provide more value to high-uncertainty-avoidance consumers because such brands have high perceived quality, lower perceived risk and lower information costs. Brand signaling theory suggests that credibility can build brand equity (Erdem and Swait, 1998). Furthermore, higher brand credibility can increase consumers’ perceptions of product quality by influencing their psychophysical processes whereby objective quality levels are transferred into perceived, subjective quality levels (Erdem, Swait, and Louviere, 2002).

Maathuis, Rodenburg, and Sikkel (2004) have insisted on the significance of brand credibility in consumer’s decision-making and choice perceptions, and the credible brand is expected to induce higher levels of consumer loyalty. In other words, a credible brand would easily generate loyal customers if it consistently conforms to its promised quality and trust induce brand’s credibility which, then leads to a bigger customer brand relationship (Alam, Usman Arshad, & Adnan Shabbir,
Sweeney and Swait (2007) results from samples of retail bank indicate that brand credibility serves in a defensive role: it significantly enhances word-of-mouth and reduces switching behaviors among customers.

*Generation Y*

This is a segment that comprises individuals who were born between 1980 and 2000 and that are also referred to as Millennials, net generation or Echo Boomers (Valentine and Powers, 2013). Individuals in this segment like to work in a team and in an organized and growth-oriented culture because they believe they would better accomplish their goals. They are also eager to achieve their objectives within a short time period (Viswanathan and Jain, 2013). They are influenced by western culture, and therefore they are eager to spend money or experiment and adapt to new products and brands. Although they have high brand awareness, they are not loyal to a brand loyal being called “brand switchers”. It is important to note that the purchasing power of this young segment will keep increasing over time (Jurisic and Azevedo, 2010). Since Gen Y’s start to use social media the marketplace, the workplace and the society have been changing; it will ultimately lead to new business models, processes, and products (Bolton et al., 2013).

Thus, younger customers are more likely to change their banks easily, so if retail banks want to retain younger customers, they need to offer more meaningful incentives to younger customers than they offer to older customers. This situation highlights the need for managers to design different switching barrier packages for each customer age group (Tesfom and Birch, 2011).

Given that e-banking services are designed essentially to suit individuals who prefer convenience, quicker service, more frequent and less face-to-face retail banking services, one would expect that Generation Y individuals, would be expected to use the e-services more regularly given that individualistic societies tend to be more consumption-oriented and therefore more encouraging towards spending (Rugimbana, 2007).

Generation Y group likes to travel and prefers to spend money on experiences rather than materialistic items. Their responses to online marketing are expected to be different as they process website information five times faster than older generations and are the most emotional and least loyal customers compared to all other generations (Bilgihan, 2016). Bilgihan also demonstrated that trust is the most important antecedent of e-loyalty in online shopping for Gen Y customers. Brand equity is also a key precursor of e-loyalty. Finally, a positive online experience (flow) is also a significant precursor of e-loyalty (Bilgihan, 2016).

*Banking Sector*

For several years now, the banking sector has been under several challenges namely the technological development. The Internet has transformed the way in which individuals, groups, organizations
communicate, obtain information, access entertainment, and conduct their economic and social activities. Looking forward, by 2018 almost 3.6 billion people, i.e. half of the world’s population will be connected to the internet or the mobile internet (Nagurney, 2014).

In response to market competition and with relatively low setup costs, traditional banks have adopted a policy of enhancing the possibilities of their online services. Interactive banking services have currently become a common practice, ubiquitously performed all over the world and are now an integral part of the modern commercial environment (Levy, 2014).

This significant change extends across all levels of service in the banking industry. Advances in technology, globalization, and customization have created a dynamic banking environment in an attempt to improve service quality and satisfy customers’ need for faster, easier, independent and real-time service (González, Mueller-Dentiste, and Mack, 2008).

Internet banking has become a strategic tool for business development has gained wide acceptance internationally (Sahoo and Swain, 2012). There are some main benefits of Internet banking for both banks and customers (Sahoo and Swain, 2012): (i) its permanent availability; (ii) banks have succeeded reduced queues through technology. Also, banks use internet facility for customer’s transactions and will reduce paperwork, will give a quick response to the customer; (iii) e-banking makes easier for customers to compare banks’ services and products. Moreover, it can raise competition among banks, and allow banks to penetrate new markets and thus inflate their geographical reach; (iv) e-banking Customers can easily access services from abroad and through wireless communication systems, provides them enormous benefits regarding the ease and cost of transactions.

Mobile has become an intrinsic and vital part of bank customers’ everyday life, and they expect banks to respond rapidly to their demands and provide the level of service they want (EFMA, 2014). According to the second annual Trends in Consumer Mobility report of Bank of America, of those consumers who use a mobile banking app, nearly two-thirds (62%) access it at least a few times a week or more, while one in five (20%) check once a day or more (Bank of America, 2015).

Mobile Banking covers various areas, from apps to mobile financial services and even mobile payments, and from smartphones to smart TVs. These are all part of the rapidly evolving mobile ecosystem (EFMA, 2014). In addition, according to the Consumer Mobility report of Bank of America (2015), 74% of consumers check their balance or statement, 63% consult transactions via their mobile banking app and 72% of Millennials (ages 25-34) generation report using mobile deposits. Additionally, nearly 38% pay bills, almost 32% use it to locate a branch or ATM and 15% manage investments.
Despite the huge worldwide migration towards the use of mobiles in recent years, mobile banking is still really in its infancy. There is a lot to be discovered, and many challenges to overcome the whole mobile ecosystem is continuing to grow and evolve (EFMA, 2014).

Banking for generation Y

As banks target technology-friendly Gen Y customers, they must focus on developing products and services in unique and innovative ways. Gen Y customers are more likely to be attracted by innovation, quality of service, and accessibility to various products and services such as payment systems and banking accounts. To that end, mobile and social media tools are powerful ways to engage Gen Y (Capgemini and Efma, 2015).

The reasons that younger generations patronize banks is that they offer more sophisticated, online and mobile banking services and is a more convenient access to ATMs (Putnam, 2012). Online or mobile banking is an influential factor for about 25% of younger generations, but only 18% of older boomers or matures. Gen Y is more likely to pay attention to what their friends say, text or put in their Facebook pages about a bank than what the bank is saying about itself. Gen Y prefers to receive communications via the bank’s online banking site (after login), e-mail or the bank’s website more than by “snail mail.”

Gen Y have some requirements & demands (Capgemini, 2014): (i) they are more interested in products and services that offer low fees and charges and banks that offer student accounts, without maintenance fees, and loans with lower commissions and fees; (ii) they look for banks with higher rates on savings accounts; (iii) they prefer banks whose processes are more streamlined and offer a high level of convenience; (iv) they will select a bank that delivers the greatest value and benefit to them. In additional, they prefer banks that have a transparent feedback system that will act on customer suggestions and complaints; (v) they prefer banks that provide mobile and online capabilities because of high reliance on smartphones.

Therefore, in order to encourage an ongoing mutually valuable relationship with Gen Y customers, banks need to focus on four key areas that could increase Gen Y customer stickiness (Capgemini, 2014): (i) banks should introduce specific checking and savings accounts with competitive interest rates and a high level of online and mobile banking convenience. Banks should provide attractive long-term savings, pension, and securities and insurance products and services to meet this need; (ii) banks should bundle payment instruments (Mobile Wallets - Prepaid Cards - Credit Cards - Personalized Cards); (iii) banks should focus on enhancing their online and mobile channels; (iv) banks need to embrace social media platforms to engage Gen Y customers who are more likely to trust experiences posted on social media by other customers and use social networks and platforms to voice their opinions.
RESEARCH MODEL AND HYPOTHESES

The Customer Experience attributes encompass: Accessibility, Ease of doing business, Executional excellence, Personalized offering, Staff engagement, Value for money, and Reputation affect the organism. The organism is defined by the attitudinal state that includes satisfaction and by the perspective that includes credibility.

Figure 1. Research model

The overall hypotheses proposed for this study are the following:

**H1: Customer Experience, that is,** Accessibility(H1a), Ease of doing business(H1b), Executional excellence(H1c), Personalized offering(H1d), Staff engagement(H1e), Value for money(H1f), and Reputation(H1g) **positively affects customer satisfaction of Generation Y in experiencing the bank.**

**H2: Customer Experience, that is,** Accessibility(H2a), Ease of doing business(H2b), Executional excellence(H2c), Personalized offering(H2d), Staff engagement(H2e), Value for money(H2f), and Reputation(H2g) **positively affects bank credibility of Generation Y in experiencing the bank.**

METHOD

Data Collection

We collected secondary data through a revision of previous researches related to the topic. With the support of the theoretical background and in order to collect primary data an on-line survey was created and launched via the umfrageonline website, being available during February and March 2016. Therefore, it was chosen and online survey because (i) it allows a quick response and it possible to reach a higher number of Generation Y’s customers in a small period of time in different places; (ii) the study is aimed at Generation Y that is also known as the Internet generation, increasing the
importance of using an on-line survey. The survey was spread to customers via Facebook. We posted the survey’s link on several Facebook pages like universities and youth organizations.

Questionnaire Design

The questionnaire was mainly designed to measure: Customer Experience attributes, internal emotional consumer states. The items of the questionnaire were rated on a 5-point Likert scale: (1= strongly agree, 2= agree, 3= Neither agree nor disagree, 4= disagree, 5= strongly disagree).

Hence, in the first part, the respondent had four demographic questions: gender, age, marital status and educational background. In the second part, the respondents were asked to answer eighteen questions concerning the seven Customer Experience attributes (1-Accessibility, 2-Ease of doing business, 3-Executional excellence, 4-Personalized offering, 5-Staff engagement, 6-Value for money, and 7-Reputation). Those eighteen questions were grouped into two groups. This part was based on the study of KMPG International (2014). In the third part, the respondents were asked to rank that Customer Experience attributes according to its importance to them according to the scale 1= most important, 7= less important.

In the fourth part, the respondents were asked to answer questions about customer satisfaction, based on Erdem and Swait (1998) and bank credibility, adapted from Leverin and Liljander (2006).

Sample Profile

The sample of this study consisted of Generation Y customers of banks from different countries around the world. In order to achieve the target sample, an online survey was spread through Facebook with URL embedded that lead the respondents to the survey.

Almost 550 questionnaires were spread over a two-month period in 2016. Thereby, we gathered a sample of 211 respondents. The data consists of 205 usable survey participants (120 male-58%; 85 female-42%). Most of the answers are from individuals aged between 21-25 (46.8%) and between 26-30 (35.1%) followed by 31-35 (13%) and 18-20 (5%). Regarding the marital status, most the respondents were single (180), and the others 25 were married.

Finally, regarding the education level, most of the sample is doing or already has University degree (100-49%), 41% were doing or already had a Master degree, 3% has a Ph.D. degree, and 7% had a senior high school degree.

RESULTS

Table 1 shows the descriptive statistics and the reliability of the constructs. The constructs reveal to be reliable since the values of Cronbach's Alpha (CA) are higher than 0.7.

Note: CA-Cronbach Alpha
In order to test the hypothesized relationships of H1 and H2, multiple regression analysis was used. In this case, multiple regression determined the relative importance as well as the significance of the relationship between customer experience, the organism state, and responses.

In order to test multicollinearity among independent variables, the Variance Inflation Factor (VIF) was examined, and we concluded that all VIF values in this study were within an acceptable range (VIF values were below 10). For all of them, Tolerance values were superior to 0.1. Given the sample's dimension, it can be considered that the Durbin-Watson test is at the inclusion zone (close to 2).

The seven attributes of Customer Experience (Accessibility, Ease of doing business, Executional excellence, Personalized offering, Staff engagement, Value for money and Reputation) were used as independent variables while Satisfaction was the dependent variable. The results in table 2 show that there is a significant positive relationship between the Customer Experience and Satisfaction (p < 0.05). Satisfaction is explained by the seven predictors by 41.8%. Yet, only the Accessibility (β = 0.193, p ≤ 0.05), Executional excellence (β = 0.267, p ≤ 0.05) Personalized offering (β = 0.124, p ≤ 0.05), and Reputation (β = 0.202, p ≤ 0.05) are important to explain the Satisfaction variable. The Ease of doing business, Staff engagement, and Value for money do not significantly contribute to explaining the Satisfaction.

</table>
Regarding H 2, the seven attributes of Customer Experience; Accessibility, Ease of doing business, Executional excellence, Personalized offering, Staff engagement, Value for money and Reputation were used as independent variables while Credibility was the dependent variable. The results in table 2 show that there is a significant positive relationship between the Customer Experience and Credibility (p < 0.05). The seven customer experience attributes help to explain 51.7% of the variability of Credibility. However, only the Executional excellence (β = 0.188, p ≤ 0.05), Staff engagement (β = 0.172, p ≤ 0.05), Value for money (β = 0.145, p ≤ 0.05) and the Reputation (β = 0.402, p ≤ 0.05) are important to explain the Credibility variable. The Accessibility, Ease of doing business and Personalized offering do not significantly contribute to explaining the Credibility.

We also intended to find how the Bank customer experience attributes are important for Gen Y customer. To achieve this task, we asked them (customers) to rank the seven attributes that represent the seven categories of customer experience. The customer experience attributes were: Value for money ; Getting things right the first time; Put the consumer first; Staff who are honest and tell the truth; Ease of getting issues/queries/complaints resolved; Availability of services and Offers products and services that can be tailored to my specific needs (KPMG, 2014).
A custom table was created to test the data. Table 4 shows the number and percentage of respondents for each rank; the results determined that the majority of respondents mentioned Value for money (i.e. fair and appropriate fees and charges) as the most important attribute (rank 1) (68 respondents - 33.2%). The least important for most of the respondents (rank 7) was Offers products and services that can be tailored to my specific needs (90 respondents - 43.9%).

Regarding table 5, there are two attributes (Getting things right the first time and Put the consumer first) that have a close number of respondents 39 – 41 respectively. The final order of importance for the seven attributes, with the number and percentage of respondents who gave each rank, is the in following table 6 (1= most important, 7= less important).

CONCLUSIONS AND MANAGERIAL IMPLICATIONS

The present study has the intention to go further in understanding how customer experience of Gen Y could affect the outcomes (customer satisfaction and bank credibility) of the banking sector’s efforts from a marketing perspective.

In what concerns the “Rank the Customer Experience attributes” we saw that “Value for money” (i.e. fair and appropriate fees and charges) was the most importance attribute (33.2% of respondents). The least important attribute in this sample was “Offers products and services that can be tailored to my specific needs” (43.9% of respondents). Those results are consistent with the ones found by KPMG International for banks (KPMG International, 2014). The only different is that Gen Y in this sample gave “Getting things right the first time” and “Put the consumer first” attributes more importance than “Staff who are honest and tell the truth”.

We found a significant positive relationship between the dependent variables and at least one of the independent or outcome variables. Therefore, the customer experienced attributes of Accessibility, Executional excellence, Personalized offering and Reputation have a positive impact on Satisfaction. On the other hand, the customer experienced attributes of Executional excellence, Staff engagement, Value for money, and Reputation have a positive influence on Credibility, which is consistent with the work of Syrett and Lamminman (2004) and Capgemini and Efma (2014). The results for Satisfaction are consistent with the ones found by Baumann, Elliott, and Burton (2012) that claim that customer “retention” satisfaction relies on the quality of the relationship and the experience that the customer has with their bank. Reputation has a dual role on both Satisfaction and Credibility.

These conclusions have implications to understand the importance of customer experience concept in the banking sector for Gen Y and contribute to the development of a new model for banks that focus on the emotional side of the interaction between Gen Y and banking sector. Particularly, banks need to be aware of the importance of the value for money for Gen Y as a first reason to stay or leave the Bank. Getting consumer first and doing things right at the first time occupy an important place in building positive Gen Y customer experience. Furthermore, particular attention should be paid to Reputation because it plays a leading role to achieve marketing efforts outcomes and it is the foundation to any relationship between Gen Y and banks.
Personalized genuine offerings along with excellence performance is a critical issue for Gen Y in the banking sector. Each of Executional Excellence and Personalized offering contributes to achieving the marketing goals of banks through different aspects. Moreover, it has been noticed that the Gen Y does not feel active or energetic during experiencing the bank environment as he/she does in other industries. From that, bank’s managers should consider that in planning the process of the interaction between Gen Y and bank by making this process more entertainment for example.

In sum, banks need to work in making Gen Y customer experience unique, not boring or something Gen Y need to deal with. This should be done with customized services and products that tailored with the special need of this segment along with ongoing innovations that benefit from continuing IT development.

ABSTRACT
With this paper we examine the factors that influenced the evolution of the olive oil prices over the past 30 years in the Iberian Peninsula (Portugal and Spain). The research aims to study the olive oil sector, not only by the means of a brief characterization, but also by performing an empirical study focused on the determinants that may affect the olive oil market, regardless being on the production or on the retail side. Accordingly, the research uses a comprehensive dataset, examining factors from olive production related to olive oil market conditions, which impact on retail conditions and consumption, and including other economic variables as well. Covering the period from 1986 to 2015, the data was subject to statistic testing and validation using a multiple regression analysis model. Our results suggest the presence of a relationship between the olive oil prices and a set of several factors, such as climate conditions, olive cultivated area, gross national income, and olive oil production, number of mills, value of exports and consumption.

Keywords: Olive oil prices, olive oil production, retail and consumption, international trade, socioeconomic conditions, Portugal and Spain

INTRODUCTION
In the Iberian Peninsula, which comprises Portugal and Spain, the production of olive oil, which is also referred in this paper simply as “oil”, is very high, despite there are other countries in the world, outside the Mediterranean basin, that also produce significant amounts, such as California, in the United States, or Argentina and Australia. The reason these countries are also producers is due to their climate properties, since, as in the Mediterranean, the temperature of several regions in these countries is moderate (Pires, 2005).
In addition to the use in food, the olive oil also serves for nutritional and therapeutic uses, prevents the onset of breast cancer and cervical cancer, as it has monounsaturated fatty acids which reduce the bad cholesterol, meaning that it is a healthy fat (Barranco et al., 2001; Kiritsakis, 1992).

In Portugal, the largest olive areas are in the Alentejo and Trás-os-Montes regions (Ministério da Agricultura do Desenvolvimento Rural e das Pescas, 2007). In Spain, the main olive oil producing region is Andalusia (Barranco et al., 2001; Consejería de Agricultura y Pesca, 2011).

The evolution of prices depends on many factors, such as the production level, the economic level and social level.

With this paper we will examine the factors that possibly influence the price of oil in recent years, in Portugal and Spain. For this reason, we will observe and analyze several agricultural, atmospheric, and socio-economic factors.

The data obtained will be analyzed using an econometric model, an OLS regression. This paper is organised as follows. It first starts with a research on olive oil, to examine the causes which may justify the oil price changes in the Iberian Peninsula. Second, the assumptions to study and the methods to use are defined. Finally, following the data description, the results are shown and discussed, allowing to present our final conclusions.

**THEORETICAL FRAMEWORK**

In any scientific research work it is necessary to know and deepen the theme that will be handled. That said, we will start with a brief summary on the price of olive oil and the determinants that influence theoretically this variable, as the weather, imports and exports of the product, level of production, or socio-economic conditions of consumers.

*Price of olive oil: definition and evolution*

The price of oil is the amount received per unit in cash, being added to this amount all the costs for the elaboration as well (Instituto Nacional de Estatística, 2003).

The olive oil market in the Iberian Peninsula improved when its countries joined the European Union in 1986 (Comissão Europeia da Agricultura e Desenvolvimento Rural, 2003).

By doing the analysis about the olive oil sector in Portugal, according to the INE report, when an increase in the base price occurs, it turns out that it was coincident with a bad agricultural year, meaning there were decreases in production volume. When the harvest season is good, as in 2009, the production volume gradually increases thus achieving a high supply and therefore a lower price (Instituto Nacional de Estatística, 2010 a).
Atmospheric conditions

The climate is one of the most important determinants impacting the formation of olives and therefore the oil. This factor affects their development, producing best olive oil or worse in quality, so depending on atmospheric conditions harvest each year (Kiritsakis, 1992).

Water for olives to grow is one of the crucial variants, so that productivity is more and better because all olive development processes depend on water (Rodrigues & Correia, 2009).

Level production

Olive oil production is greatly affected by weather conditions and by pests, therefore its production varies from year to year and therefore yields will also fluctuate (Pinto, 2003; Guerra, 2010).

The European Union (EU) produces about 75% of world production. The EU’s largest oil producer is Spain (over 50% of EU production), followed by Greece and Italy (Tasdogan et al., 2005).

As shown in Figure 1, over the last ten years the olive production suffered from volatility.

According to a study by INE regarding the harvest of 2014/2015 in Portugal there was a sharp drop compared to 2013/2014. This change was due to bad weather conditions. However, production in Portugal has been growing, with the exception of this last campaign, as seen in the previous figure (Instituto Nacional de Estatistica, 2016).

The products on the market must be of top quality, so that in the retail the consumer is left satisfied at the time of purchase (Pires, 2005). “The commercial quality of a product is the set of characteristics or attributes which distinguishes them from other similar goods” (Pires, 2005, p.13).

The cultivated area is the sum of utilized agricultural area for the cultivation of olive trees (Instituto Nacional de Estatistica, 2010 b; Gabinete de planeamento e politica agro-alimentar & Direcção de serviços de produções vegetais, 2001).

According to figure 2, the area cultivated for the last 10 years in Portugal was initially gradually increased, however in the last 5 years a decrease occurred, while Spain recovers from a large drop that
occurred in 2011/2012 and 2012/2013 campaigns. In figure 2 you can see that Portugal is still very far from reaching the values of neighbouring Spain.

![Figure 2. Cultivated area in the Iberian Peninsula](image1)

Source: Adapted from collected data from INE and MARM

An oil mill is an industrial plant where change olives and turn into different types of olive oil (Instituto Nacional de Estatística b, 2010).

Over the past few years the number of mills has been dramatically decreasing in Portugal, as more and more demands on the operating conditions are high. In 2014/2015 campaign only 474 mills were in operation for Portugal (Instituto Nacional de Estatística, 2016). While in the neighbouring country, in the same period there were around 1759 mills distributed throughout the country (Ministerio de Agricultura y Pesca, Alimentación y Medio Ambiente, 2015).

![Figure 3. Number of oil mills in Portugal and Spain](image2)

Source: Adapted from collected data from INE and AAO (Agência para el aceite de oliva)

The economic level the good functioning of the mills depends on quantity, cost, the olive and the efficiency and effectiveness of the transformation (Pires, 2005).

**Inputs and outputs**

Imports of a product represents the entry of any well into a country (Instituto Nacional de Estatística, 1999). The balance of trade of olive oil in Portugal has about tons of olive oil imports 73500, the quantity of olive oil produced by Portugal just happy about 50% to 60% of the needs of the Portuguese consumption (Observatório dos Mercados Agrícolas e das Importações Agro-Alimentares, 2010).
The oil inputs to the Spanish region, for example in the 2009/10 harvest were only about 49.8 thousand tons (Consejería de Agricultura y Pesca, 2011).

Exports are equivalent to the outputs for international trade, i.e. is the trade of products for international countries (Instituto Nacional de Estatística, 1999).

At the moment the European Union is one of the main producers and as such is also the main exporters, since Spain is one of the main exporters, the harvest of 2014/15 were about 831,194 t (Ministerio de Agricultura y Pesca, Alimentación y Medio Ambiente, 2016).

The country with the largest portion of Portuguese exports is Brazil, which holds about 60% of total exports (Observatório dos Mercados Agrícolas e das Importações Agro-Alimentares, 2010).

Socio-economic conditions of families

In this case the household income is the total receipts acquired through social, received wages, net amounts resulting from work on their own or interest received (Rosa, 2010).

The human consumption, characterized by the quantities of a product or good that is available to the public, this product can be consumed in the initial medium or through industrial processing, in the latter case the oil is included (Instituto Nacional de Estatística, 2010 b).

As you can see in Figure 4, Spain had a very similar oil consumption over the past eight years, however in 2012/2013, there was a fall, and is now trying to exceed it. As for Portugal, the amount consumed is very similar over the last ten years represented in the figure below.

![Figure 4. Consumption of olive oil in Portugal and Spain](source)

Source: Adapted from collected data from COI (Conselho Oleícola Internacional Espanhol)

During the campaign of 2014/15 consumption of olive oil in Spain reached 492,200 tons (Ministerio de Agricultura y Pesca, Alimentación y Medio Ambiente, 2015). In Portugal the consumption of olive oil, according to the data in figure 4, in the 2014/2015 season was 74,450 tons (Instituto Nacional de Estatística, 2016).
METHODOLOGY

This section provides the methodological part, consisting of the initial question, the construction of issues on his holding in the preparation and observation of an analysis model.

Description of the problem

The starting question of this project is a scientific question, which includes a study of several variables and relationships between them. Which may result in new theoretical and scientific contributions. The starting question is: "What factors contribute significantly to the oil price variations in the Iberian Peninsula?"

For the exploration of the themes were done research on some subjects within the theme, such as: what are the biggest oil producers in Europe; the main factors that influence the price of this well for the countries under study; and how changes in the price of oil in the Iberian Peninsula over the last 30 years.

With the composition of this project will be going to analyze the variables that influence the price of oil, and from this step will be to go prepare an analysis model to be able to understand, determine and study the factors that influence the price of olive oil in the Iberian Peninsula.

The data for the composition of this analysis were obtained through literature searches, readings of various documents and some statistical databases such as Portuguese and Spanish INE, Pordata, IOC (International Olive Council) and MARM among others.

Construction of the analysis model and hypothesis system

The analysis model is to integrate facts that influence the price of oil (dependent variable) of the Iberian Peninsula. The independent variables were divided into groups, a can be seen in figure 5 and the following hypotheses transcribed.

The following figure describes the analysis model that demonstrates the possible influence of the independent variables in the price of oil in order to answer the initial question.

![Figure 5. Analysis Model](image_url)

According to figure 5, the following research hypotheses are to test:
H1: The price of oil is influenced by weather factor C (Weather in degrees centigrade (°C)); and PM (Average precipitation in millimetres (mm)) in the Iberian Peninsula;  

H2: The price of oil is influenced by the level of production factor PA (Oil production in tonnes (t) to Spain and Portugal in hectolitres (hl)); PAO (Production of olives as thousand tonnes (1000t)); SC (Cultivation of olive trees measured in thousand hectares (ha)); and LA (Number of mills) in Spain and Portugal;  

H3: The price of oil is influenced by inputs and outputs E (Exports of olive oil to Portugal are measured in euros (€), while for Spain are measured in tonnes (t)) and I (Imports of olive oil to Portugal are measured in euros (€), while for Spain are measured in tonnes (t)) in the Iberian Peninsula;  

H4: The price of oil is influenced by socio-economic conditions of the Portuguese and Spanish families RNB (Gross national income in thousands of euros (10^6 €) and CA (Consumption of olive oil in metric tonnes (t)).

Analysis of the information previously collected runs several steps to find valid results. The first step is the preparation of data for all years and study variables, which are able to calculate the descriptive statistics and the correlation matrix with the aid of Gretl program. The second step is the evaluation of the relationship between variables, this ratio is calculated through the OLS. This method is a mathematical optimization technique, which seeks to find the best fit for the data, i.e., an estimate of demand parameters to fit a certain function of a set of data, this function may be linear or nonlinear.

The data adjustment results from the minimization of the sum of squares of the regression residuals to maximize the degree of adjustment, here the variables have a linear relationship to each other. In order to test the absence of heteroscedasticity refers to the White test and to test the absence of autocorrelation refers to the Durbin-Watson test (Johnston & Dinardo, 1997).

RESULTS

Preliminary analysis of the data

Throughout the research, there were some difficulties in the first place to find the variables equal to the two countries and secondly so that these variables were calculated with the same numerical quantities, which is not the case.

That said, there are two stages: the first will be the study of the variables for the years 1986 to 2015, this study will be carried out for both countries but separately; the second step will be the study of all common variables for both countries.
With this we intend to get better results realizing move the variables that influence the price of oil and are common to both countries.

**Descriptive statistics**

In tables 1 (Descriptive statistics of Portugal for the years 1986 to 2015) and 2 (Descriptive statistics of Spain for the years 1986 to 2015) which are in annex presents descriptive statistics according to study steps listed previously. These tables analyze the percentage changes that have occurred in recent years.

Over the years of study to Portugal (Table 1) check are some decreases in percentages, standing out as the sharpest I.

Regarding the next ten years there are some increases, although in some cases negligible, distinguishing more increase CA.

By observing Table 1 it appears that the final percentages are practically positive, with only three variables with negative percentages, PGA2 (Olive oil production in the degrees of acidity between 2,1° the 3,3° in tonnes (t) to Spain and Portugal in hectolitres (hl)), LA and C.

By making the variations to Spain (Table 2) the oscillations are substantially positive. In the second variation is seen that there is only a negative percentage to atmospheric variables (C, PM), although the percentage is negligible. By taking into account the overall variation is denoted that the percentage is always positive, with the exception again of the PM variable.

**Correlation Matrix**

Tables 3 and 4, which are attached represent correlation matrices for the multiple hypotheses. According to the hypothesis entered in Table 3 (Portugal correlation matrix for the years 1986 to 2015) which stands out the variable with the highest correlation value is the PAO with PA, another example is RNB with the CA. For Spanish province, according to Table 4 (correlation matrix for Spain in 1986 and 2015) variable with the highest correlation value SC is to RNB.

**Analysis of the facts behind the price of oil**

Then to check if indeed the variables influence the price of oil will actually be performing the estimation by the OLS. From which arise the following equations for the model:

1) Equation for Portugal Portuguese including all variables found in the study:

$$\gamma_{PCA} = \alpha_i + \beta_1 Ci + \beta_2 PMi + \beta_3 PAOi + \beta_4 PAOi + \beta_5 SCI + \beta_6 LAi + \beta_7 Li + \beta_8 Ei + \gamma_1 RNBi + \beta_9 CAi + \epsilon_i$$

2) Equation for Portugal including only common variables with Spain:

$$\gamma_{PCA} = \alpha_i + \beta_1 Ci + \beta_2 PMi + \beta_3 PAOi + \beta_4 PAOi + \beta_5 SCI + \beta_6 Li + \beta_7 Ei + \beta_8 RNBi + \beta_9 CAi + \epsilon_i$$

3) Equation for Spain including all Spanish variables found in the study:
\[ \gamma_{PCA} = \alpha_i + \beta_1 c_i + \beta_2 PM_i + \beta_3 PAO_i + \beta_4 PAO_i + \beta_5 SCI + \beta_6 I_i + \beta_7 E_i + \beta_8 RNBI + \beta_9 CAi + \epsilon_i \]

Where:

\( \gamma_{PCA} \) - Current prices of oil in million euros (10^6 €)

\( i \) - The study period;

\( \alpha_i \) - Constant term;

\( \beta \) - Coefficient of explanatory variables;

\( \epsilon_i \) - Error term.

The previous equations were estimated for the OLS and will suggest which factors most affect the price of oil over the last 25 years (1991-2015).

**Analysis of the results**

At this point we are investigating, it is studied and seen which variables are most important, presenting them in the regression tables (Tables 5 and 6 in annex), but at this point only were considered the years 1991 to 2015 (25yrs), so that the significance level was higher. Table 5 (Regressions of variables for Portugal) represents the various regression models for Portugal, while Table 6 (Regressions of variables for Spain) presents the models for Spain.

To Portugal will be performed three regression models. Regressions 1 and 2 interpret the multiple regression analysis, regression 1 includes all study variables and regression 2 involves only the variables that improve the final results from the model 1. In regression 3 interprets the regression analysis multiple, but here are only considered the common variables for both countries.

For the Spanish country will be adopted the same method. The regressions 1 and 2 interpret a multiple regression, the model 1 which includes all the existing Spanish variables and model 2 shows only the variables that improve the model 1.

These regressions were estimated using OLS. Throughout the following two tables (Tables 5 and 6 in Appendix) shows the determination coefficients and the overall significance test (test F) for all regressions.

For models with multiple regression analysis are referred to the White test to test whether the model is or not heteroscedastic and the Durbin-Watson test to test regressions in terms of autocorrelation.

Along the Table 5 and 6 are also the respective coefficients and standard deviations, representing the level of significance: statistically significant Variable *-10%; **-Statistically significant Variable to 5%; -Statistically significant Variable to 1%.

By making the first multiple regression analysis to Portugal (model 1), the results were expected better, but yet the variables that influence the price of oil are C; SC and E with a 5% significance level. The first model respects the White test and Durbin-Watson test, ie there is no heteroscedasticity and autocorrelation, despite being a model with collinearity for C variables C; PA; PAO; LA; I; E and
RNB. The second model was run, to improve the first, just to get better results were removing the variables more collinear (PA; PAO; I; and RNB). That said, the variables with significance level were: CA for 10%; C for 5%; and LA and E to 1%. This model has no heteroscedasticity, autocorrelation and collinearity.

The third model as the model 1, concerning the absence of autocorrelation heterocedasticity and, despite being a collinear model variables for: PA; PAO; I; E and RNB. Variables with significance level were: 10% for C; SC and E to 5%; and RNB to 1%. When speaking of quality adjustment table 5 attached checks that are statistically significant. Determining coefficients all have identical values approximate 95%.

Multivariate analysis for Spain is represented by two models, as shown in Table 6 attached. This 1 model results from the model 3 of Portugal, have some differences. Here the significant variables are: RNB for 10%; SC to 5%; and PA and CA to 1%. That said, the SC variable is common to both countries, as well as RNB, although it has a different significance level. This model regards the absence of autocorrelation, heteroskedasticity and collinearity. The second model in Spain has been improved compared to the first, so this improvement was possible, the following variables were taken: C; PM; I; and E. That said, they were able to be variable with the highest level of significance: SC to 5% and PA, RNB and CA to 1%. This model also respects the absence of collinearity, autocorrelation and heteroscedasticity. As for the correlation coefficients at both regressions have identical values of 97%.

Discussion of results

**H1:** The price of oil is influenced by weather factor (C and PM) in the Iberian Peninsula;

The price of oil is only influenced by the C in 3 models (Table 5 attached) of Portugal coming to the conclusion that C when changing from normal conditions can influence the price of oil, then just do not reject this hypothesis for Portugal. As for PM variable, as the relationship is non-existent for both Portugal and to Spain, then it rejects this hypothesis regarding the PM.

**H2:** The price of oil is influenced by the level of production factor (PA; PAO, SC, and LA) in Spain and Portugal;

PA only influences the price of olive oil in the regression 1 and 2 in Spain, there is a high significance level for the price of oil, and depending on the production the price of oil changes. As for PAO significance level is non-existent for the two countries. When analyzing SC note that is significant before the price of olive oil for both countries compared, which means it is a price influencer variable because the more it is the cultivated more supply can be the product will soon influence its price. As for LA variable, just can analyze for Portugal because it could not enough data to Spain. By analyzing this variable to Portugal, its degree of significance before the oil is very good, as shown in the model 2.
With regard to the rejection of this hypothesis is rejected only completely for PAO variable because all other influences the price of oil, although in different ways.

H3: The price of oil is influenced by inputs and outputs (E and I) in the Iberian Peninsula;
When analyzing E note that only have influence on the price of oil to Portugal. However the economic level this factor is important because the more a country exporting a product more revenue come by improving your balance. Logo for the variable E, do not reject this hypothesis. As I, as not influence the price of oil in any case, you have to completely reject the hypothesis for this variable.

H4: The price of oil is influenced by socio-economic conditions of the Portuguese and Spanish families (RNB and CA).
When analyzing the variable RNB for Portugal and Spain faces that the significance level is 1% to 3 model and model Portugal 2 Spain. As for this CA is significant for Spain, according to the results of the price of oil is influenced by CA, as shown in model 1 and 2. For Portugal CA is also significant in model 2, despite having a significance level. The price of oil is influenced by socio-economic conditions mentioned, so this hypothesis is not rejected.

CONCLUSIONS
Throughout this work were studied factors influencing the determination of the price of olive oil in Spain and Portugal. To achieve results, it was necessary to find an appropriate dataset, supported by reliable sources. The databases found allowed to construct twelve research variables for Portugal, and nice research variables for Spain, over 30 years. Using this dataset, several tests were performed, forcing to fit the models, reducing the analysis timespan for 25 years, allowing this way to obtain some variables with statistical significance, choosing ultimately ten variables for Portugal and nine for Spain.

One limitation of this study is concerning some difficulties to obtain data for variables that would be equal or similar for both countries analysed. As a consequence we missed two variables for Spain. Lack of consistency within the time series also forced the authors to reduce the period of analysis.

This paper aimed to get more knowledge about the determinants of the price of oil, in particular to realize which variables influence the price of oil statistically and see if these variables are similar for the two countries under study.

The factors that contribute significantly to the interdependence and causality in the price of oil in the Iberian Peninsula are: SC and RNB. According to the model used, the variables with more weight in determining the price of oil for Portugal are C; LA; E; and CA. However, to Spain the most significant variables are: PA; SC; RNB; and CA.
Overall, the results obtained suggest the presence of a relationship between the olive oil prices and a set of several factors, such as climate conditions, olive cultivated area, gross national income, and olive oil production, number of mills, value of exports and consumption.

As a suggestion for further research, we would like to recommend expanding the scope of analysis, possibly increasing the years of study, and studying other olive oil-producing countries, such as Italy and Greece. It would also be interesting to add some other research variables such as the income of farmers, subsidies production aid, and the number of olive trees negotiated.

EFFECT OF EMPLOYEE THRIVING ON INNOVATIVE WORK BEHAVIOUR

Lyndon, Shiji; Rawat, Preeti; Varghese, Billy Sam

1HR Department, K.J. Somaiya Institute of Management Studies and Research, Mumbai, India
2UESI, New Delhi, India

ABSTRACT

The purpose of the present study was to advance the literature on thriving by examining its influence on innovation in organizations. We posited positive linkage between employee thriving and innovative behaviour at workplace. The study adopted survey method to test the hypotheses. Data was collected from a sample of 223 employees working in service sector. As hypothesized, results suggest that the experience of thriving at work leads to employees engaging in innovative work behaviour. The results also suggest that amongst the two dimensions of thriving i.e. learning and vitality, learning opportunities is a better predictor of innovative work behaviour.

Keywords: thriving, vitality, learning, innovative work behaviour

INTRODUCTION

Work constitutes a very important aspect of an individual and society’s life. It is demonstrated by the fact that a significant amount of time of an individual’s life is spent at the workplace and work also contributes greatly to the socio-economic development of any society (Harpaz, 1990). Despite the importance of work, research shows that work is a major contributor of stress (Sonnentag and Frese, 2003). However, work can also be a major source of thriving of an individual (Niessen et al., 2012). Thriving refers to psychological state wherein individuals experience positive energy and learning. Opportunities to thrive at work leads to positive outcomes. Past research has shown that thriving is an important antecedent to employee health and well-being (Shirom, Toker, Berliner, Shapira, and Melamed, 2008; Spreitzer et al., 2005), performance (Carmeli et al., 2009), leads to organizational citizenship behaviour (Porath et al., 2007) and thriving also stimulates proactivity at work (Ashby, Isen, and Turken, 1999; Carmeli, Ben-Hador, et al., 2009). Studies also show how experience of thriving can reduce burnout of an individual (Maslach, 2003).

Innovation is one of the key strategies identified by business organization to improve firm performance in the ever changing competitive environment (Han, Kim and Srivastava, 1998;
THRIVING

Spreitzer, Sutcliffe, Dutton, Sonenshein, and Grant (2005 : 538) defined thriving as “the psychological state in which individuals experience both a sense of vitality and a sense of learning at work”. Individuals who experience thriving feel alive and energetic about their work and feel they are growing because of the learning opportunities (Spreitzer et al., 2005). Thriving is a temporary psychological state and not an enduring disposition (Chaplin et al., 1988).

The two essential conditions of thriving are vitality and learning. Vitality refers to feeling of energy and aliveness (Nix, Ryan, Manly and Deci; 1999). Learning refers to opportunity for growth and development by acquiring required skills and competencies. Thriving is closely linked to personality growth and hence a continuous process and not a onetime activity (Ryff, 1989). Vitality without learning does not lead to thriving as it would not provide opportunities for the individual to flourish. While, learning without vitality shall not lead to positive outcomes as the individual might not be motivated to exhibit newly acquired competencies at workplace (Spreitzer et al., 2005). Thus, thriving includes both affective (vitality) and cognitive (learning) aspects of psychological state (Spreitzer et al., 2005).

Thriving is not a dichotomous state where an employee either experiences thriving or not. Instead, it is a continuous experience where an individual may experience less or more thriving. Sonenshein (2005) conducted a qualitative study which captured both vitality and learning dimensions of thriving. Spreitzer et al. (2005) developed a socially embedded model of thriving at work place which is based on the assumption at individuals thrive in the context of their situations in which they are placed. It is based on two dimensions of work i.e. the contextual features of the work unit and the resources which are produced while doing the work. The model explains how the contextual factors of the work
(decision making discretion, information sharing, climate to trust and respect) leads to agentic work behaviour (task focus, exploration, heedful relating) which leads to thriving at workplace. Further, the agentic behaviour of the individuals produces resources (knowledge, positive meaning, positive affective resources, relational resources) which again leads to experience of thriving. The model also explains how experience of thriving at work leads to positive outcomes such as healthy adaptation to work environment leading to positive development of the individual.

There are other constructs which are similar to the concept of thriving, such as the constructs of flow, engagement and subjective wellbeing (Carmeli & Spreitzer, 2009; Niessen et al., 2012; Spreitzer et al., 2005). Flow is defined as “a subjective state people when they are completely involved in something to the point of forgetting time, fatigue, and everything else but the activity itself” (Csikszentmihalyi and Rathunde 1993, p. 59). Flow leads to an intense involvement in the activity at hand (Schuler, 2012). Schaufeli and Bakker (2004) defined engagement as “a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication and absorption. Vigor refers to high level of energy, dedicated signifies enthusiasm and pride and absorption is characterized by fully involved in ones work. Subjective well-being is defined as the “phenomena that includes people’s emotional responses, domain satisfactions, and global judgments of life satisfaction” (Dieber et al, 1999). Subjective well-being is a broad area which includes moods and emotions and cognitive evaluation of domain satisfaction and life satisfaction. The common thread which binds thriving with flow, engagement and subjective wellbeing is the vitality dimension of thriving. However, thriving is different from these constructs in that unlike thriving the other constructs do not have the dimension learning. Hence, individuals can experience flow, engagement or wellbeing without learning experience; while thriving isn’t complete without learning (Spreitzer et al., 2005).

**INNOVATIVE WORK BEHAVIOUR**

Innovation has been widely used as a strategy by organizations to improve their products, services, procedures and processes (Aldrich, 1999; Jack and Anderson, 2002; Shane, 2008). Creativity and innovation are sometimes used interchangeably (Basadur, 1997) but they are different constructs. Creativity connotes development of novel ideas (Mumford and Gustafson, 1988) while innovative behaviour goes a step further to implementation of these novel ideas (Scott and Bruce, 1994). Innovation leads to either creation or radical redesign of existing products, services or services (Woodman, Sawyer and Griffin, 1993). Thus, innovation is aimed towards adding value to the organization

De Jong (2006) defined innovative work behaviour as “individuals’ behaviours directed toward the initiation and intentional introduction of new and useful ideas, processes, products, or procedure
within a work role, group or organization (p. 19)". Process of innovation involves three stages i.e. generation, promotion and application of novel ideas to improve organizational performance (Janssen, 2005). At each stage of this innovation process organizational members can engage in innovative behaviour (Yidong and Xinxin, 2013).

In order to positively encourage innovation at workplace, Jong and Hartong (2007) developed inventory of leaders’ behaviour which influences employees innovative behaviour at the workplace. Inventory included behaviour such as innovative role-modelling, intellectual stimulation, stimulating knowledge diffusion, providing vision, consulting, delegating, support for innovation, organizing feedback, recognition, rewards, providing resources, monitoring and task assignment.

**THRIVING AND INNOVATIVE WORK BEHAVIOUR**

Employees who experience thriving at work feel the momentum and can see themselves progress (Carmeli and Spreitzer, 2009). Thriving constitutes affective (vitality) and cognitive (learning) aspects of psychological state. When individuals experience positive moods and emotions, it builds social and psychological resources (Fredrickson, 2002) which would help them to engage in improving work processes. Positive moods and emotions affect cognitive thinking by expanding thinking faculty to come out up creative problem solutions, which would further help individuals to be more innovative. Opportunity to learn and develop at workplace helps individuals in multiple ways. Learning helps employee to gain expertise in their work (Amabile, 1998) and also to hone new skills. Thus, learning helps employees to try out new things, improve existing processes and practices and demonstrate creative behaviour (Carmeli and Spreitzer, 2009) which would ultimately result in innovation in the organization. Wallace et al. (2013) found that employees who experience thriving at work would be willing to engage in innovative behaviour. Based on the discussion, following hypothesis were developed.

H1: Thriving will lead to innovative behaviour in the organization.

H2: Vitality will lead to innovative behaviour in the organization.

H3: Learning will lead to innovative behaviour in the organization.

**METHOD**

Survey data was collected from 223 employees from service industry. 71 percent participants were male and had a mean age of years. 64 percent were postgraduate with 45 percent having less than 10 years of work experience.
Thriving was measured by 8 item adapted scale developed by Porath, Spreitzer, Gibson and Garnett (2012). Innovative work behaviour was measured by 4 items scale developed by Dension et al. (1995). The responses for both the scale were captured on likert scale. Figure 1 shows the research model.

![Figure 1: Research Model](image)

**ANALYSIS**

The results were analyzed using SPSS version 16. Kaiser-Meyer-Olkin (KMO) Test value of 0.88 and 0.84 of thriving and innovation scale respectively indicates that sampling is adequate and factor analysis can be carried out (Table 1 and 3). Thriving scale showed two dimension of thriving i.e. vitality and learning. It explained 70.7 percent of cumulative variance (Table 2). While, four item scale of innovation showed one dimension (Table 4) and it explained 70.7 percent of cumulative variance.

DISCUSSION

It is said that organizations who see and act upon the opportunities and possibilities for change through innovation in the current volatile and uncertain business environment will not only survive; they will successfully compete and flourish in the face of the emerging adverse and fluctuating...
business and economic conditions⁸. Innovative changes require organizations to rethink how they perceive and sense customer's needs wants and expectations and how they adapt to an increasingly connected and digitized world. This brings focus on innovative behaviour of employees. Innovative work behavior was defined by De Jong (2006) as individuals' behaviours directed toward the initiation and intentional introduction of new and useful ideas, processes, products, or procedure within a work role, group or organization. It’s a complex work behavior consisting of generation, promotion, and application of new ideas intended in the work role, group or organization, which aims at improving organizational performance (Janssen 2000, 2005).

Innovative behaviour involves being willing and competent in adapting and in knowing how to think differently. The purpose of the study was to advance the literature on thriving by examining its influence on innovation in organizations. We posited positive linkage between employee thriving and innovative behaviour at workplace. Thriving was the independent variable and innovative work behaviour was the dependent variable. The two essential conditions of thriving are vitality and learning. Vitality refers to feeling of energy and aliveness (Nix, Ryan, Manly and Deci; 1999). Learning refers to opportunity for growth and development by acquiring required skills and competencies. Thriving is a continuous process and not a onetime activity (Ryff, 1989). Thriving is not a dichotomous state where an employee either experiences thriving or not. Instead, it is a continuous experience where an individual may experience less or more thriving (Sonenshein, 2005).

Consistent with the findings of previous research (Carmeli and Spreitzer, 2009; Wallace et al., 2016) we found that thriving at workplace explained innovative behaviour of employees (R²= 0.45; p<0.001). This supports the first hypothesis.

Vitality at work—closely aligns with the idea of intrinsic motivation, which has often been studied as a key element in relation to creativity (Amabile, 1996) and innovation (Anderson et al., in press). However, according to Sonenshein, Dutton, Grant, Spreitzer, and Sutcliffe (2006), thriving is distinct from intrinsic motivation in that although thriving may at times derive from a desire to perform a behaviour based on the affective enjoyment of the behavior itself (i.e., vitality), at other times the impetus for thriving has been described by emphasizing personally important achievement and recognition goals (i.e., learning). In our study vitality explained innovative work behaviour (R²= 0.30 ; p<0.001). This supports the second hypothesis.

Thriving is self-regulatory in nature because it allows employees to gauge whether their work behaviors are providing personal development in a positive direction (Spreitzer, Sutcliffe, Dutton, Sonenshein, & Grant, 2005) and leading to the process of learning. This brings us to the component of

learning in the construct of thriving. In our study learning explained innovative work behaviour \((R^2=0.42; p<0.001)\). This supports the third hypothesis.

**LIMITATIONS AND FUTURE DIRECTIONS**

The study was primarily cross sectional in nature. More insightful results can be drawn from longitudinal study. Longitudinal investigations would also provide an opportunity to examine the reciprocal nature of thriving and innovation to determine the role that successful innovation plays in subsequent thriving at work and vice versa, testing the suggestions by Spreitzer et al. (2005) that thriving operates through a continuous feedback loop to resources that enable future thriving. The study has not taken into consideration the contextual factors which can act as antecedents (for example passion, and creative self-efficacy) or moderators (e.g., job complexity), and mediators (e.g., job satisfaction) that could account for important variance in innovation. Finally, leadership style is a particularly important contextual factor that could be explored to expand our findings. Just as transformational leadership has been related to subordinate creativity (Shin and Zhou, 2003) and employee need satisfaction (Kovjanic, Schuh, Jonas, Quaquebeke, and Dick, 2012), supportive leadership styles (e.g., authentic leadership, ethical leadership) might further enhance the motivational benefits stemming from a high employee involvement climate and, thereby, promote thriving and innovation in the workplace.

CASE STUDIES AND MANAGEMENT ACCOUNTING RESEARCH: EPISTEMOLOGICAL CONSIDERATIONS

Makrygiannakis, Georgios

Department of Accounting and Finance, Technological Education Institute of Sterea Hellada, Psahna, Euvoea, Greece

ABSTRACT

In management accounting qualitative research is usually hetero-identified in relation to quantitative approaches. Yet, this negative positioning is no longer enough to cover inter-paradigmatic debates between qualitative researchers, which are often based on contrasting epistemological positions. The paper presents the implications of epistemology on case study research, as well as the form and role of the subjectivist, positivist, realist, and critical case study.

Keywords: case studies, management accounting, epistemology

INTRODUCTION

Case study research has developed from a peripheral approach to the dominant quantitative research, to a self-distinguished research tradition with its own strengths and challenges. It is now considered as the most adequate approach to address how and why research questions, to bring to the foreground the complexity of management accounting practice in real organisational contexts, to study non-functional practice rationalities, and to address change in accounting and organisations (Ferreira and Merchant, 1992; Pettigrew et al., 2001; Scapens, 1992, Yin, 2003).

Case studies are methods and not methodologies (Llewellyn, 1992; Otley and Berry, 1994; Richardson, 2012; Scapens, 1990; 1992). The case study allows flexibility and individual variation, and can be used with any philosophical perspective, whether positivist, subjectivist, or critical (Dube and Pare, 2003; Richardson, 2012). But that does not mean that the case method of the different paradigms is identical. The role that the case method has in any piece of research is dependent on the epistemological assumptions of the study (Otley and Berry, 1994). Subsequently, different types of case study methods are used in different methodologies (Scapens, 1990). In this paper different types of case study are discussed and later used to describe the different use (and relative value) of the methods employed by different research paradigms.
Although in management accounting there are many discussions on what can be described as the operational work that case studies are employed to do, there is not much discussion on epistemological implications on case study work. However, by simply categorising case studies under operational classifications covers the many differences between epistemologically different approaches. Otley and Berry (1994) note, “...the precise role that case-based methods can play will also be dependent upon the epistemological stance taken by the researcher.” But it is not only the role that differs but also the whole form and entity of the method.

The case study method can take quite different forms under different research paradigms. The objectives and challenges inherent to each tradition are not the same, and naturally the criteria for designing and judging quality case studies are quite different under different epistemologies (Cresswell, 2007: 15-30; Dube and Pare, 2003). Otley and Berry (1994) warn that “…many, but not all, of the criticisms raised about research case studies in accounting and control are criticisms that workers adopting one epistemological stance do not follow the nostrums of another.” They advise, “[c]ase studies are not value free…[thus]...they are likely to be more valuable where they are clear about their initial theoretical propositions and where they consciously attempt to develop their own theoretical modifications, however tentatively” (Otley and Berry, 1994), a thesis that Scapens (1990) and many others support.

Despite the above tolerant and rather relativistic positions, we recently witnessed a strong debate in MA on the topic. The traditional dichotomy in MA research between the mainstream ‘positivistic’ research and the ‘alternative’ interpretative one has created more confusion than clarity, as becomes evident from the dialogical paper of fifteen researchers in Ahrens et al. (2008). Part of the problem is because interpretative research is usually hetero-identified in relation to the ‘others’ (Ibid.). Yet, this negative positioning is no longer enough to cover inter-paradigmatic debates (Baxter et al., 2008) between qualitative researchers. Particularly, there are researchers starting to prescribe to case studies both realist and subjective elements (Kakkuri-Knuuttila et al., 2008a; Kakkuri-Knuuttila et al., 2008b; Lukka and Modell, 2010), others suggesting that qualitative work could be informed by different paradigms (Armstrong, 2008; Davila and Oyon, 2008; Richardson, 2012), or at least different social theories (Baxter et al., 2008) – thus practically with different paradigms again, as not all the social theories are paradigmatically unified. Finally there are researchers that explicitly interconnect the method with the subjectivist paradigm (Ahrens and Chapman, 2006; Parker, 2012).

It thus seems that “...the notion of interpretive research in management accounting is [still] in need of clarification” (Kakkuri-Knuuttila et al., 2008b). This paper attempts to contribute to that direction by discussing how different epistemologies results in different case study methods, and how these may be employed in management accounting research. The operational classifications of case study
research are presented in the next section. The implications of epistemology on the case study method, whether following the subjectivist, positivist, realist, or critical paradigm, are discussed next, and then the paper concludes.

OPERATIONAL CLASSIFICATION OF CASE STUDIES

According to Otley and Berry (1994), case studies are classified as ‘explorative’, ‘critical case’, and ‘illustrative’. They consider the central role of case studies to be exploration, which moves beyond description towards explanation. From a positivist stance, deductive work generates hypotheses from prior theory and attempts to test them empirically. Inductive work attempts to theoretically explain observed phenomena. A critical case can be used in order to falsify a theory, or to modify and implement an existing theory, while an illustrative case can be used to illustrate a pre-defined theory. Most scholars, though, prefer a four-category classification, the descriptive, illustrative, exploratory, and explanatory cases.

Descriptive case studies have the objective to describe accounting and control systems, techniques and procedures, in order to present the actual accounting practice in real-life organisations (Scapens, 1990). Kaplan (1986) strongly favours descriptive case studies, as an attempt to acquire the practitioners’ knowledge. Perhaps the clearer way to describe this method is that “…a descriptive study does not have a set of clearly delineated dependent and independent variables. The absence of a limited number of well-defined variables distinguishes case-study descriptive research from other types of research” (Simon in Kaplan, 1986: 434). Descriptive case studies provide three benefits for management accounting academics (Kaplan, 1986): they provide the basis for other forms of research, track interesting practices and organisations (illustrative), and highlight leading-edge practice. Finally, they support the reproduction of academic knowledge by providing university teaching with rich descriptions of practice.

Illustrative studies try to illustrate new and innovative practices developed in particular companies (Scapens, 1990). The method is employed mainly to present best practices or best companies, something that is somewhat fuzzy as to what best practice consists. Kaplan’s approach, which was presented above, is profoundly targeting ‘best practices’. Otley and Berry (1994) use the term differently, as they consider illustrative studies as aiming to illustrate a particular pre-defined theory. They note that it is difficult to accept that they do anything other than reinforcing the initial theoretical position. Nevertheless this argument is rooted in empiricism. Theory from a non-instrumentalist point of view is an attempted effort to understand and explain reality and, as such, pre-defined theory is
part of the exploratory or the explanatory designs in some of the paradigms that will be shortly discussed.

The distinction between the different types of case study is not always clear-cut (Ryan et al., 1992; Scapens, 1990), and this becomes more obvious when discussing the exploratory and explanatory case methods. For example Scapens (1990) notes, “the distinction between exploration and explanation can be ambiguous”, a statement that Otley and Berry (1994) probably support, since in their classification they are both categorised as one: exploratory studies, which are described as moving away from mere description towards explanation.

Exploratory case methods are used to explore reasons of particular accounting and control practices (e.g. Setthasakko, 2010). It seems that Scapens (1990) inscribes in them positivistic functionality since, he argues, they represent preliminary investigations, aiming at producing hypotheses. They are considered to be the first step of a next study that will test these hypotheses. Perhaps we should prefer to describe them as preliminary investigations, aiming at producing theory, whether predictive or analytical. Explanatory cases are used as an attempt to explain the reasons of accounting and control practices. The focus of study is on the specific, rather than on producing generalisations. Theory is used for understanding and explaining the specific case(s) (Scapens, 1990). Of course what explanation is differs among different epistemologies (Humphrey and Scapens, 1996; Kakkuri-Knuuttila et al., 2008; Scapens, 1990), which leads to completely different forms of the explanatory case method.

Finally, case studies may be distinguished to single-case and multi-case studies; the former are based on a single entity, while the latter are concerned with more than one case (Kaplan, 1986; Scapens, 1992). While the sample size is not of particular concern to the field researcher (Ferreira and Merchant, 1992), it could be argued that in single case the researcher focuses more on the specific, while in multi-case designs the focus may be theory replication and development (Scapens, 2004), or case comparison (Maxwell, 2004).

**EPISTEMOLOGICAL CLASSIFICATION OF CASE STUDIES**

There are different paradigmatic positions in regards to the nature of reality and the ways that reality(-ies) are addressed. At the one extreme, positivism accepts a reality external to the perception of individuals, which can and should be studied objectively. This emphasis on objectivity leads to a clear preference on quantitative research. At the other extreme, subjectivist paradigms argue in favour of a plethora of subjective realities, while the primary effort of research is to understand this multiplicity. Qualitative research methods are advanced for that reason (Hopper and Powell, 1985).
Realism accepts the partial externality of reality but, unlike positivism, addresses a stratified and not flat empirical reality (Llewellyn, 2007), as well as multiple perceptions about the external reality (Krauss, 2005). Since case studies are the dominant methods of the subjective paradigms the discussion will start with them.

Subjectivist

The aim of many subjectivist case studies is to enquire, understand, and present the multiple realities of the people under enquiry. This is why the leading scholars of that tradition argue for ‘richness’ in the field studies; rich is not synonymous with detail but “has more to do with making understandable the actions and motivations of often very skilful people…” (Ahrens and Dent, 1998). Rich field studies are able to highlight better these different realities.

Scapens (1990; 1992), under a constructivist epistemology, inscribes to case studies the mission of helping us understand the social structures that shape current practice. All forms of case studies are useful, but explanatory ones are essential for the above. Explanation under such epistemology aims at understanding the processes, which are involved in managers’ actions. Any explanation is perceived as “open, flexible and temporal, rooted in an interactive relation between theory and observation…” (Humphrey and Scapens, 1996).

Consequently, the principles for evaluating interpretive case study research are not the same as those in the case of positive studies (Klein and Myers, 1999; Lincoln and Guba, 2003: 274-281). In some cases, and particularly “…for some phenomenologically orientated, interpretivist and constructivist researchers, there is no unambiguous social reality ‘out there’ to be accounted for, so there is little need to evolve methodological canons to help explicate its laws” (Miles and Huberman, 1994: 2). For example, Klein and Myers (1999), having their starting point on the philosophy of phenomenology and hermeneutics, as well as experience from anthropological research, proposed seven principles for the evaluation of the phenomenological field studies: hermeneutic circle, contextualisation, research interaction, abstraction and generalisation, dialogic reasoning, multiple interpretations, and finally the principle of suspicion.

Positivist

Positivist case studies might try to establish an experimental environment in order to test a theory. Comparative analysis is an effort towards a natural experiment, while others from a quasi positivist stance propose the study of a single organisation, in order to provide adequate experimental control (Lee, 1989; Otley and Berry, 1994). The emphasis of a positivist case study method, similarly to the familiar for positivists survey method, is the establishment of rigour to the scientific inquiry (Dube and Pare, 2003; Pare, 2001). Rigour is established through a close and clear application of procedures.
and criteria proposed by scholars like Dube and Pare (2003), Eisenhardt (1989), Lee (1989), Pare (2001) and Yin (2003). The criteria of validity and reliability known by the familiar quantitative positive studies are accepted, even if modified, in order to judge the quality of research.

Under the positivist paradigm, case studies tend to be descriptive or exploratory. The aim of the later is in “...defining questions, proposing new constructs and/or building new theories” (Dube and Pare, 2003). The positivist case study can be better understood as a part of bigger project that employs surveys in a later stage, or had employed them in a previous one (Kaplan, 1986; e.g. Awwad and Akroush, 2016). The theory-building ability of the case study method is connected by these scholars to an approach as close to pure induction as possible (Eisenhardt, 1987). That is, as relatively free from prior theorising. Their aim is in hypothesis development (Kaplan, 1986). Nevertheless, positivist case studies have been recently used to test hypotheses, for explanatory reasons (Dube and Pare, 2003), since it is proposed that they are a valid method in order to falsify theories (Bent, 2006). Lee (1989) provides a ‘scientific’ methodological deductive framework in that direction. In that explanatory case, prior theorising is considered to be essential (Lee, 1989; Yin, 2003), and regarded to add rigour to the study (Dube and Pare, 2003).

Realist

The realist case study is placed between the subjective and positivist methods discussed above. Some similarities with the positivist case methods are that they usually use the same criteria for evaluating the quality of a case project. Part of that similarity is because the positivist case studies are themselves a departure from the mainstream tradition of positivism, towards a more realist stance, since the dominant statistical methods are downgraded.

Nevertheless there are differences, rooted again in the different epistemologies. A realist case study cannot be limited to descriptions. Realists regard description as insufficient and are quite sceptical about the utility of prediction, and thus argue that explanation is necessary. Realists are also less defending of their case studies and consider them more self-standing than positivists. The latter might adopt a defensive position, first since one positivist epistemic criterion is objectivity. Objectivity is sometimes unfortunately regarded as an ontological position, when what it truly implies is that reality can be objectively known (Dobson, 1999). Case studies have less objectivity, thus as already discussed positivists usually place their case studies as a part of a bigger study, which is able to account for objectivity. Secondly, because for positivists causal inference is connected to observed regularities (Maxwell, 2004; Maxwell and Mittapalli, 2007), something not easily assessed with the smaller samples of case study research. By contrast realists do not consider qualitative data inferior to quantitative, as they do not accept that there is really an objective way of acquiring knowledge, and
thus they do not design their case studies as part of larger enquiry. Theorising through statistical methods is one way of understanding reality, but this method, as all methods are, is incomplete, partial, and theory laden.

Thus realists are more confident about the value of case studies since they considered them, first, one valid way of acquiring knowledge, and second, a method that can be used for explanatory knowledge. Explanation is about acquiring “local knowledge”, knowledge about the actual events and processes that lead to specific outcomes (Huberman and Miles, 1985). Causality is “…consisting not of regularities but of real (and in principle observable) causal mechanisms and processes, which may or may not produce regularities” (Maxwell, 2004: 247) and cannot be assessed independently of the context of the processes (Maxwell and Mittapalli, 2007; Sayer, 1992: 60-61; 2000: 114-118).

Triangulation is central to the realist case study (Perry, 1998). “Triangulation has been generally considered a process of using several perceptions to clarify meaning, verifying the repeatability of an observation or interpretation” (Stake, 2005: 454). By acknowledging that there are different perceptions of the external reality, the aim is to bypass the perceived realities and come as close to the external one as possible; triangulation is a means to that cause. It has to be noticed that this point shares theoretical similarities with recent pragmatic approaches proposed for MA research, where “…all studies intended to add to our theoretical understanding need to include an etic element, since it must be the researcher who draws the conclusions from his/her findings” (Kakkuri-Knuuttila et al., 2008 –original emphasis). This thesis integrates a moderate form of constructivism and a moderate form of realism (Lukka and Modell, 2010). The difference is that realism uses subjectivity in order to come close to the external reality while pragmatism addresses objectified explanations at a second stage. While many pragmatists are ontological realists, they implement a socially negotiated criterion of truth in their epistemology (Baert, 2003; Pleasants, 2003). This in turn is reflected in their case-criteria. For instance, Lukka and Modell (2010 – their quotation marks) suggest the criterion of plausibility, “used to denote whether an explanation “makes sense” and whether it can be inter-subjectively accepted as a likely one.” The use of different criteria for the evaluation of the case method results in turn in a different form of the method, compared to the realist one.

Finally realist case study methods are more complex than positivist ones, and not only because they want to be self-standing. Central contributors to the theories of realism disregard both inductivism and deductivism (Bhaskar, 1998: 48-103) and propose the alternatives of abduction and retroduction. Some researchers in the realist stream are still maintaining them in their research designs, but the design is based on combinations, parallel and interchanging applications of deduction and induction (Sobh and Perry, 2006), which unavoidably results in a more complex method.
A further distinction is that prior theory always precedes realist case study method; while in the positivist this is not always the case. More significantly, prior theory has a completely different meaning for the two traditions. In positivism prior theory is used in order to test deductively the predictive power of the theory. In contrast, the realist tradition is sceptical about the ability of predictions. In realism prior theory is usually part of an abductive or retroductive design (Lukka and Modell, 2010; Modell, 2017) and is used as a path to approach the data through its predefined and perhaps later reshaped theoretical concepts. Moreover, it is quite likely that positivist approaches will be framed within functional research, while realists make inferences to more abstract levels of theory and aim in understanding of the social and political implications of management accounting.

Critical

Critical case studies are usually designed in a longitudinal mode. Data are categorised according to a well-defined, established before the empirical enquiry, theoretical framework. The aim is that this framework will reveal social inequalities, which will be criticised in an effort to liberate people from their historical mental, emotional, and social structures (Guba and Lincoln, 1998; Perry et al., 1998), an effort to bring social balance and justice.

Critical theories are not paradigms in the traditional way. In the Hopper and Powell (1985) classification they are distinguished in ‘objective’ and ‘subjective’ approaches. Their meeting point is simply the critique and the effort to be active social criticisms rather than passive recorders of reality. As such, there are no unique quality criteria of the critical case studies (Healy and Perry, 2000). Technically speaking, their case methods follow their epistemology, i.e. either a constructivist or a realist one.

Nevertheless, it is more precise to argue that critical cases are similar but not the same case methods as their relative non-critical ones, even if sharing the same paradigm. A critical researcher may wish to engage actively in the enquiry, wanting to do something about the phenomenon under investigation (Laughlin, 1995). Technically speaking again, this will most probably lead to a different approach to the enquiry. Engaging with the field is not a neutral activity but actually an act of intervention (Wengraf, 2001). Critical researchers are more likely to choose a highly intervening engagement with the field than non-critical ones. In turn, this will lead to different kinds of data and a differentiated case method.

CONCLUSIONS

Despite the above discussed epistemological differences it is not suggested that case studies are neutral and empty shells. True enough, epistemology gives meaning to case study research but case
studies entail a greater degree of intervention between the researcher and the participants if, for instance, compared to a survey. Given this similarity, this paper explores some of the fundamental differences of epistemologically distinct case study methods. While this paper does not offer a throughout discussion, it highlights that epistemology shapes the whole form of the case method. The position advanced is that there is a role for case study research for every paradigm, the aims and outputs of epistemologically different case methods are distinct. This has implications on the design of a research project: Depending on the questions addressed and the research problem at hand researchers may need to adopt one or another epistemological position. This position will facilitate the research procedure, but will also frame the findings and contributions of the research problems within its range.

AN INTRODUCTION TO BIOETHICAL RIGHTS
Maniatis, Antonios

University of Applied Sciences, Athens, Greece

ABSTRACT

This paper includes a constitutional - law overview of the four generations of fundamental rights and introduces to the new set of bioethical rights by correlating them to some older ones. For instance, not only people are endowed with the 4G fundamental right to bioethics but also they deserve to be endowed with the “forgotten” right to pursuit of happiness, which should be correlated to bioethical questions, such as the revindication of women beyond the age limit of 50 years to medically assisted procreation. The 3G right to respect and restitution of human beings, exhibited in museums, particularly to autochthonous people, is under recognition in the current era of 4G rights, as it is the case of France, which has not adopted a general law on the matter, yet. Last but not least, various issues, such as the legal protection of the embryo against medical error and the role of the gestational mother, highlight the important economic dimension of the field of bioethics.

Keywords: Bioethics, Climate Change Law, Demeter / Nature / Pacha Mama, Ethics, Fundamental rights, Genetic engineering, Gestational mother, Right to compensation for damage caused to an embryo, Right to restitution of human remains protected as heritage, Right to pursuit of happiness

INTRODUCTION: BIOETHICS, A NEW FIELD OF ETHICS

The current research has to do with a particular topic of global interest, human rights related to Bioethics. Bioethics, conceived in the years 1960 as a field of moral analysis, constitutes a term relevant to a multidisciplinary approach (philosophy, theology, sociology, law…), having as an objective to fix a certain number of theoretical principles and solve practical questions that emerged in the developed societies due to the advent of techniques on the living beings (genetical manipulation, cloning, artificial procreation, research on stem cells, therapeutic fury…) (Borillo, 2011).

On the one hand, as far as the normative dimension of Bioethics is concerned, this field has been affected by two opposite schools of thought. These schools, according to the theory of Weber, are the “Ethics of responsibility” and the “Ethics of conviction”. The first approach promotes the practical consequences of the action, in the decision – making timing and the partisans of this School will count precisely with common failures of man, as signalized by Weber (Weber, 1995). In this context, the
woman’s right must prevail on the life of embryo and the patient’s freedom on the doctor’s obligation of care. As a result, each person is considered as responsible for its own options and the law can interfere uniquely as long as a behavior causes harm to third persons.

On the other hand, the Ethics of conviction is based on the concept of immutable principles basically coming from religions (for instance, prohibition of abortion and of euthanasia in the name of sacredness of life).

Due to the very brief history of Bioethics and the limited extent of legislative dispositions on the matter in national legal orders, this paper is going to take an introductory approach to this “crossroad of various sciences” as for ethical questions relevant to human life.

We suppose that there are various 4G fundamental rights related to bioethics.

The current paper will shed light to the following subjects:

- the history of the consecration of the previous generations of fundamental rights in the history of mankind,
- the current generation of rights,
- the right to pursuit of happiness,
- the new ethical right to restitution of human remains, protected as cultural heritage,
- the right to compensation for damage caused to an embryo and
- rights related to Medically Assisted Procreation and economic impacts.

AN OVERVIEW OF PREVIOUS GENERATIONS OF FUNDAMENTAL RIGHTS

Fundamental are the rights of persons, either natural or legal, that have to do with the role of the State. The doctrine recognizes four consecutive generations, in the history of emergence of these public-law rights (Maniatis, 2017a).

First of all, there are the classical rights, such as the civil rights to life and freedom, and the political rights, that began to emerge mainly through the French Revolution (1789-1799). This Revolution manifested a special interest on the right to life but it did not abolish the institution of capital punishment. Not only it maintained the death sentence in spite of an opposite proposal but it consecrated a single way of execution, the Guillotine, by alleging the principle of equality and to avoid the pain felt by the executed. This approach was consistent with the idea that the purpose of capital punishment was simply to end life rather than to inflict pain. This ethical concept has been later adopted even for the imprisonment, which is conceived as punishment, not for punishment.

After World War I, the second generation emerged, including three groups. The first one is the most known, in relation with this period of history. It is about social rights, with the State as a donator of crucial services for the weak social groups, if not for the entire population as it is the case of the
delivery of educational services. The second group consists in “economic” (civil) rights, having to do with the participation of people to the market as employees. It is about the dynamic group of strictly related rights to work, to syndicalism and to strike.

Last but not least, there is also a set of cultural rights, like the rights to art, sport etc.

Finally, the third generation began to emerge about in 1975, having to do with rights initially and mainly of people in the framework of the international community rather than of each person in the interior of a State.

This all-time classic set includes inter alia the following rights:

- mainly to the natural environment but also to the cultural one, as it is the case the specific right to cultural heritage of humanity,
- to water,
- to peace,
- to development.

As already signalized, the emblematic case consists in the enjoyment and the protection of the environment, particularly of the natural one, so the post-Cold War international community was intensively characterized by ecological concerns, strictly related to human life and health. Essentially, it is not about a mere right to the environment but an entire, dynamic set of rights and principles, such as the right to water (mainly to drinking water), to sustainable development (which at the same time is mainly a general fundamental principle) and to energy, although the energy was usually conceived as a concept relevant to the right to the development of the economy. It is also to mention the modern tool of the principle of precaution, which initially emerged in the international and European context.

The legal development of this tool confirms the remark that the environment constitutes one of the sectors with major incidence of the European Union Law on national law (Nunziata, 2014).

AN OVERVIEW OF 4G FUNDAMENTAL RIGHTS

Nowadays, humanity leads a new era of consecration of fundamental rights, in which 4G ones emerge. If the environment constitutes the emblematic right of the previous generation, the typical right of the new wave consists in the legal concept of the “Information Society”. For instance, through the revision of the Greek Constitution, held in 2001, this text has been endowed with a lot of modern rights and tools, of both third generation (right to protect the environment, for the first time explicitly consecrated, sustainability) and fourth generation, such as the rights to participation in the Information Society and to protection of personal data. It is to point out that as the most important contribution of Greece to the European legal culture are considered article 24 of the Constitution, dedicated to the environment, and the environmental jurisprudence of the Council of State.
Rights and principles belonging to a certain generation are in a process of development or eventually retrocession, in the periods of the next generations. For instance, as far as the tool of sustainability is concerned, besides the alleged principle of equality between antiquities and modern monuments, sustainability could have been used in favor of two listed buildings located in the street of the new Acropolis Museum of Athens, in the framework of the correspondent trial before the Council of State, in 2009 (Maniatis, 2010). This supreme administrative tribunal of Greece avoids any explicit use of the constitutional principle of sustainability, after its introduction in the Constitution through the 2001 revision, not to mention that this Court had already consecrated it through its pioneer jurisprudence, some years earlier! Perhaps the judges, who on international scale are inspired by a wider tendency of judicial “self-restraint” in their duties, not only in the environmental disputes, consider the block of constitutional dispositions on the right to sustainable development as a too drastic legal “weapon” to make an explicit use, even in the famous trials. In other words, they do not find it indispensable to be explicitly based on the principle of sustainable development, to achieve the protection of the environment, independently from the fact that there is a School of Thought that does not consider this principle itself as a tool of the Environmental Law but only one of its components (sustainability).

Furthermore, the United Nations Framework Convention on Climate Change entered into force on 21 March 1994 and has actually near-universal membership. The UNFCCC is a “Rio Convention”, along with the UN Convention on Biological Diversity and the Convention to Combat Desertification, adopted at the “Rio Earth Summit” in 1992. The three international texts are intrinsically linked. Due to the date of entrance into force, the UNFCCC ties in with the 4G character of the correspondent right to Containing Climate Change (CCC). The Paris Agreement (in French “Accord de Paris”) on Climate Change is an official agreement within the UNFCCC, dealing with greenhouse gases emissions mitigation, adaptation and finance, starting in the year 2020. This world’s first comprehensive climate agreement was adopted by consensus on 12 December 2015 and entered into force on 4 November 2016. It provides an opportunity for countries to cope with the threat of climate change by keeping a global temperature rise this century well below 2 degrees Celsius and to pursue efforts to limit the temperature increase to 1,5 degrees Celsius. However, we have to signalize that it makes no explicit mention to the human right to water, despite the precedent of the Oslo Principles on Global Climate Change Obligations. So, the right to water, which is of utmost importance for life, remains one of the most marginal 3G rights worldwide, perhaps like the second generation right to tourism, whose the separate, specific branch of law is relatively new (Mylonopoulos, 2016).

The aim of the Paris Agreement is to enhance the implementation of the UNFCCC through:
“(a). Holding the increase in the global average temperature to well below 2 °C above industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above preindustrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;

(b) Increasing the ability to adapt to the adverse impacts of climate change and foster climate resilience and low greenhouse gas emissions development, in a manner that does not threaten food production;

(c) Making finance flows consistent with a pathway towards low greenhouse gas emissions and climate-resilient development”.

The contribution of each State to achieve the worldwide goal of the Agreement is determined by all States separately and is called “Nationally Determined Contribution (NDC)”. However, no mechanism has been previewed to force a State to set a target in its NDC by a specific date and no enforcement will be if a set target within a NDC is not met. There will be only a “name and encourage” plan. Unlike its predecessor, the Kyoto Protocol, which sets commitment targets endowed with a legal force, the Paris Agreement allows for voluntary and nationally determined targets.

In 2015 Climate Change Law (or Climate Law) was still in the process of acquisition of its autonomy against the older, general branch of Environmental Law (Nespor, 2015). From June 2015 and on, the right to CCC has gained a sufficient judicial protection, mainly due to a Dutch sentence emitted then against the correspondent government. As far as the Climate Law is concerned, it has gained its autonomous status against the older general branch of Environmental Law, after the Paris Agreement on Climate Change.

Besides, other 4G rights have emerged, such as the relevant to genetic engineering and bioethics as well as to the world of animals (Del Giudice, 2016). Many 4G rights have a very important economic impact, as it is the case of the right to energy efficiency, especially of buildings, which comes from the 3G general right to energy (Bordin, 2014).

Last but not least, there is a great similarity between the fourth generation and the third one, particularly because they share the collective or communitarian nature (rights having to do with the interest of the entire community) and above all the solidarity character, which is located within the private sector. It is to signalize that this character may be also conceived in another similar context, namely as solidarity coming from the private sector towards State authorities which operate as the representatives of public interest. The solidarity character of 4G rights within society is exemplified by Internet, which constitutes a virtual reality field, in which man can express solidarity towards victims of an illegal act or help them.
THE RIGHT TO PURSUIT OF HAPPINESS

The subject of happiness is not merely juridical but has to do mainly with other sciences, such as psychology, and to the social enquiry, like the case of bioethics (Maniatis, 2017b). The great intellectual, Umberto Eco, made an all-time classic comment, on the matter, in 2014 (Eco, 2014). He formulated the opinion that the literature on happiness is enormous, from Epicurus and perhaps before him and on, but he believes that nobody knows in what happiness consists. He cannot admit that it is about a permanent status for common people. The question is that happiness, conceived as an absolute fulness, is a very transitory situation, episodic and brief, like a moment in the course of an excursion in the countryside. Furthermore, the idea of happiness evokes always the personal happiness and hardly ever the one of the human species.

In the current period of 4G rights, a part of the doctrine has begun to attempt to prove that there is also an implicitly consecrated constitutional right relevant to happiness. However, it would be more accurate to classify it in the first generation due to its inclusion in the Declaration of Independence of the 13 USA, of 4th July 1776. This revolutionary text recognized the human right to pursuit of happiness along with the classical rights to life and to freedom of human beings. This right is also included in the French Declaration of the Rights of Man and the Citizen. This text of 26th August 1789 is directly influenced by Thomas Jefferson, the primary author of the American Declaration, who was at the time in France, serving as a diplomat, and worked closely with General Lafayette in composing a Bill of Rights for France. This first fundamental text of French Revolution recognizes the rights of men to property, liberty and life. It makes also reference to the objective of the “happiness of all”. Despite the lack of explicit mention of slavery in the Declaration, slave uprisings in the Haitian Revolution took inspiration from its words. In 1793, due to the rebellion of slaves in Haiti, a part of the French revolutionists adopted the policy of abolition of slavery. It is to point out that the Declaration constitutes the point of reference of the French institutions, mainly in the Constitutions of 1852, 1946 and 1958. The Preamble of the current Constitution makes an explicit reference to it whilst even the Constitutional Council tends to invoke it. The right to pursuit of happiness, being
present in the above-mentioned Declarations, was omitted in the Constitutions of the era that was inaugurated by them.

As far as the juridical science is concerned, it seems rather divided on this “forgotten” human right. On the one hand, in 2008 the opinion was formulated that this right exists, resulting from various factors, like the historical antecedent (Gemma, 2008). Although the right was recognized in Declarations and not in ulterior formal Constitutions, it is not regarded as strange in both the vocabulary and the principles of Constitutional Law.

It is logical to look for a legal back in article 2a of the Italian Constitution (and in the similar disposition of article 25 par. 1a of the newer Greek Constitution), according to which: “The Republic recognizes and guarantees the inviolable rights of the person, both as an individual and in the social groups where human personality is expressed”. This disposition is endowed with a content quite similar to the question of recognition of new human rights. Various rights have been deduced from sectors of doctrine and jurisprudence in Italian legal order, beyond the explicitly consecrated in various constitutional dispositions. For instance, the Constitutional Court has expressed its interest in new human rights, like the right to protection from genetic manipulations.

However, the right to pursuit of happiness does not have the same nature to the consecrated in the Constitutions and to those deduced from these. It is possible to be deduced from the Constitution, via the recourse to either the teleological interpretation or the systematic one. It constitutes the ratio of all the other constitutional rights, being considered as a system, and from this ratio would be possible to deduce this right, being transversal to the other ones. It is connected with the phenomenon of multiplication of constitutional rights of various nature, in the process of interpretation of the fundamental charter. From the explicit provision of one or more constitutional rights it is possible to deduce rights that are implicitly formulated, because either these rights are the prerequisites of the explicitly consecrated rights (for instance, the right to life is not mentioned in the Italian Constitution whilst it is previewed in other Constitutions) or simply result from the mentioned rights (like the right to the environment in correlation with the right to heath, being mentioned in article 32 of the same Constitution). On account of these data, it is obvious that the right to pursuit of happiness is not just another right, beyond the classical ones. It is in a logical relation not with some single rights but with the entire constellation of the constitutional rights.

Nevertheless, it is notable that the right to pursuit of happiness has historically acquired an autonomous rank, let alone in a logical connection with the rights of major importance for the existence and the happiness of human beings (life and freedom), as already mentioned. From this context, in view of the new discipline of bioethics, the USA Declaration does not back up uniquely the prohibition of any form of slavery but also the respect for human life and the right to procreation.
THE RIGHT TO RESTITUTION OF HUMAN REMAINS PROTECTED AS HERITAGE

Nowadays, a fundamental right is under recognition, albeit in a rather shy and quite limited way. It is about the right to restitution of remains of the body of a deceased person and, more generally, to respect of these remains against the traditional approach of their exhibition in museums, as far as they are protected as heritage.

The secularization and the slow easing of the position of the Church have permitted the development of various collections including human remains, mainly in the 19th century (Hershkovitch, Rykner, 2011). However, from 1970s and on, the problem of respect for the human body emerged and the presentation of human remains to the public was contested. On this quite ambivalent topic, France has a pioneer position: it has adopted, since 1994, a first legislative text on bioethics, namely law n. 94-653 of 29th July 1994 relevant to respect of human body. The French legislator continued this approach, which has led to the promulgation of laws of 6th August 2004 relevant to bioethics and then of 19th December 2008 relevant to the funeral management. These newer texts result from the interest particularly in the use of human beings and in the means to prevent slavery.

For instance, within the last text there is Chapter III, having to do with the status and the destination of the ashes of deceased persons, whose the body gave rise to cremation. According to article 11, after article 16-1 of Civil Code, an article 16-1-1 is inserted, composed as follows:

“Art. 16-1-1. - The respect due to the human body does not cease with the death.

The remains of deceased persons, including the ashes of those whose bodies have given rise to cremation, must be treated with respect, dignity and decency”.

As far as the problem of the presence of human remains in the national collections is concerned, another disposition coming from the first law on bioethics, has been invoked in both restitution cases that captured very much the interest of media in France (Hershkovitch, Rykner, 2011). It is about article 16-1-3 of Civil Code, according to which “the human body, its elements and its products cannot be the object of a patrimonial right”. The first case had to do with the serious ethical question of restitution of mortal remains of Saartje Baartman, known with the ironic nickname “Hottentot Venus”. Finally, the body of that black young woman, coming from the actual territory of South Africa, was given to this country in 2002, through an exceptional law of the French Parliament, namely without any use of the conventional administrative procedure of declassification of cultural goods. In a similar way, the norm on the matter was also invoked by the municipality of Rouen in the trial introduced by the French State against it, in the case of the tattoo head of a Maori warrior, which had been offered to it as a gift. The Minister of Culture did not share the volunteer of the Municipality to give the head to the museum TE Papa of Wellington, following the trend of many European museums in the
framework of the case of the tattoo heads of Maori people, located out of New Zealand. However, the disposition on the matter has to do with the living people, not the human remains, as it has been confirmed by the administrative jurisprudence in the Maori head case. The law of 4th January 2002, relevant to the “museums of France” has made it possible to integrate scientific collections into national collections and, consequently, to submit them to the status of public ownership, which includes the traditional principles of imprescriptible character of the owner’s claims and of inalienability. The violation of the principle of inalienability of the public ownership led the Minister of Culture to activate a procedure against the decision of the Municipal Council of Rouen, relevant to the return of the Maori head to the museum Te Papa. Nevertheless, it is to signalize that not only this decision was not legal because it transgressed the inalienability principle but also it could not get rid of this principle through the administrative procedure of declassification! Indeed, law prohibits any declassifications of goods integrated in collections of “Museums of France”. Finally, another exceptional law was adopted, of 4th May 2010, to reset the Maori heads to New Zealand.

Anyway, the question of restitution of human remains to autochthonous people is very delicate in various points of view, particularly because these remains may result in destruction for religious reasons. For instance, the former director of British Museum Neil McGregor has declared that this museum decided the restitution of two bags containing the ashes coming from the cremation of two chiefs, to the Aborigine representatives of Tasmania (Hershkovitch, Rykner, 2011). With the ashes, it is not technically possible to make an analysis of DNA, which has been destroyed. However, the question is whether in some decades or centuries other scientific methods emerge, ensuring this analysis, or not. The decision of the museum was more difficult to make, on account of the fact that the community of Aborigines had the intention to return the ashes to nature, to resume a broken cycle.

Last but not least, if France has informally begun to establish a 4G right to restitution of human remains, USA are the pioneer country on the matter, by adopting the “Native American Graves Protection and Repatriation Act” (NAGPRA, Public Law 101-610), in 1990, to pay respect for the rights of autochthonous people. This law has been successfully applied and has inspired other countries to adopt some solutions of legislative or para-legislative nature. So, the right to restitution of human remains is a 3G one, at least as far as the USA are concerned.

THE RIGHT TO COMPENSATION FOR DAMAGE CAUSED TO AN EMBRYO
The Italian Supreme Court emitted the sentence n. 16754/2012, for which the doctrine has manifested an important interest. The Court of Cassation, which has judged the aforementioned right to happiness as a thoroughly imaginary in a case relevant to tourism law (Ferro, 2014), in another case had to cope with the issue of compensatory damage for children born with Down syndrome due to a
failed diagnosis of the illness during the pregnancy. First of all, the right to health is widely recognized explicitly in Constitutions, as it is the case of article 32 of the Italian one, as already signalized. The doctrine remarks that this article makes speech not of “person” but of the “individual” as a subject of this right. As a result, it is possible, due to this formulation, to attribute it to the conceived, which is not legally a “person” but may be considered as an “individual” (D’Amico, 2015). It denies the existence of a right to be born healthy whilst even the above-mentioned sentence, which recognizes the right to compensation of the human being born with Down syndrome, seems to recognize the right on the matter. The “ratio decidendi” of the sentence consists rather in an “extension” of the compensation, which is directly attributed to the mother (and also to other members of the family), to the born, who is a subject that suffers personally the incidences of the medical error. The sentence ties in with the constitutional dictation, given that it excludes (explicitly) the compensation of the child against the mother that, in spite of the diagnosis of the pathological findings, is the unique entitled to makes up the decision to go on with pregnancy. Indeed, it is exclusively up to the woman the faculty to opt for the voluntary interruption of pregnancy in presence of dangers for her life or for her health, as it is clearly fixed in Law n. 194/1978.

Besides, the Constitutional Court of Italy, particularly in its sentence n. 27/1975, has denied, in the matter of abortion, the possibility to equate the conceived, not being a “person” in terms of Civil Law, to the mother, who is a person. The same Court, in the matter of medically assisted procreation, particularly in sentence n. 159/2009, has admitted that law n. 40/2004 can reconcile the rights of the embryo with the claims of the procreation. It is about the treatment of the conceived as an object, instead of being a subject of rights (D’Amico, 2015).

According to another opinion on the above-mentioned judgement of the Court of Cassation, granting such compensation to the baby born with Down syndrome is tantamount to postulating a right not to be born. Subsequently, the doctrine tries to refute this right by showing that it is illegitimate and that, consequently, so is the aforementioned compensation. Some of the objections to this hypothetical right are:
