The outcome of the content analysis consists in the interpretation of the directions of change and, more specifically, the innovative branding aspects that are closely related to digitisation. As table 2 shows, the directions of change are identified by the combination between the research perspectives on the evolution of branding (i.e. conceptual, managerial and organisational) and the main characteristics of digital marketing contexts (i.e. hyper-connectivity and openness). The specific innovative branding aspects are defined by the combination of the abovementioned dimensions.

</tr>
<tr>
<td>Organisational perspective (organising branding is based on ...)</td>
<td>Hyper-connectivity: Brand manager as “orchestrator”; network-based structures</td>
</tr>
</tbody>
</table>

Table 2 - Innovative branding aspects related to digitisation.

In particular, thanks to hyper-connectivity and openness, the brand becomes a social engagement platform for stakeholders (Ramaswamy and Ozcan, 2016), representing a nexus of a hybrid network between online and offline worlds. The managerial approach becomes open and multi-way (Vernuccio, 2014), based on negotiating meanings (Gensler et al., 2013) and managing influence (Fournier and Avery, 2011). Increasingly more network-based, agile and flexible, the organisation has at its heart a “new” brand manager, who orchestrates a variety of internal and external capabilities (De Swaan Arons, 2014), while at the same time incorporating new nodes: consumers and other stakeholders.

CONCLUSIONS

On the theoretical front, this review makes multiple contributions. The comprehensive literature review of the past fifty six years has first and foremost enabled us to establish how branding has evolved
according to three key research perspectives (i.e. conceptual, managerial and organisational). Gaining insight from thematic content analysis, we developed a broad interpretative framework representing in an integrative manner the different paradigmatic phases of branding evolution (i.e. sign, image, identity, relational and social paradigm), from a theoretical and managerial standpoint. Moreover, we have contextualised the most recent changes brought about by the digital revolution within the aforementioned perspectives and in the long term branding evolution. Innovative aspects directly connected to digitisation have thus emerged under conceptual, managerial and organisational profiles. Findings shows the fact that this long evolution has been non-linear and multi-path, with the current branding profiles yet to be researched fully (Aaker, 2015; Louro and Vieira Cunha, 2001).

From an academic point of view, the results make a serious contribution to the brand literature, offering researchers a broad and integrated vision of an evolutionary path that to date has mainly been examined in a fragmentary way (Low and Fullerton, 1994; Laporte et al., 2016). Furthermore, this overview provides researchers an initial integrated analysis on the conceptual, managerial and organisational challenges of branding in the light of the main characteristics of marketing digital contexts. In terms of academic implications, our findings provide marketing scholars with a cogent basis for identifying and developing future lines of research on the manifold innovative aspects of branding under the three perspectives. More specifically, based upon our results, researchers are invited to develop theoretical and empirical studies on under-researched emerging areas, such as the brand as social engagement platform for stakeholders, the brand management inspired by an open approach and the brand manager as “orchestrator” in network-based structures.

As for the practitioners, this work provides a first positive contribution towards developing greater awareness on the substantial innovations which should be implemented with regard to thought systems, managerial practices and organisational solutions for effective brand management in the age of digital revolution. In front of the challenges posed by hyper-connectivity and openness, managers should redesign branding under the perspectives aforementioned, rethinking: 1) the brand concept (as a nexus of a global network that includes online and offline worlds and adds a social engagement platform for stakeholders); 2) the brand management (as a multi-way social process inspired by an open approach); and 3) the brand organisation (with brand managers as orchestrators operating in agile and fluid organisations).

One limitation of the current work is linked to the extreme amplitude of the time span that has been taken into consideration, which does not allow studying deeply on more specific aspects related to the different paradigm phases. Moreover, we only examined English-language academic publications, assuming that this type of article represent suitably business reality. Therefore, we strongly believe that these limitations can easily be overcome by future research, analysing a wider range of publications.

EFFSAMWMIX : AN EFFICIENT STOCHASTIC MULTI-ARMED BANDIT ALGORITHM BASED ON A SIMULATED ANNEALING WITH MULTIPLICATIVE WEIGHTS

Villari, Boby Chaitanya; Abdulla, Mohammed Shahid
Indian Institute of Management Kozhikode Institute of Technology, Kerala, India

ABSTRACT

SAMWMIX, a Stochastic Multi-Armed Bandit (SMAB) which obtains a $O(\log T)$ where $T$ being the number of steps in the time horizon, is proposed in the literature. A blind-SAMWMIX which incorporates an input parameter, which has better empirical performance but obtains a regret of the order $O(\log^{1+2a} T)$. Current work proposes an efficient version of SAMWMIX which not only achieves a regret of order $O(\log T)$ but also exults a better performance. A proof for the same is given in this work. The proposed effSAMWMIX algorithm is compared with KL-UCB and Thompson Sampling (TS) algorithms over rewards which follow distributions like Exponential, Poisson, Bernoulli, Triangular, Truncated Normal distribution and a synthetic distribution designed to stress test SMAB algorithms with closely spaced reward means. It is shown that effSAMWMIX performs better than both KL-UCB & TS in both regret performance and execution time.

Keywords: stochastic multi-armed bandit; stochastic processes; reward distributions; optimization;

INTRODUCTION

Decision making under uncertainty is a challenge in a turbulent environment. Partial feedback from the environment leads to incomplete information giving rise to uncertainty. The agent has to learn sequentially (i.e. in many iterations) by relying only on reinforcements with partial feedbacks obtained due to the previous decision. Thus, the decision maker should explore the entire set of available decision choices in an attempt to improve the knowledge about the problem’s current solution and exploit the currently available knowledge on the problem’s solution choices to choose the best choice. Multi-Armed Bandits (MAB), a family of Machine Learning algorithms, are tailor-made to handle such explore-exploit problem situations[1]. The
MAB problem is a sequential decision-making task where the decision maker (agent) decides to choose (pull), at each time step, an action (arm) from a pool of $m$ actions - based on some informed choosing strategy (policy). With the aim of maximizing the average payoff from this exercise in the long-run, the agent examines these payoffs to continuously improve the policy and decide on the future selection of arms. Alternatively, the same can be seen as a regret minimization problem where the regret is the difference between rewards of an oracle policy that chooses the best arm in every time step and the rewards of the learned MAB policy. It is known that in $T$ pulls, $O(\log T)$ regret is the lowest possible regret an MAB algorithm can achieve and thus the desirable target.

The Upper Confidence Bound (UCB) class of MAB algorithms, both in the stochastic and contextual settings, is considered a benchmark. However, in both settings, UCB requires a ‘pick the best arm’ behavior, which is performed by explicitly picking the maximum among the $N$ arms. The metrics associated with each arm will, however, change from pull to pull. This makes the per-step complexity of the UCB class of algorithms $O(T)$. The proposed SMAB algorithm effSAMWMIX differs in avoiding maximization and instead picking a ‘Soft-Maximum’ via a Boltzmann Exploration structure. Since the ‘Soft Maximum’ is encoded inside a probability vector, the generation of an arm’s index using this probability vector contributes to a $O(\log T)$ complexity – which makes the algorithm very competitive if $T$ happens to be large. This advantage is over-and-above the improved precision of SAMWMIX and its variants due to a theoretical result[2] that bounds the ‘finite sample regret’ (i.e. the probability of choosing the wrong arm in each pull).

In a previous work, the authors proposed Gamma Optimized SAMWMIX(GO-SAMWMIX) [3] with a simple heuristic improvement over the original. The bounds on this algorithm largely remain the same as that of original but GO-SAMWMIX is reported to have better effectiveness than its predecessor in terms of the number of times the best of the choices are chosen by the algorithm over a given time horizon $t$. This work proposes an efficient version of SAMWMIX which not only obtains a regret of $O(\log T)$ but also has a better performance in terms of efficiency i.e. the number of times the best action is pulled and thus lowering the regret or maximizing the cumulative reward over the horizon $t$. This work compares the performance of effSAMWMIX vis-à-vis that of the state-of-the-art KL-UCB algorithm [4] and Thompson Sampling(TS) algorithm[5, 6] which is seen to gain prominence in this decade. The tests are done over rewards which follow distributions like Exponential, Poisson, Bernoulli, Triangular and Truncated Normal distribution’s and a synthetic distribution designed to
stress test the algorithm with closely spaced reward means $\mu$. (see section IV). effSAMWMIX has achieved a superior performance as detailed further in this paper.

**MULTI-ARMED BANDITS- A REVIEW**

The Multi-Armed Bandit (MAB) problem in brief

A MAB problem is a sequential decision-making problem with discrete time steps or horizon $T$. The agent chooses an action in every time step from a set of $N$ possible actions. Then the environment will provide the reward pertaining to action $i$ at time step $t < T$. Thus process continues in the following way.

1. Agent chooses action $I_t$ & thus interacts with environment
2. Environment provides the rewards $x_{i,t} \in [0,1]$ for $t \in \{1,T\}$ and reward $x_{i,t}$
3. Observing this reward, $x_{i,t}$, the agent tries to maximize the cumulative reward i.e. $\sum_{t=1}^{T} x_{i,t}$ by the time step $T$

Fig.1. The MAB problem

For a general MAB, it is to be noted that the rewards could follow any distribution but are to be bounded by $[0,1]$. An agent is tested to achieve a highest cumulative reward or lowest cumulative regret to be graded better. Imposing additional assumption on the generalized MAB problem will lead to a variant, of our interest, called the Stochastic Multi-Armed Bandit (SMAB).

**The Stochastic Multi-Armed Bandit (SMAB)**

In SMAB settings it is assumed that the reward $x_i$ follows a fixed distribution $v_i \rho \in [0,1]$ unknown to the agent. The reward of each action $i$ is independent of the rewards it obtained from any other time horizon (or pull) and independent of rewards of other actions [7]. This means that the rewards $\{X_i\}_{i=1}^{K}$ are assumed to be i.i.d from $v_i$ and all the rewards of $K$ choices(arms) are also independent of each other.

In addition to Stochastic settings, an adversarial setting[8] that exists for MABs which is not the setting for the algorithms studied in this work.
Performance Measures for an SMAB

In an SMAB (also for any MAB) setting, an algorithm is evaluated based on the cumulative reward or the cumulative regret obtained due to the agent’s decision-making processes over the time horizon. Thus, regret $R$ is a measure of how far the performance of contended algorithm is compared to an oracle policy that knows how to pick the best possible action in every each time step $i$ in horizon $\mathcal{H}$. For all CMABs, regret $R$ is a central conceptual variable to be considered and concentrated towards obtaining a logarithmically changing regret over time horizon. During experimentation the regret $R$ is plotted against horizon $\mathcal{H}$ so as to observe and compare with algorithms reported or contented against.

An expected payoff regret or simply expected regret $R$ is defined as follows

$$R = \sum_{t=1}^{T} \left( \max_{i=1,2,...,N} E[X_t^i]\right) - \sum_{t=1}^{T} X_t^i$$

Thus $R$ is the difference between the payoff of an optimal arm as selected by an oracle policy (in expectation over the arm’s distribution) and the actual payoff obtained by the MAB policy in contention. Since in real time environment, the oracle policy might not be known in advance, $R$ happens to have significance only in simulated environments where the testing is done to evaluate the algorithm’s performance.

THE effSAMWMIX ALGORITHM

The effSAMWMIX algorithm is based on SAMWMIX[2] which indeed is based on a variant of simulated annealing called Simulated Annealing with Multiplicative Weights(SAMW). The regret is calculated as given below. As mentioned earlier, the SAMWMIX and its variants use a ‘Soft-Maximum’ via a Boltzmann Exploration structure. Since the ‘Soft Maximum’ is encoded inside a probability vector, the generation of an arm’s index using this probability vector contributes to a $O(\log K)$ complexity – which makes the algorithm very competitive if $K$, the number of available arms, happens to be large. This binds the finite sample regret which is the probability of choosing a wrong action in each pull.

The effSAMWMIX algorithm chooses the arms by calculating and maintaining a vector $\phi_t^j$ where $j \epsilon [1, K]$ are the number of arms available and $t \epsilon [1, T]$ is the time horizon. The $\phi_t^j$ is given below.
(1) is similar to (10) of [2] since it represents a Boltzmann exploration schema. The learning component which is the step-size $\gamma_t$ and the inverse temperature parameter is given below.

$$\gamma_k = \frac{N(4 + (d + d_k)^2)}{k(d + d_k)^2 - (d + d_k - 2d^2)}$$  (2)

$$\eta_k = \frac{1}{\gamma_k + 1} \log \left(\frac{1 + d \left(\frac{n}{\gamma_k} + 1\right)}{2N - \gamma_k - d^2}\right)$$  (3)

The construction of proof is based on the definition of an expected regret which is defined as the expected cumulative loss incurred due to not playing the best possible arm $a^*_t$ during the iteration $t$ where $e[1, T]$. The calculation of the maximum expected regret is put below.

Maximum Regret of MAB = $\max_{1 \leq j \leq N} \{\sum_{t=1}^{T}(X^j_t - \hat{X}^j_t)\}$

$$= \sum_{t=1}^{T} \{E[\sum_{t=1}^{N}(X^i_t - \hat{X}^i_t)]\}$$

$$= \sum_{t=1}^{T} \{E[\sum_{t=1}^{N}(X^i_t - \hat{X}^i_t) / \mathcal{F}_{t-1}]\}$$

$$= \sum_{t=1}^{T} \left\{E[\sum_{j=2}^{N} \Delta_i \phi^j_t]\right\}$$

$$= \sum_{t=1}^{T} \left\{\sum_{j=2}^{N} \Delta_i E[\phi^j_t]\right\}$$

Figure 2. Calculation of Maximum Expected Regret

The proof for logarithmic regret is similar to that of SAMWMIX and thus can be documented similarly. Since $\sum_{p=1}^{T}(\Delta_i / p) = \log (T)$, obtaining an upper bound of $O\left(\frac{1}{T}\right)$ on expectation $E(\phi^j_t)$ for any suboptimal arm implies a logarithmic regret in effSAMWMIX. From the following set of equations, we derive the value of $\gamma_k$ which essentially differentiates the effSAMWMIX from SAMWMIX.

By altering the Boltzmann exploration schema of SAMWMIX from
\[ \phi_{t+1}^j = (1 - \gamma_t) \frac{\phi_t^j e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} \phi_t^j e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \]

which is (10) of [2] to that of effSAMWMIX which is

\[ \phi_{t+1}^j = (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \]

where \[ \eta_k = \frac{1}{\eta_{k+1}} \log \left( \frac{1 + d e^{\frac{(n + 1)}{\sigma_k^2}}} \right) \]

if \[ K_p = d, C_p = \frac{N}{\eta_p} + 1, \sigma_p^2 = 2 \frac{N}{\eta_p} - d^2, \text{then} \]

\[ \eta_p = \frac{1}{C_p} \log \left( 1 + C_p K_p \right) \]

The regret is defined as \[ R = \Sigma_{t=1}^{T} \left[ \Sigma_{j=2}^{N} \Delta_j E[\phi_t^j] \right] \]

But \[ \phi_{t+1}^j = (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \]

Thus \[ R = \Sigma_{t=1}^{T} \left[ \Sigma_{j=2}^{N} \Delta_j E \left[ (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \right] \right] \]

\[ = \Sigma_{t=1}^{T} \left[ \Sigma_{j=2}^{N} \Delta_j E \left[ (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \right] \right] \]

Since \[ e^{\Sigma_{i=1}^{N} x_{i}^j} \leq \Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j} \], the following equation (4) holds true.

\[ (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{\Sigma_{j=1}^{N} e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \leq (1 - \gamma_t) \frac{e^{\Sigma_{i=1}^{N} x_{i}^j}}{e^{\Sigma_{i=1}^{N} x_{i}^j}} + \frac{y_t}{N} \quad (4) \]

Considering the following inequality

\[ e^{\Sigma_{k=1}^{K} \eta_k x_{i}^k} \cdot e^{\eta_k (d_k) (x_i^k + d_k)} \leq \Sigma_{j=1}^{N} e^{\Sigma_{k=1}^{K} \eta_k (d_k) x_{i}^j} \quad (5) \]

be true for every \( i \) including \( i = 1 \) to \( N \) and if \( a_k \) is the winner arm in \( k_{th} \) iteration, (5) can be written as follows

\[ e^{\Sigma_{k=1}^{K} \eta_k x_{i}^k} \cdot e^{\eta_k (d_k) (x_i^k + d_k)} \leq \Sigma_{j=1}^{N} e^{\Sigma_{k=1}^{K} \eta_k (d_k) x_{i}^j} \]

Fething \( \eta_p \) from SAMWMIX [2]

\[ \eta_p^{samwmix} = \frac{1}{C_p} \log \left( \frac{1 + C_p K_p}{\sigma_p^2} \right) \quad \text{where} \quad K_p = d \]

\[ \eta_p^{samwmix} = \frac{1}{C_p} \log \left( \frac{1 + C_p d}{\sigma_p^2} \right) \]

Analogous to SAMWMIX we define \( \eta_p^{effsamwmix} \) as...
\[ \eta_p^{\text{effsamwmix}} = \frac{1}{c_p} \log \left( \frac{1 + c_p(d + d_p)}{\sigma_p^2} \right) \]  

(7)

Getting the notations back incorporating \( d_k \), i.e.

\[ \eta_p^{\text{effsamwmix}} = \eta_p(d_p) \text{, parameterized by } d_k \]

\[ \eta_p(d_p) = \frac{1}{c_p} \log \left( \frac{1 + c_p(d + d_p)}{\sigma_p^2} \right) \]

\[ \phi_{p+1}^j = (1 - \gamma_p) e^{\frac{\phi_{p+1}^j}{2\sigma_k^2 + K_p c_p}} + \frac{Y_f}{N} \]

To obtain logarithmic regret, the summation term in exponent should be a logarithmically increasing entity. Hence we equate it to log \( K \)

\[ \sum_{p=1}^{K} \frac{K_p^2}{2\sigma^2 + K_p c_p} = -\log K \]

which implies that \[ \frac{K_p^2}{2\sigma^2 + K_p c_p} = \frac{1}{k} \]  

(8)

Since \( K_p = (d + d_k) \), equation (8) is rewritten as

\[ \frac{2(2N - d^2) + (d + d_k)(N - \gamma_k + 1)}{2(2N - d^2) + (d + d_k)(N - \gamma_k + 1)} = \frac{1}{k} \]

Thus \( \gamma_k = \frac{N(4 + (d + d_k))}{k(d + d_k)(2d + 2d - d^2)} \)

Thus an exploration parameter \( \gamma_k = \frac{N(4 + (d + d_k))}{k(d + d_k)(2d + 2d - d^2)} \) will aid effSAMWMIX in achieving a logarithmic regret \( \log T \) over the horizon \( T \). The pseudocode for effSAMWMIX algorithm is put below

**Algorithm 1 effSAMWMIX SMAB algorithm**

**Input**: Rewards Vector \( G_t \), set of Arms \( N \), number of rounds \( T \)

1. Using \( G_t \) Calculate \( d = \min \Delta(\mu_1, \mu_2, ..., \mu_N) \) where \( \mu_i \) is the reward mean of Arm \( i \).

2. Calculate
   a. \( C_0 = N + 1; \sigma^2 = 2 \cdot N; \)
   b. \( \eta_0 = \frac{1}{c_0} \log \left( \frac{1 + c_0(d + d_p)}{\sigma^2} \right) \)
   c. \( \text{startIter} = ((4 + d) \cdot N + d)/d^2 \)

3. for \( i = 1, ..., N \) do
   a. Obtain reward \( X_{t=i} \)
   b. Initialize \( \phi_{t} = \eta_0 \cdot \left( \frac{\text{startIter}}{N} \right) \cdot \left( \frac{X_{t=i}}{\sigma^2} \right) \)
   c. Initialize pull count for arm \( a^i \) as \( p_i = 1 \)

4. for \( t = (\text{startIter} + 1 + N), ..., (\text{startIter} + T) \) do
   a. Obtain random probability \( r \)
b. Choose an arm \( i \) as winner if \( \sum \phi^i_t > r \) and store reward \( \hat{a}^i_{t- \text{startiter}} = a^i_t \) and normalize the reward using its probability \( \hat{r} = a^i_t / \phi^i_t \)

c. Update \( p_i = p_i + 1 \)

d. for \( d_t = 1, \ldots, t-\text{startiter} \) in steps of \( d_{\text{step}} \) do
   i. Calculate \( k_t = d + d_t; \)
   ii. \( \gamma_{\text{temp}} = ((4 + k_t) * N + k_t) / (t \times k_t^2) \)
   iii. \( C_t = \left( \frac{N}{\gamma_{\text{temp}}} \right) + 1 \) and \( \sigma_{\text{temp}}^2 = 2 * N / \gamma_{\text{temp}} \)
   iv. \( \eta_t = \frac{1}{C_t} \log \left( \frac{1+ \eta_t + k_t^2}{\sigma_{\text{temp}}^2} \right) \)
   v. \( \sum \phi^i_{\text{temp}} = \sum \phi^i_t + e^{\eta_t \Sigma_n x^i_t} \)
   vi. If \( e^{\eta_t \Sigma_n x^i_t} > \sum \phi^i_{\text{temp}} \) then assign \( d_{\text{true}} = d_t - d_{\text{step}} \)

e. Assign
   i. \( K_t = d_t + d_{\text{true}} \)
   ii. \( \gamma_t = ((4 + k_t) * N + k_t) / (t \times k_t^2) \)
   iii. \( C_t = \left( \frac{N}{\gamma_{\text{temp}}} \right) + 1 \) and \( \sigma_t^2 = 2 * N / \gamma_{\text{temp}} \)
   iv. \( \eta_t = \frac{1}{C_t} \log \left( \frac{1+ \eta_t + K_t^2}{\sigma_t^2} \right) \)
   f. Now update \( \phi^j_{t+1} \) using (1) which is
      \[
      \phi^j_{t+1} = (1 - \gamma_t) \cdot \frac{e^{\eta_t \Sigma_n x^j_t}}{\Sigma_{j=1}^N e^{\eta_t \Sigma_n x^j_t}} + \frac{\gamma_t}{N}
      \]

Output : \( \phi \) vector

**EMPIRICAL EVALUATION OF effSAMWMIX**

effSAMWMIX is currently being compared to the performance of KL-UCB and TS. We chose KL-UCB for that it is prominently cited and compared to in MAB literature. Similarly, TS is gaining prominence[9] in the scientific fraternity in this decade. Also, effSAMWMIX has performed better than its predecessors GO-SAMWMIXM and SAMWMIX which in turn has as superior performance over UCB1 algorithm. This work reports the performance of effSAMWMIX vis-à-vis to that of KL-UCB and TS over the following reward distributions. The main purpose of these numerical experiments using various reward distributions is to compare the
performance in terms of cumulated regret and the number of times the arm with the best mean reward (best arm henceforth) is pulled.

**Customized Synthetic Distribution (CuSyn)**

It is known that the mean reward of any arm influences the decision making of an SMAB. The closer the mean rewards of the available arms, the difficult it should be for an SMAB algorithm to latch on to the best arm for that iteration. A Customized Synthetic Distribution (CuSyn) is designed with an input parameter that allows distributing the rewards of the arms so that the minimum reward mean’s difference between any two arms is controlled. For example, using 0.1 as a parameter, the arms’ reward distributions will be placed so that the closest of the arms will have their reward means differing only by 10%. This ensures control over the closeness of the arms and allows for stress testing the algorithm.

**A few other Reward distributions**

Taking clues from [10], reward distributions of the arms are set so that their means are in an exponential distribution or a Bernoulli distribution. The algorithms are tested with arms that follow a Triangular Distribution [11] and a Normal distribution truncated to be bounded between [0,1] (Truncated Normal Distribution henceforth). The results of the numerical experiments are put below.

**Design of the Experiment**

Numerical experiments are performed on effSAMWMIX, KL-UCB and Thompson Sampling(TS) algorithms using the computational software package MATLAB. All the distributions are to have rewards \( \in (0,1) \) and the rewards are i.i.d for all the five arms \((K = 5)\) in consideration. The time horizon is set to be 2000 pulls \((T = 2000)\) and each run of the code is called an experiment. 100 such experiments are conducted and the results are averaged to remove any randomness in the results. The results are put below when the rewards followed each of the distributions named below.

**Customized Synthetic(CuSyn) Distribution**

The cumulative regret accumulated by effSAMWMIX is the lowest as shown in Fig.1. effSAMWMIX has chosen the best possible arm the most number of times (see Fig.2.) and thus aggregated to a lower regret compared to KL-UCB and TS.

![Fig 1. Comparison of cumulative regrets when the rewards followed a Customized Synthetic Distribution.](image)

Also, the average time taken, to run an experiment with effSAMWMIX is about 67 milliseconds which is the lowest (See Table.1). Thus effSAMWMIX is both effective (lower regret) and efficient (lower computation time) of the three algorithms.

**Triangular Distribution**

effSAMWMIX performed better than the other two algorithms both in terms of efficiency and effectiveness. The cumulative regret accumulated by effSAMWMIX is the lowest as shown in Fig.3.

![Fig 2. Comparison of best arm’s Pull Count when the rewards followed a Customized Synthetic Distribution.](image)
effSAMWMIX has chosen the best possible arm the most number of times (see Fig.4.) and thus aggregated to a lower regret compared to KL-UCB and TS. Here also the average time taken to run an experiment with effSAMWMIX is about 58 milliseconds which is the lowest (See Table.1) of that of the three algorithms.

Truncated Normal Distribution

effSAMWMIX’s performance is superior to other two algorithms when the mean of arms’ rewards followed a Truncated Normal Distribution.
effSAMWMIX is superior both in effectiveness and efficiency (see Fig.5 & Fig 6)

![Comparison of cumulative regrets when the rewards followed a Bernoulli Distribution.]

Fig 7. Comparison of cumulative regrets when the rewards followed a Bernoulli Distribution

When the mean of arms’ rewards followed a Bernoulli distribution the performance results are favorable to effSAMWMIX both of effectiveness and efficiency (see Fig.7 & Fig 8)

![Comparison of best arm’s Pull Count when the rewards followed a Bernoulli Distribution.]

Fig 8. Comparison of best arm’s Pull Count when the rewards followed a Bernoulli Distribution.

Poisson Distribution

effSAMWMIX performed better than the other two algorithms in terms of time efficiency.
TS has performed better than both KL-UCB and effSAMWMIX (see Fig.1 & Fig.2.) even though TS’s time efficiency is the lowest of the three (see Table .1.).

Exponential Distribution

The time efficiency of effSAMWMIX is still the best among the algorithms in comparison but the regret of KL-UCB is the lowest.

While effSAMWMIX achieved a lower regret than that of TS, KL-UCB has the best regret when the rewards followed an Exponential distribution.
Fig 12. Comparison of best arm’s Pull Count when the rewards followed an Exponential Distribution.

CONCLUSIONS AND FUTURE DIRECTIONS

The proposed SMAB algorithm effSAMWMIX is compared with the KL-UCB and Thompson Sampling MAB algorithms. The tests are run when the available arms follow the various distributions mentioned in the preceding sections. In all the cases, effSAMWMIX achieved a better time efficiency than those in comparison. Except for when the arms’ rewards followed either an Exponential distribution or a Poisson distribution, effSAMWMIX outperformed KL-UCB and TS in terms of effectiveness i.e. with a minimum of the cumulative regret achieved over the horizon. In the case when the arms’ rewards followed an exponential distribution, KL-UCB achieved the lowest regret while effSAMWMIX ranked second. And in the Poisson distribution case, effSAMWMIX performed next to Thompson Sampling SMAB.

The effSAMWMIX obtains a logarithmic regret which is a desirable property for an SMAB algorithm. Also effSAMWMIX has a faster execution time and has the best regret performance among the three algorithms and in all the cases in discussion. In future, the authors intend to check the applicability of this algorithm by extending it to incorporate contextual information so as to address the explore-exploit problems that are common in any real-world business environment like that of a News article recommendation or cold-start problems in ecommerce domain.

REFERENCES

ABSTRACT

Portfolio Selection Problem (PSCP) is actively discussed in financial research. The choice of available assets poses the need for exploration and the objective to maximize the portfolio payoffs makes the PSCP an explore-exploit decision-making problem. Multi-armed bandit algorithms (MAB) suit well for such problems when applied as the decision engines in Naïve Bandit Portfolio algorithms (NBP). An NBP’s performance varies by varying the MAB inside the algorithm. In this work we test a Stochastic Multi-Armed Bandit (SMAB) named effSAMWMIX, which we proposed in a previous work of ours, to solve the PSCP. We compare the performance of effSAMWMIX vis-à-vis KL-UCB, Thompson Sampling algorithm and the benchmark Market Buy & Hold strategy. We tested the algorithms on simulated and real-world market datasets. We report our results where effSAMWMIX, applied as the decision-making engine of NBP, has achieved better cumulative wealth for all portfolios when compared to the competing SMAB algorithms.

Keywords: Portfolio Selection Problem, Multi-Armed Bandit, Geometric Brownian Motion

1 INTRODUCTION

Decision making under uncertainty has always been a challenge to a decision maker. A Portfolio Selection Problem (PSP) often encounters such uncertainty due to the
changing economic and political environments. The fast proliferation of the information, on Internet-based modern day economies, imposes a need to make a quick decision based on the available but limited information. Many business problems including the Online Portfolio Selection Problem (OPSP) could require simultaneous optimization and the best choice identification. OPSP has been widely discussed in Computational Finance (Borodin and El-Yaniv 2005; Fiat 1998; Li and Hoi 2014; Mohr and Schmidt 2013; Schmidt, Mohr and Kersch 2010).

To solve any PSP, the investor decides on a strategy to allocate the available (finite) wealth among the available choice of assets. Every asset is a diverse investment opportunity and the realization of the asset allocation strategy builds a portfolio. An asset is risky if the prices of the asset are uncertain and such riskiness needs to be incorporated into the portfolio allocation process. The time between any two portfolio allocation decisions is called a period. If there is only one decision during the whole investment period, it is called a Single-Period PSP. A multi-period PSP requires sequential decision-making over the time horizon of investment and thus is proposed as an online decision-making problem. Investor’s during the decision making is to optimize an objective decision which could be the Return on Investment (RoI) or Risk of losing wealth (Risk) or a combination of both (Risk & Return). Thus portfolio decision making could also involve the management of Risk and maximize the RoI. The following section briefly discusses the PSP and introduces a Machine Learning (ML) perspective of the OPSP problem.

2. OPSP & MACHINE LEARNING ALGORITHMS

In the academic literature, OPSP is addressed in two ways. The first one considers the risk management into the objective function and thus the performance measure will be quantified by the Cumulative Wealth (CW) achieved or the net risk of the decision with respect to the achievable wealth. Such performance measures are seen from Markowitz’s seminal work (Markowitz 1952) and also in Sharpe’s
work (Sharpe 1966). A few other works followed similar risk management measures until recently in 2011 (Lisi 2011), (Rockafellar and Uryasev 2000). It can be observed that these ideas are characterized by building statistical models of the asset prices in the market. The input to these statistical models requires a forecasting model in some form (DeMiguel, Martín-Utrera and Nogales 2015). The forecasting model, in turn, requires a calibration based on historical data of asset prices (Sharpe 1963) or market capitalization data (Fama and French 1992).

The second way of addressing the OPSP is based on utilizing the modern day computing infrastructure along with intelligent ML techniques that include Neural Networks or Reinforcement Learning Algorithms (Shen, Wang, Jiang and Zha 2015). ML Algorithms are solely based on the empirical observations motivated by dynamic rise and fall of the asset prices. Algorithms (alternatively Strategies) like Follow-the-Winner (Agarwal, Hazan, Kale and Schapire 2006; Li and Hoi 2014), Follow-the-Loser (Li and Hoi 2012) etc. are a couple of those which make use of such dynamic price changes. In brief, an ML Algorithm’s approach to OPSP is to concretely explore the available information of past asset prices and based on its indigenous technique, provide a suggestion as to how the portfolio allocation be done for the next period. The algorithm typically intends to maximize the cumulative wealth at the end of the multi-period investment horizon.

To analyze the performance of an OPSP strategy, the algorithm is run on a simulated data such as that obtained by simulating stock prices using Geometric Brownian Motion (GBM) (Marathe and Ryan 2005) and then on real-time market data obtained from standard datasets available from various sources (Bruni, Cesaroni, Scozzari and Tardella 2016). It is to be noted that though it is fast to obtain the results by running the algorithm and thus easier to compare the performance with other strategies, the quality of the results heavily depends on the quality of the input data. Hence to avoid the dependency on the same, it is common that the performance of an algorithm is compared to a benchmark algorithm (Mohr, Ahmad and Schmidt 2014).
which could be optimal in the hindsight. The Buy-and-Hold (Li and Hoi 2014) could be one such benchmark algorithm which the performance of an ML based OPSP algorithm is compared with.

This work considers using a Reinforcement Learning algorithm called effSAMWMIX which is a Stochastic Multi-Armed Bandit (SMAB) algorithm. We employ effSAMWMIX to build a Naive Bandit Portfolio (NBP) similar to Shen et.al’s work (Shen, Wang, Jiang and Zha 2015) and compare the same with NBPs that implement standard SMABs like UCB (Auer and Ortner 2010), KL-UCB (Garivier and Cappé 2011) and Thompson Sampling (Agrawal and Goyal 2012; Kaufmann, Korda and Munos 2012; Thompson 1933). We compare the performances over a multitude of simulated and benchmark datasets to analyze the results. The following section introduces SMAB and how an NBP is constructed.

3. STOCHASTIC MULTI-ARMED BANDITS & NAIVE BANDIT PORTFOLIO ALGORITHM

An SMAB typically deals with an explore-exploit problem scenario where there are a set of available choices and the decision maker has to decide on only one of the choices can be opted. This is similar to that of a Portfolio Selection problem except that in a typical MAB, the payoffs of the action other than the chosen action in that round remain unknown. But for a PSP, the data is available as the asset prices for the previous time period are known to the decision maker.

A Stochastic Multi-Armed Bandit

A Multi-Armed Bandit (MAB) problem is a sequential decision-making problem which spans over a horizon of decision-making rounds \( T \). In each round \( t \) the decision maker chooses an action \( a_t \) from among a set of \( K \) action choices that are available and obtains a reward \( r_t^{a_t} \in (0,1) \) for choosing arm \( a_t \) in round \( t \). The choice is based on an objective function that maximizes the overall reward or cumulative wealth (CW) from the decision making process. Alternatively the objective function
could be to minimize the Regret \( R_t \) which is the difference between the highest possible reward and the CW obtained by the algorithm up to that round of decision making (Lai and Robbins 1985; Robbins 1985).

Thus, the cumulative reward of a MAB is
\[
CW = \sum_{t=1}^{T} E(r_{t}^{a_t})
\]
(1)

Let the maximum possible reward be \( \nu^* \) and hence maximum reward for such an oracle policy is \( T \ast \nu^* \).

Then the regret of the MAB algorithm is given by
\[
R_T = TV^* - \sum_{t=1}^{T} E(r_{t}^{a_t})
\]
(2)

A general MAB has no restrictions on the reward distribution. But a Stochastic Multi-Armed Bandit (SMAB) problem imposes an assumption that the rewards of each of the available action choices (arms) follow a fixed distribution \( \nu_i \) on \([0,1]\) unknown to the SMAB algorithm. Also the reward of each action \( i \) is independent of the rewards it obtained from any other time horizon (or pull) and independent of rewards of other actions (Robbins 1985). This means that the rewards \( \{X_{i,t}\}_{t \in \mathbb{N}} \) are assumed to be independent and identically distributed (i.i.d) from \( \nu_i \) and all the rewards of \( K \) choices (arms) are also independent of each other. While there are a few other MAB settings like the adversarial MAB (Auer, Cesa-Bianchi, Freund and Schapire 1995) where the environment chooses the rewards so as to minimize the CW, we deal with SMABs with the rewards following the assumption stated above.

**A Naive Bandit Portfolio strategy**

A Naive Bandit Portfolio (NBP) implements an SMAB inside as a decision-making engine. The inputs to the SMAB are the time horizon \( T \), number of available arms \( K \) where each arm represents a portfolio or asset, the time period between the decisions \( \Delta t \) which could be a day for daily returns or a week for weekly returns or month or an year. \( r_{t}^{a_i} \) is the reward obtained when an asset \( a_i \) is chosen in time period \( t \) and \( CW_t \) is the cumulative wealth obtained until the round \( t \).

The gross return on \( i^{th} \) asset in round \( t \) is denoted by \( r_{t}^{i} \) and is obtained as given below
\[
r_{t}^{i} = \frac{P_{t,i}}{P_{t-1,i}}
\]
(3)
where $P_{t,i}$ is the price of the asset $i$ at time $t$. Thus the returns in round $t \in (1,T)$ over the time for the portfolio with $K$ arms can be given as $R_t = (r_{t,1}, r_{t,2}, r_{t,3}, \ldots, r_{t,K})^T$. The portfolio investment decision over is the determination of the weights proportionate to which each the investment is budgeted over the assets available to the investor. Thus the weights vector at time $t$ which is represented as

$$\omega_t = (\omega_{t,1}, \omega_{t,2}, \omega_{t,3}, \ldots, \omega_{t,K})^T \quad (4)$$

Thus $\omega_{t,i}$ which is the invested wealth percentage on the $i^{th}$ asset in round $t$ is determined by the SMAB algorithm.

$$\sum_{i=1}^{K} \omega_{t,i} = 1 \quad (5)$$

Also for an SMAB to operate, $r_t \in (0,1)$ which means that the rewards are to be normalized and then given as the input to the algorithm. This is a critical condition to be imposed on the dataset in order to use any SMAB on an OPSP. Another critical aspect is the introduction of a parameter $\tau$ indicating the rolling-horizon settings (Shen, Wang and Ma 2014), which is the number of periods of data prior to the current decision making period, the algorithm should consider while calculating the necessary input parameters like the mean return, standard deviation and the Sharpe ratios (SR). Thus for an NBP, the return for an asset $i$ in round $t$ is given as $r^i_t = SR^i_t \quad (6)$

Where

$$SR^i_t = \left( \frac{\mu^i_t}{\sigma^i_t} \right) \quad (7)$$

The $\tau$ denotes the rolling-horizon time period. For example, $\tau = 120$ indicates that the mean ($\mu$) and standard deviations ($\sigma$) of the past 120 time periods is taken in to consideration for calculating $SR^i_t$. Then to get the $SR^i_t \in [0,1]$ normalize the $SR^i_t$ for based on data for every asset $i$ in period $t$.

$$nSR^i_t = \frac{SR^i_t - \min_{(SR^i_t^{[\tau+1,K]})}}{\max_{(SR^i_t^{[\tau+1,K]})} - \min_{(SR^i_t^{[\tau+1,K]})}} \quad (8)$$

The Naive Bandit Portfolio algorithm’s pseudocode is put below.

```
Inputs: $K$ (assets), $T$ (time horizon), $\Delta t, R, \tau$
for $i = 1$ to $(T - \tau)$ do
    Step-1: Estimate the average return $\mu^i_t = E(R_t)$ based on previous $\tau$ periods
    Step-2: Estimate the standard deviation $\sigma^i_t = \sqrt{\lambda^i_t}$ where
            $\lambda^i_t$ is the variance of asset i's returns for the past $\tau$ periods
    Step-3: Using (7) Calculate the $SR^i_t$ matrix for every asset for rounds $t = \tau$ to $T$.
    Step-4: Using (8) Normalize the $SR^i_t$ matrix so that every $nSR^i_t \in [0,1]$ for round $t = \tau$ to $T$. This $nSR^i_t$ is the adjusted Reward function
    Step-5: Provide $nSR^i_t$ as the input for the SMAB algorithm
            which could be UCB, KL – UCB, Thompson Sampling or eff SAMWMIX
```

Figure 1: A Naive Bandit Portfolio (NBP) algorithm
From the Step 5 of NBP algorithm (Figure 1), it is seen that an SMAB is implemented to compute the weights vector for any round \( \epsilon[1, T - 1] \). Current work compares the performance of the proposed effSAMWMIX SMAB with UCB1, KL-UCB, and Thompson Sampling (TS) algorithms. The functioning of each of these algorithms is put below.

The UCB1 algorithm

UCB1 is among those first generation algorithms that update and consider both exploration and exploitation components in a same surrogate UCB parameter (Auer, Cesa-Bianchi, and Fischer 2002). Consider the following UCB1 parameter to be updated in every iteration for every arm \( ucb_i^t = \max\left(\bar{x}_i^t + \frac{2\ln(t)}{n_i}\right) \) where \( \bar{x}_i^t \) is the empirical mean of observed reward of arm \( i \) until round \( t \) and \( n_i \) is the total number of times arm \( i \) is played until round \( t \). This UCB estimate is similar to \( ucb_i = \arg\max(\bar{\mu}_i) + \mathcal{P}_i \) for any round \( i \). While \( \arg\max(\bar{\mu}_i) = \max(\bar{x}_i^t) \) is the exploitation component, \( \mathcal{P}_i = \frac{2\ln(t)}{n_i} \) is the exploration bonus. Thus the optimistic guess parameter will get updated simultaneously with knowledge related to both exploration and exploitation. The UCB1 algorithm can be written as follows

**Initialization** : Play (execute) each arm once and obtain rewards \( x_i \).

Further, play the arm that satisfies \( \arg\max(\bar{x}_i^t + \frac{2\ln(t)}{n_i}) \) in that round

- \( n_i \) is number of times that particular arm is played so far
- \( t \) is the current round
- \( \bar{x}_i^t \) is the average reward for arm \( i \) at round \( t \)

Figure 2: UCB1 algorithm

The KL-UCB algorithm

KL stands for Kullback-Leibler divergence and KL-UCB (Garivier and Cappé 2011) differs from UCB1 in the padding function \( \mathcal{P}_i \) which is derived by employing KL divergence. The authors reported improved regret bounds for KL-UCB where \( \mathcal{P}_i \) incorporates the distance between estimated reward distributions for the arms when calculating the UCB parameter. The algorithm is put below.

**Initialization** : Play (execute) each arm once and obtain rewards \( x_i \).

Further, play the arm that satisfies \( \arg\max_i(n_i, d(\mu_i, M)) \leq \log t + c \log \log t \) in that round

- \( n_i \) is number of times that particular arm is played so far
- \( i \) is the arm

\[
 d(\mu_i, M) = \mu_i \log\left(\frac{\mu_i}{M}\right) + (1 - \mu_i) \log\left(\frac{1 - \mu_i}{1 - M}\right)
\]

Figure 3: KL-UCB algorithm
The Thompson Sampling algorithm

Thompson Sampling (TS) heuristic was proposed by Thompson (Thompson 1933) in 1933 but remained less popular compared to other MAB algorithms for the lack of proofs on the regret bounds which were given very recently (Agrawal and Goyal 2012). Also, the proof for logarithmic regret to Thompson sampling has come only recently (Kaufmann, Korda and Munos 2012). It can also be argued that TS cannot be ignored for the lack of proofs on the regret for its empirical performance (in simulated environments) outperformed a few well known MAB algorithms for example UCB. Hence this work considers TS as a competent algorithm to compare with the effSAMWMIX. The TS algorithm is given below

\begin{itemize}
  \item Initialization:
    \begin{itemize}
      \item Set $\alpha, \beta$ which are the prior parameters for Beta distribution
      \item Set $S_i = 0, F_i = 0 \ \forall i$ where $S_i$ is success counter and $F_i$ is failure counter
    \end{itemize}
  \item Loop: For every round $t = 1, ..., T$ do
    \begin{itemize}
      \item For every arm $k = 1, ..., K$ do
      \item Draw $\theta_i$ according to $\text{Beta}(S_i + \alpha, F_i + \beta)$
      \item Draw an arm $i = \arg \max_i \theta_i$ and observe the reward $r$
      \item If $r = 1$ then $S_i = S_i + 1$
      \item Else $F_i = F_i + 1$
    \end{itemize}
\end{itemize}

Figure 4: Thompson sampling algorithm

The effSAMWMIX algorithm

effSAMWMIX is based on SAMWMIX (Abdulla and Bhatnagar 2016). It differs from upper confidence bound like algorithms since it avoids searching for a maximum of a resulting parameter. Instead, it picks a ‘soft-maximum’ using a Boltzmann Exploration structure. It calculates a probability vector $\phi_k$ over the set of $K$ arms. This $\phi_k$ is iteratively updated to obtain a $\phi$ which associates maximum probability of 1 to the best arm $a^*$ and 0 to the rest of the arms. The equation for $\phi$ is put below

$$\phi_k^{t+1} = (1 - \gamma_t) \frac{e^{\sum_{j=1}^{K} \eta_t x_k^j}}{\sum_{j=1}^{K} e^{\gamma_t x_k^j}} + \frac{\gamma_t}{N}$$ \quad (9)$$

Where $\eta_t$ is similar to that of SAMWMIX except that it is parameterized by a $d_k$ which is obtained by the utilization of a heuristic. Equation (9), put above, is the same as that of equation (10) in SAMWMIX’s original proposition. effSAMWMIX obtains the superiority on how the learning parameter $\gamma_t$ is calculated as put below.

$$\gamma_k = \frac{N(4 + (d + d_k))}{k(d + 2d_k)^2 - (d + d_k - 2d)^2}$$ \quad (10)
Further, the parameter $d_i$ is obtained by using a heuristic to quickly converge without requiring a closed form of an equation. The effSAWMIX algorithm is put below.

<table>
<thead>
<tr>
<th>Input: Rewards Vector $G_i$, set of Arms $N$, number of rounds $T$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using $G_i$, calculate $d = \min \Delta(\mu_1, \mu_2, \ldots, \mu_N)$ where $\mu_i$ is the reward mean of Arm $i$. Calculate</td>
</tr>
</tbody>
</table>
\[
\begin{align*}
G_0 &= N + 1; \quad \sigma^2 = 2 \times N; \\
\eta_0 &= \frac{1}{G_0} \log \left( \frac{1 + G_0 \times d}{\sigma^2} \right) \\
\text{starttter} &= \frac{(4 + d) \times N + d}{d^2} \\
& \text{for } i = 1, \ldots, N \text{ do} \\
\end{align*}
\]

Obtain reward $X_{t=i}$.

Initialize $\phi_i^t = \eta_0 \times \left( \frac{\text{starttter}}{N} \right) \times \left( \frac{X_{t=i}}{N} \right)$.

Initialize pull count for arm $a^t$ as $p_i=1$.

Obtain random probability $r$.

Choose an arm $i$ as winner if $\sum \phi_i^t > r$ and store reward $G_i^{\text{starttter}} = a_i^t$ and normalize the reward using its probability $\bar{x} = a_i^t / \phi_i^t$.

Update $p_i = p_i + 1$.

Assign $K_t = d + d_{ttrue}$.

Assign $\gamma_{ttrue} = \frac{((4 + k_t) \times N + k_t) / (t \times k_t^2)}{T - N - \text{in steps of } d_{tstep}}$.

Calculate $k_t = d + d_{ttrue}$.

Calculate $C_t = \left( \frac{N}{\gamma_{ttrue}} \right) + 1$ and $\sigma_t^2 = 2 \times N / \gamma_{ttrue}$.

Calculate $\eta_t = \frac{1}{C_t} \log \left( \frac{1 + C_t \times k_t}{\sigma_t^2} \right)$.

Calculate $\Sigma \phi_{ttrue} = \sum \phi_i^t + e^{\Sigma \eta \bar{x}^t}$.

If $e^{\Sigma \eta \bar{x}^t} > \Sigma \phi_{ttrue}$ then assign $d_{ttrue} = d_t - d_{tstep}$.

Assign $K_t = d_t + d_{ttrue}$.

Assign $\gamma_t = \frac{((4 + k_t) \times N + k_t) / (t \times k_t^2)}{T - N - \text{in steps of } d_{tstep}}$.

Calculate $C_t = \left( \frac{N}{\gamma_{ttrue}} \right) + 1$ and $\sigma_t^2 = 2 \times N / \gamma_{ttrue}$.

Calculate $\eta_t = \frac{1}{C_t} \log \left( \frac{1 + C_t \times K_t}{\sigma_t^2} \right)$.

Now update $\phi_i^{t+1}$ using (1) which is

$\phi_i^{t+1} = (1 - \gamma_t) \times \frac{e^{\Sigma \eta \bar{x}^t}}{\Sigma \phi_i^t} + \frac{\gamma_t}{N}$.

Output: $\phi$ vector.

Figure 5: effSAWMIX algorithm
The performance of the four algorithms in the current context are compared against simulated GBM portfolios and real-world benchmark datasets as explained in the following sections.

4. EXPERIMENTS

Experiments are conducted on both simulated datasets and real-world datasets. The simulated datasets are obtained by using Geometric Brownian Motion prediction techniques as explained below

Stock prediction on Simulated Geometric Brownian Motion Datasets

Geometric Brownian Motion (GBM) is also known as Wiener Process in which the logarithm of a quantity that varies at random will follow a Brownian Motion (Wilmott 2000). GBM is formally a mathematical modeling technique that is often used to predict the short-term stock price movement (Ladde and Wu 2009). Since the stock price movement is often unpredictable the GBM’s random walk model tends to predict the stock prices with reasonable accuracy (Fama 1995). This work considers the GBM to build a synthetic dataset to test the performance of the NBP algorithm that utilizes effSAMWMIX, UCB1, KL-UCB and TS as the SMAB engine for the NBP. The GBM dataset is generated using the daily closing prices which are the input for the GBM model. The returns are calculated for each asset using the following equation

\[ R_i = \left( \frac{P_{i+1} - P_i}{P_i} \right) \]  

(11)

Where \( P_i \) is the closing price of the asset on day \( i \). If \( T \) is the total number of periods where the returns are calculated then the mean return \( \mu \) is calculated as follows

\[ \mu = \frac{1}{T} \sum_{i=1}^{T} R_i \]  

(12)

Also the standard deviation of all the returns \( \sigma \) is calculated as

\[ \sigma = \sqrt{\frac{1}{T-1} \sum_{i=1}^{T} (R_i - \mu)^2} \]  

(13)

If the price of stock at time \( t \) is \( S(t) \) and a random value generated at that time is denoted by \( X(t) \) then the \( S(t) \) is calculated using GBM as follows.

\[ S(t) = S(0) \cdot e^{(\mu - 0.5\sigma^2)t - \sigma [X(t) - X(0)]} \]  

(14)
Experimental Settings & Simulation results

From the S&P 500 Stock dataset (Bruni, Cesarone, Scozzari and Tardella 2016) we have randomly picked \( n \) stocks from the same so that the SMABs will have \( n \) choices (arms) to choose from. Each of the stocks have the periodic closing prices from November 2004 to April 2016. The \( \mu \) & \( \sigma \) are calculated for each of the \( n \) stocks and a new set of closing prices are predicted using GBM prediction equation (14). This newly generated stock price closing data will now be the dataset on which the NBP's performance is evaluated when the NBP uses a different SMAB for decision making process. The naming convention for the GBM simulated portfolio dataset with 5 assets \( n = 5 \) is GBM05 and that with 15 assets \( n = 15 \) is GBM15. The results of the experiments on GBM05 and GBM15 datasets are put below. Also effSAMWMIX employed inside NBP is henceforth addressed as NBP-effSAMWMIX. Similarly, NBP-UCB1 indicates that UCB1 is employed inside NBP. The other two algorithms are denoted as NBP-KLUCB and NBP-TS where KL-UCB and TS are employed inside NBP respectively.

Figure 6: Cumulative wealth curves across the investment periods on GBM05 dataset

NBP-effSAMWMIX performed better than when NBP-UCB1, NBP-KLUCB, NBP-TS. Also, NBP-effSAMWMIX has acquired a better CW than the Market Buy & Hold Strategy (Li and Hoi 2014). Results are similarly favorable for NBP-effSAMWMIX when simulated portfolio consisted of 15 assets (see Fig.7.). The terminal cumulative wealth acquired per a unit investment is shown in Table 1.
Figure 7: Cumulative wealth curves across the investment periods on the GBM15 dataset.

**Stock prediction on real-world benchmark datasets**

We choose benchmark datasets from (Bruni, Cesarone, Scozzari and Tardella 2016) and (Li, Sahoo and Hoi 2016) where the datasets are validated for the comparative performance of portfolio selection models. These datasets are generated using real-world price values obtained from major stock markets. They are reported to contain error-free cleaned data of weekly return values which are adjusted for dividends and stock splits. These publicly available datasets help in an unbiased comparison of the different NBP-SMAB portfolio selection strategies that are tested in this work. We chose these datasets to get a variety of data in terms of region, market type, the number of assets and the number of periods. For example, MSCI measures the equity market performance of global emerging markets and DJIA gives the stock market data from the USA which is a developed economy.

Table 2 provides the details of the datasets under consideration for this work.

We report (Table 3.) the terminal cumulative wealth achieved by each of these algorithms over the four benchmark datasets mentioned above. Apparently, NBP-effSAMWMIX has achieved the highest cumulative wealth when compared to other NBP algorithms. Except in the case of NASDAQ100 dataset, NBP-effSAMWMIX has performed better than the Market Buy & Hold strategy as well.
Figure 8: Cumulative wealth curves across the investment periods on DJIA dataset.

Figure 9: Cumulative wealth curves across the investment periods on TSE dataset.

Figure 10: Cumulative wealth curves across the investment periods on NASDAQ100 dataset.
Figure 11: Cumulative wealth curves across the investment periods on MSCI dataset.

Figures 8-11 show the time series curves of the CW achieved over the investment periods. NBP-effSAMWMIX has performed comparatively with NBP-TS on DJIA and TSE datasets but has a distinguishably better performance on MSCI dataset. On the NASDAQ100 dataset, the Market Buy & Hold strategy is a clear winner from the early investment periods and none of the NBP algorithms could match its performance. Except for this one case, NBP-effSAMWMIX achieved the highest wealth level in all the datasets including the simulated GBM datasets.

5. CONCLUSION

In this work, we report the implementation of the effSAMWMIX inside of a Naive Bandit Portfolio algorithm. effSAMWMIX which has a regret of $O(\log T)$, where $T$ is the number of iterations [Boby, 2016 #179], is shown to perform better than KL-UCB and Thompson Sampling on a few popular reward distributions. This work intends to exploit this advantage (of effSAMWMIX’s performance) over competing SMAB algorithms reported in the literature. Along with NBP-effSAMWMIX, the NBP versions of KL-UCB and Thompson Sampling are evaluated for the first time in literature. We report the cumulative wealth data on both simulated and benchmark real-world datasets so as to concretely report the empirical performance of the proposed algorithm. The performance on NASDAQ100 dataset opens up the need to further assess the dataset so as to analyze why none of the NBP...
algorithms could beat the Market Buy & Hold strategy while they could in the rest of the cases. This could be because NBP does not consider asset correlations while making the decision. To further this work, we intend to do an Orthogonalization of the portfolios in order to remove the correlation and evaluate the performance of effSAMWMIX in such a scenario.

WHAT COMES FIRST, THE CHICKEN OR THE EGG: THE UNDERPINNING TECHNOLOGY OR BUSINESS MODEL?

Vinaik, Rubal; Zubac, Angelina

Strategy Link
Central Queensland University

ABSTRACT

This conceptual paper uses the extant technology and innovation management, strategic management, and strategic entrepreneurship literatures to derive a modification of the Itami and Nishino (2010) systems-based business model framework. Its objective is to provide insight at a firm level into how business model and technology change occurs as part of the global business ecosystem through learning at the firm level. It explicates how this learning is affected by four inter- and intra-firm effects, including those emanating from the global business ecosystem, as well as the rate of innovation learning across multiple levels. The paper argues that the question of what comes first, the underpinning business model or technology depends on what was learned about the firm’s (potential) place within the global business ecosystem, how this knowledge is used and the innovation life-cycle. This points to why some firms fall out of the global business ecosystem, changing its diversity mix. We conclude with a discussion of some of the paper’s more powerful implications for research and practice.

Keywords: business model; innovation; innovation system learning; technology trajectory; profit model; business system; business ecosystem; capabilities, business model life-cycle

INTRODUCTION

In the first part of the paper, the following extant literatures are briefly summarized and their key points highlighted: the business models, technology trajectories, technology disruption, value chain convergence, market convergence/disruption, hyper-competition, partnering and networks, and knowledge and big data literatures. In the next section, we describe Itami and Nishino’s (2010) business model framework. We also derive our modified version of it using key principles from the theories highlighted in the literature review. In the following section, we go into more detail about the components of the innovation systems used by individual firms, concluding that the way in which they evolve depends on how managers access and assess endogenous and exogenous forms of
knowledge, that is, that knowledge that informs the business model design and technologies of the firm over time. In the last section, we conclude that though the business model literature and the technology change literature variously alternate between arguing that technologies are underpinned by business models and evolve accordingly while business models are underpinned by technology change and evolve accordingly, which is analogous to the chicken and egg problem, what comes first is not clear-cut; it all depends on what there is to learn from the global business ecosystem, the firm’s ability to engage with it and the capacity to learn at the firm. It was also concluded that the rate of innovation that occurs within and outside of the firm’s boundaries is the result of continuous learning, and those firms that cannot learn effectively and implement the ‘right’ learnings drop out of the global business ecosystem. This has a number of implications, including the fact that business model and technology decisions involve learnings from multiple levels over time.

LITERATURE REVIEW

The business model literature is a relatively new literature (Demil & Lecocq, 2010). This literature can be split into three broad categories of research: the static view, which involves understanding different taxonomies and typologies of business models, and also how business models are defined in practice and theory; the dynamic and/or longitudinal view of business models, which involves understanding the impact of learning and the strategies learning stimulates about business models; and a systems or boundary-delineating view of business models, which involves understanding the linkages between the global business ecosystem and its business model related subsystems.

In the static view, business models have been variously defined but mostly in systems terms where the system’s objective is to create customer value using firm resources and, in turn, creates (non-)monetary forms of value for the firm (Baden-Fuller & Haefliger, 2013). In the dynamic and/or longitudinal view, the way in which the different components of business models are made to function is what gives business models their power over time, including the ability to create new versions of products or innovate them within a given set of strategic and operational constraints, that is, while using the recipe analogy, as they relate to the dish to be served up to customers (Baden-Fuller & Morgan, 2010). In a system or boundary view, business models are usually conceptualized in activity terms. This is particularly useful when understanding the business model as a vehicle for understanding how the full spectrum of activities undertaken at the firm should tie in with the pertinent activities of the global business ecosystem (Zott & Amit, 2010).
In summary, “business model choice determines the nature of complementarity between business models and technology and the paths to monetization. A poor choice can lead to low profits, a good choice to superior profits” (Baden-Fuller & Haefliger, 2013: 422).

Research on technology trajectories has been manifold. A large amount of this research has focused on the way in which technology development occurs within the firm but also how the firm is impacted by technology developed from without its boundaries. The consensus is that technology development occurring within the firm and as an outcome of the global business ecosystem involves two-way knowledge flows. Dosi (1982: 147) associates technology trajectories with the notion of a technology paradigm, since one cannot explain technology change fully without making this association.

Following on from the previous section on technology trajectories, technology trajectories can be defined in two ways according to the intensity and the nature of the change in technology involved, that is as sustaining or disruptive. (Christensen & Bower, 1996).

There are a number of drivers that contribute to convergence of value chains in the global business ecosystem. These include the emergence of common and dominant platforms (Pfaffman & Stephan, 2001), the reality that global efficiency is a function of national competitive advantage (Porter, 1990), and the strategic responses that occur within the domain of the firm when market/industry convergence is evident (Wirz, 2001).

When managers (everywhere) strategize they now have to consider the consequences of national competitive advantages becoming more marked. Sometimes this leads to the decision to relocate to another country or invest in a greenfield venture or acquire another firm to ensure the firm has a presence in a country that is strategically important, including the ability to gain access to a complementary or strategic technology rapidly (Pfaffmann & Stephan, 2001).

Likewise, markets have also been disrupted and forced to converge because firms everywhere are more able to than ever before pursue cost innovation strategies. In the last decades, the Internet and the demand for digital products and services it has stimulated has intensified the rate of change in global markets. The Internet has changed the way business is conducted forever. There is increased demand and supply of new digital forms of content, e-commerce platforms, streamlined and simple digital services and connectivity. Markets continue to disintermediate too as a result of the flexibility the Internet has provided firms of all sizes (Wirze, Schilke & Ullrich, 2010). In addition to the digitalization of world markets, intelligent network structures and the convergence of media structures have led to profound change. Firms have adopted common platforms as a result of the ready availability of these technologies, regulations and customers expecting firms to use common platforms (Wirz, 2001).
In the past, managers assumed it was possible to sustain a competitive advantage once the firm had achieved market dominance. However, globalization, the widespread adoption of proven business methods, continual innovation in technology, and new concepts in information technology have created a situation where the old model of management, once an advantage was achieved, is no longer relevant (D’Aveni & Gunther, 1994). A series of temporary advantages essentially is a proxy for a sustainable competitive advantage in this modern era (D’Aveni, Dagnino & Smith, 2010). This means that managers must invest in their firm’s resource base knowing that transient advantages via “disruptive strategic moves” may in the long-run be all that is possible to achieve (Thomas & D’Aveni, 2009:415). In addition to the abovementioned forces, hypercompetition has also been caused by deregulation across sectors (Wirz, 2001).

Globalization has led to the acceptance that business can rarely take place without some partnering and networking. This is reflected in the strategic partnering/network literatures, which confirms firms need to eschew the parochial, particularly in regard to how they configure their value chain with global partners. All kinds of partnering and network arrangements have been studied in the partnering and network literatures. Strategic alliances and constellations are undertaken to give the firm prominence and give it access to diverse forms of information, particularly information that is entrepreneurial (Koka & Prescott, 2008).

In recent times, ‘big data’ has emerged as another important way in which firms can benefit, from possessing and utilizing performance differentiating forms of knowledge. Big data in general terms is “large and varied data that can be collected and managed” (George, Osinga, Lavie & Scott, 2016: 1493).

Summary of the literature review

The literature review confirms Dosi’s (1982: 158) view that “the establishment of a defined technological paradigm is likely to be paralleled by a process of ‘internalization’ within companies of the so-called ‘externalities’ related to the innovative activity, capitalizing on the previous experience of attempts, successes and failures, etc.: within an established technological paradigm the fluid market structure characterized by the ‘heroic entrepreneurship’ often described in the literature on new industries is likely to disappear.”

Likewise, it confirms that business models are highly manipulable but also that “the typical assumption that a radically improved product or service offering will, over time, automatically lead to increased profits for the innovating firm(s) ignores the enormous problems that firms face in working out the interdependencies between business model choice and technology effectiveness.” The choice
of business model cannot be made without clarifying what might be commercially viable as part of a
global business ecosystem, as well as the technologies that the firm should invest in to create customer
value. Thus, business models mediate the link between technology and firm performance. Developing
the right technology is a business model decision regarding openness and user engagement (Baden-
Fuller & Haefliger, 2013: 419, 422).

MODEL AND OUR MODIFIED VERSION

In this section, we discuss and build upon Itami and Nishino’s (2010: 364) business model framework,
which is systems based. Itami and Nishino (2010: 364) define a business model as composing two
elements: “a business system and a profit model. A profit model “is a pattern of the firm’s intention
about how it will make a profit in its given business.” It summarizes the way in which the firm will
achieve its financial goals and differentiate itself from its competitors. A business system, on the other
hand, is the “system of works” that the firm uses to deliver value to its target customers through its
products and services. While the latter often gains the higher profile, the former is arguably the real
‘meat’ of a firm’s business model. Not only does it act as the ‘system of works’ that actually produces
and delivers the firm’s products or services, it is also the locus where a firm can learn about its
operations and the behaviors of its suppliers and customers.” Because the Itami and Nishino
framework incorporates learning, it too suggests that managers will move from one mental frame to
another of what the business model should constitute, that is, what it is at the current time and should
be in the future as determined by the strategy and the dynamic capabilities required to realize it.
Although it is acknowledged that not all firms have strategies though they will all have a business
model (DaSilva & Trkman, 2014).

In Itami and Nishino’s framework the learning system of the organization is a sub-system of the
business system, as is the delivery system, as shown in Figure 1. The learning system is the means by
which the business system can be rationalised. Its focus is the longer term strategic use of knowledge.
It is that part of the business system that renders the business system more than just a delivery system.

![Figure 1](image-url)
Itami and Nishino argue in their paper it is the business system that leads to the accumulation and development of core invisible assets. This is because the business system is where learning takes place about the firm’s delivery system, which is a system that gathers data from within the firm itself and from outside of its boundaries. They are referring to the whole value chain system the firm uses and engages here. In Itami and Nishino’s framework the firm’s core invisible assets are continually in a state of change as a result of the learning that originates from the business system. (It is clearly taken as a given in their article that core invisible assets are dynamic capabilities; dynamic capabilities make it possible for firms to keep pace with changes in markets and they derive their power from the knowledge they represent.)

The business system in broad terms is comprised of: “(1) the division of labor between the firm and its trading partners (typically a decision between outsourcing and internal procurement) (2) internally, how should the firm organize its in-house working system and (3) externally, how it should control the activities of its trading partners” (Itami & Nishino, 2010: 365-366). As indicated, Itami and Nishino apply value chain logic. They also explicate the learning system that must underpin it for the firm to be effective and, critically, innovative in the longer-term. In other words, the business system is more than just about operational activities; it is about value creation, value appropriation and learning. The firm benefits the most from its learning system if it ensures it uses its learning to build its core invisible asset base. See Figure 2.

Notwithstanding the power of the Itami and Nishino framework, we believe that the framework could be enriched by considering four learning-based inter- and intra-firm effects, including those emanating from the global business ecosystem:

1. Innovation outcomes toward global business ecosystem efficiency;
2. Innovation diversity determinants (within and outside firm);
3. Knowledge asymmetries and the big data phenomenon; and
4. The innovation system.

These are discussed below and their relationships illustrated in Figure 3.

1. **Innovation outcomes toward global business ecosystem efficiency**

The literature review highlighted the fact that the business model literature has approached the problem of explaining and defining business models from three perspectives: the static, dynamic or longitudinal, and systems view. The literature review also confirmed that when talking about business models but also technology change, trajectories of technology innovation, etc. there is necessarily a two-way flow of knowledge between the firm and the global business ecosystem. Disruptive technology change will disrupt the existing business models in the global business ecosystem, which means that individual firms that do not ride the wave of change do not survive.

This is illustrated in Figure 3 which shows that at a global level managers must pay attention to the knowledge flows coming from the global business ecosystem. Figure 3 suggests change is a two-way process when it comes to technology and business model change.

2. **Innovation diversity determinants (within and outside firm)**

In the literature review it was determined that the rate of innovation is captured by the S-curve, and this explains the rate by which technology is able to be used and its life-cycle prior to any significant structural breaks, indicating technology disruption (Christensen & Bower, 1996). In terms of sustaining and disruptive change, when this occurs this means the S-curve that was relevant is no longer the source of value creation. It is this event that makes it necessary for firms, in the focal ecosystem to change (business model and/or technology). Those firms that cannot change will not survive or will evolve into something entirely different.
Another way of saying all of the above and as Figure 3 illustrates, the factors that stimulate innovation diversity within the global business ecosystem itself - the technological disruptions that are currently prevalent, and the degree of value chain convergence, market convergence/disruption, global competition, and partnering and networking occurring within the business ecosystem – lead to widespread change. Thus, diversity is the result of learning. It is also the product of change occurring at individual firms and spilling out to other firms in the global business ecosystem (as a result of endogenous processes). Obviously, as a rule of thumb, individual firms will have a much smaller ability to influence but they will nonetheless influence. In regard to endogenous change that occurs within individual firms this is change that originates from the innovation system at the firm.

3. **Knowledge asymmetries and the big data phenomenon**

In the literature review section, which highlighted how knowledge relating to technology creates (dis)advantaging asymmetries and that the big data phenomena is intensifying the rate at which innovation is necessary, it is clear that more knowledge management and data mining capabilities are needed than ever before. This is illustrated in Figure 3 which shows that not only is knowledge (data) accessed and analysed from the global business ecosystem but that knowledge (data) is accessed and analysed at the firm level, that is, as it relates to the business model of the firm at the current time and in the future.
4. The innovation system

The literature review and as highlighted in the previous three subsections confirms the innovation system firms use can be described as the means by which firms recombine knowledge or generate new knowledge to identify novel opportunities from within and from outside the firm’s boundaries. This is possible because it is made up of three knowledge-based components:

1. Business model innovation;
2. Technology change or technology innovation; and
3. Learning from and during innovation from assessing knowledge, including knowledge which was derived from big data; this is illustrated in Figure 3.

RATE OF INNOVATION IN THE GLOBAL BUSINESS ECOSYSTEM: A FIRM LEVEL (MANAGERIAL) VIEW

In the previous section, we explained how the Itami and Nishino (2010) framework could be enriched by considering four inter- and intra-firm effects as described in the previous section. The power of this is that we can get real insight into how firms that succeed and remain competitive in the global business ecosystem contribute to innovation globally, that is, the upward trend in innovation. This can be described as the rate of innovation that occurs within and outside of the firm’s boundaries as a result of continuously learning. The assumption is that those firms that cannot learn effectively drop out of the global business ecosystem or morph.

![Figure 4](image-url)

The rate of innovation learning (slope) as illustrated in Figure 4 can be determined by the four inter and intra-firm effects and defined as follows:

\[ Y = Y_1 + Y_2 + Y_3 + Y_4 \]

Whereas,

\[ Y = \text{Rate of innovation learning} \]

\[ Y_1 = \text{Innovation outcomes toward global business ecosystem efficiency} \]

Cumulative effects of innovation learning at the firm, ecosystem and global business ecosystem levels.

Global and national business theories and practice: bridging the past with the future  
ISSN: 2547-8516  
Y2 - Innovation diversity determinants (within and outside firm)
Y3 - Knowledge asymmetries and the big data phenomenon
Y4 - The innovation system

This equation suggests that the rate of innovation learning is the result of all the four factors coming into play and the fact that the three systems (at the firm, ecosystem and global business ecosystem levels) are interdependent. It demonstrates that though it is cognitively useful to have a static approach or even dynamic/longitudinal approach when thinking about business models and the effects of technology change, or vice versa, a system approach that incorporates learning is most useful when thinking about different time horizons. The way in which value is created will be dependent on learnings that tell managers what should be the focus/foci at any one time.

CONCLUSION AND IMPLICATIONS

This paper developed the Itami and Nishino (2010) framework, which was a high-level systems explication of business models taking learning into account. Though potentially very powerful in its own right, the Itami and Nishino model only focussed on how managers continually learn about the business system with an emphasis on how managers continually learn about the delivery system (which is a subsystem of the business system). In other words, their framework is focussed on explaining how learning occurs in regard to value chain activities. This means their framework did not provide insight into how business models change in response to change that is not value chain-centric, including global business ecosystem-centric change.

Neither did it provide insight into what comes first, that is, decisions about changing or innovating the business model or decisions about changing or innovating the technologies taken up and used at the firm level. The reality is that these learning processes and decisions thereof require managers not to just engage with value chain partners but to engage in learning activities about the whole global business ecosystem, including the specifics of the ecosystem that most concerns the firm. In other words, using Darwinist principles to analogise, over long periods of time one can see the overall effect of change, that is, the business models and technologies that emerged to be dominant, but what might be most interesting is the interplay of individual factors that lead to natural selection. This kind of equifinality is worthy of further exploration quite clearly. Just like the chicken and the egg problem, we know that they evolved together to some extent within the ecosystem but at some point a happenstance affecting one or both of them occurred that explained the problem of which came first or achieved pre-eminence.
To reiterate, although our discussion provides insight into what occurs in the global business ecosystem, the objective of this paper was not to explain the whole global business ecosystem or, in other words, provide a macro level explanation of how innovation occurs but to provide insight into the way in which individual firms gather data and then change their business model, as well as the technology they decide to use and develop.

The business model literature and the technology change literature variously alternate between arguing that technologies are underpinned by business models and evolve accordingly while business models are underpinned by technology change and evolve accordingly. As indicated, this is analogous to the chicken and egg problem about what comes first. Our frameworks is a step toward understanding what might be the answer here in regard to business models and technology change, and which comes first. Thus, in addition to the concept of a technology trajectory, which has been studied extensively, the concept of a business model life-cycle, including one that develops alongside different technology trajectories, may need to be developed as a construct and studied in detail.

As a conceptual piece, bearing in mind that no empirical work using our framework has been undertaken yet, our paper suggests that the what comes first decision is learning based and over time business models and technology necessarily (mostly) evolve together, that is, in the long-run. Presumably, the managers of a firm at start-up stage must make two either/or decisions in the first instance: should the focus be on the choice of business model or the choice of technology? When we are talking about firms that are mature and part of a global business ecosystem success could be contingent upon the ability to see where the firm sits within the global business ecosystem and to what extent it can contribute to the richness of diversity within it. In this paper, this was elaborated upon in Figure 4 where the rate of innovation that occurs within and outside of the firm’s boundaries as a result of continuous learning was depicted, supporting our argument that learning is essential for global business ecosystem relevance.

Implications for theory and research

This paper contributes to a number of literatures, including the technology and innovation management, strategic management, and strategic entrepreneurship literatures. It has the potential to be a basis for learning much more about how firms learn about customers and make decisions about investing in capabilities to achieve business model outcomes and different technologies, and the iterative nature of this learning process, including how managers translate their learnings about customer value into new capabilities able to deliver on different dimensions of customer value. The modified framework in our paper focuses on the iterative nature of learning about business models and technology trajectories, as well as their various drivers; it provides the means for understanding
how learnings about customer value creation can be used to help managers decide how to change their firm’s business model and invest in technology.

Likewise, our modified framework can be used to help researchers better understand how the four inter- and intra-firm effects affect business model and technology change decisions, including across different time horizons. The business model life-cycle is a new concept and considerable scope exists to develop it via the abovementioned literatures. It may also be the situation that in different countries, etc. the way in which managers make decisions as a result of learning about these effects are significantly different, as well as the notion of a business life cycle. This too could lead to a rich research agenda.

The paper also highlighted the fact that big data has added another layer to the learning processes at firms; it has changed what it means to develop a dynamic capability. The modified framework could be used as a starting point for embarking on research that provides insight into the strategic implications of knowledge asymmetries and, in particular those that are the result of different capacities to make sense of big data. In this regard it could contribute to theory of the firm research using the knowledge-based view of the firm as its starting point (Grant, 1996; Spender, 1996). It could also lead to greater focus on the customer value-oriented marketing information system from a strategic and/or technology and innovation management research perspective.

**Implications for management**

The implications for managers are potentially vast. However, in the first instance, it is clear that the modified framework and what it implies about the rate of innovation learning at the different levels as defined in this paper, and depicted in Figure 3 and Figure 4, respectively, could make it easier for managers to understand: (1) timing issues about decisions to change the business model and/or the technology at the firm; (2) when the global business ecosystem or the ecosystem that most concerns the firm is about to change drastically; (3) the importance of big data and developing capabilities to take advantage of it; (4) how to better learn about the firm’s systems and the systems of partners, etc.; and (5) better cope with hyper-competition.

LEGITIMACY THEORY AND SUSTAINABILITY REPORTING.
EVIDENCE FROM ITALY.
Vitolla, Filippo; Rubino, Michele
Lum University, Casamassima (BA), Italy

ABSTRACT
Which information is contained in the socio-environmental and sustainability reports? How does the industry to which firms belong to affect the sustainability reports? In this paper we aim to evaluate the wideness of sustainability reports and to verify, with respect to the Legitimacy Theory, its impact on the industry in which the firm operates. The analysis was carried out on a sample of companies listed on the Italian Stock Exchange in 2015.

The idea of analysing the sustainability reports is linked to two tightly interrelated aspects: the relevant criticalities of the management of the social dimension, in view of the company’s success, and the growing relevance of voluntary disclosure systems; the second aspect is concerned, the way to manage the communication activities affects in a notable way the relationship with the stakeholders, and consequently, the whole balance of the company and the possibility of a long period of success. The specific choice of analyzing the Italian companies derives from the fact that particularly in Italy, and in general in the non-Anglophone countries, there is no established literature on the theme.

Keywords: Italian Companies, Legitimacy Theory, Sustainability Reporting

INTRODUCTION
Which information is contained in the socio-environmental and sustainability reports? How does the industry to which firms belong to affect the sustainability reports? In this paper we aim to evaluate the wideness of sustainability reports and to verify, with respect to the Legitimacy Theory, its impact on the industry in which the firm operates.

The idea of analysing the sustainability reports is linked to two tightly interrelated aspects: the relevant criticalities of the management of the social dimension, in view of the company’s success, and the growing relevance of voluntary disclosure systems. With reference to the first aspect, it is necessary to highlight the presence of a series of factors that have deeply modified in a structural way the socio-economic context in which the economic operators are working. As far as the second aspect is concerned, the way to manage the communication activities affects in a notable way the relationship with the stakeholders, and consequently, the whole balance of the company and the possibility of a
long period of success. The specific choice of analyzing the Italian companies derives from the fact that particularly in Italy, and in general in the non-Anglophone countries, there is no established literature on the theme. Moreover, having considered the influence of national macro-context sustainability, it is interesting to verify whether there is a supranational convergence of the effects caused by a relevant factor, and what is the industry with respect to the reports’ content.

The analysis was carried out on a sample of companies listed on the Italian Stock Exchange in 2015; the choice only involved the listed companies according to two basic reasons: the first was the data accessibility, the data is easily available in listed companies, the second was connected to the voluntary disclosure processes which are generally more developed and structured in the companies which have access to capital market. In order to assess the impact connected to industry it belongs to a character connection analysis was carried out, with the aim of detecting the existence of a link of any nature between the industry and the content in the sustainability report. In particular, in order to analyse the report’s content the following elements have been taken into account: an introductive part; the economic aspects; social aspects and environmental aspects. Our work is organized as follows: in the second paragraph we analysed the literature about the Legitimacy Theory, which is the spectrum in which the paper moves; in the third paragraph we described the methodology used; in the fourth paragraph we analysed and interpreted the results obtained; in the fifth paragraph we proposed our conclusions.

LITERATURE REVIEW: THE LEGITIMACY THEORY

This theory refers to a contract between society and companies, whereby the latter adopt socially oriented behaviours in order to gain social approval (Guthrie e Parker, 1989). The existence of a social contract between the companies and society is fundamental to the purpose of legitimation (Mathews, 1993). Such contract is stipulated, though in abstract terms, between the companies and the individuals that make up a local community. The local community supplies to the company the natural and human resources; the companies produce, for the community, the goods and services and they generate waste. The contract is based on mutually beneficial exchanges. The terms of this social contract reflect the social expectations on the management of the company. Such expectations can be explicit or implicit: the former about the firm’s compliance with the laws and regulations; the latter, the interests of the community in the firm’s activity (Deegan et al., 2000). The legitimacy of a firm could be threatened by the breach of explicit and implicit terms of the contract. A loss of the legitimacy creates serious hazards that might endanger the survival of the firm. In the literature, two different kinds of Legitimacy Theory can be found. The first variable has as object the individual firm. From this point of view the firm enacts choices and actions aimed at filling the gap of legitimacy, in
order to hit the desired level (Lindblom, 1994). Generally, the actions implemented aim to increase, to preserve and restore company legitimacy, that is a necessary condition to effectively operate in the social and economic context of reference. The undertaking of socially oriented actions, among which the implementation of specific reporting systems, is instrumental in order to achieve the objective of legitimacy. The second variable concerns the legitimacy of the capitalist system as a whole. In this case the development of social reporting processes is functional to the systemic legitimacy of entire industries and countries (Gray et al., 1996). Naturally legitimacy processes change from firm to firm, in space and in time, due to the different social contexts in which the companies work. In the last twenty years many studies on social and environmental reporting have adopted the Legitimacy Theory to interpret and explain practices of disclosure that are put in effect by the firms (Guthrie e Parker, 1989; Patten, 1992; Adams et al., 1998; Tsang, 1998; Campbell, 2000; Wilmshurst e Frost, 2000; Deegan et al., 2002; Milne e Patten, 2002; Newson e Deegan, 2002; O’Donovan, 2002; O’Dwyer, 2002). Among the first significant contributions it is worth mentioning the essay by Guthrie e Parker (1989) that aimed at verifying the relationship between social and environmental events and the activity of voluntary disclosure of an Australian firm (BHP Ltd) over a long-term frame (100 years, from 1885 to 1985). The results did not confirm the existence of this relationship and were considered unsuitable to support the Legitimacy Theory. Deegan et al. (2002), in a later essay, attributed the failed confirmation of the hypothesis to mistakes, by Guthrie and Parker (1989), in the measuring of the variables used to represent social and economic phenomena and the omission of significant events. The results of analysis carried out on the same firm (BHP Ltd) from 1983 to 1997, supported the Legitimacy Theory and demonstrated the link between the media attention and the activity of social-environmental disclosure. Relevant studies that have proved the validity of the Legitimacy Theory include: Patten (1992), Tsang (1998), Wilmshurst e Frost (2000), Milne e Patten (2002), O’Donovan (2002).

O’Dwyer’s essay (2002) is significant because he has tried to explore the manager’s feelings about social and environmental reporting systems. The research results underscored the influence of the external context over voluntary disclosure, even if in a completely different way from the early hypotheses: in Ireland the community persuaded the managers not to implement social-environmental reporting methods, in view of the low disposition of the Irish citizens to communicate positive results. The voluntary disclosure of positive information about the firm’s activity was considered absolutely self-defeating, in terms of legitimacy, because the social and economic context of reference felt this activity instrumental to the achievement of the firm’s economic goals. Certainly, the Legitimacy Theory has the merit of putting together the implementation of the reporting systems of sustainability and the dynamics of the external context.
In particular, it seems interesting to evaluate if, depending on the extent and the contents of the sustainability reports, the Legitimacy Theory can be applied to the single firm, to specific industries or, if, on the contrary, it concerns the whole set of firms; the resulting research question is then the following:

RQ: Can the extent and the contents of sustainability reports change because of the industry the firm belongs to?

METHODOLOGY

With respect to the objective of the work and to the research aim we selected a random sample of 50 companies listed in the Milan stock exchange which issue a sustainability report (or similar reports, such as social reports, environmental reports and integrated reports). The firms have further been grouped in 4 different industries according to the prevailing activity each one carries out: Consumer, Energy & Utilities, Financial, Industrial. For each sample company we verified the presence of the information linked to the following 35 items, grouped in four categories: Introductive part (Letter by the CEO/President; Corporate Governance; History; Methodological Note; Vision & Mission; Corporate Values & Culture, Firm Activities; Internal Control System; Reading Guide; Key); Economic aspects (Info about the financial situation; Financial Report; Value added; Financial Indicators; Share Indicators); Social Aspects (Customers; Local Community; Suppliers; Stakeholders; State and Institutions; Creditors & Banks; Media; Future Generations); Environmental Aspects (Environmental Management Tools; Environmental Training; Environmental Certifications; Environmental Research and Innovation; Remediation & Redevelopment works; Raw material consumption; Water consumption; Energy consumption; Biodiversity; Polluting emissions; Water drainage; Waste). To each sample company we assigned a value of 1, corresponding to all those items the information of which is present in the sustainability report; we assigned a value of 0 corresponding to all those items the information of which is not present in the sustainability report. To identify any statistically significant relationship between the industry type and each of the items, we built a dataset in which for each item we reported the percentage frequency of the information (both on the overall level and on the single industry).

To do this, we used the Chi-squared test of independence that, unlike correlation, can also be used when one or more of the two variables under examination are categorical. Moreover, being a non parametric statistics, it is robust with respect to the distribution of the data. It is worth noting, however, that the test does not allow to make claims about the direction of causality between the two variables but only that they are to some extent related to each other, namely, that certain categories of
the first variable match certain categories of the second one more frequently than it would be observed if the two variables were independent.

Formally, let \( X \) and \( Y \) be two variables having, respectively, \( h \) and \( k \) number of categories. Suppose we have a sample of \( n \) observations organized in the following Contingency Table (Table 1):

<table>
<thead>
<tr>
<th>( X )</th>
<th>( Y )</th>
<th>( y_1 )</th>
<th>( y_2 )</th>
<th>( \ldots )</th>

</tbody>
</table>

Table 1: Contingency Table

If the distribution of \( Y \) does not vary with the categories of the \( X \) (and vice versa), then the two variables are independent. More precisely, in this case, the conditional distributions \( Y \bigg| (X = x_i) \) will not vary with \( i = 1, 2, \ldots, h \). This implies that conditional frequencies \( \frac{n_{ij}}{n_i} \) are constant. Similarly, the conditional distributions \( X \bigg| (Y = y_j) \) will not vary with \( j = 1, 2, \ldots, k \), and then the conditional frequencies \( \frac{n_{ij}}{n_j} \) are constant as well. Then:

\[
\frac{n_{ij}}{n_i} = \frac{n_j}{n} \Leftrightarrow n_{ij} = \frac{n_i n_j}{n} \tag{1}
\]

This equation allows to compute the theoretical frequencies, that is precisely the frequencies that would be observed in the case of independence of the two variables. The chi-square index, \( X^2 \), is based on the differences between observed and theoretical frequencies and is given by:

\[
X^2 = \sum_{i=1}^{h} \sum_{j=1}^{k} \frac{(n_{ij} - n_{ij}^*)^2}{n_{ij}^*} = n \left( \sum_{i=1}^{h} \sum_{j=1}^{k} \frac{n_{ij}^2}{n_i n_j} - 1 \right) \tag{2}
\]

where \( n_{ij}^* \) denotes the theoretical frequencies calculated by (1). In the event of independence, the observed frequencies coincide with the theoretical ones and then \( X^2 = 0 \). Conversely, in the case of maximum dependence, it can be shown that \( X^2 = n \times \min[h - 1, (k - 1)] \). This occurs when each category of \( X \) corresponds to one and only category one of \( Y \).

The independence between the two variables can be tested by considering the following system of hypotheses:
\begin{align*}
H_0 & : \text{X and Y are independent} \\
H_1 & : \text{X and Y are not independent}
\end{align*}

The test statistic is given by (2) and, under the null hypothesis $H_0$, it is distributed according to a $\chi^2$ with $g = (h - 1)(k - 1)$ degrees of freedom.

**ANALYSIS OF THE RESULTS**

The report contents can be classified in the following sections (Table 2):

- introductive part;
- economic aspects;
- social aspects;
- environmental aspects.

The analysis we carried out highlights the fact that a large percentage of documents includes the letter by the CEO or by the president (94% of the analysed sample companies). Concerning the general information of the document, the methodological note shows the highest frequency percentage (86%); little popular both the key (32%) and the reading guide (18%). As far as the company profile is concerned, the information about performed activity reveals the highest percentage frequency (94%), followed by vision & mission (82%), corporate values & culture (74%) and history (64%). Finally, a large percentage of companies issuing the document provides information on the governance (90%) and on the internal control systems (88%). These data underscore, firstly, the companies’ intention to make their documents more credible. Moreover, the data show that the documents are generally issued in order to facilitate their reading and the understanding of the reports by the stakeholders. The results indicate, then, the tendency to give some information on the company’s identity and to describe a fourth dimension of sustainability, i.e. governance in line with the evolution of reporting towards the EECS systems (Economic, Environmental, Governance, Social).

With reference to the economic aspects, the prospect of value added is the highest percentage item (88%); the presence of the economic performance is also high (84%), of the share indicators (70%) and of the financial indicators (68%). Less frequent is the presence of the financial reports (26%), probably to avoid a duplication of the information found in the annual reports.

With reference to the social aspects, the results of the research highlight the presence, in the reports, of sections devoted for the large part to the categories of stakeholder. Local community 98%; Suppliers...
94%; Clients 90%; Stakeholders 84%; State 80%; less than one company in two provides information on Creditors and Banks (40%) and Media (38%). Very low (8%) was the percentage of the sections devoted to future generations: the relative field of observation has the tendency to coincide with the one concerning the environmental dimension, much more used to describe the company’s commitment with future generations.

As far as the environmental aspects are concerned, the analysis points out that the large majority of the sample companies (86%) issuing the report provide information about the tools of environmental management used, such as those for structuring the programs, for the assessment and recording of the effects of the productive activity and of the products made, for the operative control (monitoring and correction), for defining the organizational routines, for auditing and reviewing the adopted systems. The percentage (72%) of documents about the indications on the environmental certifications held is also very significant. The percentages about the companies which report on data concerning specific training (40%), about research and environmental innovation (24%) and about the remediation and rehabilitation put in place (14%) are smaller. With specific reference to the impacts, the analysis shows that almost all the companies provide information about consumption: energy, 96%, water, 94%, raw materials, 82%; high percentage frequency also for items related to the output: waste, 90%, polluting emissions, 86%. The only exception being the water discharges: only 40% of the reports contains information in on this issue.

With reference to the introductory part, the industry analysis shows that the Energy & Utilities companies are less inclined to provide qualitative information regarding the company’s profile; the narrative part about the corporate identity, instead, seems more developed in the Financial industry. However, there are no statistically significant relationships between the specific industry and content of the introductory part of the report, with the exception of the methodological note which displays a connection with the industry, significant at 5% (those being part of the Industrial e Financial industry reveal an increased predisposition in drafting the methodological note).

Concerning the economic aspects, the analysis of the industry reveals a lower frequency of the item in the Industrial sector, in view of the nature of their activities and the consequent probable focus on the other dimensions of sustainability. However, also in this regard, there are no statistically significant relationships between the specific industry and content of the report; only the relationship between value added and specific industry displays a statistical significance at 5%.

Concerning the social aspects, Energy & Utilities and Financial companies are those which include the highest number of categories of stakeholders in their reports; the companies of the Industrial sector, instead, include the lowest number of specific sections devoted to it on average. The results also show a certain degree of sectorial heterogeneity concerning the individual categories of stakeholder.
However, also in this case, there are no statistically significant relationships between the content of the report and the specific industry; the only statistically significant relationship (10%) is the relationship between the specific industry and the presence of sections devoted to the media (the Financial companies are more inclined to provide information concerning the media, probably due to the social role they play).

With reference to the environmental themes, the analysis shows the tendency to a higher accountability on the issue of environmental management of the Energy & Utilities and Industrial companies, probably related to the significant effects of their activities on the environment. In this case there is a particularly significant number of relationships between industry and environmental aspects in the reports: environmental certifications (significance at 1%); environmental research and innovation (significance at 1%); land reclamation/drainage works (significance at 1%); biodiversity (significance at 1%); polluting emissions (significance at 1%); water discharges (significance at 5%); This is linked to the different impact that the environmental issues could have on the individual companies in relation to their activity and, then, accordingly, to the industries they belong to (certainly, Energy & Utilities e Industrial sectors are more sensitive to the environmental issues than the other ones).

As far as the research question is concerned, it is evident that most of the firms draft a full and inclusive sustainability report, irrespective of the industry they belong to. The empirical analysis supports the theory of legitimacy, where it highlights that the companies search for the consensus within the context of reference through the publication of information which go beyond the regulatory requirements. In the view of the Legitimacy Theory (Lindblom, 1994), for listed companies, the increased pressures coming from the external environment also have to be considered, given their importance in terms of both positive and negative impacts, on the context considered as a whole. In this perspective, the purpose of sustainability reporting is to fill the legitimacy gap until the desired level is achieved (Lindblom, 1994), pursuing the objective of increasing, maintaining and restoring the consensus by the stakeholder. Their consensus is a necessary condition in order to act effectively in the socio-economic context in which they operate. Communication is the most important element for the legitimation within the reference environment and for the approval of the stakeholder (Gray et al., 1996). Being socially responsible is not enough to legitimize oneself, it is also required to communicate the objectives, the actions and the results obtained (Newson e Deegan, 2002; De Villiers e Van Staden, 2006). Accordingly, sustainability reporting is an aspect of particular importance for the legitimacy processes, contributing to improve the transparency in the relationships and to increase the credibility and the confidence between the community and the stakeholders.
Our empirical research confirms that there is a relationships between industry and content of sustainability reporting, although it is limited to the environmental aspects.

Several studies have generally highlighted the influence of the industry over the socio-environmental and sustainability reports (Verrecchia, 1983; Cowen et al., 1987; Ness e Mirza, 1991; Beliveau et al., 1994; Gray et al., 1995; Morris, 1997; Adams et al., 1998; Clarke e Gibson-Sweet, 1999; Hoffman, 1999; Bowen, 2000; Line et al., 2002; Archel, 2003; Brammer e Millington, 2006; Jenkins e Yakovleva, 2006). The influence of the industry on the sustainability reporting systems, according to the existing literature, can be linked to two factors (Branco e Rodrigues, 2008): the environmental relevance of the activities carried out by the firm and its proximity to the consumer. Many have been the research studies (Ness e Mirza, 1991; Morris, 1997; Clarke e Gibson-Sweet, 1999; Hoffman, 1999; Bowen, 2000; Line et al., 2002; Archel, 2003) that have demonstrated the higher tendency towards sustainability disclosure by the firms operating in particularly critical industries under an environmental perspective (oil industry, mining industry, metallurgical industry, chemical industry and paper making industry). It is necessary, in a Legitimacy Theory perspective, to consider the increasing pressures that the context is putting on the firms with a strong social and environmental significance (Cowen et al., 1987; Patten, 1991; Milne e Patten, 2002; Parsa e Kouhy, 2008) which determines a stronger commitment in their reporting activities, in order to legitimize themselves in a society and the community. According to this theoretical framework, the statistical insignificance of the industry compared to other dimensions of sustainability reporting (introductive part, economic elements, social elements) could be motivated by the growing importance of voluntary disclosure which makes firms communicate on sustainability issues regardless of their criticalities and individual activity, in order to reduce the context hostility even when it is not connected to industry specificity.

CONCLUSIONS

This work aimed at analysing the content of sustainability reports verifying whether their wideness varies according to the industries in which the companies operate. Based on the theory of legitimacy the companies adopt systems of voluntary disclosure in order to keep and widen the consensus within the local community. In this view, the companies make communicative choices and actions in order to fill the legitimacy gap, until they the level they wish is reached. The empirical analysis supports the Legitimacy Theory, in cases where the companies search for consensus through the publication of information concerning not only the financial aspects, but also the social and environmental ones. In terms of legitimacy, for the sample companies, the main pressures are those by the financial markets, which push them to a wider transparency in their relationships.
Sustainability reporting becomes particularly important in the legitimacy processes, contributing to the enhancement of credibility and building trust with the local community and with the stakeholders. Naturally, the processes of legitimacy change from firm to firm, in space and time, since the social contexts in which they operate are different.

On this basis, our empirical research confirms the existence of a relationship between the industry and the content of the sustainability reports, albeit restricted to the environmental aspects. In a Legitimacy Theory perspective it is necessary to refer to the main pressures that the context exerts on the companies with a strong social and environmental relevance which determines their greater commitment to the reporting activities, in order to legitimize themselves in society and the local community.

The results obtained are the basis for two managerial implications that must be considered together: in the industries that are particularly critical from an environmental point of view, voluntary disclosure represents an essential element of legitimacy; it is necessary, however, not to consider those reports as a formal tool of legitimacy, that would make the information homogenous in the different companies regardless of the effective informative needs of the stakeholders.

ABSTRACT

The pharmaceutical market is considered one of the important players in the global healthcare system. Nowadays, the pharmaceutical industry is growing fast due to the increasing demand for healthcare medications. This demand is due to the appearance of new diseases that haven’t been seen before, due to air pollution, extra usage of chemicals on vegetables and so on. Despite the growth in the pharmaceutical industry, Lebanon’s pharmaceutical sector is facing numerous challenges.

In this research, we will study the effect of new pricing strategies adopted by the Lebanese minister of health on the sales of pharmaceutical companies and what type of measures they have taken to overcome this situation. To achieve this, a structural interview was conducted with a brand manager at a generic brand pharmaceutical company, followed by a survey performed on a small population of fifty patients. Analysis revealed 1) that the sales matrix has doubled after the price reduction and 2) income are inversely related to branded medicine. Finally, for pharmaceutical companies to be successful in the future, they have to work on the promotional ways to deliver medicines and solutions for the disease of today and the future through a focus on the long term needs of patients to ensure the long-term profit and benefit. Thus, this can be achieved by providing the required funding, skilled employees, processes, infrastructure and strategy to achieve the desired results.

Keywords: pricing strategies, brand-name medicines, generic medicines, pharmaceutical industry, potency, bio-equivalency, healthcare expenditure, medicine substitution, consumer buying behaviour, income, price reduction, safety, quality

INTRODUCTION

The pharmaceutical market is considered one of the important players in the global healthcare system. Nowadays, the pharmaceutical industry is growing fast due to the increasing demand for healthcare medications. This field is developed because of the great research to prevent illnesses and
the great emphasis on healthcare standards. Moreover, the economics around the globe count on the pharmaceutical industry as a source for employment and earnings.

The American company 'Pfizer' is ranked first in sales with USD 47.9 billion in 2013, followed by Novartis then Roche, who achieved total sales of USD 47.5 billion and USD 39.2 billion respectively.

Despite the growth in the pharmaceutical industry, Lebanon’s pharmaceutical sector is facing lots of challenges. The high cost of pharmaceuticals along with the registration of fake medicines represents the major issues.

Lebanon’s per capita pharmaceutical spending is the top among the middle east. Pharmaceuticals represent an important share of the Lebanese market translated in the form of a sales volume exceeding 900 million USD in 2007. The annual spending on drugs as estimated by Households at 100 USD per capita in 2005.

The high spending is due to private pharmacies who have a fixed mark-up scheme on drugs by prescribing and selling pharmaceutical products that lead to high returns. Moreover, the Lebanese pharmaceutical market consists of more than 50 pharmaceutical companies, which reduces the economics of scale profits. It is noteworthy to mention that a great percentage of the Lebanese population do not have any type of drug insurance, thus the high expenditure is a problem and should be followed by controlling the pharmaceutical market.

The local pharmaceutical production is limited due to very high cost of production, lack of trust in the authenticity, small local market and the limitation in the efficiency of production. This local production can cover around 5% of the total local demand and 95% of the total products sold are imported.

There are three types of imported pharmaceutical products:
1. Vaccines and toxins for both human and veterinary medicine.
2. Gauzes and bandages such as adhesive plasters and adhesive dressings.
3. Retail medicaments including many forms or packages or doses for retail sale.

These imports are mainly products of France, Germany, Switzerland, and US. And after the augmentation in the Euro and Swiss Franc, Lebanese importers changed their choice of imports to cut the expenses resulted from the depreciation of the dollar against those currencies. Subsequently, the main imports became from the US due to the fact that local currency is tied to the US dollar. (Bankmed, analysis of Lebanon's pharmaceutical Market-December 2014).

Three questions come into consideration:
Should countries use price control measures to manage medicine prices?
Should countries adopt measures to control add-on costs in the supply chain?
Should countries promote the use of quality assured generic medicines as a strategy to manage medicine prices?

PRICING STRATEGIES OF PHARMACEUTICAL PRODUCTS

In the pharmaceutical industry, the price is the most important part of the business. The ministry of health through regulatory bodies is mainly responsible for setting a particular price. The objective behind this to ensure the safety of patients and to provide good quality healthcare and on the other hand, to let companies generate the necessary profit for the continuous production of medicines needed.

The pricing strategy for pharmaceutical products is similar to any other products but the difference lies in the application because regulatory bodies are responsible for allowing a price (Filmore et al., 2004).

COST STRUCTURE IN PHARMACEUTICAL PRODUCTS

In the pharmaceutical industry, there are four types of cost: Cost of active ingredients, the cost of other ingredients, the cost of packaging material, and cost of manufacturing.

A-Cost of Active Ingredient

The active ingredient cost is the highest cost component. It represents about 30% of total cost of the product.

B-Cost of Other Ingredients

Other ingredients defined as minor element represent 3% or less of the total costs.

C-Cost of Packaging Material

The cost of packaging material differs based on the type of packages whether a pack, a bottle or tube. In absolute terms, it ranges between Rs. 5-10 per pack of 10 tablets/capsules, per 60 ml bottle of liquid, per 5 ml injection & per 50 grams’ tube of ointments (Ahmed et al., 2014).

D-Cost of Manufacturing

The cost of manufacturing refers to a number of products being manufactured in a factory. An additional cost of R&D should be taking into consideration when applied over time. In the pharmaceutical industry, an average of 60% and above gross margin sounds good. It may go up to 500-1000% in case of new research molecule (Gehlbach et al., 1984).
SPECIAL TOPICS IN PHARMACEUTICAL PRICING

The Economy Pricing is another type of pricing strategy that pharmaceutical industry employs. It looks like in a way to the cost plus pricing but with a different perspective.

Economy Pricing

Some companies look to market brands of already established molecules at minimum prices. They put their prices based on costs and limit their profit margin to the minimum. Such molecules might have no impact on the pricing strategy. Another approach is to look for a brand with no competitors and price theirs at 75% lower price (Ahmed et al., 2014).

External Reference Pricing

ERP alludes to the act of utilizing the cost of a pharmaceutical item in one or a few nations to determine a reference cost for the purpose of setting or arranging the cost of the item in a given nation. Reference might be used for single-source or multisource supply items.

The board noticed that the execution of ERP requires an administrative system. The encounter has demonstrated that there is a danger of utilization of high-wage nations as reference nations for lower income settings. Key contemplations incorporate access to real costs and on-going observing.

Transfer Pricing Strategy

Pharmaceutical companies, differently than other consumer products, are not allowed to advertise their products or even use any type of media which allow them to keep the advertising expenses that other industries are using to diminish their profit to avoid taxes and to pay dividends to the shareholders. Besides this, a code of ethics should be signed by pharmaceutical companies that prevent them from spending or promoting their products (Swan et al., 2001; Lexchin J, 1992; Wolfe SM., 2002).

Within this context, pharmaceutical companies have the actual cost of product the only available source for manipulation. They look to increase the cost as much as they can through buying raw materials at their inflated costs from their own parent companies. This reflects the transfer pricing phenomenon. Not at all like shopper items, administrations and customer durables, pharmaceutical organizations are not permitted to utilize the broad communications for publicizing their items. This shuts a vital cost place for them, which is customarily utilized by all different enterprises to lessen their benefits and demonstrate a higher cost keeping in mind the end goal to avoid imposes and paying profits to the shareholders. Other than this, there is a strict code of ethics pertinent which abstains them from spending past a specific point of confinement on advancing their items (Swan et al., 2001; Lexchin J, 1992; Wolfe SM., 2002).
In this circumstance, the main territory accessible for control of cost is the actual cost of the product. Organizations expect to make the cost show up as high as could reasonably be expected by purchasing the crude material at an inflated cost, in the greater part of the cases from their own parent organizations. This marvel is named as Transfer pricing (Kotler P, 2002; Lundin D, 2000).

**SPECIFIC CHALLENGES IN THE PHARMACEUTICAL INDUSTRY**

Every industry has main stress points for their products and services. The main stress points that are commonly known are schedule, cost, and quality. One or more of these stress points have an influence on the benefit of the industry which results in classifying such point as critical to the accomplishment of the product, and the organization conveying it. Thus, there must be a better consideration of these stress points to better create a product. Nowadays, this period is the hardest in medicine improvement for pharmaceutical business. Lately, the political, administrative, social and financial weights are making the pharmaceutical industry more serious and it is dealt aggressively. Every year, one medicine at least is revised due to claims from clients of competitors. The most critical stress point in the pharmaceutical business is quality because it reflects the health of patients. Low-quality medicines result in ending someone’s life. Achieving the first ranking in providing a new medicine is basic, however, the course of medicine improvement is unusual. In the pharmaceutical industry, quality control measures are critical. Responding to the needs, the quality is the most critical factor to be considered to reduce the dangers in the industry. Another present test for pharmaceutical organizations is the pressure they are under to expand their efficiency, as the quantity of new products achieving the market has been expanding. This profitability decrease comes up with the fact that the business needs another and better approach in its administration of clinical research, sedate schedule, and product delivery.

**RESEARCH PROBLEM**

The increasing number and the appearance of new diseases that haven't be diagnosed earlier encouraged pharmaceutical companies to produce new drugs. These drugs have been priced highly to an extent that exceeded the normal ranges. The over prescription of brand drugs become a serious problem to be considered because of the increased cost that easily exceeds the one thousand dollars for a month treatment. These costs couldn't be affording by all patients (Norris et al., 2005). Moreover, the health expenditure cost per capita is the greatest in the middle East region. Pharmaceuticals represent an essential impart of the Lebanese market to a business volume surpassing 900 million.
USD in 2007. Family units yearly OOP spending on medicines was assessed at 100 USD per capita in 2005 (BankMed special report, 2014).

For this reason, adjusting the prices of drugs was considered as the first action done. On the other hand, it is essential to note that with a vast segment of Lebanon’s population not secured by medicines protection, the high per capita pharmaceutical use is viewed as a weight and should henceforth be handled through controlling the pharmaceutical market prices.

As a first step, The Ministry of Public Health (MOPH) prevailing with regards to forcing solely high-quality Generic medications in Primary Healthcare (PHC) offices and in making essential medicines broadly accessible in wellbeing focuses and dispensaries. This couldn’t achieve a better situation but it was able to keep the predominant situation since years. However, the total spending on pharmaceuticals stayed high as the ministry of health couldn’t influence the prescription habits of physicians who are the main contributors and it couldn’t find a way or a mechanism to expand the generics market share.

Besides this, the MOPH has created a National Drug Formulary demonstrating generic choices for every brand, which was to a great extent conveyed and distributed on the MOPH site. This would help doctors who will try of searching for less expensive option medicines for their patients. It would without a doubt be most helpful for drug specialists, once the legislation permitting them for substitution of endorsed medications is passed. While the Lebanese ministry of health is empowering the use of high-quality generic medicine (FDA or EMA approved), the originator’s organization, rather than contending by lessening the value, surges doctors with free specimens and offers generous bonuses to drug specialists (Pharmacists) achieving once in a while 100%. This practice is against fair competition. It likewise supports huge drug stores, equipped for buying greater amounts with higher rewards, to the inconvenience of little ones.

The trend in all European countries is toward the generic market, to reduce the pharmaceutical spending. And the reimbursement agents reimburse based on the generic price regardless of the drug purchased. Hence, the Lebanese minister of health found that adopting such strategy in Lebanon would cut the pharmaceutical market expenses and reduce the cash back money given by the reimbursement agents, which results in a better pharmaceutical industry. In order to reverse incentives, two ministerial decisions have been issued to control the drug prices. The primary decision (Government legislation # 301/1) forces a change of prices in light of a value correlation with Jordan and KSA. Among 1102 medications normal with KSA and 1006 with Jordan, 872 medicines were valued in Lebanon in view of an ex-industrial facility cost higher than the other two nations. Re-pricing prompted to variable abatements going after a few medications 40%.
The second decision (Government legislation # 306/1) accommodates another estimating structure that brings down the mark-ups set in 1983 regressively (net revenues diminish as ex-production line costs increment). Thus, the price decreases by the new ministerial decision and the law that forces generic companies to price their products 30% less than the originator, pharmaceutical generic companies faces limited profits. And, they should have competitive prices to be able to compete with other generic companies; thus these two factors have resulted in many new challenges that pharmaceutical companies will face.

OBJECTIVES OF THIS CASE STUDY

The objective of this study is to show the effect of the pharmaceutical industry challenges induced by the new pricing strategy and to provide recommendations for keeping their existence and assure their profit.

The objectives of this study:
1- To identify the effect of different pricing strategies on the sales matrix at pharmaceutical companies.
2- To recognize the types of measures pharmaceutical companies have taken to stay profitable with these pricing constraints.
3- To identify and to analyze the causes of such pricing strategy in the company.
4- To provide some effective solutions for the challenges faced by the company studied.

HYPOTHESIS TESTING

H0: The reduction of medicines pricing reduces the profit of pharmaceutical companies.
H1: The decrease of pricing of pharmaceutical products increases the number of units sold.
H3: Price reduction of branded medicines decreases the purchase of generic medicines.
H4: The decrease of medicine pricing encourages low-income earners to stop avoiding buying branded medicines.

RESEARCH METHODOLOGY

Since our problem is to check the challenges faced by pharmaceutical companies due to the new pricing strategies, it is suitable to conduct the two main research strategies which are: quantitative and qualitative. In order to better understand its effect, the author has conducted a qualitative research strategy which is the “one to one interview” with a manager at a brand generic pharmaceutical company, questioning him about the reasons behind the new pricing strategy, how it affected the
company and what measures have been considered. This interview has been analyzed through problem-solving technique to better understand the problem and to find out its root cause.

To support the qualitative approach, a self-completion questionnaire to fifty patients was used to gather information from the respondents. Through this questionnaire, the author is looking to understand how the new pricing strategy, more precisely, the price reduction has affected the patients purchase of medicines and how this purchase has affected the pharmaceutical profit. In addition, if there exists a relation between the reduced prices and medicines purchase habit (brand or brand generic). Through different variables correlation in the questionnaire, we get a better understanding of the effect of new pharmaceutical pricing over the medicines habit purchase and the profit generated.

The method used for sampling is a probabilistic sampling where the sample is selected randomly.

Here, the survey was conducted on a population of fifty patients who are under treatment. The questions were simple, targeting the brand generic medicines and brand medicines for a better understanding of the habit used in the pharmaceutical market. All data gathered through questionnaire were analyzed through the SPSS program; using this software, we were able to correlate multiple questions and find their implications.

The questionnaire is divided into two major sections:

Demographics: Age, gender, income and marital status and General Questionnaire which includes questions about patients purchase habit, and price reduction effect on brand and generic medicines.

ANALYSIS AND RESULTS

The descriptive analysis showed that 20% of patients are between 20 and 30, 35% of patients are between 30 and 50 and 45% of patients are between 50 and 70. More precisely, 40% of patients are male and 60% of patients are female. As for their marital status, 10% of patients are widowed, 20% of patients are single and 70% of patients are married. 15% of patients earn between 1500-2000, 25% of patients earn between 500-1000 and the majority of patients (60%) earn between 1000-1500.

HYPOTHESIS TESTING

H1: The decrease of pricing of pharmaceutical products increases the number of units sold

Based on the interview, it was explained that the main purpose of this new pricing was to shift the Lebanese pharmaceutical market to a generic market since a vast segment of the Lebanese population is not covered. However, there were double the units sold for some brands. Changing the habits of the main prescribers were our mission. In our case, promoting and assuring the quality of our products have led to an increased number of units sold and sometimes the double. Not all the populations can
buy branded products, some patients have stopped their chronic treatments because of the prices. On the other hand, the reduction of brands prices encouraged some patients to prefer the brands over generics, while others are satisfied with the generic if it offers the same quality which reflects our case. To our benefit, our main products are categorized under the chronic treatment where the patients have to take the treatment for life. Thus, the cost of treatment matters, which encourage them to go for generic medicines. This validates the hypothesis H1 where the decrease of prices increases the number of units sold.

For hypothesis testing of H3 and H4, a correlation coefficient is used to assess if price reduction and purchase habits are correlated. A bivariate correlation was used.

**H3: Price reduction of branded medicines decreases the purchase of generic medicines.**

<table>
<thead>
<tr>
<th>Table 1: Pearson Correlation</th>
<th></th>
<th>Does the reduction in the prices of brands will affect your current purchase</th>
<th>If branded medicines were slightly priced differently, would you still buy generic brands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pearson Correlation</td>
<td>1</td>
<td>.491*</td>
<td>1</td>
</tr>
<tr>
<td>Sig. (2-tailed)</td>
<td>.028</td>
<td></td>
<td>.028</td>
</tr>
<tr>
<td>N</td>
<td>50</td>
<td></td>
<td>50</td>
</tr>
</tbody>
</table>

According to the results, there exists a moderate negative correlation between current purchase and potential purchase ($r = -0.491$). This negative correlation indicates that there is an inverse relationship between the current purchase and the potential purchase after brand price reduction. As brand price reduces, and if the brand is slightly priced differently than the brand generic, patients will consider revising their purchase, will not purchase the brand generic and will prefer the brand. These results confirm the hypothesis H3 that says Price reduction of branded medicines decreases the purchase of generic medicines.

**H4: The decrease of medicine pricing encourages low-income earners to stop avoiding buying branded medicines.**
Based on this table, there is a strong negative correlation between income and branded medicine purchase (-0.675). A negative Pearson correlation indicates that as income decrease, patients will buy branded medicines at their reduced prices. This result is valid since the value of Pearson Sig. 2 Tailed is approximately 0.035 which is less than 0.05 thus results are valid. As a result, our hypothesis H4 (The decrease of medicine pricing encourages low-income earners to stop avoiding buying branded medicines) is validated and proved.

**CONCLUSIONS**

This study investigates the challenges faced by Lebanese Pharmaceutical companies after the new pricing strategy adopted by the ministry of health. To be able to recognize and identify the issues behind the problem and its effect on patients, a one to one interview was conducted with the general manager of a Lebanese brand generic company and a survey were distributed to 50 patients. This interview validated the H1 that price reduction of pharmaceutical products will increase the number of units sold. Based on the data gathered, the author validates the negative correlation between price reduction and branded medicine purchase from one side, and the income and branded medicine from the other side.

**RECOMMENDATIONS**

First of all, pharmaceutical companies need the required funding, skilled employees, processes, infrastructure and strategy to achieve the desired results. For this reason, at the country level, the company has to understand the cultures, the law, the supply chain and the people and at the organizational level, the company has to understand what motivates its employees for better creativity and productivity, and moreover it has to engage employees in the management department to make them feel as partners. The leaders of the companies are characterized by their skills, their knowledge and their IQ with the EI (Emotional Intelligence) needed to adapt to all psychological and sociological factors. For a successful future of pharmaceutical companies, they have to work on the
promotional ways to deliver medicines and solutions for the disease of today and the future. Science and technology are the most efficient ways that should fit with the business need to achieve a benefit for all stakeholders. The focus should be on the long-term needs of patients to ensure the long-term profit and benefit.

The loss that pharma companies have hemorrhaged is not valued in actual dollars but in the opportunity costs for the areas where they can find potential opportunities to invest. The revenue growth should include the following:

1-A better knowledge of the market and culture. This allows the company to better perceive and position their brands in the market.
2-Understanding the laws and the way the interpret and implement these laws.
3-A better vision for the political instability that might threaten their huge investments where they can find different approaches.
4-To better focus on the developed market who are the major providers of revenues and instability better than focusing on countries in emerging markets.
5-Focus on achieving an acceptance from the target populations to ensure the growth. This is can be done through understanding the patient’s needs, their medicinal needs and making them feel as part of the business and not as revenue potential.

THE SOLAR PV SECTOR. EVOLUTION AND GROWTH OF INNOVATION IN THE SECTORAL SYSTEM

Xue, Han1; Jorge, Niosi2

1CIRST, UQAM
2Department of management and technology, Université du Québec à Montréal, Canada

ABSTRACT

This paper discusses the product life cycle (PLC) and the industry life cycle (ILC) and sectoral systems of innovation (SSI) theories about the evolution of innovation in solar photovoltaics. PLC-ILC predicts that, over time, firms invest more efforts in process innovation, while the number of firms and the rate and diversity of product innovation eventually wither. In the sectoral innovation system perspective, taking into account that high-tech sectors are variation intensive, and that they receive institutional (public) support, the opposite may be true: over time innovation increases, new products appear, and products become more complex, by the addition of new functionalities, different applications to new market segments, and the arrival of different types of innovators. We contend that the SSI theoretical model can explain evolutionary patterns in many high-tech sectors, including biotechnology, ICT and nanotechnology. This paper is about industrial variation in the solar PV sector, and rapid growth of its market.

Keywords: sectoral innovation systems, product and industry life cycles, solar photovoltaics

INTRODUCTION

There are two basic models to study industry evolution: industry life cycle models (ILC), based on the product life cycle (PLC) and history-friendly models (Malerba, 2007). Since the late 1960s, several studies using the PLC-ILC model have pointed to the fact that a large number of industries follow a life cycle in which a radical innovation and the related entry of small new producers that introduce new products is followed by demand growth, a greater emphasis on process innovations and a selection process which ultimately leads to a concentrated market structure, and the decline of innovation (Abernathy and Utterback, 1978; Utterback, 1994). But it has been convincingly indicated that that the dynamic sequences are different from one industry to another (Klepper, 1997; Geroski, 2003, Malerba, 2007). Thus, individual-industry case studies are necessary to see the real industrial dynamics, particularly in high-technology sectors such as biotechnology, information technologies,
nanotechnology and solar photovoltaics; these sectors became noticeable after the PLC had adopted its canonical form in the 1960s and 1970s. In the meantime, some cases studies have been developed, using history friendly models, for example the computer industry (Malerba et al., 1999, 2001), the pharmaceutical industry (Malerba and Orsenigo, 2002), as well as for other industries such as software and chemicals.

This paper explores the contours of the solar photovoltaic sector, a high-tech one that, like other science-based industries, shows uninterrupted innovation from its modest start in the 1950s to the present day. Like aerospace, biotechnology, ICT, and nanotechnology, the solar PV sector does not see innovation stagnate and decline, as argued by the PLC-ILC approaches, but on the contrary, it shows continuous novelty and its branching into new paths and the creation of new products for new markets. The institutional environment, and particularly the public policy one, can explain the “anomaly”. Such institutional milieu is absent in the PLC-ILC perspective, but is a central element in the innovation systems approach.

1. THE SOLAR PV SECTOR

In the solar PV sector we can find several periods. The first one was – after the creation of the solar cell converting sunlight into electricity in the Bell Labs in 1954 - its application into satellites and aerospace products that require electrical supply out of grid production. The United States hosted the main inventors and innovators in such companies as Hoffman Electronics, Signal Corporation, Communications Satellite Corporation, and Raytheon. The first solar cell powered satellite was launched in 1958 and was a total success (Perlin, 2002). At this time, specialised companies produced most solar cells and innovation.

In a second wave of innovation, in the 1960s and 1970s new types of innovators appeared; they were companies producing pocket calculators, and other electronic material such as Canon, Sharp and Toshiba in Japan, RCA and Texas Instruments in the United States. At the same time, some large energy companies, such as Exxon, and then ARCO in the United States became interested in solar energy for powering offshore oil and gas exploration and production. In Europe, Telefunken and other firms involved in the production of satellites became interested in solar PV technologies and conducted R&D and innovation. Australia also invested in solar PV in order to power telecommunications equipment in remote zones. The new wave of applications brought new innovators, most of them being both users and manufacturers.

The cost of producing solar energy declined as novelties piled up and new innovators launched their inventions in the market. A third wave of innovation arrived in the late 1980s and 1990s, were earthly applications boomed. Rooftop solar panels and the first solar power plants connected to the grid...
appeared in California. Western European countries such as Germany, Italy and Spain adopted policy incentives, mostly feed-in tariffs (FIT) to increase the production of photovoltaic energy and reduce pollution through the use of clean technologies.

In the present, fourth wave, several Asian countries such as China, Taiwan, Japan and South Korea have taken the relay. Not only they manufacture the majority of solar PV equipment, but they are also implementing incentives to produce more photovoltaic energy at home. However, the United States is still the most innovative country, and China and Taiwan do not produce the most advanced solar equipment but rely on economies of scale; thus the rapid increase in adoption of both rooftop and grid-connected solar panels “crowds out” the most advanced but more expensive US-produced equipment. Yet, the US Department of Energy (through its National Renewable Energy Laboratory) predicts that in 2020 solar PV energy will be competitive almost everywhere with conventional sources of energy (US DoE, 2010). It is already competitive in most areas of Spain, Portugal, Italy, California, Texas and large portions of Africa and Central and South America.

In addition to these user-manufacturer innovators, universities and government laboratories have for over sixty years contributed to the development of the solar PV technology. Among them, If at the beginnings of the sector the University of Delaware was a major contributor, later on the National Renewable Energy Laboratory in the United States, the Fraunhofer Institute in Germany, the University of New South Wales School of Photovoltaic and Renewable Energy Engineering and its ARC Photovoltaics Centre of Excellence, the MIT Photovoltaics Research Laboratory and others have become more prominent.

2. THEORIES AND HYPOTHESES

The analysis of the evolution of industries has been captured by the PLC-ILC set of models for several decades. In these models, innovation starts centred in products, then product innovation declines and process innovation takes the relay. But after a certain number of years, both product and process innovation decline, the industry concentrates and it often moves to countries where the labour force is cheaper. This is the story of textiles, garment, furniture, in the past, and now bicycles, car, electrical equipment and other industries today. In the PLC-ILC theories, innovation is the result of the search activity of a particular group of firms, who are at the same time users and manufacturers. Companies produce novelty to integrate it in their product lines.

Governments have an occasional role in the process but usually they keep their hands off the product life cycle. Klepper, the father of the ILC theory, makes it very clear:

“In summary, apart from an occasional influence of the government/military, the evolution of the six products through their formative eras largely conforms with the PLC.” (Klepper, 1997)
On the contrary, the group of innovation system models that Malerba and others have pioneered, are more attentive to the specific contours of each set of industries or sectors, where particular cost structures, natural or built competitive advantages, particular policy incentives or market sizes and structures can affect the evolution of the sector. The type of models allows for different sequences in the role of innovators, different types of demand structures and knowledge flows, and different institutional settings. The general argument that we put forward here is that science-based industries and sectors (SBIS) show a fairly different set of evolutionary patterns compared to more traditional industries. In SBIS, product variation is overwhelming, the branching out of new industries and the rise of new market segments if widespread. Thus, SBIS are more prone to innovation cascades than low and medium-tech industries (Niosi, 2015).

This paper argues – like Lundvall (1992) Malerba (2004), Nelson (2005), Niosi (2010) and others have done in the past – that institutions play a key role in the development of high-tech industries. This role has specifically been studied in biotechnology (McMillan et al, 2000, Whitley, 2003), in computers and software industries (Mowery, 1996), and nanotechnology (Roco and Bainbridge, 2005; Niosi & Reid, 2007). Governments subsidize these industries in order to improve human health, industrial competitiveness, and aiming at other societal benefits. They do it through public laboratories (think at the National Institutes of Health or the New Renewable Energy Lab in the United States), through academic subsidies to R&D, and through multiple incentives to private-sector innovation, including reimbursable and non-reimbursable subsidies, tax credits for R&D, and others, including subsidized tariffs.

In addition, increasing variation is a characteristic of one type of industries, as opposed to Schumpeter Mark I and Schumpeter Mark II sectors, as well as PLC-ILC sectors. The following insert summarizes the argument.

3. SOME DEFINITIONS AND METHODOLOGY

3.1. Definitions

In order to describe industry evolution in the most precise way, the following concepts are defined for the paper:

---User innovators are the companies who directly benefit from the use of the new technology. In our case, some firms produce solar PV cells, panels and other complementary equipment, but also conduct R&D and patent at least some of the results of their R&D investment. Thus companies such as Boeing, Canon, EXXON, or Siemens are user innovators. Public laboratories and universities, as well as specialised small and medium sized enterprises conducting research and patenting, or those that install panels for individual or industrial companies and do not conduct research are not user innovators. In our definition, users and manufacturers may coexist under the same roof and within the same enterprise (Block et al, 2016).

---Integrator: solar cells are the heart of the solar photovoltaic systems, but are not the final product for most users. Other companies integrate the solar PV technologies into their products (i.e. Solar panels) and then sell to the consumers via EPC (engineering, procurement and contractor) firms; these users include producers of solar roof panels, clocks, watches, pocket calculators, satellites, aircraft, mechatronics lightning equipment used in highways, telecommunications equipment and the like.

---Related diversification: the large companies usually spin-off dedicated firms to produce the solar PV products to the end consumers in other applications;
---Mass market: the end consumers are individuals and commercial organizations that buy solar panels for houses, industrial firms or highways; also, companies producing portable electronic products such as clocks, and pocket calculators.

---Niche market: the end consumers are in such special industries as aircraft, satellites, or other specific products.

---Specialized manufacturer: they are manufacturers just focusing on solar PV cell or solar panels manufacturing, without other focus or integration plan.

-- Feed-in-Tariffs (FIT); “A feed-in tariff (FIT) is an energy supply policy that promotes the rapid deployment of renewable energy resources. A FIT offers a guarantee of payments to renewable energy developers for the electricity they produce. Payments can be composed of electricity alone or of electricity bundled with renewable energy certificates. These payments are generally awarded as long-term contracts set over a period of 15-20 years.” (US DoE, 2010) Those FIT are used not only to create incentives for the adoption of solar PV technologies, but also for wind and other renewable energies. They were adopted in Germany, Italy, Spain, Japan, and lately in China. In the USA, six states have implemented such tariffs.

3.2. Sampling and data collection

In order to review the industry evolution of the solar PV industry in terms of innovation, the patent data in United States Patent and Trademark Office (USPTO) are employed as the sample selection criteria. The data in USPTO are selected because the United States assignees own nearly 50% of the solar PV patents, and innovators based in Japan, Germany, Taiwan or the Popular Republic of China also patent their inventions in the United States in order to protect them from potential infringers.

The key words selected for collecting the patents are the “solar cell”, “solar cells”, “photovoltaic cell” and “photovoltaic cells”.

The samples are established in three categories:
1. The earliest assignees in the solar PV;
2. The top 10 biggest patent assignee companies; and
3. The top 10 biggest manufacturers specialized only in the solar PV cells and other solar system components such as solar high-tech glass, and solar energy storage systems.

For each samples in the above groups, we explore the information from their websites and the open information including the internet, the reports and the journals to find the major business, the solar PV business and their marketing positioning.

Table 3 shows that large firms (over 500 employees) dominate technology invention in the solar PV sector. This is true for all major metropolitan areas except for Taiwan, where the three largest clusters have the Industrial Technology Research Institute (ITRI) as the main owner of solar PV technology.
Since the 1980s, ITRI has become a major inventor in the area of semiconductors, and solar cells are specialized semiconductors. A capability ITRI developed in one sector of the microelectronics industry could be transferred to another sector of the same industry, for a different application.

OUR HYPOTHESES

From the survey of these two major approaches about industry evolution, as well as authors considering variation in industry structure over time, we have drawn the following hypotheses.

**Hypothesis 1**: the decline in product innovation and the number of firms is not universal as argued by the PLC-ILC theory. In “variation-intensive sectors” (most science-based industries) the opposite is true (Niosi 2000). The number of products tends to increase over time, as new applications and new components appear, and economies of scope settle (See also, Saviotti, 1996)

**Hypothesis 2**: In SBIs, including the solar PV sector, product variety increases as new complementary...
technologies enlarge the number of users and market niches. In science-based industries, variation is overwhelming. The new complementary technologies include mechatronics (i.e. sun-tracking devices), energy storage devices (accumulators, batteries), new high-tech solar glasses, new types of solar cells, and other related equipment, allowing buildings to switch from one type of energy (such as solar PV) to another such as grid provided electricity. New firms appear to grab these technical opportunities.

**Hypothesis 3**: Incentive policies have a major impact on the rate and direction of innovative activity in the sector. They come from public R&D laboratories, targeted policies such as FIT, and others. Policies have generally been assigned a modest role in PLC-ILC theories, but they have a major one in sectoral innovation system models and historical descriptions of the growth of SBIS.

**RESULTS**

Figure 1 shows the recent exponential growth of innovation in the solar PV sector. Such growth started in the 1990s and keeps on rising today. This growth is partly due to government incentives to solar PV adoption, but also the decline of solar equipment due to solar R&D in private firms, academic and public research organizations. The development of complementary technologies has made solar PV increasingly attractive.

**Figure 1: Solar cell publications and US patents granted by year, 1954-2013**

![Solar cell publications and US patents granted by year, 1954-2013](image)

Source: Scopus & USPTO

We have found different uses of solar PV technologies in an increasing number of products such as:

- Satellites, aircraft,
- Oil and gas offshore production facilities
- Calculators, watches, and other portable products
- Flat roof rigid panels for individual houses or industrial plants
- Sun-tracking solar systems using mechatronics
- Grid-connected systems (solar parks, photovoltaic power stations)
- Green solar cities
- Emerging technologies
  - Concentrator photovoltaics
  - Floatovoltaics
  - Grid integration systems
  - High-tech glass
  - Solar energy storage

The solar sector thus includes several different industries, and is characterized by large variation, and increasingly complex products. If at the origins, solar panels were covered with ordinary glass, were fixed and unable to track sun movements, today they are becoming increasingly complex products incorporating high-tech glass, mechatronics, and sophisticated inverters transforming direct current into alternate current. Most of these products are supported by the state through national research institutes, academic research, FIT, and the usual panoply of financial support of OECD and emerging country governments for R&D and innovation.

CONCLUSION

We have put together different pieces of research that analyse the evolution of a new sector. The most cited, and decades-old one, is the PLC-ILC approach, proposed in the 1960s by Raymond Vernon at Harvard University and developed by Steve Klepper at Carnegie Mellon in the 1990s. Both see products being launched in the richest countries where the first imitators also grow. These new products consequently adjust themselves to market conditions, through innovation until a dominant design emerges. At this moment, product innovation starts receding while process innovation increases. The new product is exported to less affluent countries where a second cohort of imitators appears. Economic concentration rises and large firms dominate the industry. The entire industry tends to be delocalized to emerging countries where costs are lower than in the original innovating country. The solar PV sector is also being delocalized towards Asia (China, South Korea and Taiwan). Yet, the sectoral innovation system proposed by Malerba (2002) and by Malerba and Orsenigo (1996) argues that the institutions, the markets and the technological conditions under which they are born shape sectors. Thus the history-friendly models proposed by Malerba and Orsenigo do not contradict the PLC-ILC approach, but add an important element: the role of governments in the shaping of the process.
Also, most often sectors are seldom composed by just one industry or one product. The solar PV sector involves a large number of industries from semiconductors to glass, mechanical and other.

In addition, several authors (Niosi, 2000; Saviotti, 1996) have noted the phenomenon of rapid product variation, a phenomenon that does not disappear in science-based industries and sectors, as argued by the PLC-ILC approach, but on the contrary, increases over time, and so does product innovation. Also, product variation induces growth by the expansion of industries (Metcalfe et al, 2006), that translates into aggregate economic growth. Finally, Saviotti and Pyka (2004) argued that economic growth occurs most often by the creation of new sectors. The solar PV sector is a brand new one composed by several industries.

BOOK OF CONFERENCE ABSTRACTS
IC AND ENABLING FACTORS FOR STARTUPS IN A BUSINESS ECOSYSTEM PERSPECTIVE

Abbate, Tindara1; Accordino, Patrizia2; La Rocca, Elvira Tiziana1; Rupo, Daniela1

1Department of Economics, University of Messina, UNIME, Messina, Italy
2Department of Political and Juridical Sciences, University of Messina, UNIME, Messina, Italy

ABSTRACT

The creation and development of startups have been the focus of scientific contributions aimed to explore and identify the key success factors having a significant impact on their creation, survival and performance (e.g., Gilmore et al., 2004; Schutjens and Wever, 2000; Watson et al., 1998).

Considering the areas that in the earlier years have achieved the best results in the birth and the development of innovative startups, we can identify several factors responsible for the success or the failure of new ventures. Some of these factors are related to the capability of the entrepreneur to attract, combine and develop IC. A more comprehensive analysis, however, should consider the external conditions which can influence (positively or not) the environment chosen to root and to start a new business.

External conditions can be investigated adopting the perspective of business ecosystems. Moore (1993) creates the term “business ecosystem” and Iansiti and Levien (2004) underline that “like biological ecosystems, business ecosystems are formed by large, loosely connected networks of entities. Like species in biological ecosystems, firm interacts with each other in complex ways, and the health and performance of each firm is dependent on the health and performance of the whole. Firms and species are therefore simultaneously influenced by their internal capabilities and by their complex interactions with the rest of the ecosystem.” (p. 35).

Startups can contribute to economic growth through different ways, such as diverse innovation paths/processes, new technologies and know-how, original resource combinations, new entrepreneurial culture and new competencies and capabilities (Malone, 2003; Wong et al., 2005). In fact, these factors are assuming a relevant role in entrepreneurship and innovation, helping to job creation, technological progress, high level of creative work, internationalization and alternative forms of employment (ESM, 2016).

Exploring IC in the business ecosystem perspective, the paper intends to examine the roles and the contributions of several “enabling” factors, which can differently influence the creation and development of innovative startups. The most significant of these are the commitment of institutions and organizations that are able to sharpen the skills relevant for new entrepreneurship; simplification
of rules and granting incentives; enhancing the intellectual capital of entrepreneurship and accessible financing methods.

The adopted perspective is coherent with the conclusions of a public consultation launched by the European Union summarized in the Startup and Scale up initiative that has identified which enabling factors the Member States could enforce to realize a suitable business ecosystem, supporting the growth and the development of innovative startups.

By exposing a theoretical framework this paper intend to derive some relevant implications for management, to strengthen and improve the main enabling factors, and for policy makers, to encourage and sustain new entrepreneurship.

*Keywords: startups, business ecosystem, enabling factors, new entrepreneurship, incentives, patent box, inspiring entrepreneurs, educational institutions, financing methods.*

MARKET DOCTRINE (MD), CREATIVITY, AND NEW PRODUCT PERFORMANCE IN INTERNATIONAL MARKETS

Abboud, Amer; Shoham, Aviv

Department of Business Administration, University of Haifa, Haifa, Israel

ABSTRACT
Market doctrine (MD) is a relatively new concept in the marketing literature. When first introducing, Challagalla, Murtha, and Jaworski (2014; CMJ hereafter) defined MD as "a firm’s unique principles, distilled from its experiences, which provide firm-wide guidance on market-facing choices" (p. 4). Thus, MD ensures consistent decisions across firms’ departments. MD's importance was recognized by the Journal of Marketing, which bestowed the 2014 Harold H. Maynard Award on the authors, citing their paper as the most significant contribution to marketing theory and thought of that year. CMJ viewed marketing creativity as an outcome of MD. Such creativity, in tandem with new product creativity, is an antecedent of new product performance (Im and Workman 2004). Thus, given that MD is a new concept with a potential impact on the success of new products, it is important to study this relationship.

RESOURCE BASED VIEW
According to the resource-base-view (RBV), a firm can achieve a sustainable competitive advantage (SCA) by controlling resources that are rare, valuable, inimitable, non-tradable, and non-substitutable, as well as firm-specific (Barney 1999).

MARKET DOCTRINE
MD provides guidelines to firms that face marketing challenges. It constitutes a common firm-wide approach for marketing-related decision-making. When firms use them, employees tend to rely on MDs’ guidance rather than on personal tendencies, cultural customs, or ideologies (Bailey and Maltzman 2008). CMJ described MD as four sets of principles. Principles should (1) be firm-specific (2), be experienced-based, (3) guide firm-wide marketing decision-making, and (4) include market-facing choices.

Four elements contribute to the development of MD. The first is international diversification, Related-product, decentralization of marketing authority, and decentralization of marketing activities. Regarding MD’s consequences, it improves the consistency of decision-making processes and leads to enhanced marketing-program creativity, reduced marketing impulsivity, enhanced perceived value of
marketing, and better international performance.

**NEW PRODUCT CREATIVITY (NP CREATIVITY)**

New product innovation (creativity) was identified as "the key to firms’ marketplace success, profit and survival" (O’cass and Sok 2014, p. 156). NP creativity enables firms to develop new products in response to changes in customer needs and to continuously create and embed enhanced value in their products (Ngo and O'Cass 2009). Therefore, continuous renewal of market offerings (in the form of NPs) is required in order to achieve market superiority. NP creativity provides a platform for the development of new products with beneficial attributes that closely matches customers’ needs, resulting in superior performance (Kohli and Jaworski 1990; Shoham 2002; Slater and Narver 1995).

**NEW PRODUCT PERFORMANCE (NPP)**

New product performance is an outcome of creative processes (Calantone and Cooper 1981). Im and Workman (2004) renamed NPP as NP success, which can be viewed as leading to better market (relative market share, relative sales) and financial outcomes (relative return of investment; in general, profits, market share, sales, return on investment, relative profitability) (Cavusgil and Zou 1994), as well as to customer satisfaction (Andrews and Smith 1996).

**SUMMARY**

The discussion above leads to a model flowing from MD to Creativity and New Product Performance. The model is depicted below.

*Keywords: Resource Based View, Market Doctrine, New Product Creativity, New Product Performance*

DEROGATION EFFECT OF USING SUCCESSFUL VERSUS ATTRACTIVE SPOKESPERSON IN ADVERTISING: A COMPARATIVE STUDY BETWEEN THE NETHERLANDS AND BRAZIL

Adıgüzel, Feray¹; Buranello, Renata²

¹Department of Business and Management, LUISS Guido Carli University, Rome, Italy
²Consumer Marketing Skincare at Philips, Amsterdam, The Netherlands

ABSTRACT
This research focuses on comparison of derogation effects of using successful versus attractive male spokesperson in advertising on male consumers in two culturally different countries -Netherlands and Brazil. According to the results, when a male consumer compares himself to attractive male spokespersons, the attitude towards the ad is significantly positive; when he compares himself to successful male spokespersons, the attitude toward the ad is significantly negative. Thus, men who compare themselves with a successful spokesperson do show a similar derogation effect as women who compare themselves with an attractive model. This is not the case for men who compare themselves with an attractive spokesperson. Brazilians showed more negative attitude towards the ad than the Dutch did if they compare themselves to a spokesperson. However, among non-comparers, Brazilians were more positive towards all ads than the Netherlanders were. Therefore, the derogation effect occurs for Brazilians among comparers, but not among non-comparers.

INTRODUCTION
Message delivered by a physically attractive source will tend to be more persuasive than the one by a less physically attractive source (Petty et al. 1983). However, the use of highly attractive spokespersons might backfire (Bower, 2001): the use of highly attractive models in an ad leads to derogation of the ad and of the brand. The reason was explained by the social comparison theory (Festinger, 1954). According to this theory, consumers compare themselves with idealized advertising images. The idealized images in ad raise the individuals’ comparison standards for attractiveness and lowers satisfaction with their own attractiveness (Richins, 1991). This lower satisfaction leads to negative attitude towards the ad, resulting in lower purchase intention (Bower, 2001). However, Bouwer’s study included only females and mixed results stemming from comparison to highly attractive models on advertising effectiveness. That is why we want to retest the effects of exposure to attractive models in ads on ad effectiveness for males. Besides, we wonder how using a successful male spokesperson influences ad effectiveness and which derogation effect –attractive versus
successful male spokesperson needs an attention of companies. Gulas and McKeage (2000) found that exposure to advertising containing idealized images of financially successful males reduced male viewers’ level of self-esteem. However, this study investigated only negative effects in terms of self-perceptions, but not advertising effectiveness. More importantly, they did not investigate whether exposure to an attractive versus successful spokesperson causes higher derogation. That is what the contribution of this study to marketing knowledge.

Success plays an important role in how men see themselves. Whilst men select their partners based on physical attractiveness, women select partners based on their social power and their financial ability (Willis and Carlson, 1993). Therefore, financial success can be considered an important feature of males. Moreover, besides attractiveness, social status among boys is also associated with high expected earning power (Dong et al., 1996). This leads to wondering whether financial success is for men what attractiveness is for women.

On top of these, we compare the derogation effects in two culturally different countries: Brazil and the Netherlands. There are two main reasons of these choices. First, globalization has increased the importance of understanding whether the same advertising strategies of developed economies can be also used in emerging economies. So far, a few studies indicate that consumers from economies in transition have different attitudes regarding advertising than do consumers from developed counties (Feick and Gierl, 1996). With respect to advertising the influence of cultural differences is very pervasive since “as a form of social communication, advertising is considered to be particularly reflective of culture” (Hong et al., 1987). Second, these two countries are strikingly different in terms of Hofstede cultural dimensions. Brazil is more collective, masculine country with higher power distance. All these dimensions can reflect on how people view a successful person and it is therefore expected that Brazilian consumers exhibit higher levels of derogation toward a successful person in an ad than Dutch consumers.

The research objective is therefore to investigate the level of derogation effect caused by exposure to a successful versus an attractive male spokesperson while controlling social comparison. Additionally, cross-country differences of consumers towards an ad with a specific spokesperson will be investigated. This will be useful for companies when deciding whether to adapt a specific ad to a different culture or to change it completely. The results of this research will make it possible to know which type of spokesperson will be more effective for an ad, and thus the type of spokesperson that can generate higher likability and success for the ad.

METHODOLOGY
Four fictional ads were created: 1) a successful and attractive male spokesperson, 2) a successful and non-attractive male spokesperson, 3) a non-successful but attractive spokesperson, and 4) an average looking and not successful spokesperson. The participants were exposed to one ad of four experimental conditions randomly (2x2 between-subject design). The data was gathered with an online survey from only males. A total of 257 respondents, 131 Dutch and 126 Brazilians, were used in the analyses.

FINDINGS

The empirical findings indicate when a male consumer compares himself to an attractive male spokesperson, ad attitude is significantly positive; when he compares himself to a successful male spokesperson, ad attitude is significantly negative. Thus, men who compare themselves with a successful spokesperson do show a similar derogation effect as women who compare themselves with an attractive model. This is not the case for men who compare themselves with an attractive spokesperson. Brazilians indicate more negative ad attitude than the Dutch do if they compare themselves to a successful spokesperson. However, Brazilians are more positive towards all ads than the Netherlanders among non-comparers. So, the derogation effect occurs for Brazilians among comparers, but not among non-comparers.

INTERNATIONAL DIFFERENCES IN SPORT EVENT SPONSORSHIP EFFECTIVENESS

Adigüzel, Feray1; Kennett, Christopher2

1Dept. of Business and Management, LUISS Guido Carli University, Rome, Italy
2Dept. of Technology Management, LaSalle-Universitat Ramon Llull, Barcelona, Spain

ABSTRACT

Major sports events such as the Olympic Games and FIFA World Cup have achieved global reach through extensive media coverage and the involvement of multinational sponsors. Sports provide a highly attractive mix of drama, emotion and information that attract very loyal customers: sports fans. The need to engage sports fans in meaningful ways that involve sponsors has been an ongoing focus of sports marketing research. However, relatively few studies have focused on how the effectiveness of sport event sponsorship might differ internationally and across national cultures.

Our field-based study offers an important extension to current research. Specifically, we conducted an international survey of Euroleague Basketball’s fans and gathered data from 4365 respondents across ten European countries to identify country-specific patterns. The questions in the survey included fan demographics, behaviour, opinions and attitudes towards sponsors. We conducted multilevel modelling using individual and country level variables and investigated the determinants of sponsorship effectiveness, namely brand affect, and the differences among them.

The findings indicated the positive effect of perceived fit, sponsor brand familiarity, attitude sponsorship, brand association, event involvement, the success of fan’s team, the number of traditional media used to follow games, and finally product/brand category usage on brand affect. Team loyalty, sport involvement, age and gender have a negative effect on brand affect. From our findings, when sport involvement and team loyalty increase, brand affect decreases. When a sport consumer uses traditional media to follow the Euroleague, brand affect increases. Interestingly, we did not observe the same effect for new media. There were differences in the effects of perceived fit and brand familiarity across countries. When country’s indulgence increased, brand affect also increased while the opposite effect was observed for masculinity. There were significant differences in brand affect across ten countries based on fixed effect model. We further explain cross-cultural differences in sponsorship effectiveness and additionally provide several implications for marketers.

INTRODUCTION

Major sports events have become an integral part of the global entertainment industry through increasing exposure through multiple media channels. These events, such as the Olympic Games and
FIFA World Cup or the regular fixtures in the NBA or English Premier League, are used by commercial sponsors to reach large live audiences and clearly defined customer segments as part of wider marketing and communication strategies. Worldwide spending on sport sponsorship has reached to $62.8 billion in 2017, and along with the sales of media rights is one of the key revenue streams for sports organizations (IEG, Statista, 2017). Sponsorship in sports has been the focus of numerous studies, many of which focus on consumers’ ability to recall sponsors’ brands and the Return On Investment (ROI) that sponsorship provides sponsors (Deitz et al., 2013). The literature to date reveals a concern for the relative effectiveness of sponsorship as a promotional strategy and whether the high priced deals at the top end of the industry provide value for money. However, the effectiveness of sports sponsorship in terms of cross-cultural comparison has received little attention by scholars to date. Indeed, sports marketing research literature have mainly focused on the antecedents of effectiveness which can be listed as: perceived sponsorship fit (Simmons and Becker-Olsen, 2006); attitude toward sponsorship (Meenaghan and Shipley, 1999); sport involvement (Gwinner and Bennett, 2008); familiarity with the sponsoring brand (Chanavat and Martinent, 2009). Although sponsorship has attracted a lot of interest in the academic world so far, research of sponsorship effectiveness concerning multiple countries is rare up to this point (Meng-Lewis et al., 2013; Lee and Mazodier, 2015; Séguin et al., 2005). Most studies concentrate on the domestic region of the sponsored property (i.e. the country where an event is hosted or where a team comes from) and limited to generalizability.

Our study is based on a sample of 4365 respondents from an international survey of Euroleague Basketball’s fans conducted in 2015 and provides new insights on: 1) sponsor equity in terms of brand affect in ten different countries in an international sports league, and 2) the role of several antecedents of sponsor equity (perceived fit, sponsor brand familiarity, involvement with the event, sport, and team, attitude towards sponsor, the success of fan’s team, traditional/new media, product/brand usage, age and gender) in an international sponsorship. The study was conducted in the context of the Euroleague Basketball, which is the leading professional basketball competition in Europe comprising teams from up to eighteen countries. The findings provide insights for sponsors and sports organizations and inform decision-takers as to the level of standardization of their sponsorship-linked marketing communications by revealing to which extent consumers’ attitudes to and perceptions of sponsorship differ between countries.

We conducted multilevel modelling using individual and country level variables and compared the results to fixed/random effect and multiple linear regression analysis. We observed significant differences in brand affect across ten countries using fixed effect model. Using the multilevel model, we concluded that there are differences in effects of perceived fit and brand familiarity across ten
countries. When Hofstede’s culture dimension “masculinity” increased, brand affect decreased. However, when indulgence increased, brand affect also increased. The most important variable explaining brand affect was perceived fit. The significant positive effects on brand affect were perceived fit, sponsor brand familiarity, attitude sponsorship, brand association, event involvement, the success of fan’s team, the number of old media to follow games, sponsor brand category usage. The negative effects on brand affect were team loyalty, sport involvement, age and gender. That is, when sport involvement and team loyalty increases, brand affect decreases. While the usage of traditional media increased brand affect, interestingly we did not observe the same effect for new media.

ABSTRACT
This research examines the influence of shopping motivations on impulse buying behaviour and compares these effects in emergent and mature markets. Shopping is becoming a gradually hedonic activity worldwide with an increasing number of multichannel buying opportunities. Unexpectedly, the research on the relations between shopping motivations and impulse buying does not exist, yet. Impulsive buying behaviour is a widely recognized phenomenon in mature markets. It is even estimated that 40 percent of all money spent is through impulse buying. While impulse buying has been much studied in mature markets, especially in the U.S., there have been a few studies in emergent markets. Data were collected from 520 female shopping mall visitors in four countries representing two mature markets (the Netherlands and Germany) and two emerging markets (Turkey and Russia) and analysed with structural equation modelling. There were significant differences in the effect of gratification, adventure, value, and quality seeking motivation on impulse buying, but not the ones of role play, social and idea. Adventure and gratification motivation influenced positively impulse buying both markets. Value motivation negatively influenced impulsive buying in mature markets, but opposite of it in emerging markets. Value motivation was not hedonic in mature markets; however it was both hedonic and utilitarian value in emerging markets. The effect of quality seeking motivation on utilitarian value was only significant in emerging markets. We additionally discuss several implications for marketers.

INTRODUCTION
As a phenomenon of modern society, more and more purchase decisions result from consumers spontaneously giving in to a sudden “urge to buy” (Rook, 1987). For instance, in the United States, even about 62% of supermarket sales and 80% of luxury-goods sales were estimated as a result of impulsive buying (Agins, 2004). Thus, we can state that impulse buying is an essential source of profits of retailers. Recently, some researchers have begun to ask “when” and “why” impulse buying occurs (Vohs and Faber, 2007). Our study contributes to this stream by examining shopping motivations that cause impulse buying. Shockingly, none of the existing studies on impulse buying have been investigated the relationship between shopping motivations and impulse buying so far.
Additionally, most of the studies about the precursors of impulse buying have been conducted only in mature markets, especially in the United States. In fact, the importance of emerging economies on profits of multinational brands has been gradually increasing. More than 80% of the world’s consumers live in emerging markets and transitional economics (ECMs) (Steenkamp and Burgess, 2002). Many emerging countries have been experiencing large changes in their retail environment parallel to their steadily rising income levels as a result of continuing economic growth.

Shopping motivations influence key retail outcomes, namely loyalty, positive word of mouth, and satisfaction with the retailer (Jones et al., 2006). Shoppers differ significantly in terms of why they shop, what they look for, how they evaluate shopping experience, how they shop and purchase. Culture and economic welfare may have a strong influence in what aspects of shopping consumers find important (Kacen and Lee, 2002). There is a strong need to understand how consumers behave in emergent markets and especially, understanding their shopping motivations and whether these motivations differ from consumers’ motives in mature markets is essential. In practice, which motivations cause impulse buying in emergent and mature markets can be beneficial for multinational companies to understand whether they need different marketing strategy than the ones from mature markets. Since we conceptualize that shopping motivations can contain both hedonic and utilitarian value, some motivations might be hedonic in mature markets, but utilitarian in emergent markets; so that some motivations can influence impulse buying while not in other market. The current study fills in this gap and contributes to literature by investigating hedonic and utilitarian motivations in both markets and comparing the effects of them on impulse buying. This study focuses on both utilitarian, namely quality seeking motivation and hedonic, namely adventure, social, gratification, idea, role, and value motivations which are conceptualized by Arnold and Reynolds (2003) in a mature market (i.e. USA).

**METHODOLOGY**

Data were collected in shopping malls from only female shoppers in four countries, representing two leading Western mature markets (the Netherlands and Germany) and two important emerging markets (Russia and Turkey). After testing the cross-cultural invariance (configural and metric invariance) with multi-group confirmatory factor analysis, we examined the equivalence of structural paths in two markets with the chi-square difference tests on multi-group structural equation model (LISREL 8.8; Jöreskog & Sörbom, 1999).
FINDINGS

Our findings indicated that there are significant differences in the effect of gratification, adventure, value, and quality seeking motivation on impulse buying, but not for role play, social and idea ones. While the effect of gratification on impulse buying in mature markets was larger than the one in emergent ones, the effect of adventure on impulse buying in emergent markets was larger than the one in mature ones. Interestingly, value motivation negatively influenced impulse buying in mature markets, but no significance observed in emergent ones. This is due to the fact that value motivation was both utilitarian and hedonic value in emergent markets, while it was more utilitarian than hedonic value in mature markets. Social, idea and role play motivation were hedonic value in mature markets, but they were not in emergent markets. Quality seeking was significantly utilitarian in emergent markets, but neither hedonic nor utilitarian in mature ones.

THE IMPACT OF EXISTENTIAL GUILT APPEAL ON CONSUMER INTENTION TO PURCHASE CAUSE-RELATED PRODUCT OR TO DONATE TO CHARITY

Adomaviciute, Karina; Urbonavicius, Sigitas; Urbutyte, Ieva
Marketing department, Vilnius University, Vilnius, Lithuania

ABSTRACT
Charity support behavior increasingly attracts more and more debates of researchers in the scientific literature. The interest in this topic is also encouraged by charity organizations which are constantly looking for ways of attracting more support for their sponsored charity types and projects. An advertising campaign is one of the most important elements for the existence of charitable organization (Burt, 2012). In order to make it more effective different appeals are used. Guilt appeals are commonly used by charity organizations to evoke donation to charities (Huhmann and Brotherton, 1997). Moreover, a huge number of research had examined the impact of guilt appeals on charitable donations (Lwin and Phau, 2014; Hibbert et al., 2007; Basil et al., 2006; Bozinoff and Ghingold, 1983). The critical question is whether the existential guilt appeal differently impacts the most analysed types of charity related behaviour: direct donation to charity and purchase of cause – related product. Previous studies did not analyse this relationship.

The purpose of this paper is to examine the impact of existential guilt appeal on consumer intention to donate or to buy cause-related product. The study included two steps: a pilot study in order to find the suitable form of an advertisement to be used as a stimulus for inducing existential guilt, and the main quantitative study. Online survey and non-probability (convenience) sampling were used for the main study. This study is based on a survey of 374 respondents from Lithuania. Respondents received an advertising message designed to induce existential guilt and reported their behavoural intentions provoked by this manipulation.

Results confirmed that existential guilt had direct positive impact on both charity related consumer behaviour forms: purchase of cause-related product and donation to charity. However, this relationship was stronger in the case of direct donation to charity.

The analysis enriches a scientific knowledge gap in the consumer choice between donation to charity and purchasing cause-related product. Most researches analyse only one of behavioural cases, that is: which factors determine either the donation to charity, or consumer intention to purchase cause-related product, though the two behaviours include certain similarities. This study provides new insights into the knowledge about similarity between the donation to charity and purchasing cause-related products, confirming the importance of existential guilt in both instances. From the managerial...
perspective, it was confirmed that existential guilt induced by advertising helps raise funds both by direct donations and by cause-related purchasing. Moreover, the results confirmed previous studies suggesting that negative emotional appeals are considered as an effective way to lead to a greater intention to donate to charity (Chang and Lee, 2009; Anik et al., 2011).

IMPACT OF STRESS AND JOB SATISFACTION ON MENTAL WELL-BEING OF HEALTHCARE PROFESSIONALS

Aggrawal - Gupta, Meenakshi1; Vatharkar, Poonam2

1Organizational Behavior and Human Resource Management, Indian Institute of Management, Indore, India
2Organizational Behavior and Human Resource Management, University of Mumbai, Mumbai, India

ABSTRACT

INTRODUCTION

The job of healthcare professionals is highly regarded (Mechanic, 2003) but stressful (Firth-Cozens, 2003). Many occupational stressors like long/odd working hours leading to poor sleeping habits, high performance expectations, and time pressures contribute to higher stress levels on physicians (Clever, 2002).

Excessive level of stress leads to reduced feeling of mental well-being (Chandraiah et al., 2003). Many studies have shown that healthcare professionals have high rate of mental health problems like anxiety (Kroenke et al., 2007) and depression (Firth-Cozens, 2006). Due to odd working hours, unpredictability of work commitments and lack of control over professional life, doctors also face high level of work family conflicts. It again affects their mental well-being (Elston, 2009; Hughes and Bozionelos, 2007).

Job satisfaction is regarded as an attitudinal variable and considers the extent to which people like or dislike their jobs (Spector, 1997). The issue of job satisfaction of physicians is very crucial since it affects not only their own health, but also health of their patients (DiMatteo et al., 1993). Previous research suggests that job satisfaction of physicians leads to greater productivity, better patient care and their own health and mental well-being (Judge et al., 2001). In addition to job satisfaction, career satisfaction (Parasuraman et al., 1996) also forms an important element of the way healthcare professionals view their work. The study is undertaken to understand if stress, work family conflict, career and job satisfaction of physicians have an impact on their mental well-being.

LITERATURE REVIEW AND HYPOTHESIS

Due to nature of job, healthcare professionals have to face multitude of occupational stressors. Number of studies have found that stress in doctors is inversely related to their job satisfaction (Cooper, 1989; Richardson, 1991). Excessive stress among healthcare professionals is harmful to themselves, as it creates conflicts between various life roles, contributing to the feeling of “overload”
and reduced physical and mental well being (Sekaran, 1983; Greenhaus & Parasuraman, 1986). Thus, it is hypothesized that

**H1** - *If perceived stress of physicians is high, their mental well being, global job satisfaction and career satisfaction will be low.*

Due to numerous reasons like long working hours and emergency on call services, medical profession is vulnerable to work interference in family life. This work family conflict has adverse impact on well being of physicians (Elston 2009). Job dissatisfaction is regarded as indirect cost due to work family conflict. (Quick, et al., 1997)

**H2** - *If work family conflict of physicians is high, their mental well being, global job satisfaction and career satisfaction will be low.*

Previous research has found that, job satisfaction is related to health and mental well being of employee. (Rathi and Rastogi, 2007). When job dissatisfaction increases, it boosts feeling of burnout, which ultimately leads to reduced mental well being (Arnetz et al., 1987).

**H3** – *If global job satisfaction and/or career satisfaction of physicians is high, mental well being will also be high.*

In fact, if the job satisfaction or career satisfaction is high, it may help physicians to cope with various stressors and support their well being (Bliese et al., 2017). It is expected that

**H4** – *Global job satisfaction and/or career satisfaction will mediate between perceived stress and mental well being.*

**H5** – *Global job satisfaction and/or career satisfaction will mediate between work family conflict and mental well being.*

![Figure 1: Research Model](image)

**METHODS**

**Sample** – Data was collected through a survey form 100 senior health professionals. Respondents were contacted either personally or via e-mail and were explained the purpose of the questionnaire and
ensured confidentiality of responses. Of the 600 questionnaires that were distributed/ emailed, 100 arrived by the data analysis deadline date and/or were usable.

Measures

Mental Well Being (MWB) was measured with a 14-item scale developed by Tennant et al. (2007). Global Job Satisfaction (GJS) and Career Satisfaction (CS) were measured using scale reported by Linzer et al., (2000). This scale measures 13 aspects of job satisfaction. For the purpose of this study, two sub scales – 5-item Global job satisfaction and 4-item Career satisfaction were considered. Perceived Stress (PS) was measured using 14 items scale by Cohen et al. (1983). Work Family Conflict was measured using a 5 item scale developed by Netemeyer et al. (1996). All scales had reliabilities above 0.70 (Table 1).

ANALYSES AND RESULTS

Mean, standard deviations and correlations are reported for all variables in Table 1. Moderate to strong correlations are found between mental well being, global job satisfaction, career satisfaction and perceived stress. Work family conflict does not show correlation with mental well being and perceived stress of physicians.

*p<.05    **p < .01

The results of hierarchical multiple regressions (controlling for gender, age & educational qualification) shows H1, H2 and H3 were supported though perceived stress did not significantly predicts career satisfaction. Since WFC did not appear to be significantly correlated with MWB, we could not test for mediation (H5 not supported). Results of Sobel Test for mediation reports that global job satisfaction partially mediates between perceived stress and mental well being of physicians (Z = -2.944, SE = 0.058, p value <.01). However, career satisfaction did not play a mediating role (H4 partially supported).

DISCUSSION

This study suggests that the nature of work for physicians may require them to manage stress and various time and resources related challenges. However, Structuring the work environment and
context may help them cope with these stressors and ensure that their well-being is not negatively impacted.

Keywords: Mental well being, perceived stress, job satisfaction, career satisfaction, work-family conflict

FAMILY BUSINESS EFFICACY AND PERFORMANCE

Al Kayid, Wejdan Saeed; Zhongqi, Jin; Ramakrishnan, Sumeetra; Priporas, Costas

The Business School, Middlesex University, London, United Kingdom, UK

ABSTRACT

This research examines the concept of family business efficacy which can provide a better understanding of the role of family business efficacy beliefs in delivering success and providing high levels of family firm performance. Through the concepts of family and collective efficacy and by exploring relevant antecedents of FBE from various domains. In this context, it is relevant to study the family business sphere from social and psychological perspective using the social cognitive approach. Family business efficacy as a construct has not been studied before; this study will therefore define and develop a scale.

The concept of family business efficacy is theoretically generated from the efficacy theory proposed by Bandura (1977). The focal purpose of this development is to understand the family firm’s productivity from an organisational psychology perspective, specifically from Bandura’s social cognitive approach. Self-efficacy theory is central to Bandura’s view and is related to a person’s perception of their ability to reach a goal. Therefore, Bandura (1977) defines self-efficacy as “the extent or strength of one’s belief in one’s own ability to complete tasks and reach goals”. Self-efficacy is widely applied in different fields, including business, education, psychology, media and medicine.

To address the research objective, a mixed method research design will be adopted, following Churchill’s (1979) paradigm to develop a reliable measurement scale. A qualitative method will be applied in the early stages of the research, in order to understand in depth the nature of the research problem. It will also help to improve the research model and hypothesis. This research intends to apply the collective efficacy scale to different overlapping organisations and the social capital of individuals as well as groups, to highlight the relationship between the overall efficacy of families and family businesses. Therefore, a quantitative approach will be also used to measure each construct established on the basis of the existing literature. The data will be gathered in family-owned businesses in the UK and Saudi Arabia, focusing on founders and CEOs of different levels and industries of family firms.

ESTIMATION OF MANAGERIAL DISCRETION IN ACCRUALS USING FIRM LIFE CYCLE

Almand, Andrew\(^1\); Cantrell, Brett\(^2\); Dickinson, Victoria\(^2\)

\(^1\)School of Business, Henderson State University, USA
\(^2\)E. H. Patterson School of Accountancy, University of Mississippi, USA

ABSTRACT

Detecting earnings management commonly involves the estimation of discretionary accruals, i.e. accounting estimates that are subject to managerial discretion. Discretionary accruals are modeled as total accounting accruals less expected, or normal, accruals. This indicates that the measurement of the discretionary portion of accruals relies on a fully-descriptive model of the normal accruals generating process. Moreover, a sample of firms used to estimate “normal” accruals necessitates that the firms within that sample are sufficiently homogenous with respect to the overall earnings process and the economic fundamentals that govern that process.

When normal accruals estimates are misspecified, discretionary accruals are also measured with error, which reduces the power to detect earnings management. Thus, increasing the homogeneity of the sample of firms used to determine the normal accrual process (Ecker et al., 2013; Zarowin 2015) enhances estimations of normal accruals and detection of earnings management. While prior literature has used industry and/or size to group firms, we propose firm life cycle stage as another economic characteristic upon which to organize firms. Refining the grouping of firms to increase sample homogeneity allows financial statement users, as well as regulators, to develop more accurate expectations about normal accruals, which lead to better estimates of discretion. The improvement in estimates of potential earnings management leads to better understanding of earnings quality and, as a result, a more efficient allocation of resources.

We use a combination of simulated and actual earnings management to compare earnings management detection ability using several common models of discretionary accruals and across varying estimation partitions of firms (i.e., year, industry, size, life cycle stage, and multiple combinations of those characteristics). Specifically, we seek to complement the prior literature by examining an alternative fundamental characteristic, firm life cycle stage, in place of (and in later tests in addition to) industry and size. We posit that firms in similar life cycle stages face similar strategic concerns, managerial pressures, growth prospects, etc. and expect the similarity in these factors to drive homogeneity in the “normal” accruals generating process. To measure these strategic concerns, pressures and prospects, we identify firm-specific life cycle stage using the cash flow pattern proxy developed by Dickinson (2011).
We predict homogeneity within each life cycle stage ultimately reduces measurement error in estimating the discretionary portion of accruals by capturing the magnitude of managerial pressure to use discretion to achieve earnings targets conditional on the various stages of operating performance and economic growth (i.e., life cycle). We also assert that industry and/or size characteristics do not fully capture these stages of performance. Dickinson (2011) demonstrates that firm life cycle is not merely an industry effect or linearly related to firm size, and thus represents a different construct. Therefore, we suggest that using life cycle to organize firms will improve the homogeneity of the accruals estimation procedure and the resulting measurement of managerial discretion over and above industry or size alone.

We examine the efficacy of firm life cycle stage to improve the estimation of discretionary accruals using several models. Common discretionary accruals models include the Jones model (Jones 1991) and the modified Jones model (Dechow et al., 1995). Stubben (2010) models discretion based on the receivables accrual to capture premature recognition of revenue as revenue management is the most prevalent form of earnings management found in the Security and Exchange Commission’s (SEC) Accounting and Auditing Enforcement Releases (AAERs).

To conduct our tests, we simulate earnings management in varying estimation groupings (industry, size, life cycle, and a combination thereof) across the three discretionary accruals models to determine whether life cycle stage improves homogeneity of the normal accruals process for both revenue and expense manipulation. We find that estimating managerial discretion by firm life cycle stage produces estimations with less bias and measurement error than estimates modeled either in the cross section or by industry or size. Next, we investigate whether life cycle stage improves estimation models in instances of actual accrual manipulation using AAER data and find that varying types of accruals management are more easily detected in certain life cycle stages. While detection varies for expense and revenue manipulation by life cycle stage, overall, we find firm life cycle stage improves the homogeneity of estimation samples and thus the detection of earnings management for the majority of the population.

Finally, and perhaps more critically, we examine the rejection rates by life cycle stage when no manipulation is present. We find the revenue model to be misspecified for all life cycle stages and the Jones models to be misspecified for all stages other than growth when life cycle measures are not included. The revenue model over-identifies introduction and decline firms, while under-identifying growth, mature and shake-out firms as manipulators. The Jones and modified Jones models over-identify introduction, shake-out, and decline firms while under-identifying mature firms. Including firm life cycle information remediates or improves the misspecification resulting in better-performing models. Thus, including firm life cycle information not only decreases Type II errors, but also reduces
Type I errors. Collectively, the results offer strong support that firm life cycle increases sample homogeneity and enhances model performance.

It is important for financial statement users and other interested parties (e.g., auditors, standard setters, regulators, and researchers) to understand how and to what extent managers use discretion when estimating accounting earnings. Refining the sample selection on which to estimate the accruals generating process increases the accuracy of the identification of manipulators. This study contributes to the literature by providing a more complete picture of which firms manage earnings and how that earnings management relates to particular economic circumstances. In turn, this knowledge aids standard setters in revising existing standards or requiring additional disclosures to increase the faithful representation of financial reporting.

EXPLORING THE EFFECTS OF BRAND COMMUNITY CENTRIC MODEL ON FANDOM AND BRANDOM OF FOOTBALL FANS

Alon, Anat Toder; Shuv-Ami, Avichai
The School of Business Administration, Peres Academic Center

ABSTRACT

INTRODUCTION
Football (soccer) clubs have emerged as significant brand communities that provide a complex social context in which multiple relationships are formed, and where media concerns, branding practices and financial interests collide with fan enthusiasm and community affiliation (Hewer, Gannon & Cordina, 2015). The need to understand and leverage sports fans-brand relationships has become especially critical for sports marketers dealing with marketplaces characterize by increasing commercialization (Crawford, 2004). Although there is a growing research corpus on the cultural and social aspects of football club fandom (e.g., Healy & McDonagh, 2013; Guschwan, 2012), researchers do not have a good understanding of the various levels of relationships that shape these communities. Thus, although many sport clubs strive for the brand genuineness, marketing competence and fans commitment that strong fandom provides, not many comprehend what it takes to achieve such advantages.

CUSTOMER-CENTRIC MODEL OF BRAND COMMUNITY
McAlexander, Schouten and Koenig (2002) suggested that brand community from a customer-experiential perspective is a fabric of relationships in which the customer is situated. Employing the basic premises of the customer-centric model of brand community, our study measured four sports fans-centric relationships: Fans-Fans Relationships, Fans-Management (firm) Relationships, Fans-Team (brand) Relationships, and Fans-Product (sport, e.g., football) Relationships. Following McAlexander, Schouten and Koenig (2002), it is assumed that the more each relationship is internalized as part of the fan’s life experience, the more the sports fan is integrated into the brand community and the more loyal the fan is in consuming the sports team brand.

BRANDOM VERSUS FANDOM
Nowadays, the majority of the sports teams around the world are not community-based organizations as it used to be in the past, but rather they are commercialized corporations with business orientation
(Crawford, 2004). Following Guschwan (2012), this study approaches sports team supporters from two lenses:

1. The Brandom lens, which defines supporters as loyal customers and potential commodities. Guschwan (2012) offered the term brandom to describe the pseudo-fan culture engineered by brand managers eager to cultivate consumer loyalty. Accordingly, sports team support is considered as a consumption activity, since it involves the choice and preference of one alternative over the other, which is reflected in purchasing tickets for specific games and seasonal subscriptions, attending a team’s games, connecting to dedicated sports channels, and purchasing merchandise. Branding creates an identity for a sports club and differentiates the sports club from competitors (Schilhaneck, 2008). Thus, building sports club brand equity involved the consideration of intangible factors, such as: actual or aspirational fans imagery, the type of personality the sports club portrays, the feeling that the sports club tries to elicit in fans, and the type of relationship it seeks to build with its fan base (Keller, 2003).

2. The Fandom lens, which understands supporters as agentive meaning-producers who use fandom for their own uses. According to Guschwan (2012), "Participatory fan culture … offers freedom of expression and a measure of independence" from the club management "and the hegemony of the market that brandom lacks" (p.26). Indeed, Healy and McDonagh (2013) emphasize the culture and value co-creative roles played by football fans. The communal-social aspect is at the heart of fandom. Thus, fandom can allow individuals the opportunity to feel a sense of togetherness and cohesion with fellow supporters (Fillis & Mackay, 2014).

RESEARCH METHODOLOGY

The current research employed a survey to examine the impact that different levels of fans-centered relationships have on sport team supporters’ brandom and fandom and the effect of these constructs on brand loyalty and intentions to attend games. The respondents were 776 Israeli football fans.

RESULTS

The hypothesized model was analyzed with AMOS 18.0 structural equation modeling (Arbuckle, 2009) using the maximum-likelihood estimation method. It was demonstrated that all four types of fan relationships were significantly correlated with each other, and in general, the correlations between fans-product relationship and the other three types of relationships were weaker than the correlations between the other types of relationships. In addition, it was demonstrated that three of the four types of relationships significantly predicted both brandom and fandom, and fans-product relationships...
had the strongest effects on both of these variables. Only the fans-management relationships were not linked to brandom and fandom. Brandom also significantly predicted levels of fandom, and both these variables predicted both loyalty and intentions to attend games.

**DISCUSSION**

The findings of this study reveal important theoretical implications. First, the focus of the current study on understanding the social and cultural context of sport clubs as brand communities has the potential to reframe and revitalize some of the basic knowledge on sports clubs loyalty and fans experiences. In addition, following Guschwan (2012), this study has juxtaposed the language of fandom with the language of branding. Moreover, this study deviated from previous research on sports club fandom by distinguishing different levels of fans-centered relationships and by investigating the impact that these different relationships have on sport team supporters' brandom and fandom and the effect of these constructs on brand loyalty and intentions to attend games. In addition, the current study provides some significant managerial implications. Providing that the current study emphasizes that fan-product relationship play a significant role in fan identification (Fandom) and sports club's brandom, it is recommended that managers should allocate major resources on activities that enhance fan-product relationships in order to increase fan identification, loyalty and repatronage intention.

AN ASSESSMENT OF CUSTOMER RETENTION WITH SELF-SERVICE TECHNOLOGY: A COMPARATIVE STUDY BETWEEN INTERNET BANKING AND MOBILE BANKING IN SAUDI ARABIA

Alsiehemy, Ali; Battor, Moustafa; Pantano, Eleonora; Dennis, Charles
The Business School, Middlesex University London, UK

ABSTRACT
Self-service technologies (SSTs) are systems that allow customers to independently access banking services at a time and a place of their choice. Such technologies have been widely integrated into banking logistical systems to raise the geographical coverage, decrease labour costs and provide customers with a better service, thereby enhancing their satisfaction and retention.

However, the retention of SSTs is not ideal, especially in developing countries, and the growth in the adoption of such technologies is still sluggish. Therefore, several studies relating to SSTs have been conducted, and numerous factors have been examined and many theories formulated. However, there is still a need to select a theoretical framework that is appropriate for the customer (i.e. individual consumer) context. Furthermore, in Saudi Arabia, there are a limited studies examining the use of SSTs (e.g. Internet banking and Mobile banking), but none examining retention. Thus, the fundamental aim of this thesis is to propose and examine a conceptual model that best explains the key factors influencing Saudi customers’ retention of SST banking channels: Internet banking and Mobile banking. The conceptual model proposed was based on the Technology Acceptance Model (TAM) and Expectation Confirmation Theory (ECT). This was extended by adding perceived risk and culture as an external factors.

TAM proposes that users’ behavioural satisfaction determines their acceptance and adoption of new technologies. In turn, behavioural satisfaction is determined by users’ perceptions of the technology, namely usefulness and ease of use. Perceived usefulness is the extent to which individuals consider that using a specific technology will result in improving their productivity. Perceived ease of use, on the other hand, is the degree to which people think that using a specific technology requires minimal effort (Venkatesh et al, 2003). The second theory used is Expectation Confirmation Theory (ECT), the expectation-confirmation paradigm has been one of the most robust theories established in this regard (Churchill and Surprenant, 1982). Its objective is to provide an insight into consumer satisfaction and repurchasing behaviour of a product or service. ECT hypothesises that the satisfaction of a consumer to repurchase a product or service is determined by his or her level of satisfaction with it. This level of
satisfaction, on the other hand, is determined by two things: firstly, the initial consumer expectations (pre-purchase expectation), while the second determination is after-purchase differences found between initial expectations and the performance of the product or service (confirmation).

Following a positivist paradigm, this study will employ a quantitative data collection method as it is the most suitable research paradigm for the current study (Bhattacherjee, 2012; Orlikowski and Baroudi, 1991) for these reasons: First, the SST is a mature research field, where there are several theories and models that have been well-validated; they therefore can be used to explain individual perception towards technology (Orlikowski and Baroudi, 1991; Venkatesh et al., 2003; 2012). In other words, the existence of strong theoretical foundations (e.g. TAM, UTAUT, TPB, TRA, and ECM) allows the researchers to pick up the relevant factors, either dependent or independent, that could be used to predict individuals’ intention and perception towards emerging systems (Orlikowski and Baroudi, 1991; Venkatesh et al, 2003; 2012). With regard to the current study, as presented in Chapter 3, the conceptual model and research hypotheses comprised in this model are based on existing theory (TAM), ECM model and other factors derived from SST literature (i.e. perceived risk and culture).

Second, the focus of the current study is on conducting an objective test for the main factors influencing consumers’ continuous intentions and use of SSTs. This is more likely to be attained by adopting the positivist approach, which usually has a higher degree of objectivity in methods and in researchers (Bhattacherjee, 2012; Bryman and Bell, 2007; Easterby-Smith et al., 2002; Orlikowski and Baroudi, 1991). The main factors included in the proposed model have been selected according to theoretical and logical justification, not the researcher’s beliefs and thoughts. The current study uses an online questionnaire, allowing respondents to answer the questions separate from the researcher, and such data is more objective and would not to be affected by the researcher’s own beliefs.

Thus, a quantitative approach was selected as an appropriate approach to the nature and aim of this study. Structural equation modelling (SEM) will be conducted using AMOS 21 to analyse the data that will be collected from the field online survey questionnaires to a convenience sample of Saudi banking customers. The model fitness and the constructs’ validity and reliability will be tested, followed by the validation of the conceptual model and research hypotheses. The results will be explained thoroughly to show the significant and insignificant relationships in the conceptual model.

This study makes an important contribution by applying TAM and ECT to examine new technology (SSTs) in a new context (Saudi Arabia). By including perceived risk and culture alongside the TAM and ECT constructs and adding new relationships. Further, in an attempt to address the lower usage
rate of SSTs, this study will offer Saudi banks some guidelines for designing and marketing SST channels in order to enhance their acceptance and retention by Saudi customers.

INTENSIFYING THE POWER OF THE PORTUGUESE LANGUAGE:
COMMUNICATING ON SCIENCE
Alves, Gisela; Martins, Moisés de Lemos
CECS, University of Minho, Braga, Portugal

ABSTRACT
Given the European overseas expansion of the 15th and 16th century, Portugal has been considered a pioneer country in globalization together with the Portuguese language have a vast impact on an economic, financial, political and cultural level. The aim of this paper is to identify and intensify the power of the Portuguese language in the communication of science, understand the way that the Portuguese language impacts on scientific dissemination and how editors of Portuguese journals may improve the impact factor of their journals.
We propose to analyse three scientific journals in which Portuguese is the official language of scientific dissemination and three scientific journals in which English is the official language of scientific dissemination. The journals have the highest scientific impact according to the Google Scholar metrics.
Methodologically, this is a qualitative analysis as well as a documental analysis which checks different sources and a quantitative analysis; a mixed methodology.
The implications of this research will occur at the level of the features that contribute to a better and more visible scientific dissemination. We hope that the results will define strategies which will allow one to make the most of the importance that is represented in the diversity and richness of the Lusophone cultures and arts to intensify their representation in the European Union and the world.
The aim of this paper is to provide the features that editors of Portuguese journals should demand in order to make their journals better qualified in international rankings.
This paper aims to comparatively research 6 scientific journals in two different languages, with a scientific impact, in order to understand which features, have an impact in their dissemination, thus contributing to fill in this gap.

HOW TRUST AND COOPERATION HAVE AN IMPACT ON INTERNATIONAL BUSINESS: A CASE STUDY
Alves, Gisela
CECS, University of Minho, Braga, Portugal

ABSTRACT
PURPOSE- The purpose of this paper is to examine how trust and cooperation have an impact on international business. First, the author examines how trust affects cooperation and how cooperation affects trust. The aim is to study if there is retro-feeding between trust and cooperation and how it affects international business.

DESIGN/METHODOLOGY- In terms of the methodology, the author chose a qualitative analysis: a case study of a shoe exporting company. Interviews with the manager/CEO of the exporting company and the employee in charge of the exporting activities were carried out to obtain answers for the research questions. This study used a qualitative methodology, an inductive method, the paradigm was constructive and different sources were checked. FINDINGS- Trust is reflected on cooperation and cooperation is reflected on trust. There is retro-feeding between trust and cooperation. The empirical findings largely support the conceptual framework. As expected, trust is reflected on cooperation and cooperation is reflected on trust. Most importantly, the author also found a significant interaction effect between the retro-feeding of trust and cooperation.

PRACTICAL IMPLICATIONS- Relationship Marketing, trust and cooperation have become an important strategic priority for managers. This study allows managers to make more informed decisions regarding the cooperation initiatives of their organizations and establish international successful business relationships.

ORIGINALITY/VALUE- This study connects trust literature with cooperation literature, both of which are very important in relationship marketing literature. This study addresses a gap in the literature in relation to issues of trust and cooperation. Viewed through a signaling theory lens, this study provides new insights as to how positive and negative trust and cooperation messages and behavior may help or hurt the firm.

MULTI-CHANNEL AND OMNICHANNEL MARKETING: THE NEW TRENDS IN DIGITAL MARKETING COMMUNICATIONS

Amirkhanpour, Monaliz¹; Vrontis, Demetris²

¹Faculty of Business, Education and Professional Studies (BEPS), University of Gloucestershire, Cheltenham, UK
²Distance Learning Unit, University of Nicosia, Nicosia, Cyprus

ABSTRACT

Minsker (2014) and Heinze et al. (2017) believe that traditional marketing campaigns are becoming obsolete after the widespread propagation of digital technologies such as social media and mobile devices which transform passive brand consumption to active brand engagement and passive consumers to active digital consumers. Snyder (2011), Amirkhanpour et al. (2014), Yadav et al. (2015), and Lamberton and Stephen (2016) believe that mobile marketing fails as an isolated channel; it works best when integrated with other digital channels especially social media to form a multi-channel marketing strategy. In multi-channel marketing, marketers directly invest in several channels such as social media, email, mobile apps, a physical and/or online store to target customers. Smith (2017) states that the goal of multi-channel marketing is to build a strong and unique marketing strategy for each channel to target customers based on their specific preferences (Figure 1).

![Figure 1: Illustration of Multi-Channel and Omnichannel Marketing](source)

As shown in Figure 1, omnichannel marketing is an advanced form of multi-channel marketing with a balanced approach. This form of marketing views the entire business experience from the customers’ perspective because it keeps the customer at the centre of its business model by seamlessly coordinating positive customer experience across multiple channels. Marketers are increasingly combining mobile marketing with social media to deepen their interactions with consumers because it is estimated that by 2023, more than a billion people will access their favourite social networks using smartphones. Therefore, marketing campaigns should pay extra attention to this fundamental
transition by first understanding the preferences of their digital customers (Charlesworth, 2015; Vrontis et al., 2016; Brown, 2017; Hogberg, 2017).

The purpose of this research is to investigate the role and importance of the new trends in digital marketing communications especially within the mobile marketing domain. This will be achieved by exploring the significance of adopting a multi-channel or omnichannel marketing approach; investigating the role of social media and advanced mobile devices such as smartphones in selecting the appropriate marketing strategy; and proposing a conceptual framework towards its utilization in the wider context of strategic marketing. The research at this stage of development is theory-based and enhanced by secondary data. Theoretical considerations from the literature are further conceptually developed to construct a mobile marketing provisional framework for empirical validation. Furthermore, the research presents some gaps and inconsistencies which were identified by the researchers during the systematic review of qualified literature sources. The most important research gap is that the topic of mobile marketing via smartphones has attracted little attention even though it is important to both marketing executives and marketing researchers, but marketers are simply basing their decisions on anecdotal case studies and reports published in the popular press (Persaud and Azhar, 2012). Moreover, there is no commonly accepted framework for mobile marketing because a proper conceptualization of mobile marketing is still missing. Vrontis et al. (2016) and Smith (2017) state that there is no agreement on an explicit definition of mobile marketing that captures the true nature of the phenomenon. Therefore, the scope of mobile marketing is still vague. The mobile marketing domain requires continual researcher attention due to the rapidly changing nature of the technology infrastructure and the business environments because the existing strategies and business models can quickly become obsolete due to the emergence of new technologies and consumer trends (Oztas, 2015; Seema and Joyce, 2015). Although there is substantial progress in the field of mobile marketing, academic research is still in its infancy and can offer fruitful research avenues.

Methodologically, the research is theory based and enhanced by secondary data. The theoretical findings are further conceptually developed to construct a digital marketing provisional framework which will be mainly based on mobile marketing communications. Both the framework and its underlying theoretical foundation will be primarily validated through interviews with specialists and customer online surveys. The interviewees act as controls and enhancers of the theoretical development and framework. The research outcomes do add to the growing knowledge concerning mobile marketing and its role as a new digital channel in brand innovation. Furthermore, they will set the basis for a more refined understanding through a more comprehensive perspective on the topic.

MEASURING THE ECONOMIC EFFECTS OF TOURISM: THE CASE STUDY OF ITALY

Andreottola, Francesco; Massaro, Maria Rita

1National Research Council of Italy, Institute for Research on Innovation and Services for Development (IRISS-NCR), Naples, Italy
2Dept.of Business Systems and Operations, University of Bedfordshire Business School, Luton, UK

ABSTRACT

Tourism plays a relevant role in increasing the national GDP while fostering the local economies (Cortés-Jiménez, 2008; Economics, 2016; Polo & Valle, 2008; Rosignoli et al., 2013; Seetanah, 2011; UNWTO, 2013; Zhang et al., 2007). According the WTTC, the international tourism revenues in 2016 reached 2.306 billion dollars (WTTC, 2017) representing the 3.1% of the global GDP. This data is forecasted to rise by 3.8% to USD 2,394.2bn in 2017. Tourism represents a very peculiar industry since its offering includes a combination of different products and services; in fact, the opportunity to combine and diversify the basket of goods offered to tourists generates incomes over many sectors (Archer, 1984; Candela & Figini, 2012; Frechtling, 2013; Murillo et al., 2013). Tourists’ per capita expenditure doubles or even triplicates when adding to the overnight costs the amount they spend making purchases on the territory (Europa Inform, 2004). Nevertheless, despite its importance for the national economies, it is problematic to estimate its impact for the lack of appropriate and exhaustive methodologies.

Due to the cultural and artistic richness and the variety of its landscapes, tourism is of high relevance also in Italy where the most reliable and acknowledged tourism data sources are those provided from Italian National Institute of Statistics (ISTAT) and from the Bank of Italy’s Italian Exchange Office (UIC). There are also important surveys carried out from public organizations like the National Tourism Observatory (ONT), the Regional Observatories on Tourism or conducted by private institutes like the Tourism Studies Center (CST) in Florence, the International Center of Studies on Tourism (CISET) in Venice, the Italian Touring Club, Unioncamere’s National Tourism Research Institute (ISNART) and the private research center Mercury – Turistica.it. However, according the OCSE reports (2011), the Italian statistics are patchy, unreliable, not timely, neither detailed; as a consequence, they are of little are unsuitable and insufficient to provide a measurement of the overall impact that tourism has on the national economy.

In order to overcome these limits, different methods have been proposed such as the “Tourism Satellite Account” (TSA); thus in 2012 ISTAT set up the ‘Italian Conto Satellite sul Turismo’ (CST). The CST allows to measures the revenues generated by the touristic demand of services and goods while...
considers in details the components of the touristic demand and how this is related to other industries. The CTS is designed according the QMR 2008 standards developed by Eurostat, the United Nation Statistics Division, OCSE and UNWTO and consists of 10 indexes of which the Italian CST takes into account only the first 6. On the demand side CST considers inbound tourism, domestic tourism, outbound tourism and the internal tourism. On the supply side, CST takes into account the internal production and the added value by branch of activity. Finally, putting together the data on the internal touristic consumption together with those on the touristic supply, the CST determines the VAT of the tourism industry. Thanks to the CST, in 2010 it is calculated that the added value produced by the tourism related industries was € 82,833 million, corresponding to the 6% of the entire Italian added value. Tourism in Italy represents the 76, 8% of the entire VAT, underlying how this sector is important (ISTAT, 2012).

Through a desk research and secondary data analysis, the paper discusses and compares the potentialities and limits of the official statistics and those offered by the CST methodology.

The finding outlines that CTS system overcomes some of the limitations of the existing statistics, but only measures the direct effects of tourism on other sectors, while it is still not possible to estimate the economic effects of tourism, in particular the indirect revenues. The reasons are many: a) the available official statistics does not fully capture the entire economic impact, as they cannot estimate the actual tourists’ consumption; b) the tourism sector is a synthetic industry (Candle and Figini, 2012) that is tourists’ demand for goods and services is satisfied by the offering from traditional and heterogeneous industries; c) the demand for tourist goods and services in a territory is difficult to distinguish from the demand for goods and services of residents; d) statistics cannot take into account when the local consumers became local visitors.

The main contributions of this work are: a. to provide an extensive and systematic overview on the existing official statistics, highlighting their features, potential and limits; b. to understand vantages and drawbacks of the TSA approach as implemented by the Italian CST.

The research outcome supports researchers and practitioners in identifying the tool that better fits with their information needs; the review, mapping the existing methodologies, supports also the private and public operators and the government in their decision-making and in the elaboration of effective business and policy strategies.

THE STATE OF UNIVERSITY – BUSINESS COOPERATION IN GREECE

Angelopoulou, Konstantina¹, Tsoukatos, Evangelos²

¹School of business, University of Nicosia, Cyprus
²School of Management and Economy, University of Applied Sciences of Crete, Greece and School of business, University of Nicosia, Cyprus

ABSTRACT

This study aims to measure the level of University-Business Cooperation (UBC) in Greece from the perspective of the Higher Educational Institutions (HEIs). In addition the study investigates the factors influencing UBC and the level of development of the mechanisms that support and promote UBC, coming from strategies and policies of the HEIs.

INTRODUCTION

The interactions between HEIs and Business have been described in the “Triple Helix” theory, according to which the linking of university-industry-government, is considered an important driver of knowledge-based economies, fostering innovation and economic development (Etzkowitz & Leydesdorff, 2000). In addition to teaching and research, universities are increasingly expected to take on technology transfer and commercialization as part of their mission (Rasumsen, 2006). Universities’ relationships with industry are formed through a series of sequential transactions though the mechanisms of technology transfer, such as sponsored research, licenses, spin-off firms and the hiring of students (Bercovic & Feldman, 2006).

In the framework of European Union’s growth strategy there is a clear emphasis on the development of linkages between Universities and Business, as a necessary contribution for the development and competitiveness of the European economy (European Commission, 2006). The “Innovation Union” flagship initiative of Europe 2020 Strategy, aims to improve framework conditions and access to funding for research and innovation so as to ensure that innovative ideas can be turned into products and services that create growth and jobs (European Commission, 2010). Moreover, in the context of EU cohesion policy Member States are invited to translate the EU targets to national targets and develop national strategies for economic growth and innovation.

University Business Cooperation (UBC) is defined as all types of direct and indirect, personal and non-personal interactions between HEIs and business for reciprocal and mutual benefit, including “Collaboration in R&D”, “Commercialization of R&D results”, “Mobility” (academics, students, business professionals), “Curriculum development”, “Lifelong learning, Entrepreneurship” and “Governance” (Davey et al., 2011). UBC was first investigated in 2011 at a European level (Davey et al., 2011). The
The present study is being carried out for the first time at national level, covering the period of 2010-2015, during which several actions were implemented under the governmental policy for research and innovation.

METHODOLOGY

The main research question is the situation of UBC in Greece, including the main factors influencing UBC and the mechanisms that support UBC, from the perspective of the Higher Educational Institutions. For the quantitative research method, a structured questionnaire was addressed to Academics and HEI representatives of all Greek Higher Educational Institutions, during January to May 2016. Of the entire sample of 242 respondents, 214 (88.4%) of them are Academics and 28 (11.6%) HEI representatives. Concerning the area of knowledge-research, 68.2% of the total respondents work in the field of engineering and natural sciences, 17% in the field of health and agricultural sciences, while 13.6% in the field of social sciences. For the extent of UBC development, units of measurement were used for each type of cooperation.

Table 1: Types of Cooperation in UBC and units of measurement

<table>
<thead>
<tr>
<th>Type of Cooperation</th>
<th>Unit of Measurement</th>
<th>Type of Cooperation</th>
<th>Unit of Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Cooperation in R&amp;D</td>
<td>Number of Contracts/Research Contracts (under national/European/business funding)</td>
<td>2. Commercialization of R&amp;D results</td>
<td>Number of patents/disclosures of inventions/licensing/spin-offs</td>
</tr>
<tr>
<td>3. Mobility (Academic-Student)</td>
<td>Number of movements (Temporary or permanent movement from HEIs to business and vice versa)</td>
<td>4. Curriculum development</td>
<td>Number of educational programs (courses, modules etc. by delegates from business and universities)</td>
</tr>
<tr>
<td>5. Lifelong learning</td>
<td>Number of educational programs (adult education, permanent / continuing, involving the acquisition of skills, knowledge attitudes and behaviours by HEIs' delegates)</td>
<td>6. Entrepreneurship</td>
<td>Number of actions (for developing innovative thinking &amp; entrepreneurship culture within the HEI)</td>
</tr>
<tr>
<td>7. Governance</td>
<td>Numbers of participants (business leaders and/or academics involved in decision-making boards of HEIs and firms) (correspondingly)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The units of measurement were categorized into 3 groups each of which corresponds to a cooperation level (low, moderate, high). The questions addressed to Academics for the 5 types of UBC since the extent lies primarily with Academics' initiatives and willingness. For the next 2 types the questions addressed to HEI representatives since the extent of UBC lies with HEI's policies. Concerning factors (drivers, benefits and barriers), influencing UBC, respondents were asked to rate different factors through a 5-point Likert scale. Referring to mechanisms that support UBC are including the
structures and approaches HEIs put in place in order to enhance UBC, as well as specific actions and operational activities undertaken by HEIs to support UBC. Respondents were asked to rate different mechanisms through a 5-point Likert scale. A paired-samples t-test was conducted for the significance of the means difference.

RESULTS

The results show that during the last five years, 55.8% of the academics of Greek higher educational institutions have cooperated with business in one at least type. The extent of UBC is mostly low for the 5 types, "Collaboration in R&D", "Commercialization of R&D results", "Mobility", "Curriculum development" and "Lifelong learning", while is medium for the 2 types of "Entrepreneurship" and "Governance".

Table 2: Total view of UBC

<table>
<thead>
<tr>
<th>Total view of UBC</th>
<th>Level of UBC</th>

</thead>
<tbody>
<tr>
<td>Governance</td>
<td>3 = High</td>
</tr>
<tr>
<td>Entrepreneurship</td>
<td>2 = Medium</td>
</tr>
<tr>
<td>Lifelong learning</td>
<td>1 = Low</td>
</tr>
<tr>
<td>Curriculum development</td>
<td></td>
</tr>
<tr>
<td>Mobility (Academic-Student)</td>
<td></td>
</tr>
<tr>
<td>Cooperation in Research and Development</td>
<td></td>
</tr>
<tr>
<td>Commercialization of R&amp;D results</td>
<td></td>
</tr>
</tbody>
</table>

By comparing the above results with that of the European study, it seems that the results are similar, except for "Collaboration in R&D" and "Mobility" which are in a medium level, at European study. Concerning factors influencing UBC there are slight differences in the perception between Greek and European HEIs. The Drivers related to "Access to funding resources" and "Employment opportunities for students" are perceived to be of high importance in facilitation of UBC in Greece, while "Mutual trust, Commitment and Respect" are perceived to be highly important at European level. "Bureaucracy within or external to the HEI", "Lack of financial resources of the business" and "Business lack awareness of HEI research activities/capabilities" are identified to be the most important Barriers in developing UBC for Greek HEIs, while "Lack of funding for UBC" (either external or of HEI and business) is considered the most important at European level. Finally, for both Greek and European level "Improvement of employability
of future students” and “Improvement of productivity at local and regional level” are perceived to be the most important Benefits from developing UBC. Concerning mechanisms developed by HEIs’ strategies, at European level seem to be a better level of development, with “Career Offices” and “Alumni networks” as the most developed structures, in a medium level, while operational activities such as “Collaboration activities facilitating student interaction with business” and “Entrepreneurship education to students” are the most prevalent activities. In Greece the above Structures and Operational Activities are also the most developed but in a lower level.

CONCLUSIONS – DISCUSSION

In generally we could argue that the results of the study are promising for Greek HEIs. More than 55% of Academics cooperate with business in Greece, while they perceive there are important drivers and benefits in developing UBC. However, it seems that HEIs should focus more efforts on existing or developing mechanisms for supporting UBC. Except from the objective metrics of this study, qualitative elements should be taken into account since every type of cooperation needs different level of procedure difficulty to achieve. Also a similar study from the perceptive of business should be valuable for comparison and deeper UBC understanding. It is expected that the study’s findings will prove significant to those who are directly involved in this process, but especially for policy makers for development and innovation.

AUTONOMY, INNOVATION MATURITY AND INTRAPRENEURSHIP AS
DRIVERS OF INNOVATION MANAGEMENT PROCESSES: EVIDENCE FROM
THE WATER SECTOR

Annunziata, Eleonora¹; Pellegrini, Chiara¹; Rizzi, Francesco²; Frey, Marco¹

¹Institute of Management, Scuola Superiore Sant’Anna, SSSA, Pisa, Italy
²Department of Economics, University of Perugia, UNIPG, Perugia, Italy and Institute of Management, Scuola Superiore Sant’Anna, SSSA, Pisa, Italy

ABSTRACT

Water utilities are, by nature, adverse to risks of innovation. Despite that, the adoption of sustainable innovation by water utilities has the potential to improve environmental performance as well as open up new business opportunities. As a consequence, a great variety exists in the way water utilities internally develop innovation management processes that facilitate the adoption, introduction and development of innovation in their business operations.

Based on literature review and empirical data drawn from eleven case studies of Italian, Israeli and Spanish water utilities, this paper explores the factors that influence initiation, adoption and post adoption of innovation management processes. The study disentangles how external factors, i.e. regulation, market forces and environmental resilience, stimulate the adoption of innovation, and how organizational and individual factors drive the further development of innovation management processes. Among these factors, autonomy, innovation maturity and intrapreneurship differentiate water utilities in pro-active, reactive or hybrid. This categorization reflects diversity in both organizational policies and sustainable innovation management processes.

The study shows that the need to solve single contingencies is not a key driver for the implementation of innovation management processes, which instead depend on the organizations’ capabilities to respond proactively to external pressures.

MANAGEMENT OBJECTIVES IN M&A DECISIONS: A DEPARTURE FROM RATIONALITY?

Arnold, Nicole1, Bengoa, S.D.2

1University of Gloucestershire, Cheltenham, UK
2University of Applied Management Studies, Mannheim, Germany

ABSTRACT

INTRODUCTION

Strategic decision-making (SDM) has been part of numerous research and theoretical discussion (Zafirovski, 2008, Shephard and Rudd, 2014, Mitchell et al., 2011, Rahman and De Feis, 2009). More recently, the debate departs from pure rational models accepting that executive’s traits, behaviours, experiences, and values affecting the strategic outcomes (Greve, 2013, Magni, 2009, Cohen and Kudryavtsev, 2012). Especially in mergers and acquisitions (M&A) research indicates that merger activity as well as, the underlying organizational motives for the investment’ decision is at least bounded rational (Camerer et al., 2004). This emphasizes the view that those who make the strategic M&A decision might impose potential behavioural effects. Thus, the current research directs the perspective towards personal characteristics of the decision-maker and examines factors associated with a cognitive-experiential perception in strategic M&A decisions.

As suggested by earlier research, cognitive aspects of strategy formulation e.g. hubris (Liu and Xie, 2011, Haynes et al., 2010), overconfidence (Ferris et al., 2013, Dittrich et al., 2005), narcissm (Rosenthal and Pittinsky, 2006) and emotions (Lerner et al., 2015, Seo and Feldmann Barrett, 2007), are frequently underrepresented in strategic (investment) decision-making models. At the same time, it exists extensive research on bounded rationality and administrative behaviour (Harstad and Selten, 2013, Lee, 2011, Magni, 2009, Gigerenzer, 2016a). Therefore, the research aims to expand existing theoretical approaches of non-rational decision-making into the field of strategic decision in the specific organizational context of M&A. Focusing on accessing executive’s decision-making behavior and the cognitive-experiential factors influencing it. It seeks to support the argument of managers’ personal characteristics e.g. inspiring strategy formulation and decision (Finkelstein et al., 2009) and explores these characteristics within the specific complex field of M&A. This overarching qualitative research contributes to a new holistic perspective, since almost all of the existing mainstream literature applied quantitative methods by analyzing single factors separately.

LITERATURE REVIEW
Cognitive experiential theory (CET) is used as the basic theoretical framework for this research and expanded into the field of strategic M&A decisions. It was introduced by Epstein (1973, 2016) as an implicit self-theory, i.e. it directs people’s behaviour and they prosper and adapt automatically through continuous experience, including self, other people as well as the impersonal and their interaction. Supporting the basic assumptions of non-rational executive’s behaviour in this study, CET has particularly incorporated adaptive unconscious action, i.e. the experiential system, besides the rational system.

Focussing on strategic decision in M&A investment, the literature review shows that explanations of merger activity over time as well as, organizational strategic processes allow for managerial discretion. Additionally, recent research departs more and more from the overall rational models of SDM. Mergers occur in periodic waves with particular characteristics and different amplitudes for each cycle. Beside neoclassic concepts (Gort, 1969, Jovanovic and Rousseau, 2002) there emerged behavioural models that identified positive relation between merger activity and miscalculations (Tobin, 1969, Shleifer and Vishny, 2003, Rhodes-Kropf and Viswanathan, 2004, Gugler et al., 2012) as well as, managerial discretion and optimistic beliefs of the buyer (Petmezas, 2009, Morellec and Zhdanov, 2005). While current research does not provide for a full or more holistic explanation of the phenomenon, it indicates, that more emphasis shall be placed on the potential effects on M&A activity, that may arise from organizational behaviour, moreover from the actual decision maker’s strategic M&A decision.

Besides the notion of the decision-maker acting economically rational, the administrative man (Simon, 1997) with cognitive limitations, has gained a position in social sciences. Emergent concepts include risk and uncertainty (Tversky and Kahneman, 1981, Kahneman and Tversky, 1979, Bruhin et al., 2010), heuristics (Gigerenzer and Gaissmaier, 2011, Gigerenzer, 2016b, Kahneman et al., 1982), hubris (Liu and Xie, 2011, Haynes et al., 2010, Hiller and Hambrick, 2005, Roll, 1986), upper echelons (Bromiley and Rau, 2015). Additionally, agency motives (Grinstein and Hribar, 2004) as well as, political behaviours of the top management team (Bailey and Peck, 2013). At the same time personal characteristics and the organizational and personal environment as well as private and professional experiences influencing the person, including culture (Doidge et al., 2007, Li et al., 2013) and behavioural patterns (Hofstede et al., 2012) are considered to influence ones actions.

It is shown that literature only allows for a set of models and management theories but social sciences have missed to provide a comprehensive view of environmental, organizational conditions, and the individual capacities of the decision maker. Conclusively, this research supports the view that there is a requirement of integrating cognitive-experiential elements of CET into rational strategic decision-making. It examines under which conditions experiential factors specifically effect executive’s
economic rationality in strategic M&A decisions as well as potential interdependencies between the individual factors.

METHODOLOGY

The investigation uses a qualitative and exploratory approach to reveal the facets of behavioural, non-rational motivation in strategic M&A decisions. Qualitative research uncovers subjective meaning where social reality constitutes particular, culturally and historically derived meaning and relevance structures determining the behaviour of the people experiencing it (Greenfield et al., 2007). A qualitative approach is uniquely suited to explore new avenues (Amis and Silk, 2007, Macenzie and Knipe, 2006, Marshall and Rossmann, 2011, Wertz, 2011) of human experience and social perception in behaviourally affected M&A decisions since participants are permitted to express meaning and relevance in their own words rather than being restricted to ‘predetermined categories’ created by a researcher in relation to hypothesized cognitive characteristics. Also, this methodology corresponds to both the complex context of the research and its central questions, where in-depth investigation of individuals’ psychological constructions illuminate individuals’ varied understandings, tacit processes and hidden beliefs in the context of their surrounding environment of exogenous economic flows and endogenous organisational behaviour.

CONCLUSION

This research is part of a doctoral thesis and currently work in progress. Once results are available, this study provides for a new perspective in SDM and organizational behaviour. The findings shall provide for a more precise formulation of the social phenomena of behavioural perspectives in M&A investment decision-making and shall motivate scientists to to take a more holistic view by integrating cognitive, experiential and social behaviours in their theoretical models. Additionally, it helps practitioners to become more aware of their behaviours to improve their business practice and power in decisive strategic decision formulation.

COMMUNICATION SKILLS OF ENTRY-LEVEL ACCOUNTANTS IN GREECE

Asonitou, Sofia1; Tourna, Eleni1; Koukouletsos, Kostas2; Touloumis, Konstantinos1

1Business Administration Department, Athens University of Applied Sciences, Athens, Greece
2Computer Engineering Department, Piraeus University of Applied Sciences, Athens, Greece

ABSTRACT

The aim of the present study is to explore the communication skills and tasks of the entry-level accountants (ELAs) in Greece. Prior research worldwide and in Greece has proven the gap between the generic skills of accounting graduates and the skills required by employers (Hassall et al., 2001; Willcoxon et al., 2010; Yap and Yong, 2014; Andre and Smith, 2014). Research in Greece has revealed analogous results (Mandilas et al., 2014; Asonitou, 2014, 2015) however no study has so far examined the needs of local industry regarding the communication requirements for entry-level accountants as already investigated in other settings (Hassall et al., 2010; Siriwardane and Durden, 2014). This study adapts the questionnaire of Siriwardane et al. (2015) for the Greek context and explores the results and their implications for the local environment. The instrument is addressed to experienced accounting practitioners of international and national firms, who have supervised ELAs in order to survey the frequency of communications tasks performed by ELAs, the importance of the identified communication skills and attributes, and the ELAs communication skills and performance. The study unveils implications for the accounting education in undergraduate, graduate and professional level.

IMPACT OF CORPORATE GOVERNANCE MECHANISM ON FIRM PERFORMANCE: EVIDENCE FROM AN EMERGING MARKET

Ataay, Aylin

Galatasaray University, Management Department, Istanbul Turkey

ABSTRACT

The last decade has witnessed an explosion in the number of studies on the corporate governance around the world. Much corporate governance research has been grounded from agency theory. The central premise of agency theory is that executives as agents of shareholders (principals) may engage in self-serving behavior that can be inconsistent with the shareholders’ wealth maximization objectives. To constrain or mitigate this managerial opportunism, shareholders may use a diverse range of corporate governance mechanisms, including monitoring by boards of directors or large outside shareholders. In addition, equity-based managerial incentives may also help to align the interests of agents and principals. Finally, managerial opportunism can be constrained by external markets, such as the threat of takeover, product competition, and managerial labor markets.

A mounting number of investigations correspondingly struggles to comprehend cross-national differences in corporate governance. However, such approaches remain problematic because institutions modify the basic principal–agent relationship in ways that require specific contextualization. Institutions matter for corporate governance because these create different sets of incentives or resources for monitoring, as well as embody different sets of values and normative understandings about the nature of the firm. The specific conditions of the “Anglo-Saxon model” constitute the exception rather than the rule when looking at Continental Europe, East Asia, India, and emerging economies in other regions such as Turkey. For example, Turkey has a particularly different system of corporate governance from Anglo-Saxon and continental Europe countries counterparts. In addition to the highly concentrated ownership structure, few dominant shareholders control Turkish listed firms. This situation, together with the absence of a practical market for external corporate control due to the low level of development of capital markets, the lack of dual organic structures of internal governance and the low level of legal protection available to minority shareholders may significantly facilitate the controlling shareholders to obtain extra benefits at the expense of minority shareholders, substitute control with executive compensation and weaken managerial power of executives.

Current study aim to investigate complementarities and substitutions between different corporate governance mechanisms in listed companies and their effects on firm performance in
Turkey. Current academic studies have tended to focus on particular aspects of corporate governance in isolation. Our aim is to look at corporate governance mechanisms holistically as a system of interdependent elements, and to better understand how drivers of ‘good’ corporate governance are supported or substituted by other complementary mechanisms. More specifically, the ownership concentration, board leadership structure, board size and composition, managerial shareholdings, institutional shareholdings, and family shareholdings are investigated. Some early evidence reveals that the proportion of independent directors on the board is negatively related to the percentage of family shareholdings. Board size shows a significant negative relation with all the CG mechanisms except the firm performance (ROE). The finding that the family controlled firms have lower debt ratio than the institutionally controlled firms. The capital market seems to complement the institutional shareholdings, family shareholdings, and ownership concentration in monitoring the CEO and board of directors.

WOMENOMICS: IS THE WORKFORCE READY?
Averianova, Irina1; Nae, Niculina2
Faculty of Communication, Nagoya University of Commerce and Business (NUCB), Nagoya, Aichi, Japan

ABSTRACT
In 2013, Japanese Prime Minister Shinzou Abe launched a series of reforms to revitalize Japan’s lagging economy and to infuse it with much needed workforce. One ambitious part of Abe’s stated policy, referred to as “womenomics”, attempts to avert the disaster of an “inverted socio-economic pyramid”, with a diminishing number of workers supporting a growing number of retirees, by enabling wider participation of women in the workforce. There are two main factors underpinning this policy. On the one hand, the work potential of Japanese women is gravely untapped, as less than two thirds of them are employed outside the home. On the other hand, the Japanese society, at large, strongly adheres to the traditional gender-role distribution, according to which woman’s place is at home, not in the workplace. This is reflected in conservative, sexist employment practices and an insufficient support system for working families with children. While some government measures, as envisioned by womenomics, are imperative, no less significant is the need for social transformation coming from “the bottom-up”, that is reconsidering the traditional norms defining the society's attitudes towards working women.

The present study addresses these particular problems and offers insights, with regards to women’s participation in the workforce, into the attitudes and expectations of male and female undergraduate students attending a Japanese business university. Although young people’s opinions indicate a certain shift away from traditional views, the reality in the workplace is still likely to abate these expectations, hindering the country’s progress towards “womenomics.”

LINKING CONSUMER BEHAVIOR, VIRAL MARKETING AND CINEMATOGRAPHY: A PRACTICAL APPLICATION FOR NGOS

Avgeropoulou, Katerina; Melanthiou, Yioula; Papasolomou, Ioanna

University of Nicosia, Cyprus

ABSTRACT

The purpose of this research is to examine the link between Consumer Behavior Theory, Viral Marketing, and Videography/Cinematography, in order to understand how certain practices and tools can increase consumer engagement. This is particularly important for organizations like NGOs, since as literature suggests, NGOs’ use of social media, can significantly increase consumer engagement and thus activation and action through content that causes high emotional arousal either positive (fun, laughter) or negative (suspense, anxiety) (Falsafi et al., 2011; Berger & Milkman, 2011). Due to the nature of NGOs and the impact that they seek to have in society, by using a powerful medium such as video (cinematography) in social media platforms (viral marketing) they can engage consumers (consumer behavior) and ultimately achieve their active involvement assisting therefore towards NGOs’ mission achievement. The research method that was used to collect data for this study was Netnography since it is considered to be the most appropriate in examining online content (La Rocca et al., 2014) and understanding consumer behavior in the online world (Sandlin, 2007). Four video/marketing campaigns that went “viral” on YouTube were selected for observation and analysis of both audiovisual and textual content, as well as observation and analysis of consumers’ reaction to these viral videos. The selection of the particular videos was based on their success and popularity documented in the literature (Mohr, 2014). The findings of this research enabled the researchers to develop a framework where specific and realistic recommendations are all combined. This framework may be used by NGOs (and not limited to) for developing their online content aiming for high consumer appeal and engagement and ultimately succeeding in their mission and enhancing their reputation. In addition to the practical implications of this research, theoretical contributions have also been made since this three-tier link between consumer behavior, viral marketing and cinematography had not been investigated previously. This study is of course not free from limitations however clear future research directions are provided for further suggested research to address these limitations and progress further with the topic at hand.

ESCAPE EXPERIENCES IN LIGHTHOUSE TOURISM: A PHOTO ELICITATION PERSPECTIVE

Azevedo, António J. A.

School of Economics and Management, University of Minho, Braga, Portugal

ABSTRACT

The lighthouse tourism which has been flourishing in several coastal areas provides the ideal scenario for escape experiences. This paper aims to discuss the implicit meanings, symbolisms and emotions evoked by lighthouses, in particular those related with recreational storm chasing, “land’s ends” pilgrimage and gaze upon dystopic places. Using a qualitative approach, the classification of “lighter” dark tourism product is supported by filmography content analysis, photo-elicitation and lighthouses promotion websites. Several case-studies were discussed providing support for a taxonomy of motives for engaging (dark) lighthouse experiences: risk recreation; isolation and loneliness; pilgrimage; ship wrecking; memorials; dystopia; and “ice palaces” gaze. Public decision makers, maritime authorities and tourism operators may acknowledge the theoretical and practical contributions provided by this paper and develop innovative escape experiences thus giving more “energy” to these peripheral regions.

INTRODUCTION

This paper aims to discuss the symbolism of lighthouses and all their implicit ingredients which can make them a tourism product segment with a relevant attraction power and economic value.

Just a few weeks before the conclusion of this article, the news of the opening of the first lighthouse adapted to hotel in Spain (at Pancha island, Lugo) and the reopening of the "Semaforo" in Finisterra (Galicia, Spain), have reinforced the relevance of the theme of this paper. These are two examples among the 7742 lodgings named with the “lighthouse” word and evaluated by Tripadvisor website besides the 4307 restaurants and 19 tours related with lighthouses. In the website www.bookalighthouse.com it is possible to book a lighthouse from the 67 options in Europe, in Africa (2), North America (6) or Australia (1). England is the country with the higher number (40) of lighthouses being promoted.

What kind of thoughts and emotions are elicited when you see a lighthouse?

1 http://elpais.com/elpais/2017/01/25/paco_nadal/1485345397_929449.html
LITERATURE REVIEW

According to the Pine II and Gilmore’s grid (1988), tourists may engage four different types of experiences realms depending of the level of participation (active versus passive) and the space-time framework (absorption versus immersion). Living in a lighthouse is an escape experience as the tourist (actively and by immersion) “plays” the role of the lighthouse keeper. This type of experience provides the ideal scenario which awakes several motivators: sensation seeking mechanisms such as the risk recreation associated to storm chasing thrill (Xu et al, 2012) or the attraction/gaze for death sites or dystopic places (also designated as darktourism).

Considering that in the literature the author did not find any paper that explicitly analyzes the lighthouse thematic within the dark tourism context, this paper gives a relevant contribution to fill this gap and introduces an innovative concept of (dark) lighthouse tourism. Moreover, limited discussions of meanings have been ascribed to marine environments (Wynveen, Kyle & Sutton (2010), therefore this paper will also discuss the gaze upon lighthouses photos, and the emotions and thoughts elicited or induced by lighthouse films.

The concept of dark tourism or thanatourism was primarily defined by Foley and Lennon (1996, p.198) as “the presentation and consumption (by visitors) of real and commodified death and disaster sites”. Later Stone (2006, p.151) proposed the dark tourism spectrum as classification methodology for the supply in dark tourism comprising several layers or stages which can be gradually represented by a continuum framework from “darkest to lightest”.

Therefore the author will claim that lighthouses may be classified as lighter dark tourism product according to Stone’s spectrum, since this category has all the necessary features usually associated to dark tourism. Lighthouses elicit unconscious thoughts and emotions which are implicitly related with death and can be intentional promoted by tourism operators as suggested by Sharpley (2009). The lighthouses are usually located in the coastal areas and islands which have a higher propensity for occurring disasters such as ship wrecks (for instance, the Coast of Death/ “Costa da Morte” in Galicia, Spain).

Therefore the visit to a lighthouse, or its use as lodging, is aligned with the claims of Stone and Sharpley (2008, p.586) who developed a model that aimed to conceptualize dark tourism as an opportunity to face “mortality moments” but within a distance and environment perceived as safe, allowing the “social neutralization” and “de-sequestration” of death and its reconceptualization.

METHODOLOGY AND FINDINGS

The relationship between risk/death and lighthouses is also supported by the 2016’s filmography. In order to demonstrate that relationship this paper will use a qualitative methodology which includes:
a) a content analysis of the synopses of several recently released films; b) the interpretation and semiotic processing of some lighthouses photos in order to build a taxonomy of explicit/implicit meanings.

The symbolism of lighthouses comprise several aspects that are deeply discussed later in the literature review section: a) the lighthouse as a landscape element; b) the risk recreation factor; c) the emotion contagion provoked by lighthouses; c) the lighthouses located in “lands’ ends” as “power spots” and dark tourism products;

Finally this paper will also present some case studies of routes based on the lighthouse’s thematic to highlight the design of dark tourism experiences: a) the hiking route “Camino dos Faros” in the Galician coast.; b) the lighthouses route in Brittany (France); c) the Lake Michigan lighthouses’ route; d) Other iconic lighthouses used as lodging.

Keywords: Lighthouse tourism; dark tourism; risk recreation; escape experiences; pilgrimage; dystopia.

DO COUNTRY-SPECIFIC FACTORS AFFECT THE VALUE RELEVANCE OF BRAND VALUE? AN EMPIRICAL ANALYSIS

Bagna, Emanuel1; Dicuonzo, Grazia2; Perrone, Andrea2; Dell’Atti, Vittorio2

1Department of Economics and Management, University of Pavia, UNIPV, Pavia, Italy
2Department of Economics, Management and Business Law, University of Bari Aldo Moro, UNIBA, Bari, Italy

ABSTRACT

Intangible assets and especially brands are considered as determinants of firm value. Due to their growing importance, consulting firms (e.g., Interbrand, Brand Finance and Millward Brand) publish annual reports on estimated brand values. Prior literature find that the brand values provided by independent parties are reflected on stock prices and therefore they are value relevant (Bart et al., 1998). The results prove that these non-accounting values represent a source of information for investors. However, the relationship between brand values and stock prices could differ across countries. Previous studies reveal that the value relevance of accounting variables diverges on a country basis and identify several country-specific factors which affect the information content of accounting variables. These factors are referred to the legal system, the accounting regulation and the financial system (market-oriented vs bank-oriented) of the different countries. To our knowledge, no studies test the effect of country-specific factors on the value relevance of non-accounting information.

The aim of this study is to investigate whether the value relevance of brand values provided by third independent parties differs across countries. Furthermore, we test if all country-specific factors examined affect the relationship between stock prices and non-accounting information. The analysis is based on a sample of brand values provided by Interbrand, Brand Finance and Millward Brand (BrandZ). These brands are owned by companies listed in different stock markets. This work has both theoretical and practical contributions. It fills the gap in the literature by providing evidence about the influence of country-specific factors on the value relevance of non-accounting information. Also, the results could help investors in their decision-making process, providing more tools to analyse the ability of stock prices to capture non-accounting information in different institutional context.

A COMPARATIVE CROSS COUNTRY ANALYSIS OF BANK MARKETING STRATEGIES DURING THE CURRENT GLOBAL FINANCIAL CRISIS

Balomenou, Chrysanthi; Akriviadi, Amalia

Faculty of Social Sciences, Post Graduate Program in Banking, Hellenic Open University, Patrai, Greece

ABSTRACT

GENERAL REMARKS

The current economic and financial crisis has caused a number of changes in financial markets and societies around the globe and has largely affected the behaviour of individual consumers. As a consequence, the relationship between commercial banks and their customers has also been affected by this fluctuating environment. Indeed, the median bank customer is gradually transforming his preferences, influenced by the transformations in the banking and financial markets as well as the profound changes which take place at the macroeconomic environment almost every day. The present paper analyses, both from a theoretical and from an empirical viewpoint, the behaviour of bank customers during the current crisis from a marketing perspective. Our research, which relies upon a formalised questionnaire, focuses on the Greek and the Luxemburgish banking sectors with the purpose to present, examine and compare the various marketing strategies which bank marketers follow in the two countries. Our main purpose is to gauge (by applying a binary logistic regression methodology), the degree to which the crisis has affected the demand and supply of the existing banking products and services, and to evaluate (via chi-squared Pearson correlation test), how marketers have reacted (or should react) to this sort of changes in order to help banks to stay afloat. According to our main findings, the Greek banks face more serious challenges compared to those that their Luxembourgish counterparts do. In particular, bank customers in Greece have a higher level of insecurity, as most of them have -partly or fully- withdrawn their deposits from the banks with which they have long-standing relationships. In contrast, the customers of Luxembourgish banks hold close ties to their primary banks regardless of the crisis. Arguably, marketers in both banking markets are called to meet the newly-developed needs of bank customers and promote the relevant products as appropriate, resorting to innovative strategies which will take the emerging financial and socioeconomic conditions into serious consideration. A series of this sort of products and techniques are proposed and described in our study.

THEORETICAL BACKGROUND
The undergoing economic and financial crisis has exerted a significant impact on financial markets, economies, and societies worldwide, contributing to deep and profound transformations in consumer behaviour worldwide (Kotler P., et al, 2009).

The bank-customer relationship has been largely affected by the crisis, since the latter has seriously hit the banking sector.

The median bank customer behaviour has been changed to a large degree; the preferences, needs and objectives of bank customers have been influenced by the rapid changes that have taken place in the financial, but also in the broader economic environment (Special issue on consumer confidence in financial services after the crunch: new theories and insights, 2009).

The effects of the crisis on bank marketing management (Kotler P., Keller K.L., 2012)

Insecurity/Uncertainty

Aggressive customer → conservative customer

Reduction of the marginal propensity to consume

Increase of the marginal propensity to save

Other substantial changes due to the crisis:

“Credit” and confidence shock → significant changes and upheavals in the market of banking products and services (Akinbami, F., 2011).

AIM OF THE PAPER

The main objective of the paper is the following:

To assess the extent to which the crisis has affected the preferences and altered the behaviour of bank customers and how this, in turn, has affected bank products and services from a marketing viewpoint.

In order to achieve the aforementioned goal, we focus on:

the Greek and the Luxembourgish banking environments, presenting and comparing the various marketing strategies and policies of bank marketers in these two European countries.

the post-marketing strategies, capable of promoting a set of modern banking services in the light of the crisis.

RESEARCH QUESTIONS

In which degree differentiated the demands of bank customers for the existing bank products and services (mainly regarding deposits) in the examining two Eurozone economies with different economic backgrounds and also with differences in their banking environments.
Is there any need to search and find new, modern marketing strategies based on the experience of the recent financial and economic crisis?

RESEARCH METHODOLOGY 1

In order to evaluate the extent to which the crisis has affected the choices and, in general, the behavior of banking customers in two Eurozone countries with different economic status and performance: Greece and Luxembourg, we adopted the following research methodology:

Qualitative approach/analysis based on a ‘in-house’ questionnaire in Greek and English. The survey took place from early January to late March 2013 and our sample were 190 bank customers in Greece and Luxembourg. In addition, we run a binary logistic regression analysis to empirically examine our main arguments based on our survey (qualitative) data. More specifically, we construct our logit regression model, based on the correlation tests we run, by applying the standard chi-squared Pearson correlation test. Actually, we test 2 hypotheses: a)H0: the examined variables are not correlated and b)H1: the two variables are correlated with each other.

RESULTS 1

The main revealing results by our empirical results are the following:

All the variables of our model are associated with a statistically significant relationship with the dependent variable in both regressions (i.e., for the Greek and the Luxembourgish banks).

Those individuals who have withdrawn their money (even for one day) from a bank other than their main bank during the crisis, are more likely to have withdrawn their funds from the main banks as well. This holds true for both depositors in Greek banks and the depositors in Luxembourgish banks (i.e., in both regressions).

The same phenomenon holds true for survey participants who have transferred money to some banking institution abroad.

Those who have requested or to be requested renegotiation of the terms of their mortgage loan in the near future from the main bank because they have been affected by the crisis, they have not proceeded to (fully or partly) withdraw their deposits from their main bank.

When respondents, both in Greece and Luxembourg, most trust a foreign bank, then it is more likely to have withdrawn their deposits from the main bank.

RESEARCH METHODOLOGY 2
For checking if there any need to search and find new, modern marketing strategies based on the experience of the recent financial and economic crisis, taking under consideration the results of our applied research we elaborated a qualitative analysis relying on the innovative Bank marketing strategies in view of the crisis. In order to realize this analysis we use as a case study the Luxemburgish Banks.

RESULTS 2

In Luxembourg, we passed from product marketing to individualised marketing. Thus, we can say that in this case the Individualised marketing and product planning in practice concentrated on (Banque International a Luxembourg, 2013):

Non-flat interest rate in some of the banking products offered: marketers are designing customized products which individual characteristics based on the individual customer needs.

Cross-selling activities.

In other words, in Luxembourg the bank marketers adopted the Strategy 1:1, which was launched in 1994 by Don Peppers, Martha Rogers and Dorf Bob in their book entitled “The One to One Field Book” and has become imperative, since the customization of the banking products helps to strengthen customer loyalty and faith and creates the environment for higher future returns.

In Luxembourg we can, also, observe (Banque et Caisse d’Epargne de l’Etat Luxembourg, 2013):

A re-evaluation of consumer trends and desires, combined with defensive marketing strategies instead of aggressive ones.

An implementation of interactive strategies between bank customers and the bank focussing on:

The bank needs to adopt a more customer-oriented approach, which will be promoted through interactive strategies between the customer and the same.

Implementation and use of the so-called ‘digital channels’.

The bank marketers through interactive strategies can, on the one hand, recover the lost confidence in their relationships with their customers on an individual basis and, on the other hand, to improve and customer their services to the new needs and desires of their customers.

As regards the advertising and budget setting (Srinivasan, R., et all., 2011):

The banking institutions that maintained their budget for promoting products and services largely unchanged during the crisis ended up with less losses in terms of customer numbers.

Further, those institutions gain ground faster in terms of market shares during the recovery phase of the economy than those that decided to impose cuts in advertising budgets.

OVERALL CONCLUSIONS AND IMPLICATIONS
From all the above mentioned it is obvious that (Pastore-Reiss, E., 2012):

After the crisis, the individual customer holds the handlebar.

Marketers should offer the ‘product and services maps’ to each of their customers showing him/her the path that he/she wishes to follow.

These ‘maps’ should include alternative products that would primarily meet the needs and the objectives of each individual customer.

More than ever, we must now focus on the quality of customer service, because under the new market conditions is not sufficient to maintain the existing clientele but also to establish a long-term relationship.

The bank marketers should comprehend the new consumer/customer behaviour and transform bank marketing as appropriate for the shake of their banks and for contributing to the recovery and the sustainability of the entire banking system.

**SUGGESTIONS FOR FURTHER RESEARCH**

**METHODOLOGY (1)**

We will use a logistic model which will capture the difference on Greek and Luxembourgish customers who have withdrawn their deposits from the above country banks. The logistic model will be conditional on different factors each time we run a regression in order to see which of these are more important for the bank owners. In addition, we will split the dataset to two periods in order to capture the impact of the pre- and post–crisis period on bank deposits.

One criterion which will be used will be the examination of funding integration, through the importance of factors, on the on-going attitude of customers, in order to compare their behavior during the two periods of investigation. Is there a similar pattern in the behavior of customers between Greek and Luxembourgish banks or Luxembourgish banks have affected less the withdrawn behavior of their customers? Do the Greek and Luxembourgish bank customers feel more uncomfortable with the banking system in Greece and Luxembourg?

**METHODOLOGY (2)**

If this is the case, we will measure the reaction of Greek and Luxembourgish bank customers on their process of getting their deposits to other countries. In particular, we would like to estimate whether these countries is, for example, Switzerland taking into account integration between foreign Greek and Luxembourgish deposits in Switzerland in comparison to domestic Greek and Luxembourgish
banking. This approach will reveal whether foreign Greek and Luxembourgish bank customers are more closed to the domestic Greek and Luxembourgish banking system or they prefer other banking systems for their deposits regarding their overall deposits.

**METHODOLOGY (3)**

Co-integration methodology will be applied in order to uncover different or similar patterns among the two country bank systems, one in Greece or Luxembourg and the other one abroad.

The dataset which will be collected is not only qualitative but also quantitative. We will measure the degree of banking integration through the quantitative dataset. While, in contrast, both the qualitative and quantitative dataset will be used in logistic conditional regression. Thus, we will create a questionnaire for the qualitative dataset, and quantitative dataset will be collected from Bankscope in order to run the two aforementioned methods.

THE CRUCIAL ROLE OF LENDER OF LAST RESORT AS ONE OF THE MAJOR MEANS OF THE BANKING SAFETY NET, ESPECIALLY IN CRISIS AND RECESSON PERIODS

Balomenou, Chrysanthi
Faculty of Social Sciences, Post Graduate Program in Banking, Hellenic Open University, Patrai, Greece

ABSTRACT

The main objectives of this, mainly, theoretical paper are: a) to highlight the importance of Lender of Last Resort, because without a lender of last resort financial stability is not possible and systemic financial crises get out of control. b) to stress the attention on the fact that Classic LOLR principles should be reviewed in light of Great Recession and c) to examine/compare the role of the central banks, especially FED and ECD in providing lender of last resort/emergency liquidity assistance (LOLR/ELA) and consequently, to analyze the Quantitative vs Credit easing that they are providing relatively, in crisis periods.

Thus, this paper seeks to assess the importance of banking system liquidity, generally but especially in financial crises and how the responsible authorities (in our case, at a national level, central banks and at an international one (ECB and FED)), may deal with it. Further more, this paper examines challenges in effectively implementing the lender-of-last-resort function in the EU single financial market. Briefly highlighted are features of the EU financial landscape that could increase EU systemic financial risk. Briefly described are the complexities of the EU’s financial-stability architecture for preventing and resolving financial problems, including lender-of-last-resort operations. The paper examines how the lender-of-last-resort function might materialize, by ECB vs FED during a systemic financial disturbance affecting more than one EU-US member state. Further more the paper identifies challenges and possible ways of enhancing the effectiveness of the existing architecture of ECB.

This scientific work is divided into 2 parts. In the first part, the function of a lender of last resort is analysed. In addition, it is presented the role of a lender of last resort that has been amended with the fundamental changes of the financial system that took place during the last 30 years and especially during the recent global financial crisis and its bad effects. While, in the second part, are presented the dimensions that the Fed and the ECB take over the function of lender of last resort in order to investigate, via a comparison analysis whether there are existing any differences between both euvres or not. Actually, the interventions made by the Fed and the ECB are described and judged in a detailed way.
Traditionally, discussion of the role of the lender of last resort has focused on the national economy, without regard for international complications, whereas, the contemporary one concentrated on the international context of it.

The arising by the aforementioned goals of the paper, research questions are focusing on how liquidity problems during the current crisis have differed from the past and in what way were, are and would be solved, through the central banks at national level– ECB – FED at international one, acting as Lenders of Last Resort in the former and the revised form, respectively. The subprime crisis has brought back to light proposals to regulate banks’ liquidity as a complement to solvency regulations. Based on several past and recent academic relevant researches, I suggest that liquidity regulations might indeed be a way to limit the pressure on Central Banks in favor of liquidity injections during crisis periods. Another crucial question is the allocation of responsibilities between the Central Banks and the Banking Supervisors in international level in the management of banking crises. Financial crises have become more frequent over the last two decades than they were previously. So, in the second part of the paper, I try to illuminate the fierce debate over how the monetary authorities (FED and ECB) handle and should handle these crises by bringing together a selection of characteristic writings on the subject and by reflecting the relevant viewpoints. In the same part another crucial arising research question is how the ECB – FED respond to the great dilemma “efficiency versus stability” in the financial /banking system and its regulatory framework and in a broader way “growth versus development” in the socioeconomic system, especially in the second phase of the crisis (2010-2012) where the main features of the crisis weren’t similar and the crisis took another turn with epicentre in the euro area and the ECB response shifted to another level, than the Fed’s one.

Regarding the methodological adopted approach, in order to answer the aforementioned research questions: Given that, as I mentioned, initially, this is a theoretical paper, I apply a qualitative analysis basing on the following methods, per part: In the first part, via a comprehensive literature review, I elaborate a qualitative analysis divided in 2 periods (before crisis, in periods of normalcy and in crisis periods: a) a historical analysis of the function of the classic role of Lender of Last Resort, and its definition, b) a Contemporary Analysis, of the international Lender of Last Resort in its revised version implementing in crisis periods, ba) Detailed comparative analysis of its main principles in periods of economic growth vs economic crisis, c) Comparison analysis between LolR-ELA (Emergency Liquidity Assistance) and EFSM (European Financial Stability Fund).

Financial crises have become more frequent over the last two decades than they were previously. So, in the second part of the paper, I try to illuminate the fierce debate over how the monetary authorities (FED and ECB) handle and should handle these crises by bringing together a selection of characteristic
writings on the subject and by reflecting the relevant viewpoints (literature review). Moreover, I elaborated comparative analysis, in terms of the following interventions of the ECB-FED: a) Risk Management vs Standard Economic Policy, b) Credit Easing vs Qquantitative Easing c) Conventional vs Unconventional monetary policy d) Rules vs. Discretion in Monetary Policy. Finally, trying to evaluate the effectiveness of each solution, I conducted a Swot Analysis, focused on: a) What is the efficiency of the handled policies of ECB and FED (i.e. Strengths), b) what are the Weaknesses in adopting Conventional instead of Unconventional monetary policies applied by the ECB and the Fed, during crisis times in terms of liquidity – Credit. b) What prospects for monetary policies applied by ECB and FED (i.e. opportunities) c) What risks of the policies of ECB and FED carried out (in other words, (Threats). But due to the qualitative type of the research, it should be pointed out that it is difficult to evaluate the effectiveness of each solution.

Thus, according to the main finding of the qualitative, per part, research:

In the first part we can observe that: During a financial crisis a central bank should lend comprehensively, at low interest rates. It should also accept poor collateral, and save systemic, relevant institutions even if these are insolvent, however, the owners of such institutions should not be rescued. (Herr,H,2014). Reputation and confidence are and were at the core of what LOLR/ELA operations aim to achieve. In this sense, the revision of the traditional principles ought to mitigate the issues of “stigma” (resulting from a perception that only the desperate go to the LOLR/ELA). (Campbell, A.& Lastra R, 2009, p.496). In any case, given that the longer a crisis lasts the more severe its effects are and according to Aditya Chakraborty (2008): “At the end of the tunnel of a financial crisis lies not light, but the gloom of recession. As surely as smoke follows fire, what comes after a financial meltdown is an economic downturn”. The repair of the financial system is a major priority for governments around the World. Besides, according to Ben Bernanke, (cited in Campbell, A.& Lastra R, 2009, p.497). “[H]istory demonstrates conclusively that a modern economy cannot grow if its financial system is not operating effectively.” Central banks and public authorities can claim that if they are to assist an institution in “a rainy day” they should regulate that institution in “a sunny day.” Hence, regulation and protection tend to be mutually reinforcing. So, the importance of a clear mandate and a set of enabling rules for the central bank with regard to financial stability, in particular with regard to its LOLR/ELA operations contributes positively to the safeguard of confidence and has a positive reputational effect. From all the above, it is obvious that all the proposing reforms could contribute to a more effective and efficient function of the LOLR, provided that they will be combined with the appropriate reforms and restructuring strategies of the Banking and generally financial system.
As far as the results addressed to the second part, revealing from the qualitative comparative analysis between ECB – FED and in someway the BoE, briefly: Different economic and financial structures require different crisis responses. Different crises also require different tools and resources. The first ‘stage’ of the financial crisis (2007 -2009) was similar on both sides of the Atlantic, and the response was also quite similar. The second stage of the crisis is unique to the euro area. Increasing financial disintegration within the region has forced the ECB to become the central counterparty for the entire cross border banking market and to intervene in the sovereign bond market of some stressed countries. The actions undertaken by the ECB, however, have not always represented the best response, in terms of effectiveness, consistency and transparency. This is especially true for the (Securities Markets Program) (SMP): by de facto imposing its absolute seniority during the Greek PSI (Private Sector Involvement), the ECB has probably killed its future effectiveness. Furthermore, we can argue that concerning the arising great dilemma: efficiency versus stability in the financial /banking system and its regulatory framework, from our research it is obvious that when we have an effective banking system the relevant rules are ineffective, on the contrary when it is crisis prone the relevant legislative framework is stable. This dilemma is resembling to another great one that can be found in the field of regional science: efficiency versus equity. (Konsolas, N, 1997). So, in our examining situation, the FED undertook massive asset purchases financed by central bank money, the so-called Quantitative Easing (QE). A similar approach was followed by the Bank of England (BoE). While the Federal Reserve and the BoE have done QE, the ECB had to respond to an increasing financial disintegration within the region. The ECB has been forced to become the central counterparty of the entire cross border banking market and to intervene in the sovereign bond market of some stressed countries. Therefore, its main policy approach can be qualified as ‘credit easing. In the assessing procedure of the effectiveness of the two approaches it emerges that while the ECB has responded massively to the crisis (LTRO (longer-term refinancing operations) and SMP (Securities Market Program)), it has also tried to minimise its own risk. Alas, this implies that its policy cannot be fully effective. This approach is significantly different from the one chosen by the FED, who showed its willingness to take on credit risk in order to provide relief to private investors, which therefore could recover quickly. Consequently, in this way FED supports the entrepreneurship and reinforces both the economic growth and development. The ECB makes a distinction between interest rate policy, which guides macroeconomic variables (growth, inflation), and unconventional policy, the objective of which is to prevent a liquidity crisis and to ensure the stability of the banking and financial system. So, we can say, that in a way the ECB is following more a by rules monetary policy. On the other hand, Fed, for its part, sees unconventional policy as an extension of interest rate policy, with the aim of easing monetary conditions further. Thus, as it is obvious, the FED’s policy could be
considered as more discretionable one. Besides, The difference between the two policies is found in the fact that the increase in the ECB’s balance sheet to a great extent is the result of “actions” by the banks (demand for liquidity at the LTROs), while that of the Fed results from its own willingness to buy securities. Furthermore, the Fed carries out outright purchases of securities, while the ECB grants liquidity via refinancing operations (collateral). In addition, the objectives pursued by the ECB are to prevent a liquidity crisis, help the banks and thus dampen the risk of a credit crunch. The Fed, for its part, explicitly states that its actions aim to make monetary conditions more accommodating in order to boost the economy (via a fall in long-term interest rates, stimulus for stock markets, etc.). Finally, in order to declare more the research output and specify the metrics used to measure the participating Central Bank’s own risk. I quote 2 characteristic comparative diagrams, per crisis period, where are indicated the following: a) In the first figure, referring to the 1st crisis period are presented the Total Assets/Liabilities of ECB, FED and BoE, showing that increase in the ECB balance sheet, during this period looks small with only 170%. While, over the same period, the Fed’s expansion has been of the order of 230% and in the UK, (BoE) it reached 300%. b) In figure 2, related to the 2nd crisis period, it is presented Central banks’ Securities purchase as % of GDP (Gross Domestic Product). In this figure, we can observe, how the purchases made by ECB under the two open market operations (i.e. Securities Markets Programme – SMP- and Covered Bond Purchase Program- CBPP appear very limited in comparison to the QE (Quantitative Easing) undertaken by the FED and the BoE. So, it is verified that the statistics are in accordance with the theoretical – qualitative findings of my research.

SMES, SOCIAL MEDIA AND INTERNATIONALIZATION: AN EXPLORATIVE RESEARCH

Bartoloni, Sara; Pascucci, Federica

Department of Management, UNIVPM, Ancona, Italy

ABSTRACT

OBJECTIVE AND RESEARCH QUESTION

Removing the geographical distance between seller and buyer, the online channel has made more feasible for SMEs to become international and to operate on a global level (Sinkovics et al., 2013). In this scenario, social networks, such as Facebook, are attracting more and more attention from both researchers and practitioners, due to their great potential to conduct marketing activities internationally (del Carmen Alarcon et al., 2015). These tools are known to create new direct relationship channels with customers, to promote products and brands through E-worth of mouth, to raise brand awareness and loyalty (Vernuccio, 2010), both at a domestic and an international level.

However, implementing an international social media strategy is not so simple as it seems. In fact, even if creating a Facebook account is a simple and low-cost operation, there are some issues that cannot be ignored, such as the “cultural problem”. Internet has not removed the “psychic distance” among people of different countries and the cultural variables profoundly influence users’ expectations, online preferences and behaviors. In literature, the issue of the cultural adaptation has been deepened in particular with reference to the corporate web site (Singh and Pereira, 2005); a lot of studies have shown that the localization of the content and the structure of the web site influences its own performance, in terms of superior usability, trust and conversion rate (Bartikowski and Singh, 2013). The same multilingual and cultural problems could be found also in the social media area (Tsai and Men, 2014). Moreover, cultural norms impact on the choice of the social network platform to use: in some countries, such as China or Russia, people prefer to use local platforms, for example Qzone or VKontakte. This means that a company will need to customize social media aspects of its marketing strategy to fit and accommodate national differences.

From a systematic literature review about this topic a gap has emerged: studies about social media use in the international marketing strategies of firms are scarce, especially as regards to the SMEs. We found only three studies that dealt with this topic (Berthon et al., 2012; Munar, 2012; Yang and Wang, 2015). So, in order to close this gap, the purpose of this study is to explore the social media use of SMEs in an international marketing context. In particular, the research question is the following:
Have Italian SME been using social media in their international marketing strategies and, if so, how do they use them to communicate with foreign customers?

METHODOLOGY

Since the topic is mostly unknown and in congruence with the explorative nature of the research purpose, a qualitative methodology has been chosen and in particular the multiple case studies method has been implemented (Stake, 1995; Yin 2003). Through the “purposful sampling” technique, we selected n.7 Italian SMEs of Food and Beverage industry, that are “information rich cases”, following the “theoretical saturation” principle (Eisenhardt, 1989). We chose this industry because it is one of the most representative of Made in Italy, it is export-oriented (SACE, 2016) and because of its level of attractiveness abroad, especially online (Fondazione Symbola – Unioncamere – Fondazione Edison, 2015).

We collect the data through face to face semi-structured interviews, specifically investigating the languages adopted, the presence of targeted foreign accounts, the use of customized content and the main barriers faced by firms in foreign social media activities.

MAIN FINDINGS

✓ In general, the use of social media channels seems to be unplanned and improvised, without a clear strategy in mind. In the majority of the cases (n.5) they are internally managed and there is not a specific editorial plan for the content publication (with two exceptions). The main purpose of this presence is to promote brand and to gain visibility abroad.

✓ The empirical evidence shown a limited propensity to adapt the social media presence, both in terms of language and content. In 5 out of 7 cases the firms have implemented a single Italian page, where some English contents are rarely published. In these cases, the localization issue is not perceived as relevant, showing a significant gap between the suggestions of theory and the practice. In only two cases some forms of adaptations have been implemented. Firm F has adapted the platform to the target country – they use Facebook for Italian market and Twitter for USA. Firm G adopts a so called “multilocal strategy”, but with a peculiarity: the country-pages are managed by the foreign local dealers and not by the firm directly.

✓ The motivations of this scarce adaptation are the same for all the firms. First of all, they don’t perceive the need to communicate to foreign customers in a differentiated manner, depending on their cultural traits, even if they are aware of the cultural differences. Second, they complain about the lack of human resources with adequate competences to dedicate to the social media management at the
international level. Connected to this, there is the issue of inadequate external services supply, as perceived by the firms. Thirdly, the small size and the consequent lack of financial resources are other factors that prevent the investigated firms to use and adapt social media to the foreign customers.

✔ A scarce knowledge of the possible localization strategies by the investigated firms has emerged. They seem to ignored the existence of hybrid strategies, such as the “glocal approach”, that entail lower costs and complexity than the complete localization, and so are more suitable for their size and resources.

✔ The presence of a marketing department, the firm’s size (micro, small or medium) and the export rate seems to not influence the social media approach in international marketing.

SOCIAL MEDIA IMPACT ON NPO BRAND EQUITY: CONCEPTUALIZING

THE TRENDS AND PROSPECTS

Belenioti, Zoe-Charis¹; Vassiliadis, Chris A.²

¹Faculty of Economic & Political Science/ Dept. Journalism & Mass Communications, Aristotle University of Thessaloniki, AUTH, Thessaloniki, Greece
²Department of Business Administration, University of Macedonia, UOM Thessaloniki, Greece

ABSTRACT

Previous studies have shown the correlation between marketing communication mix and branding outcomes. Upon the emergence of Web 2.0, influential researchers have highlighted the need for further investigation on how branding models such as the brand equity dimensions (brand awareness, perceived quality, association and brand loyalty) are reshaped or formulated (Berthon, Pitt, Plangger, & Shapiro, 2012; Bruhn et al., 2012; Hennig-Thurau et al., 2010; Kapoor, et al, 2013; Keller, 2009). Nevertheless the advent of social media resurged scholars’ attention, still literature into branding equity within social media is extremely limited and fragmented given the embryonic stage of social media research (Bruhn et al., 2012; Langaro et al., 2015 ; Kuvykaite & Piligrimiene 2014 ; Belenioti, 2015; Belenioti et al., 2015; Vassiliadis & Belenioti, 2015 ; Belenioti & Vassiliadis 2016). Thus, both for profit (Kuvykaite & Piligrimiene 2014) and non-profit organizations (NPOs) have been failing to successfully reap all the social media benefits within branding (Belenioti & Vassiliadis, 2016; Vassiliadis & Belenioti, 2015). So far, no single study investigates the impact of social media on brand equity within the non-profit sector. Following the call of Barreda et al. (2015), this study seeks to remedy this problem by conceptualizing the literature of the social media impact on NPOs’ brand equity and by providing a new research agenda. For first time, this interdisciplinary project makes a major contribution by enhancing our understanding the link between social media and brand equity in NPOs and by suggesting a new research agenda and managerial implications.

THE SOCIAL RESPONSIBILITY IN BANKING: REVIEW AND RESEARCH PERSPECTIVES

Bellomo, Mario Filippo Paolo; La Rosa, Fabio
Economics and Law Faculty, “Kore” University of Enna, Enna, Italy

ABSTRACT

This paper proposes a review concerning the topic of social responsibility in banks. In the backdrop of the economic crisis which is still ongoing, companies are requested to align with the directives and, more generally, with the values of social responsibility. The compliance to social responsibility nevertheless cannot only be seen as a commandment imposed from the top and far removed from the competitive business environment which is passively adapted to, but rather as an opportunity for diversification and competitive advantage (Birindelli et al., 2015). Such problem is exacerbated in the banking sector, in which the elements of competitive differentiation are often ephemeral and volatile, since they are based on price (in the loans and services context) and performance (in the management of deposits).

This paper focuses on six areas, which have been extensively analyzed by the national U.S. and European literature in the banking sector, in details: I) the relationship between attention to social responsibility and incomes or stock performance of banks; II) the effects of cultural, ethnic and gender variables on social responsibility indicators; III) social responsibility and its impacts in terms of customer satisfaction; IV) the compilation of rankings of bank operators, on the basis of results achieved in terms of social responsibility; V) the relationship between attention to social responsibility and degree of self regulation and cooperation; VI) the relationship between attention to the liability and legal enforcement on a national scale.

The study proposes to deepen some critical issues, in order to offer ideas for new research into yet unexplored areas.

As regards the first and third area, literature shows as people may not believe in an explicit trade-off between being profitable and meeting legal, ethical, and discretionary responsibilities anymore. Yet, banking industry surveys have highlighted a mismatch between consumer satisfaction and massive spending on CSR programs. Indeed, it is evident the omission of research on the differential impact of CSR initiatives on consumer satisfaction. Given both the increasing investment in CSR strategies, and the fact that customer satisfaction mediates firm market value, more awareness of the hierarchy of customer-preferred CSR initiatives is needed in order to enable banks to adapt their CSR programs, to not only benefit community, but also to improve customer satisfaction (McDonald et al., 2008).

In reference to the second area, literature confirms significant differences in CSR across cultures even...
within one single internationally operating organization; meeting such differences does not come at the expense of economic performance levels or legal limitations (Van den Heuvel et al., 2014). The most important question arising from this issue is whether CSR-oriented organizations will survive in the long term in the whirlpool of supercapitalism (Reich, 2007) and hypercompetition (D’Aveni, 1994), strongly emphasizing shareholder satisfaction. Further research on the differences in CSR across various cultures should be undertaken, incorporating various populations in different countries, through multinational banks with branches across different countries since often researches are focused only on one nation located banks.

In reference to the fourth area, literature underlines that these approaches have the advantage of being quite transparent and objective, as they are based on publicly available information on websites of banks and supranational bodies and reporting specialized NGOs. The biggest flaw of these researches is the limited number of banks for which reports are available, since there is a generalized problem of insufficient disclosure in CSR activities (Scholtens, 2009).

As regards the fifth and sixth areas, data confirm that financial firms in countries with stronger legal enforcement measures engage in more CSR activities, but interestingly, those firms in countries with stronger shareholders’ rights engage in less CSR activities.

Furthermore financial firms in countries with more cooperative employer–employee relations, will be more CSR minded; self-regulation in the financial industry has a significantly positive effect on CSR. A financial firm, adopting either the Equator or Wolfsberg Principles, will be an attractive investment for socially responsible investors (Hsiang-Lin et al., 2009).

A CHOICE OF SOCIALLY RESPONSIBLE INSTRUMENTS: SME STUDY IN 6 COUNTRIES

Belyaeva, Zhanna1; Lopatkova, Yana1; Kislyak, Nadezhda1; Rudawska, Edyta2

1Graduate School of Economics and Management, Ural Federal University, GSEM-UrFU, Yekaterinburg, Russia
2Faculty of Economics and Management, The University of Szczecin, Szczecin, Poland

ABSTRACT

Nowadays socially responsible strategies are first associated with big corporations. In the meantime SMEs are more flexible to respond to changes in society and the environment. One of the reason that the sustainable strategies of SME are questioned that there is a lack of data and transparency over the globe.

This abstract pinpoints current trends in socially responsible instruments that SME in 6 countries use in the framework of corporate social responsibility. We differentiate country-level CSR-SME models and outline the selected models using qualitative and quantitative methods. We have measured the factors providing the key motivation for owners to invest in socially responsible actions using a sample of 750 SME in food industry in 6 countries of a diverse economic, social and cultural level of development: Russia, Poland, Great Britain, Germany, Spain, and Croatia. The main aim of the research is to develop a new knowledge about the relation between the scope of socially responsible strategies application in SMEs and a degree of socio-economic development of the selected country. The study implies the following methodology: 1) survey among representatives of small and medium-sized businesses through online questioning and interviewing; 2) descriptive research and statistical analysis; 3) comparative analysis of results in different countries.

Comparative analysis of small and medium-sized businesses in Russia and Europe allows us to assess the socio-economic differences and differences in the actual state of implementation of the project idea between countries that participate in the project.

The main issue applies to the identification of the way socially responsible strategies and CSR tools are used in SMEs. The research revealed what a socially responsible strategy for SMEs in different countries means (table 1).

United Kingdom | 1) Conducting ethical activity (according to laws and regulations) 2) Offering environmentally friendly and safe products/services for customers |

Participants were asked to assess the challenges facing the business. On average for all countries the main tasks facing the business in the next 3-5 years are: attraction and retention of clients, creating a strong corporate image and positive reputation, preservation of personnel.

The questionnaire was compiled by the international research team and translated into 6 languages. After pilot testing we have adjusted the questionnaire for local use. The questionnaire consists of 4 parts: the place of socially responsible strategies in the overall business strategy; level of manager’s awareness in CSR (understanding of terminology, difficulties and benefits of introducing a socially responsible strategy); using the tools of a socially responsible strategy based on marketing mix: product, price, distribution, communications and employees; descriptive statistics of companies: firm size, turnover from sales, period of operation etc. Participants were asked to evaluate the tools they use within their socially-oriented strategy in 5 areas of the marketing mix. The comparative results are shown in figure 1.

Figure 1. The importance of the main directions of the implementation of socially responsible enterprise strategy in the countries under study

The binary model used to conduct the probability analysis between application CSR strategy and influence factors (representative’s knowledge about socially responsible strategies; manager’s attitudes towards the concept; marketing experience, etc.). This tool will allow us to describe the relation between the scope of socially responsible strategies application in SMEs and a degree of socio-
economic development of the selected country. Thus, this set of methods allows obtaining qualitative and quantitative data. Hence, it makes possible to fully and from different sides consider the problems of the study and draw more precise conclusions. It was also proposed to assess the benefits that enterprises receive through the introduction of CSR. A descriptive study was based on average values. The formula for the binary choice model is shown below. Test results are presented in the table 2.

\[ p(\text{practice}) = F(\beta_0 + \beta_1 \times \text{mission} + \beta_2 \times \text{term} + \beta_3 \times \text{staff} + \beta_4 \times \text{turnover} + \beta_5 \times \text{origin} + \beta_6 \times \text{P4_31b} + \beta_7 \times \text{gdppc}), \]

where mission is an existence of mission; term - knowledge of CSR terminology; staff - number of staff; turnover - net turnover; origin - the age of the firm; P4_31b - selling goods/services on the Internet; Gdppc - GDP of the country, $/1000.

CONSUMER-BRAND ENGAGEMENT THROUGH WEBSITE STIMULI

Bilro, Ricardo; Loureiro, Sandra Maria Correia

Marketing, Operations and General Management Department, Instituto Universitário de Lisboa (ISCTE-IUL) and Business Research Unit (BRU/UNIDE), Lisbon, Portugal

ABSTRACT

RESEARCH AIMS
Previous studies concerning consumer engagement have been dedicated to conceptualizing the construct and proposing scales to measure it (Van Doorn et al. 2010; Bolton 2011; Bijmolt et al. 2010; Brodie et al. 2011; Hollebeek et al. 2014). Yet, further research has been suggested in those studies regarding antecedents and outcomes of online consumer engagement. The following questions remain open: what drives consumers to be online engaged? And what are the outcomes of being online engaged? The aim of the current research is to contribute to the fulfillment of this gap in the literature, analyzing which dimensions of online stimuli with websites exercise more effect on online engagement and which of this dimensions’ most influence brand advocacy.

THEORETICAL BACKGROUND
Previous research attempts to consider and suggest several factors, such as customer involvement (e.g., Hollebeek et al. 2014), employee engagement in offline context (e.g., Pansari & Kumar 2016), or even customer purchase process, incentivized referrals, social influence and knowledge sharing, as related to customer engagement. Brodie et al. (2011) also consider that customer engagement occurs by interactive and co-creative customer experience with the focal agent. Therefore, the stimuli of the experience using websites to search for information and purchase the products may be a driver to customer engagement.

The current research aims to consider three stimuli of online experience influencing the customer engagement: information/content, interactive features, and design-visual appeal. According to Loureiro (2015), there is no standard method of evaluating websites and (Law et al. 2010, p.310) advance that ‘researchers do, and should, choose the most appropriate approach for their research objectives, target markets, and stakeholders.’ In this sense, this research is adopting the previously mentioned three stimuli following Loureiro (2015) and Han & Mills (2006), which are considered appropriate for measuring stimuli of online experience as antecedents of online consumer engagement.

Customer engagement has also been associated with consumer-brand connection and brand usage intention - the willingness to use again - (Hollebeek et al. 2014), or firm performance (Pansari & Kumar
2016), improved consumers’ contributions to collaborative product development process or co-creation experiences or even brand referrals(e.g., Bijmolt et al. 2010; Sawhney et al. 2005). In this sense, we suggest that when customers are engaged to an online supplier brand, not only will be self-connected to the website and wish to use it again but will also recommend it to others customers’ and excuse it if anything went wrong (brand advocacy).

HYPOTHESES
Several studies have pointed out that comprehensiveness, uniqueness, accuracy, and entertainment value, as well as the timeliness of information/content, will increase customers’ shopping experience (Aladwani & Palvia 2002; Kaynama & Black 2000). Therefore, the Information/Content dimension can be defined as the extent to which a user thinks that information/contents are useful, updated, and reliable (Park et al. 2007). Thereby:

H1: Information/content has a positive relationship with online engagement, that is, Cognitive processing (H1a), Affection(H1b) and Activation (H1c).

Interactive features of a website refer to items that generate a responsive behavior from online consumers such as sending inquiring emails or searching and planning through the website. These items allow consumers to engage in a certain manner to the website after a design-visual appeal has captured their attention and information/content have increased their interest in (Han & Mills 2006). In this sense, we propose:

H2: Interactive features has a positive relationship with online engagement, that is, Cognitive processing (H2a), Affection(H2b) and Activation (H2c).

An important test for online suppliers concerns about deciding the style and visual interest of the website in a way that it will enhance consumers’ flow process and consider the online consumers’ experience as well as goal-directed behaviors. Therefore, the design-visual appeal dimension refers to the proper use of color, graphics, image, and animations, that is, the organization and presentation of a website (Park et al. 2007). Thereby:

H3: Design-visual appeal has a positive relationship with online engagement, that is, Cognitive processing (H3a), Affection(H3b) and Activation (H3c).

As describe in the literature, brand advocacy can be perceived as the extent to which person actively recommend or support, relative to other brands, a specific brand within a product category to other customers (Badrinarayanan & Laverie 2013), as well as the consumers’ behaviour intending to try new
products of the brand, spreading favourable word-of-mouth and being resilient to negative information (Pai et al. 2013). Therefore, we propose:

H4: The cognitive processing dimension of online engagement has a positive relationship with brand advocacy

H5: The affection dimension of online engagement has a positive relationship with brand advocacy

H6: The activation dimension of online engagement has a positive relationship with brand advocacy

EXPECTED OUTCOMES

The current research intends to understand if the online consumer’s experience creates stimuli that could generate online consumer engagement. It’s our aim to find a causal relationship between stimulus and mentioned online engagement dimensions, e.g., to measure the relation between Interactive features and Cognitive processing or between Affection of engagement and Information content. From what we can see so far, Information content presents a very significant stimulus on cognitive processing and Information content, and Design-visual appeal seems to have a significant effect on Activation. However, Interactive features need deeper understand concerning its effect on Activation. About the relationship between online engagement and brand advocacy, it is expected to understand and analyze which dimension (Cognitive processing, Affection, and Activation) most influence brand advocacy, as well as to recognize the influence of each one and its respective significance.

Keywords: Information/Content, Interactive Features, Design-Visual Appeal, Online Engagement, Brand Advocacy.

DOES THE PRESENCE OF WOMEN IN SUPERVISORY BOARDS INFLUENCE
FIRM PERFORMANCE?

Binder, B.C.K.

School of Engineering, Pforzheim University, Pforzheim, Germany

ABSTRACT

Many large companies in Europe include mainly men in supervisory boards and the women quota is often lower than 20%. The present article looks at the companies of EURO STOXX 50 in the year 2015 and their success and tries to establish whether this success can be related to the percentage of female members in supervisory positions. It replicates in this way the study of Binder, Alonso-Almeida and Bremser (2016) which analysed the relationship between female’s representation in the management board (executive board) and firm performance (measured by earnings before taxes - EBT) of the EURO STOXX 50 companies in 2014. It is in the same time an extension of the original study as the supervisory board is brought under scrutiny.

INTRODUCTION

This article offers an insight into the relationship between the economic success of 50 European companies and the gender balance on supervisory boards. For this purpose the article builds upon existing literature in the field of KPIs, diversity management, supervisory boards, and women quota, etc. Thus, the paper can help investors or business owners to gain a thorough understanding of the current business environment.

LITERATURE REVIEW

Women’s presence in supervisory boards was a controversial issues in past decades. Beaufort and Summers (2013) identified at European level a 1.5% change of women representation in mainly male supervisory boards between 2009 and 2013. If women were already member in a supervisory board, the women quota was likely to increase further. According to the above study the average women quota in supervisory boards in Europe in 2013 was 7.9%. France stood out as a positive example with a women quota of 28.1% in 2013.

The study “Women matter. Gender diversity, a corporate performance driver” shows that companies with a higher proportion of women in top management perform better (McKinsey, 2007). Other authors signal rather the lack of evidence that female representation in supervisory boards improves profitability (Ferreira, 2014). In a study with 108 German large corporations which took place between

Global and national business theories and practice: bridging the past with the future
ISSN: 2547-8516
2009 and 2013, there was not enough evidence to indicate a significant relationship between gender diversity and firms' financial performance (Dick, 2015).

The present research focuses on the companies of the EURO STOXX 50 index, and aims at exploring whether there is a link between the EBT of these successful European companies and the number of women in supervisory boards. The following hypothesis is formulated and will be tackled in the following sections:

H1: Enterprises which have a higher gender quota in supervisory boards are more successful and achieve a higher EBT.

**METHODOLOGY**

The EURO STOXX 50 Index was selected to represent the performance of the 50 largest companies among 19 supersectors in the year 2015. Moreover, EURO STOXX 50 index is one of the most liquid indices for the Eurozone and serves for benchmarking purposes. It represents the performance of only the largest and most liquid companies in a sector (STOXX Limited, 2016).

The current study looks at the number of women in supervisory boards as presented in the 2015 annual reports of the fifty EURO STOXX companies, and data regarding the EBT of each of the fifty companies was collected via financial websites.

**FINDINGS**

The 50 EURO STOXX companies in Europe are located only in 7 countries and are active in no less than 16 economic sectors. In six out of the seven countries, the women quota in supervisory boards in 2015 was higher than 25% in average (see figure 1).

![Figure 1: Number of women on the supervisory board of EURO STOXX companies in 2015 in different countries](image-url)
In contrast, only in two countries the women quota in management boards in the year 2014 was higher than 25% (Binder et al., 2016). This shows that there are more women in supervisory boards than in management boards. If France and Germany, the countries with the highest number of companies in the EURO STOXX index are compared, one can see that France has a higher concentration of women in supervisory positions (36%) as well as a higher number of companies in the EURO STOXX index. However, these companies are less successful than the German companies in terms of EBT per employee. The German companies have a better EBT per employee although the women quota is lower when compared with that of French companies (26%). However, the 26% women quota seems to lead to better results by EBT per employee in the top 10 companies compared to other German enterprises.

DISCUSSION OF RESULTS AND CONCLUSION

The statistical analysis conducted in this study has shown that the raised hypothesis can be supported. Nevertheless, these findings should be treated cautiously. They do not imply that women in supervisory positions are more effective than men. With the exception of three companies, the supervisory boards of the other EURO STOXX 50 companies contain mainly male persons. The success of a company is also a result of the entire supervisory board, male and female alike.

MARKETING DOCTRINE AS A PRECURSOR TO NEW PRODUCT DEVELOPMENT AND INTERNATIONAL PERFORMANCE: TOWARDS A TESTABLE THEORETICAL MODEL

Boulos, Jumana Shukri; Shoham, Aviv
Business Administration, University of Haifa, Haifa, Israel

ABSTRACT

INTRODUCTION

New product introductions have been commonly viewed as a key component of sustainable competitive advantage and as a vehicle for growing businesses profitably. However, most ideas for new products never get to the introduction phase and around 40% of new products of those introduced to the market fail to meet commercial objectives of the firms that launched them. In search of critical factors underlying new product success, we propose a model of new product performance utilizing Marketing Doctrine (MD hereunder), developed by Challagalla, Murtha, and Jaworski (2014) as a new concept that can help in advancing the understanding of success factors in developing new products. MD was defined as "a firm's unique principles, distilled from its experiences, which provide firm-wide guidance on market-facing choices". The conceptual model developed here is based on the notion that MD serves as an RBV resource. It leads firms to create new product development capabilities, through which they can develop innovative products, leading in turn to successful international market introductions and therefore to high international performance. The study should make an original contribution since it will provide a first empirical test of the relationship between MD and new product success.

Given the importance of successful new product introductions (Cooper 1979; Cooper and Kleinschmidt 1987; Yenipazarli 2014), considerable conceptual and empirical research has focused on new product success (NPS) factors. According to Cooper (1990), successful product innovations have payoffs in way of enhanced cash flows as well as in higher firm valuations by equity markets (Cooper 1990).

However, most ideas for new products never get to the introduction phase and around 40% of new products of those introduced to the market fail to meet commercial objectives of the business units that launched them (Crawford, 1977, 1987). Firms thus find themselves in a double bind. On one hand, they must innovate continuously and consistently to remain competitive, but on the other hand,
innovation is risky and expensive. Thus, it is crucial to assess the role of critical factors underlying NPS (e.g., Cooper 1979; Cooper and Kleinschmidt 1987; Yenipazarli 2014).

In light of the above, we propose a model that utilizes MD (Challagalla, Murtha, and Jaworski 2014; CMJ hereunder) as an important precursor to the development and success of new products. CMJ (p. 7) defined MD as "a firm’s unique principles, distilled from its experiences, which provide firm-wide guidance on market-facing choices".

While CMJ’s paper was conceptual in nature, it provided some measure of support to the notion that greater use of MD enhances firms’ performance, more so when competitive intensity is high. Moreover, their field research indicates that roughly 10% of fortune 500 firms have adopted this "principles-based" approach.

Based on CMJ’s conceptualization of MD, we propose that it is a resource in the spirit of the Resource-Based-View theory (RBV hereunder) and use RBV-based arguments for explicating MD’s role in contributing to NPS. RBV argues that resources satisfying four conditions (valuable, rare, inimitable and non-substitutable), contribute to the development of capabilities, which are sustainable competitive advantages (Barney 1991). MD satisfies the conditions underlying RBV theory thus serving as a basis for firms’ capability for developing new products for international markets and through such a capability, contributes to international performance.

Our model is depicted in Figure 1. Based on the argument that MD serves as an RBV-like resource which meets the conditions required, it leads firms to create new product development capabilities, through which they can develop innovative products, leading in turn to successful international market introductions and therefore to high international performance. Testing empirically the integrative model shown in Figure 1 should help advance the marketing discipline understands of new product success factors.

The research will be based on a survey distributed to top managers of international Israeli companies. The sample will include companies from a wide cross-section of industries. Responses to the survey will be purchased from I-Panel, Israel’s largest consumer panel company according to pre-specified conditions.

Statistical analyses will include descriptive statistics, correlations, reliability analyses (alpha coefficients), factor analyses, and regression models.
Keywords: Marketing Doctrine, Resource-Based-View, New Product Success, International Performance.

DOES MONEY BUY YOU HAPPINESS?

Bozcuk, Aslıhan

Accounting and Finance, Department of Business Management, Akdeniz University, Antalya, Turkey.

ABSTRACT

PURPOSE

Happiness has riveted many scholars since the times of Plato and Aristotle. There is a rich body of work that refers to happiness as a descriptive psychological term and an even colossally richer body of work that refers to happiness as a philosophical term. Regardless of the various approaches to defining the term, ask anyone you know if they are happy and they will have an answer for you. This provides the basic motivation for this research.

This study asks a simple question; “Does money buy you happiness?”. In doing so, it looks at the issue form a personal financial point of view and takes into account not just income but also a number of factors that might have an impact on the overall financial status of an individual. A novelty provided by this work is the inclusion of ‘hope’, or rather the lack of it, in the inquiry of the association between happiness and personal finances.

A basic search in SSCI1 for the topic “happiness” brings 16,288 results, only 62 of which fall into the Business Finance category. Out of that 62, only 5 studies adopt the personal financial situation point of view. Hence this research is valuable in bridging the gap between happiness and personal finances through the novel inclusion of hope.

CONCEPTUAL FRAMEWORK

Happiness is defined by Aristotle as “the central purpose of human life” (Kraut, 2016). Also referred to as subjective well-being, happiness encompasses a broad number of elements relating to both physical and emotional well-being, such as good friends, wealth and power, to name a few. More recently, Wilson (1967) was the first to put together a comprehensive list of attributes a happy person possesses, which includes “young, healthy, well-educated, well-paid, extroverted, optimistic, worry-free, religious, married person with high self-esteem, job morale, modest aspirations, of either sex and of as wide range of intelligence” (p.294). These attributes carry quite a few common points with those originally suggested by Aristotle2.

---

1 SSCI: Social Science Citation Index, Web of Science by Thomson Reuters.
2 For a complete literature review, summarising more than 300 papers on the topic, please refer to Diener Et al.(1999) and Helliwell (2001).
The other pillar of this study, the lack of “hope” is defined as feelings about the future, loss of motivation and pessimistic expectations. Beck et al. (1974) constructed the Beck Hopelessness Scale (BHS), a well-established and widely-used instrument in quantifying hopelessness. It consists of a 20-item self-administered inventory, with ‘yes’ or ‘no’ answers, initially used in a clinical setup involving hospitalised patients who had recent suicide attempts. Recently, Pompili et al. (2016) use the BHS instrument in assessing the association between hopelessness, depression and subjective well-being.

**METHODOLOGY**

A short questionnaire was administered in public places, usually city centres and shopping malls, in 10 different cities in Turkey. City selection was based on obtaining the widest possible array of economic, geographical and cultural differences. Question selection is based on Helliwell (2003) with modifications to reflect country-specific conditions and the addition of the BHS. Every third person was approached and invited to participate in the one-page, anonymous questionnaire including questions about their age, gender, marital status, number of children, chronic illnesses, education status, ownership of a house and a car, employment and pension status, happiness rated on a 10-point visual scale and the BHS inventory. There are 1,482 respondents with a rejection rate of 40.7%.

**FINDINGS**

The average (min-max) happiness score is 6.08 (0-10), average age is 35 (19-75) and average Beck Score was 6.52 (0-20), respectively. 52% of the respondents are male.

</tbody>
</table>

Dependent variable: Happiness Score. (*) Forward Stepwise Regression including all variables.

Table 1 presents the results of the univariate and the multivariate regressions, with happiness as the dependent variable. All 3 models are statistically significant with a p-value of 0.000. In Model 1, household income is positive and significantly related with happiness. In model 2, as expected, there is a negative and significant relation between happiness and the Beck Score. While income alone can explain 6.1%, the beck score alone can explain 22.1% of the variability in happiness. Model 3, shows the results of the multivariate regression (forward stepwise) including all of the variables included in the
study. Income, the Beck score and work status together can explain 27.6% of the variability in happiness. Work status, defined on a 5-point scale from most to least job security, is negatively related with happiness.

Based on these findings, it is safe to say that, money does have a positive impact on happiness. However, taking into account all the demographic, financial, health and employment related variables included in this study, future prospects in terms of hope and job security, seem to have a much greater bearing on how happy we are.

HRM - PATIENT ORIENTATION AND TEAMWORK CLIMATE LINKAGE IN HEALTH CARE INSTITUTIONS: THE ROLE OF CALLING AND PROSOCIAL MOTIVATION
Bučiūnienė, Ilona; Goštautaitė, Bernadeta
Management department, ISM University of Management and Economics, Vilnius, Lithuania

ABSTRACT
Although a weak patient orientation and poor teamwork climate among healthcare professionals (HPs) may have far-reaching implications, such as increased medical error and patient mortality (Sexton et al., 2006), their antecedents have been rarely studied in management research. This issue can be analysed from different perspectives. On the one hand, HPs’ job is associated to personal calling, i.e. work that satisfies their core values (Schabram, K. and Maitlis, S., 2017) and itself should lead to higher patient orientation. On the other hand, patient orientation may be facilitated by prosocial motivation, i.e., the desire to benefit other people (Grant, A.M., 2008). Prosocially motivated employees are driven not by inherent interest in the work itself, but rather by the need to expend effort to benefit other people (i.e., patients). Prosocial motivation may also have a positive impact on patient orientation through strengthening teamwork climate, as providing of healthcare is based on a complex multidisciplinary collaboration in teams (Ang, Bartram, McNeil, Leggat, & Stanton, 2013; Leggat, Bartram, & Stanton, 2008).

Consequently we can suppose that calling and prosocial motivation could be two important individual factors affecting HPs’ patient orientation. What are organizational mechanism which enhance these individual factors and lead to teamwork climate and patient orientation behaviour of HPs? Complex research covering individual factors, i.e. HPs’ calling and prosocial motivation and organizational factors, i.e. HRM practices and their effects on healthcare-relevant work outcomes such as teamwork climate and patient orientation has been scarce. We analyse the role of HRM system and individual factors, i.e. HPs calling and prosocial motivation in fostering teamwork climate and patient orientation in health care institutions (HCI).

THEORETICAL APPROACH.
We rely on configurational HRM approach which suggests that strategically designed HRM systems with specific HRM practices supporting and reinforcing each other and in this way composing HRM bundles, generate synergistic effects and lead to targeted employees attitudes and behaviours.
What bundles of HRM practices do lead to patient orientation in HCI and what is the mechanism through which HRM practices affect desired behavioural outcomes?

We propose that the teamwork climate in hospital as well as the patient orientation of HPs’ are affected by the team-oriented HRM practices. We further suggest that the relationship is mediated by the HPs’ prosocial motivation and moderated by calling.

THE RESEARCH DESIGN AND APPROACH TO DATA ANALYSIS.

We conducted a survey of HPs in 5 hospitals in Lithuania. In order to avoid the common-source bias (Podsakoff, MacKenzie, Jeong-Yeon, & Podsakoff, 2003) we separated data collection of independent variables i.e. the survey of physicians and nurses, and dependent variables – the survey of their direct supervisors’ (the head and the senior nurse of a department). A multiple regression analysis with the bootstrap method (Preacher, Rucker, & Hayes, 2007) was calculated to test the proposed moderated-mediation model.

ORIGINALITY/CONTRIBUTION.

The current paper provides new insights into the linkage between HRM practices and positive healthcare-related organizational outcomes by illustrating the intervening effects of individual prosocial motivation and calling.

THE PRACTICAL SIGNIFICANCE.

The teamwork climate in hospitals as well as the patient orientation of healthcare professionals can be facilitated by team-orientated HRM practices.

Keywords: patient orientation, HRM, calling, prosocial motivation, health care institutions, health care professionals.

INNOVATION NETWORK DYNAMICS IN THE AEROSPACE CLUSTER IN TUSCANY

Capone, Francesco; Zampi Vincenzo

Dept. name of organization, name of organization, acronyms acceptable, City, Country

ABSTRACT

In the debate on the new trends in innovation studies and the research and development (R&D) management of innovation networks (Kastelle and Steen, 2014; Dagnino et al., 2015), a significant amount of attention is being increasingly devoted to the role of similarity among partners in forming new relationships or partnerships (Molina-Morales, 2015; Ahuja et al. 2009).

Scholars of social network analysis have long discussed the concept of homophily (McPherson et al., 2001), which is the tendency of two partners that share some characteristics (sex, age, habits, etc.) to have a higher propensity to develop some kind of relationships (friendship, business, etc.). In recent years, literature on innovation studies and innovation networks has primarily focused more attention on the concept of proximity, particularly on what is known as cognitive proximity or geographical proximity (Molina-Morales, 2014; Boschma, 2005), especially paying attention to how the proximity between partners facilitates firms and networks’ innovativeness (Muscio, 2006).

The debate on proximity is widespread, and some forms of proximity are perceived negatively as obstacles to collaborating or developing partnerships among firms and research centres or universities (Ben Letaifa and Rabeau, 2013; Broekel and Boschma, 2011).

Within the research on innovation networks, many authors have focused on these issues, discussing as many as five to seven different forms of proximity which encourage the formation of relationships and innovation (Knoben and Oerlemans, 2006; Boschma, 2005). Generally speaking, there are at least five forms of proximity that are recognized in the literature: geographical, cognitive, organisational, institutional and social proximity.

However, most contributions on proximity and innovation networks, at this time, are based mainly on case studies or qualitative analysis (Ritter and Gemunden, 2003; Knoben and Oerlemans, 2006) with only a few quantitative exceptions (Balland, 2012; Morrison et al., 2015; Molina-Morales, 2014; Presutti et al., 2012; Capaldo and Petruzzelli, 2014).

The aim of this study is to analyse the role of various forms of proximity in the formation of inter-organisational innovation collaborations and, specifically, to investigate how organisations have chosen their partners to form innovation networks. The paper focus on the aerospace cluster in Tuscany as a high technology business, composed by large and small and medium firms that develops innovation thanks to inter-organizational collaborations.
The work contributes to management and innovation network studies through a novel methodology for network analysis, Exponential Random Graph Models (ERGM), that allows to analyse large networks, and it also fits into the contemporary availability of big data to support management decisions and the analysis of competitive environments.

The methodology can be of interest in management and innovation network studies as it allows the analysis and measurement of the impact of different types of variables in very large networks composed of numerous organisations and relationships (Pina and Lazega, 2010; Broekel and Hartog, 2013). This application is particularly useful when it is necessary to investigate multidisciplinary inter-organisational networks in high-technology industries involving several national and international firms and organisations.

For these purposes, we adopt the novel statistical methodology of exponential random graph models (ERGMs) (Hunter et al., 2008) that allows us to investigate and provide statistical estimations of the structure of large networks.

This paper analyses innovation networks operating in the business of high-technology of aerospace industry in Tuscany. The aerospace industry is particularly interesting as is growing sector, where innovation happens thanks through inter-organizational networks. A questionnaires on innovation dynamics and collaborations have been administered to the firms operating in the aerospace cluster in Tuscany. A redemption rate of 75% permits to apply social network analysis to the answers on relationship dynamics.

Our results underline the importance of various forms of proximity in the formation of innovation networks. Moreover, the work points out managerial implications in innovation studies and R&D management in order to assist firms in choosing their partners and forming an innovation network.

MANAGING ORGANIZATIONAL AND BRAND IDENTITY IN FAMILY FIRM: PRELIMINARY EVIDENCES FROM AN ITALIAN CASE

Casprini, Elena¹; Ticci, Camilla²; Zanni, Lorenzo³

¹Institute of Management, Scuola Superiore Sant’Anna, Pisa, Italy
²Department of Business and Law, University of Siena, Siena, Italy

ABSTRACT

INTRODUCTION

This paper explores how a family firm manages its identity, distinguishing between organizational identity and brand identity. Family firms represent an important type of organization worldwide and have attracted a lot of attention from both academics and practitioners. Most of research has focused on the characteristics of family firms especially with respect to internationalization and, more recently, innovation strategies, but least attention has been deserved to how family firms’ peculiarities may influence marketing strategies (Micelotta and Raynard 2011; Reuer and Fischer 2010). In particular, little is known about how family firms manage their organizational identity and brand identity (Micelotta and Raynard 2011).

LITERATURE BACKGROUND

The paper links two streams of research: that of organizational identity, usually adopted by organization and management scholars, and that of brand identity, widely adopted by marketing scholars and managers.

An organizational identity refers to “organization members’ collective understanding of the central, distinctive and enduring character of the organization” (Micelotta and Raynard, 2011:198). For long time, organizational identity theorists have noted that organizational identity is enduring, i.e. “an identity that remains the same over time” (Gioia and Corely, 2000: 65), but also has a sense of continuity (Gioia and Corley, 2000). On the contrary, organizational identity scholars have noted that organizational identity changes over time. Gioia and Corley (2000), for example, introduce the concept of adaptative instability in organizational identity, sustaining that firms possess an identity, linked to its self-definition, and an image, derived from how third parties define the firm, and that the interrelationship between identity and image are mutually influencing and evolving over time.

On the other side, a brand identity refers to “the consistent and targeted representations of the organization in its managed communication with external communication” (Micelotta and Raynard, 2011:198). Extant research has noted that family firms tend to communicate their brand identity with
different strategies, such as family preservation, family enrichment and family subordination (Micelotta and Raynard 2011). Overall, brand management serves for bridging identity and image (Beck 2016), and empirical research notes that family-based brand identity influences competitive orientation and firm performance (Craig, Dibrell, and Davis 2008).

Bridging these two streams of research, the aim of this paper is to explore the mechanisms underlying how a family firm manages its organizational identity and brand identity.

**METHODOLOGY**

We adopted a single case study design (Yin 2003). The single case of an Italian family firm has been analysed. Data were collected by in-depth interviews on two family- and two non-family members, direct observation derived from a six-month internship and secondary data sources, mainly corporate presentations and websites. Interviews were recorded and transcribed. We adopted the Gioia’s methodology for analysing data and we use NVivo10 software for coding analysis (Gioia, Corley, and Hamilton 2013). Starting from quotes of the informants and the derived concepts, five themes (Organizational identity, Brand Identity; Preserving founder’s style in products; Maintaining territory linkages; Smoothly Leveraging on new communication channels) and two aggregate dimensions (Identities; Professional managers actions) were identified.

![Figure 1. Professional managers actions and family firm’s identities](image)

**RESULTS AND DISCUSSION**

Our case revels that the family firm manages its organizational identity and brand identity through three mechanisms (“Professional managers actions”): (1) preserving founder’s style in products, (2) maintaining territory linkages, and (3) smoothly leveraging on new communication channels. The case also stresses that these three mechanisms have been triggered by the professionalization of the family
firm. The professionalization of the family firm happens through second-generation family members and the involvement of nonfamily members. Figure 1 represents the findings of the case. The paper presents limitations of qualitative approaches, often linked to a certain degree of subjectivity in developing codes. We suggest that multiple case studies might be carried on in order to theoretically generalize our results.

From a managerial point of view, our case suggests that in managing their identity, family firms have to distinguish between their organizational and their brand identities, and to create a fit among them via the three mechanisms introduced. Managing brand is important for competing, but in order to build a brand image family firms need to first developing their organizational identity.

ENHANCING TOURISM DURING 2007-2013 PROGRAMMING PERIOD IN ROMANIA: THE CASE OF BRASOV GROWTH POLE

Catana, Aida; Manea, Daniela; Titan, Emilia
Economic Cybernetics and Statistics Doctoral School, University of Economic Study, ASE, Bucharest, Romania

ABSTRACT

The tourism dynamics analyzed in the context of the access to the European Structural and Cohesion Funds within the programming period 2007-2013 is correlated with the evolution of the different relevant aspects: the evolution of the structure corresponding to touristic units, the dynamic of the lodging units or the analysis of the average duration of the stay as well as the manner in which the financial resources have been used. With an allocation of 74.3 million euro in the programming period 2007-2013, the Brasov Growth Pole has pursued the contribution to the achievement of economic and social development in a sustainable manner. The implementation of projects with European financing in areas such as public utilities, transport, social and educational infrastructure have generated changes in different sectors, including tourism, which this paper proposes to present. The evolution of the tourism, its dynamics at the level of each locality that is part of the Brasov growth pole are presented by the statistical analysis. The effects of the European financing obtained from Regional Operational Programme 2007-2013 are thus reflected in the sustainable development of the Brasov growth pole from the point of view of the dynamic of tourism.

CRITICAL SUCCESS FACTORS OF THE MERGERS AND ACQUISITIONS PERFORMANCE: INTERRELATIONSHIP OF PLANNING STAGE (PRE-MERGER) AND INTEGRATION PROCESS (POST-MERGER)

Chew, Grace

Business Administration, International School of Management, Paris, France

ABSTRACT

This study addresses the neglected variables, such as due diligence analysis and cultural differences analysis at the pre-merger stage, and HR practices at the post-merger stage, and highlights gaps in the literature, by indicating the understanding of the important relationships between pre- and post-merger stages as a major area for improvement in mergers and acquisitions (M&A) research and organizational performance. The complicated nature of M&A situations has prevented M&A practitioners from achieving the maximum results after the M&A.

Different streams of research have studied different areas of the M&A stages. Historically, two main streams of management research have studied either pre- or post-merger integration stages. One stream, focusing on the pre-merger stage, examined the relationship between firm-level measures of financial performance and the strategic fit between buying and selling firms (Singh and Montgomery, 1988; Palich et al., 2000), with an emphasis on the potential synergy and added value of the acquisition to the buying company, in other words, on choosing the right merger. The other stream focuses on the post-merger stage, and examines the cultural fit of the buying and selling firms, and its impact on the success of the merged company (Chatterjee et al., 1992; Sarala and Vaara, 2010; Stahl and Voigt, 2008; Weber et al., 1996; Weber, 1996; Weber et al., 2011b). However, these studies pay little attention to cross-cultural management, despite the fact that cultural differences play an important role in the success or failure of M&A.

Different streams of research focus on different research levels. The strategic management literature has primarily focused on strategic analysis, which identifies characteristics of the two firms and looks into the best strategic fit to realize the maximum synergy potential and value creation in M&A. On the other hand, the organizational behavior literature has primarily focused on factors pertaining to the human side during post-merger integration. These include a focus on individual behavior and the processes during integration, such as top executives’ commitment and turnover as a result of culture clashes (Lubatkin et al., 1999; Weber, 1996; Weber et al., 1996; Weber and Drori, 2011), structural changes (Ellis et al., 2012; Weber, Tarba, and Bachar, 2011), and HR practices, such as the different effects of training and communication on M&A success in various countries (Weber et al., 2012). Each stream of research focusing on different variables has led to inconsistent findings.
There are also two other streams of research focusing on different types of variables (context versus process). More researchers pay attention to the research of context variables at the pre-merger stage, while others focus more the process variables at the post-merger stage. Table 1 shows that context variables that have received high attention at the pre-merger stages include relatedness, cultural differences, buyer experience, and relative size in previous M&A. On the other hand, process variables that have been investigated, usually at the post-merger stages, include HR practices, level of integration, communication, and structural changes.

</tr>
</tbody>
</table>

Table 1. Variables that received high research attention (Source: Handbook of research on mergers and acquisitions by Weber, 2013)

Table 2 shows examples of variables that receive more research attention. However, among the differences between the two streams is that process variables, such as planning at the pre-merger stage, receive much less attention. Process variables, such as planning (including due diligence analysis and cultural differences analysis) at pre-merger stage and HR practices at post-merger stage, are the variables requiring further research (Weber, 2013). A recent article showed the role of cultural differences analysis in all M&A stages but most of the potential relationships are yet to be explored (Weber and Tarba, 2012).

Table 2. Example of stages that may receive more research attention (Source: Handbook of research on mergers and acquisitions by Weber, 2013)

Examples of hypotheses for this study are as follows:

H1: The higher the planning level the higher M&A performance

H2: The higher the planning level the higher the use of HR practices at post merger stage

H3: The higher the use of HR practices at post merger stage the higher M&A performance

FOOD WASTE REDUCTION AND SHELF LIFE EXTENSION: THE CASE STUDY OF OLIVE PATÈ

Chiara, Filomena; Pellegrini, Giustina; Contò, Francesco

University of Foggia, Italy

ABSTRACT

The food sector has to manage a number of complexities generally dealt within supply chain management, besides products perishability (Van der Vorst et al., 2005). Actually, food scraps or losses represent irrational use of resources producing a negative direct impact on the income of entrepreneurs and consumers (Fiore et al., 2015; Eriksson et al., 2012); therefore a coordinated strategy that improves the entire supply chain efficiency is required. Fruits and vegetables usually account for the highest proportion of food waste in many developed countries (Stefan et al., 2012). According to FAO (2013) the global carbon footprint (CF) of annual food wastage is about 3.3 Gt CO₂ equivalent (CO₂e). The amount of annual food waste in Europe is estimated to increase from over 100 million tons in 2014 to about 126 million tons by 2020 (European Commission, 2016). Therefore, the efficient management of food waste along the supply chains is receiving a lot of attention by institutions (Boxstael et al., 2014), especially given to perishable products that are among the most wasted food items within supply chains and households. In the recent past the most significant efforts in food science and technology have been addressed to extending the commercial life of food and beverages. In this context, however, very little or null attention has been paid to the possible positive contribution, coming from a shelf life extension (SLE) to the overall sustainability of a product supply chain (Amani and Gadde, 2015). Nevertheless, a shelf life extension can contrast food losses and the logistic distribution impacts.

In this regard the authors evaluate the shelf life extension impact on the entire olives derivate (olives patè) supply chain. Olives patè is a product obtained by the crush of table olives and the addition of EVOO. It has been proven that manufacture and agricultural practices such as fertilization contributed to the highest burdens in all impact categories and cropping systems (Martucci and Arcese, 2010; De Gennaro et al., 2012). The selection of the aforementioned product was done considering the importance of olives, oil and derivate in Apulia region. These products are traditionally cultivated in the Mediterranean countries (Spain, Italy, Greece and Turkey, mainly) and, more recently, in America, Australia and the Middle East (IOC, 2016). In Mediterranean area, olive farming is crucial for the cultural heritage and the economy with significant social and environmental impacts. Furthermore, the selection of that product was influenced by the beneficial effects on human health due to all of the antioxidant properties of phenolic compounds.
Numerous studies regarding olive oil health benefits, have stimulated the interest of researchers focusing on recovery of such active compounds using pruning waste. In this regard, some researchers evaluated the addition of polyphenols, extracted from waste such as leaves in olive pate made with olives and extra-virgin olive oil. Therefore a dual function is achieved: reuse of waste and introduction of a new healthy product in the market. In addition, the antioxidant action of these active compounds allows to preserve the product, extend its shelf life and consequently reducing waste (in downstream of supply chain). The main objective of this study is to investigate which decisions may be altered/re-optimized because of longer shelf-life considering a minimization of CO₂ emission and economic impact. This could be done redesigning the single supply chain to verify what are the main processes along the product’s supply chain that more contribute to waste reduction, economic and environmental sustainability:

![Conceptual Model](image)

Figure 1- Framework for designing conceptual model

The expected results show that SLE seems to have a positive effect on the environment and economic sustainability considering the active compound recovery as well as food waste reduction.

*Keywords: healthiness, sustainability, waste-reuse, waste reduction, product’s differentiation*

DEVELOPMENT OF SOCIAL ENTERPRISE: DISTRIBUTION OF PROFIT OR NON-DISTRIBUTION CONSTRAINT?

Cosentino, Antonietta¹; Di Stefano, Cristina²; Magistro, Angela¹

¹Dept. of Business Administration, Sapienza University of Rome, DEAP, Rome, Italy
²Dept. of Industrial and Information Engineering and Economics, University of L’Aquila, DIIIE, L’Aquila, Italy

ABSTRACT

THEORETICAL FRAMEWORK

The concept of social enterprise varies at a great extent in the international literature including a vast series of economic initiatives defined as social, and different legal forms. There is no single way to address the topic, and a unique definition of social enterprise cannot be identified.

Different authors tried to make a literature review on the topic analyzing the emergence of the idea in different contexts (Defourny and Nyssens, 2012; Kerlin, 2009), and identifying different schools of thought (Borzaga and Defourny, 2004; Anderson and Dees, 2006; Defourny and Nyssens, 2010; Hoogendoorn et al., 2010).

In the 1996, Salamon and Anheier conducted the first relevant survey on nonprofit sector comparing the nonprofit sector at international level.

EMES Network developed a conceptualization of social enterprise that may represent a framework grounded on different social, political and economic “traditions” (Defourny and Nissens, 2003).

Even if there is not an agreement between all the authors, Peredo and McLean have identified one common characteristic in all the definitions of the social enterprise: the “problem-solving nature” of social enterprise, that is its ability to produce social impacts (Peredo and McLean, 2006). Anderson and Dees (2006) also emphasized this concept, referring to a previous work of Young (1983); for the authors, indeed, the concept of social enterprise concerns more the outputs and the social impact produced than the incomes.

Defourny and Nyssens (2010), citing Young and Salamon (2002) specify that the notion of social enterprise in the European context is not strictly connected with the non-distribution constraint of profit, as it is in the Us context. In Europe, the final purpose of the activity carried out by the social enterprise and its governance are more important features to define a social enterprise. As in the literature there is not a single concept of social enterprise, therefore there is not a single concept of income. The latter is often misunderstood and considered as equivalent to return on equity, value
created by the enterprise, and profit (Capaldo, 2013; Knight, 2012; Lee, 1994; Magistro, 2011; Marx, 1975; Schumpeter, 1934).

The legal forms adopted in the European countries are different; the first European law on this theme was adopted in Italy in 1991 (Law 381/1991 on Social Cooperation); then, a more general law focused on social enterprise was adopted in 2006 (Law 155/2006). The first law allows a limited distribution of income, whereas the second one forbids this distribution and introduces the non-distribution constraint. However, the third sector reform has recently removed the constraint for social enterprises (Law 106/2016).

PURPOSE OF THE WORK

After having analyzed the literature on development conditions of non-profit organizations, we focus our work on the concept of profit that has been developed over the past centuries by economic and accounting theories to identify the possibility of distribution of profit as one of the most important conditions for the development of social enterprises.

For instance, Hansamann in his famous study “The role of Nonprofit Enterprise” notes that nonprofit organization can earn a profit, but the “nondistribution constraint”, how he calls the prohibition on the distribution of profit (Hansamann, 1980: 838), is referred only to the “pure profits”. According to Hansamann the pure profits are “earnings in excess of the amount needed to pay for services rendered to the organization (...) and a nonprofit enterprise is free to pay reasonable compensation to anyone for labor or capital that he provides (Hansamann, 1980: 838).

The organization’s legal commitment to devote the net earnings – in the meaning that we intend, as Hansmann’s theory – to the production of services entails that the nonprofit producer is not encouraged to raise prices or cut quality of the production he makes.

On the other hand, “a system of regulation that discourages variable-return securities and investor control, and therefore makes it difficult to attract venture capital, is less of a liability” (Hansamann, 1980: 887).

We think it is true, and we follow the Hansmann’s approach to answer the following research questions:

RQ1: Can the possibility to pay a reasonable earning to any person for labour or capital that he provides affect the choices of the social enterprises on quality or efficiency of their production?

RQ2: Which effects the partial removing of non distribution constraint can produce on financial structure, ownership and governance of social enterprises?
RQ3: Can social enterprise became the most important model of no-profit commercial entrepreneurial?

To supply our research queries, we have been measuring the effects of the recent third sector reform on social enterprises especially on their ownership and financial structure. Our analysis started at the end of 2016, and it has focused on financial statements of Italian social enterprises that are not social cooperatives. Our goal is measuring the impact of the recent reform on social enterprises looking at their main economic and financial data before and after the approval of the reform. To accomplish our goal, we are observing data adjustments that will occur during the next three years, since the entry into force of the implementing decrees of Law 106/2016.

Our aim is to demonstrate if and how the recent reform can contribute to the growth of social enterprises, especially if it can orient their production, market, financing and governance choices.

We focus on two items: the first one is the potential impact that the partial removal of the “non-distribution constraint” foreseen by the reform could generate on the size of equity if, as we think, a lot of social investors will be interested in underwrite additional capital in social enterprises.

The second one is monitoring the development of equity and if it can support the growth of social enterprise especially on capital-intensive sector, as public utilities.

We reckon that the removal of the non-distribution constraint might trigger the interest of additional investors in social enterprises, and that the entire third sector might receive greater support for its development.

To support and complete our analysis, we have been analyzing the reaction of the social enterprises to the reform to identify how they think the limited income distribution possibility will affect their future decisions. To accomplish this goal, we are conducting a qualitative analysis by administering surveys to the social enterprises of the different clusters.

**RESEARCH METHOD**

We divided the entire population of Italian social enterprises – that are not social cooperatives – into classes, on the basis of two parameters: earnings and business sector. The aim of the clustering is to identify the groups of social enterprises on which the profit distribution possibility could have a greater potential impact. According to us, may be the social enterprises that have earnings higher than 3%.

Going a step further, we simultaneously clustered data units and variables (Anderberg, 2014). We obtained a restricted cluster composed by social enterprises operating in three sectors. Using the...
Ateco classification, we identified Education, Sanitary Care, Residential Social Services as the most interesting sectors for our research. In fact, our analysis showed that the enterprises operating in these sectors have obtained the highest earning. Furthermore, we have analyzed some measurements – as ROE, liabilities, labour cost, assets, net assets, leverage – of the social enterprises in the sample. All the data of the social enterprises have been acquired from the database Aida Bureau van Dijk; there are 338 units in the database. To divide the social enterprises population into clusters we used the Partitional Clustering method (Anderberg, 2014; Rand, 1971; Rokach and Maimon, 2005).

In order to evaluate the reaction of the social enterprises to the reform, we are carrying out a qualitative impact analysis (Tracy, 2012; Ritchie and Spencer, 2002) through the administration of semi-structured questionnaires to a sample of social enterprises of each cluster. To select the sample, we used a simple random sampling technique (Cochran, 2007) in each cluster, in order to minimize the risk of bias in selection. We picked up three clusters of 10-12 social enterprises for each, and more than forty questions to submit to the social enterprises managers. We are conducting individual in-depth interviews with them. For instance, we are asking if they think that the partial removing of the no-distribution constraint could damage the social mission of the firm, or which consequences may have the partial distribution of earnings, or if they will distribute the earnings, and if so, which consequence they will expect.

**ORIGINALITY/VALUE**

Whereas twenty years ago the concept of social enterprise was rarely discussed, currently it is attracting increasing interest all over the world. Most studies are focused on the notion of social enterprise, his development, variety of legal form adopted, public policies, concept and dimensions of third sector, or in general, third sector performance measurement (Kerlin, 2009; Defoury and Nyssens, 2012, Bagnoli and Megali, 2011; Monzon and Chaves, 2008, Nyssens, 2006).

On this regard, our study may contribute to the literature, considering the small number of studies on the specific subject (relationship between partial distribution of earnings and development of social enterprises). On one hand, it deepens on the relation among earning and funding, describing the potential impact of the reform on the possibility of the social enterprises to attract a larger number of equity investors, even institutional ones.

On the other hand, it shows to the investors the potentiality of the impact investing. They have been little interested in financing social enterprises so far; now, we reckon that the removal of the non-distribution constraint might trigger the interest of the investors in social enterprises, and that the entire third sector might receive greater support for its development.
CONCLUSIONS

At this stage, we answered just one research query.

RQ 1: our empirical research shows that the social cooperatives have higher earnings than social enterprises. They have same mission and similar structure – except corporate ownership – operate in the same market, produce same services, but before the recent reform only social cooperatives could share net earnings. Our theory is that the distribution of net earnings influences choices regarding to the financing of production without this necessarily means that quality of production and efficiency of enterprise have to be reduced.

About RQ number 2 and 3, our research is ongoing.

Keywords: social enterprise; income; profit; non-distribution constraint; Italian third sector reform; development of social enterprise.

A NEW PERSPECTIVE IN BUSINESS EVALUATION: MEASURING SOCIAL IMPACT VALUE. A CASE STUDY ON ITALIAN WORK INTEGRATION COOPERATIVES

Cosentino, Antonietta; Bongiovanni, Laura; Cesari, Alberto; Di Stefano, Cristina

ABSTRACT

THEORETICAL FRAMEWORK

Social impact measurement, as well as the motivations that induce private entities to monitor their own social impact, are widely debated topics by scholars and practitioners (Bengo et al. 2014). The goal of social impact measurement is usually twofold: to provide stakeholders – mainly funders – with information, and to use the results as an instrument to monitor and improve performance. Social impact is a multilevel and multidimensional concept (Nicholls et al. 2015). In order to measure it, different quantitative and qualitative methods (Hall 2012; Grieco et al. 2014) can be used, some of which are borrowed from profit-oriented business evaluation models (Gibbon e Dey 2011).

PURPOSE OF THE WORK

The main purpose of our study is to measure the social impact generated by the Italian work integration cooperatives. We believe that resources invested by different stakeholders (public administration, social cooperatives, disadvantaged groups, families, communities) produce a social value that is higher than inputs, irrespective of the effects generated by other employment inclusion policies.

A further aim of the present study, is to propose guidelines to policy makers and operators – specially social entrepreneurs – in order to raise awareness of the importance of social evaluation and of the accountability process.

Last but not least, another purpose of our research is contribute to extend a business assessment system based also on the measurement of social impact generated by the enterprises.

Future implications of this work are to address next researches on this topic in order to find out new variables other than traditional ones.
RESEARCH METHOD

The analysis is carried out on the basis of the so-called “Theory of Change” (Drucker 1993; Dees 1998). We use the GECES guidelines, Sub-group on Impact Measurement – European Commission (GECES 2015), as borrowed by EVPA (Hendeberg 2012), and the SROI model – Social Return on Investment – (Social Impact Investment Task Force 2014) that uses both quantitative and qualitative analysis based on in-depth interviews.

The survey focuses on a sample of 144 work integration cooperatives. These cooperatives are part of the social enterprise panel surveyed by the Isnet Observatory on the Social Enterprise, and they represent the statistic reference population. The values obtained from the sample analysis are subject to a statistical inference on the whole universe of social cooperatives, type A and A + B, to obtain the social impact assessment for 2016.

The proxy data analysis is completed on approximately 20 open date sources.

ORIGINALITY/VALUE

This is the first study in Italy carries out through an aggregate analysis to measure social impact value achieved by Italian work integration cooperatives.

Many existing studies focus on the evaluation of single projects or specific experiences, and adopt a vision focused on occasional activities rather than systematic ones.

Primary data provide a broad basis for economic and employment development policies that engage public and private investors which support high-impact social activities.

PRACTICAL IMPLICATIONS

We believe that the results of this study are a useful starting point for the development of a business assessment system based not only on the evaluation of economic performances, but also on the social impact generated by the enterprises. This new evaluation framework can lead to two different outcomes. On the one hand, it can guide policy interventions, on the other hand it can promote initiatives of socially responsible investors.

IS PUBLIC SUPPORT A BAD FOR THE DISSEMINATION OF CROWDFUNDING AMONG INNOVATIVE START UP FIRMS?
Cucari, Nicola; Ghi, Alessandra; Orlando, Beatrice; Renzi, Antonio
Dept. Management, Sapienza, Rome, Italy

ABSTRACT
The role of government in innovation and technological development is really significant. A large literature evaluates the effect of state and local government programs in promoting innovation (Georghiou and Roessner, 2000; Klette et al., 2000; Roper et al., 2004). According to Hall (2008), start up firms need to be financed and venture capital financing is only a partial solution to this problem. Venture capital cannot provide a complete solution to the financing needs of new technology companies, especially in the early stages because it’s focused only on certain industries and it can only be offered in amounts that are too large for many start ups and only works in developed IPO markets. As a result, a market failure exists, which demands government intervention. There are different reasons that allow a startup to use new financing methods, such as crowdfunding (CF). CF is an emerging and interesting fundraising practice for both companies and individual entrepreneurs. CF is a “method for funding a variety of new ventures, allowing individual founders of for-profit, cultural, or social projects to request funding from many individuals, often in return for future products or equity” (Mollick, 2014, p. 1). There is a significant difference between crowdfunding platforms and other forms of financing; the former has three specificities that may not be found together anywhere else (Giudici et al., 2012): i) the presence of an enabling organization with which those seeking capital (initiators) and those in possession of capital (supporters) are affiliated; ii) direct interaction between entrepreneurs and investors; iii) emergence of social groups among investors and entrepreneurs. Researches, for example, agreed that entrepreneurs prefer those sources of finance that involve giving up less control and require lower servicing costs (Vanacker and Manigart, 2010). This would explain why entrepreneurs are likely to have a first preference for personal financial resources (Bruton et al., 2015).

SCOPE AND RESEARCH QUESTION
The crowdfunding literature focusing on the capital-seeking party is predominantly concerned with the motivations for crowdfunding and the determinants of success (Moritz and Block, 2014), also if “funding success is a multifaceted concept” (Ahlers et al., 2015). Apparently, it seems to emerge a critical gap for what concern the financing of startup firms and the crowdfunding model. Therefore, we adopt a reverse logic: instead of questioning what factors drive the diffusion of crowdfunding among
startup firms, we have decided to use the original standpoint of investigating if territorial specific characteristics have a negative influence on the adoption of crowdfunding, and in particular if public assistance has a detrimental impact on the diffusion on new financing logics. To this regard, this study aims to answer the following research question: “crowdfunding and public policy are alternative or converging instruments?

LITERATURE REVIEW

With regard to the possible functions of crowdfunding, most publications can be divided into two broad categories: as a source of financial capital and, therefore, focused on its role as seed capital for start-up (for example Mollick, 2014; Schwienbacher and Larralde 2012, Ward and Ramachandran, 2010) or as a tool to support marketing activities and to test and validate the market potential of business ideas (Schwienbacher Lambert, 2010; Mollick, 2014; Belleflamme et al., 2014; Hu et al., 2015). Existing researches have identified a variety of factors that may directly or indirectly influence the funding success of a project. Researchers have found that some project properties and existence of images and video in project introduction are associated with funding success (Hekman and Brussee, 2013; Greenberg et al. 2013; Mollick, 2014). Others find that project properties, such as duration of the campaign and prestabilized funding goal, are associated with funding success. Others show that a project owner's social influence, proxied by the numbers of friends on social networks such as Facebook, has an impact on funding success (Mollick 2014). Furthermore, researches have found that there is a strong geographic component to the nature of projects, and funders are more likely to propose projects that reflect the cultural products of their geographic areas. In particular, geographical proximity to capital providers increase the likelihood of successful funding (Agrawal et al, 2014). This shows a cross-cultural perspective of investors that suggests a geo-cultural segmentation of prospective users. In other words, cultural gaps seem to affect the willingness of interaction within the CF platforms. This gives a great importance to the social and cultural factor when investing in CF (Esposito De Falco et al, 2015).

RESEARCH DESIGN

Given the exploratory nature of the research, we use a phenomenon-based research which aim is to capture, describe and document, as well as conceptualise, a phenomenon (von Krogh et al., 2012). As suggested by Doh 2015, the phenomenon-based research takes as a principal focus the ability to accurately and insightfully inform a real-world phenomenon. This methodology is strongly recommend in the entrepreneurship research (Wiklund et al., 2011). Our exploration research is based
on primary data on the phenomenon interviewing the managers of equity crowdfunding platforms and public actors as well as the analysis of secondary data from Italian government and institutional reports (e.g. Italian Ministry of the Economic Development).

RESULTS AND CONCLUSION

At a managerial level, we make an attempt to fill the literature gap for what concerns the relationship between crowdfunding and public support for high-tech start-up firms. We argue that Regional characteristics deeply impact on factors such as: availability of financial resources; typology of financing source; entrepreneurial mindset toward financial source. In its turn, the capital structure, and, hence, the form of financing, influences innovative performances of start-ups (technological dominance, etc.). Moreover, equity crowdfunding seems poorly employed for venturing high-tech start-up over the preference for public commitment. In fact, especially when the technology is strategic for Regional-based reasons (e.g. is linked to infrastructure; it can foster Regional and social advancement, etc.), the main source of financing – or, at least, the most preferred one – is public funds. Our results open up to different research questions, as instance as: 1. What are the main cultural factors influencing the venture finance process? How are they linked to Regional characteristics? How they affect long run innovative performances in Regional clusters?

SHARING KNOWLEDGE TO INCREASE FOOD VALUE CHAIN: THE INTRODUCTION OF DSS BY SUPPLY CHAIN LEADER DRIVING FARMER’S MANAGERIAL CULTURAL CHANGE.

Cupertino, Sebastiano; Vitale, Gianluca; Riccaboni, Angelo

Department of Business and Law, University of Siena, DISAG-UNISI, Siena, Italy.

ABSTRACT

Main anthropic activities formally developed in terms of business processes, inevitably lead environmental and social consequences (IPCC, 2014). Therefore, managers, started to pay more attention to the overall corporate value created instead to the so limited profit maximization perspective (Elkington, 1994). In agri-food sector, in particular, strategic decisions making processes and yields goals have a direct and strong impact on soils, costs of production, GHGs emissions, water consumption (Miller, 2000), and human health. Moreover, these negative externalities are often combined also with: the current poor awareness of traditional farmers about environmental degradation (Merrilees 2005; McCann 1997); a low level of advanced and sustainable business managerial capabilities (Phillipson et al. 2004); and the perception of farmers that sustainable practices could represent a costly measure, that can depress the farm economic performance, as not properly compensated by the markets (Menozzi et al. 2015). According to Hayman 2004 and Backus et al. 1997, this problems could be sometimes solved by the introduction of appropriate and valid support tools useful to drive farmers’ decisions. To this end, we have analyzed the implementation of an appropriate Decision Support Systems (DSS) alongside a durum wheat supply chain. The trigger for the elaboration and implementation of a DSS comes from the firm leader of the supply chain analyzed. So, it is introduced the concept of “supply chain leader” (SCL) which, in our view, is a company nearer to final markets and bigger than the others, with major economical competence and skills, which has the task to implement an integrated supply chain management through the managing of the relationship with all suppliers in all phases of the supply chain (Defee, 2007). For a successful supply chain management, in fact, is required a cross-functional integration (Lambert and Cooper, 2000) while a strong co-operation along the supply chain represent an important guideline for sustainability actions and economic and environmental objectives to be achieved (Ilbery and Maye, 2005). Accordingly, SCL needs to increase trust and collaboration within the supply chain, activating a changing process characterized by sharing knowledge and skills useful to improve those managerial attitudes of both farmers and other partners positioned at many network levels. Generally, farmers are characterized by managerial weakness related to low entrepreneurial attitudes and skills (Pyysäinen et al., 2006) which could produce a myopic business programming, measurement and control of the
socio-environmental impacts produced and the risks occurred. Considering these lacks, we found interesting analyzing how a SCL, which could be characterized by a typical sustainable business model, could lead a cultural managerial change at the farming level, through an unformalized capacity building process, based on the introduction of DSS with the aim to enhance the food value chain. This investigation pursues to analyze how the cultural change of farmers is driven by the knowledge created, shared and transferred by the SCL along the whole supply chain using a DSS tool. To this scope, we developed a case study identifying and analyzing those critical and virtuous issues of several steps of cooperation between typical chain actors, such as: a MED-Italian SCL in pasta production; a business innovative partner, such as ICT SME (external to the chain) and, ultimately, its suppliers, such as some Italian farmers. We first of all started to explain the cooperative virtuous cycle of transferring and sharing knowledge within chain partners defining our theoretical framework which reconsidered the Nonaka model (1990), shifting it from a single organization context (mono dimensional) to a three-dimensional perspective encompassing the whole network involved (see Figure 1).

Fig. 1 – Re-adaptation of Nonaka Model (1990)

Secondly, adopting a qualitative analytical approach, we conducted interviews/surveys interacting with all chain actors in order to deeply investigate the mechanisms/issues which drive (or trap) the knowledge long and in supply chain, focusing on the potential and substantial role played by the introduction and use of a typical DSS tool. Finally, we found that a DSS could be defined both as an outcome of a knowledge creation process (given by a steady interaction between a SCL and its business partner) and as a useful managerial tool which supports the knowledge transfer from the SCL to its suppliers permitting to increase at the same time the level of sustainability for each chain members and of the overall food value chain.

ENTREPRENEURSHIP AS A CONTEXTUAL PHENOMENA

Czarczynska, Anna1; Mosquera, José Luis Naya2

1Sustainable Development Center Kozminski University, Warsaw, Poland
2Área de Comercializa. e Investig. de Mercados, Dep. Análisis Económico y ADE, Facultad de Economía y Empresa, Universidad de A Coruña (UDC), Spain

ABSTRACT

The paper is designed in the framework of contextual research, presenting a comprehensive approach to entrepreneurship competencies perform in the regional aspect. The main objective of the study is multicultural diagnosis of the level of competence conducive to adaptation of individuals functioning at the regional level, and to determine the overall pattern distinguished competence fundamental for entrepreneurship phenomena. Particular attention will be paid to the entrepreneurship competencies that create unique opportunities realising creativity and increasing the value of self-branding position. We are treated entrepreneurship in the context of evolutionary analysis, institutional analysis, and the time-geography. So perspective is different but complementary. Furthermore we use comparative analysis for different regions using sample groups from Spain and Poland to illustrate this phenomena in a different context.

We can observe growing importance of new ways to access critical resources like labour, influence, capital, assets or data. Value creation chain is also changing its pattern. Moving away from shareholders of profits to stakeholders of the company branding values is the moment of transition to niche-finders activity by including all stakeholders negotiation ability to the process of creating higher added value. A key element of transformation is a return to fundamental values such as trust, direct contact, or the natural environment is not detrimental to the character of goods and services consumed. Creativity is triggered by the values of the integrated unit activity in the area not only professional but also mental, emotional, physical, spiritual, cultural, social and environmental sustainability. The value in this approach is widely understood as an employer-stakeholder participation in sustainable growing of the region, far beyond the classic workers well-being. The implementation of the research output should primarily expand our knowledge of the important psychological and economic determinants that affect the functioning of entrepreneurs in particular regions.

Keywords: context, entrepreneurship, creativity, personal development, competencies, value creation

INTRODUCTION
The paper describes new model of circular flow in economy as a consequence of new innovative business circulation. We can expect a few new elements in economy such as different organization, innovative performance, as well as different communication channels and ways of management. In this new economic model different assets determine the success of particular economic activity not necessary visible in accounting reports. Reputation, creativity and ability to exist in current social network become crucial values. Value creation competencies create unique opportunities to build new labour potential and cumulate assets thanks to the value creation. Uncountable measures like reputation and trust create real values in economy and allocate resources in much more efficient way. We have to "upgrade" existing meaning of economy as an exchange of goods and services in terms of money. Somehow we are coming back to the roots of economic exchange with enrichment of employees role and increasing the value added also better distributed across the society. In addition, the model shows the impact on collective intelligence performance and the speed of business development processes. New way of economic activity leverages the wisdom of crowds and change the way groups of people produce knowledge, generate ideas and make them actionable.

Recent E&Y study (E&Y, 2015) shows that creative industries, with 30 million jobs created worldwide, constitute an important driving force of the economic growth. In case of creativity sectors economic and non-monetary impact on regions, societies and entire nations, remains underestimated. The recent intensification of digitalization has influenced the way in which creativity put real impact of digitalization on different type of local creativity (E&Y, 2015).

**PERSONAL DEVELOPMENT**

Entrepreneur cannot be ignorant in any area of life. This is a lifelong learning proficiency and art of getting more than we assumed. Skills important for Entrepreneurship we can observe during the Development Center experiments:

Source: own observation based on Development Center Process

Some metrics in DC process are composed on the theory of planned behaviour. It incorporates three dimensions: 1. Desirability: whether participants perceive achieving their goals as desirable, 2. Feasibility: whether participants feel prepared of starting a negotiation process (they know what they
know, they know what they don’t know) 3. Stability against pressure: whether participant would let their business environment, such as opponent or own organisation resistance, dissuade them from getting an agreement.

**SELF-LEARNING SKILLS MAY AFFECT CREATIVITY POTENTIAL**

Entrepreneurship process has a power to build platform for cross-compliance organization culture as a management tool for companies struggling to make the transition from a production-based to a knowledge-based economy, in which value creation depends increasingly on ideas and innovation. Rising entrepreneurship potential profoundly influences attitudes and behaviours critical to high performance, it builds trust and releases ideas, so we can achieve even the most outstanding and difficult goals while gaining the empowered cooperation of people and companies affected.

The study describes the development model of the analysed competence and the determination of key competencies in the context of learning organisations transformed into teal organisations. Identification of core competencies would allow to design further research to support certain adaptive capacity of individuals and organizations, that subject the agility and creativity in the long term using the contextual approach. Individuals and organizations are engaged in collaboration that supports the development of emerging entrepreneurs. Expertise within and across organizations and the sector is recognized and leveraged, taking advantage of a professional environment that supports and enhances formal and informal learning. Strategic goals and outcomes regarding entrepreneurship development are identified and innovative plans to achieve those goals are developed and refined to reflect new circumstances and learnings.

THE PIVOTAL ROLE OF ORGANIZATIONAL LEARNING AS A LINK BETWEEN EXPORTER’S ORIENTATIONS AND CAPABILITIES AND BETWEEN INTERNATIONAL PERFORMANCES

Dahan, Gavriel¹; Shoham, Aviv²

¹School of Management, Western Galilee College, Acre, Israel
²Department of Business Administration, University of Haifa, Haifa, Israel

ABSTRACT

Several organizational processes and characteristics have been used in the marketing literature to describe how firms should act and operate in order to identify and assimilate new knowledge. The process of identifying, assimilating, and applying useful new knowledge in organizations is an essential means by which firms adapt to changes in the competitive environment (Camisón and Forés, 2010). Following this recognition, we focused on organizational learning as a unique process that enables firms to reach a new external knowledge and consequently achieving competitive advantage. Accordingly, we developed an integrative model that contains market and innovation strategic orientations and their derived capabilities as antecedents for organizational learning’s impact on firm international performance and behavioral outcomes.

THE MODEL

[Diagram of the model with nodes labeled as follows:
- Innovation Orientation
- Market Orientation
- Innovation Capabilities
- Marketing Capabilities
- Organizational Learning
  - Knowledge Acquisition
  - Knowledge Distribution
  - Knowledge Interpretation
  - Organizational Memory
- Behavioral Outcomes
  - Commitment
  - Team Spirit
- International Performance
]
ORIENTATIONS AND CAPABILITIES

Orientations refer to philosophical conceptions according to which organizations operate; capabilities represent a firm’s accumulated knowledge and skills that enable it to enhance the value of its resources (Murray et al., 2011). Prior studies have argued that firms should develop and use multiple orientations (Hakala, 2011) leading us to introduce strategic market and innovation orientations and their corresponding capabilities (marketing and innovation capabilities) as organizational learning’s antecedents. Market and innovation orientations represent knowledge concepts. Marketing and innovation capabilities reflect the implementation of these orientations.

ORGANIZATIONAL LEARNING

Organizational learning (OL) represents the development of knowledge within organizations in a manner that leads to behavioural change to improved performance (Crossan et al., 1999; Fiol and Lyles, 1985). Following Jiménez-Jiménez and Sanz-Valle (2011), OL is conceptualized along four dimensions: knowledge acquisition, knowledge distribution, knowledge interpretation, and organizational memory. OL reflects the “capability within an organization to maintain or improve performance based on experience” (García-Morales, Jiménez-Barrionuevo, and Gutiérrez-Gutiérrez 2012, p. 1041).

FIRM PERFORMANCE

Our model examines the impact of OL on two types of performance, namely International Performance and Behavioral Outcomes. Each of these reflects different level of consequences that derive from OL’s implementation. Based on Zou, Taylor and Osland (1998), we conceptualized international performance as reflecting financial, strategic, and satisfaction components. Behavioral outcomes of firm performance reflect the degree to which individual members feel a sense of pride in belonging to an organization. Following Jaworski and Kohli (1993), we used commitment and team spirit as reflections of behavioral outcomes.

ANALYSIS AND RESULTS

We tested our hypotheses using maximum likelihood estimation in a Structural Equation Modelling (SEM) via AMOS24 software. The results indicate a goodness of fit for the full substantive model with $\chi^2 = 738.29$, DF = 285, $\chi^2/DF = 2.59$, $p = .00$, IFI = .94, CFI = .94, TLI = .93, SRMR = .08 and RMSEA = .07. Substantively, the data showed that market and innovation orientations affected marketing and innovation capabilities, respectively. In turn, marketing and innovation capabilities enhanced OL.
Finally, OL improved international performance and enhanced employees’ commitment and team spirit.

We conclude that managers should follow the dicta of both orientations and their derived capabilities. Further, firms should respond to competitive threats by managing organizational learning in order to enhance the performance.

THE IMPACT OF INTERNAL ANDEXTERNAL ORGANIZATIONAL ORIENTATIONS ON FIRM PERFORMANCE

Dahan, Gavriel1; Shoham, Aviv2; Asseraf, Yoel3

1School of Management, Western Galilee College, Acre, Israel,
2Department of Business Administration, University of Haifa, Haifa, Israel,
3Department of Marketing, Ruppin Academic Center, Emek Hefer, Israel,

ABSTRACT

Organizational orientations refer to philosophical underpinnings of organizational operations. Several orientations have been used in marketing research; some are internal, represented here by a learning orientation while others are external, represented here by a market orientation. Prior studies have argued that firms should develop and use multiple orientations (Grinstein, 2008; Hakala, 2011). Likewise, Noble, Sinha and Kumar (2002) argued that no single strategic orientation is universal in the sense that it leads to superior performance in all situations.

The major aim of this study is to examine which orientation (internal or external) is a stronger precursor of firm performance. Accordingly, we developed a model that includes both market and learning orientations and examines their impact on firm performance.

THE MODEL

Internal

External

Learning Orientation

Market Orientation

Performance
Financial
Strategic
Satisfaction
LEARNING ORIENTATION

Learning orientation (LO) is an internal orientation, which focuses on the Strengths and Weaknesses components of a SWOT model. It implies that managers should focus internally in search of organizational directions and goals. One advantage of internal orientation is that managers and employees, who are intimately involved in a business, have valuable insights and experiences that, can inform the optimization of organizational activities. Sinkula (1994) described LO as set of organizational values that influence the propensity of firms and its employees to create and use knowledge. Here, based on Hult, Ketchen and Arrfelt (2007), we conceptualized and operationalized LO as a uni-dimensional concept.

MARKET ORIENTATION

Market orientation (MO) represents an external orientation, which focuses on the Opportunities and Threats components of a SWOT model. External orientations acknowledge the role of stakeholder groups (e.g., customers or competitors) that can potentially affect organizational performance. Two main conceptualizations have dominated the literature (Shoham, Rose and Kropp, 2005). The first approach follows Jaworski and Kohli (1993) in conceptualizing a market orientation as intelligence generation, intelligence dissemination, and market responsiveness. The second approach follows Narver and Slater (1990) in conceptualizing a market orientation as a combination of customer and competitor orientations and inter-functional coordination. Here, based on Pelham and Wilson (1996), we conceptualized MO as a uni-dimensional scale.

FIRM PERFORMANCE

Following Zou, Taylor, and Osland (1998), performance was defined as three-dimensional with financial, strategic, and managerial satisfaction components. The financial dimension focuses on bottom-line outcomes such as sales and profits. The main thrust of strategic performance is that firms often have a set of strategic goals such as improved competitiveness, increased market share, and strengthened strategic position. The satisfaction dimension describes the extent to which the performance of the organization has met expectations. Subsequent analyses treated performance as a second-order construct.

ANALYSIS AND RESULTS
The sample of this study based on 204 USA firms. Our regression model was significant \( (p < 0.01) \) and explained 33.6% of the variance in overall performance. Both LO \( (\beta = 0.42, p < 0.01) \) and MO \( (\beta = 0.19, p < 0.05) \) were significant.

Substantively, the findings showed that both LO and MO affected firm performance. Notably, the impact of LO was much stronger than MO’s. From a practical standpoint, top management should aspire to emphasize both orientations in the spirit of the arguments made by Grinstein (2008), Hakala (2011), and Noble, Sinha and Kumar (2002). However, to the extent that resources are limited, an internal focus based on organizational learning should lead to improved performance more than an external focus on outside stakeholders.

THE VALUE RELEVANCE OF CORPORATE SOCIAL RESPONSIBILITY IN THE EUROPEAN STOCK MARKETS: THE INFLUENCE OF STANDARD ETHICS RATING

Dicuonzo, Grazia; Ricciardi, Francesca; Dell’Atti, Vittorio

Department of Economics, Management and Business Law, University of Bari Aldo Moro, UNIBA, Bari, Italy

ABSTRACT

Over the last years, the theme of corporate social responsibility (CSR) has continued to grow in importance and significance. This interest arises from the idea that firms engaging in socially responsible behaviour may gain competitive advantages, increasing their value. Although social reporting is not mandatory, investors are recognizing a great importance to environmental performance by choosing sustainable and responsible investments (Middleton, 2015). As a consequence, a great number of companies pays greater attention at sustainability themes, promoting a better relationship with stakeholders and ethical investments. To measure the level of social and environmental responsibility stakeholders often use ethical rating. Unlike the traditional credit rating, it is based on non-financial ratios.

The aim of this study is to investigate whether investors take into consideration the social and environmental performance, as proxied by Standard Ethics Rating, in making investment decisions. More specifically, we test whether the reputation for good sustainability is reflected in the market value. To test the hypothesis we follow the accounting based valuation model developed by Ohlson (1995). To define the level of sustainability performance we use the Standard Ethic Rating, which is published by the European sustainability agency “Standard Ethics”. This rating “measures the level of adoption of international voluntary indications on corporate social responsibility and corporate governance, as well as the risk of corporate reputation”. The empirical analysis is based on a sample of European companies listed on German, Italian, French, UK, Swiss and Belgian markets.

This study contributes to the extant literature in several ways. Firstly, we provide more evidence on the value relevance of reputation for sustainability, that is non-financial information. Secondly, we analyse the European context, differently from other works which examine the Dow Jones Sustainability Index in USA (Lourenco et al., 2014; Lourenco et al. 2012). Thirdly, we assess the influence of Standard Ethics Rating, not yet investigated.
Keywords: Value relevance, Corporate Social Responsibility, Rating, Standard Ethics, European context, Corporate Social Performance, Ohlson model, stock price.

PREDICTING THE PRESENT AND FUTURE OF AQUAPONICS WITH GOOGLE TRENDS

Dos Santos, Maria José Palma Lampreia
DINAMIA’CET—ISCTE—IUL, ESCS—IPL, Av. das Forças Armadas, Edificio, ISCTE, Lisboa, Portugal

ABSTRACT
Aquaponics is an innovative scientific and professional area in Europe and across the world with increasing importance. However, despite the importance of aquaponics in Europe and in the world to promote safely and fresh foods, there is a gap because stakeholders, researchers and other professionals don’t really know the actual development and increasing of importance this activity in Europe despite the enormous contribution of the Aquaponics Hub from COST FA 1305. To overcome this problem and to know about the status, trends and importance of aquaponics searching in Europe we conduct this work. The main goal is to analyses the aquaponics and aquaponics related terms search through Google trends tool across the European countries where the Aquaponics Hub from COST FA 1305 where present from 2014 to the present, in order to analyses the path of aquaponics and the contribute done by the Action COST FA 1305 and related research.

The methodology includes univariate and econometric models based on google trends from 2014 to the present.

The results high line confirms the increasing trends of aquaponics and aquaponics related terms across the Europe and European countries belongs to COST FA 1305, but there are significant differences among countries. In general, the results per country show a real increasing after the countries becoming member of the present action of the COST action or an increasing during the Action, but there are differences among countries country. As well the increasing of scientific papers indexed in SCOPUS or Web of Science was increasing.

Keywords: ARIMA model; econometric model; google trends; aquaponics.

INTRODUCTION
Nowadays the increasing volumes of ‘big data’ reflecting various aspects of our present activities and represent a crucial new opportunity for scientists and experts to study the fundamental questions about the complex world we inhabit (Preis et al., 2013; Axtell, R. L. Zipf, 2001; King 2011; Vespignani, 2009; Perc, 2012; Petersen et al., 2012; Christakis et al., 2009).
On the other hand, research on innovative topics, whose technology is still in constant progress, development and improvement of efficiency on the use of inputs and the production of outputs like is the case of aquaponics in Europe, sometimes results in difficulties in obtaining data. These difficulties arise, or because there is no data available from private companies, or because either there are data from other continents, or countries whose production systems do not allow comparability, or because the soil-climatic conditions, or technical-institutional-economic conditions (Goddek, et al. (2015; Dos Santos. 2016). Because they use different production techniques due to the difference in quality and quantity of inputs available in loco.

In today’s world, information gathering often consists of searching online sources. Recently, the search engine Google trends has begun to provide access to aggregated information on the volume of queries for different search terms and how these volumes change over time, via the publicly available service Google Trends. In the present study, we investigate the intriguing possibility of analyzing search query data from Google Trends to provide new insights about the importance and the role of the Aquaponics Hub from COST FA 1305 in the growth and research of aquaponics and aquaponics related terms such as aquaculture and hydroponics in the world; Europe and European countries involved in this Action.

LITERATURE REVIEW

According the Google trends search (2017) the world is paying increasing attention to aquaponics and aquaponics associated terms based on the figure 1 that presents the searching terms across the world. That date is based on google trends research between 2014 and 2016. Since the beginning of January 2004, Google has been collecting data on the number of search queries that it receives for various search terms. From these raw data, Google can then compile a weekly Google Trends query index for the number of searches completed for any particular search term (Hand, & Judge, (2012). Data provided by Google Trends are already normalized over each selected period and downloaded online in .csv format. The normalization process is reported as follows: “each data point is divided by the total searches of the geography and time range it represents, to compare relative popularity. The resulting numbers are then scaled to a range of 0 to 100” (Google Trends, 2016; Google Trends, 2017, Mavragani and Tsagarakis, 2016).

METHODOLOGY

The methodology includes the Google Trends search from 2014-2016 at European; world and per country level search. After we use univariate analysis and econometric models namely an ARIMA model based on Choi and Varian (2009):

\[ \ln y_t = \alpha_0 + \alpha_1 \ln y_{t-1} + \alpha_{12} \ln y_{t-12} + \beta x_t + u_t \]
RESULTS AND DISCUSSION

Figure 1 presents the present and prevision of aquaponics across the world. The prevision of aquaponics and aquaponics related terms show an increasing trend in the future. Besides that, the searching of aquaponics at the present (from 2014-2016) presents more or less constant values at the world level. But at the same time in Europe aquaponics and aquaponics related terms presents an increasing trend (Fig. 2). This fact could not be separate from the importance and the ward scientific, professional and at politic level work developed by the Aquaponics Hub. These results were, as well, confirmed by the partial searching per country (in Annex 1) where the searching in aquaponics and aquaponics related terms show, in general an increasing in the Google trends search after the country becomes part of this Action, but the results vary depending the country.

COMMUNITY BASED BUSINESS MODEL PROPOSITION

Drummond, Damon

School of Management, Ritsumeikan Asia Pacific University

ABSTRACT

This paper examines and proposes a new contemporary Community Based (CB) business model for sustainable community level competitive business. The paper shows how elements of this type of business model are both complex and divers compared to that for the enterprise firm. It also identifies significant CB determinants, such as, the quality and grade of clustering cooperation on the CB and how these significantly impact upon results. It applies this model and makes comparisons between Japan, Korea, Thailand and Indonesia.

One demonstrated limitation of the CB business model is making clear outcome scales, unlike the typical case, as CB models have both profitability and public interest as their goals which are not always compatible with each other.

Finally the paper reviews the CBs model for its applicability to sustainable value creation, stakeholders relationships and governance. The aim is to be able to apply this model to wide spectrum of CB business for future understanding and analysis.

EFFECT OF CULTURAL INTELLIGENCE AND PROFESSIONAL COMMITMENT ON WELL-BEING OF EXPATRIATES AND HOST COUNTRY NATIONALS

Duyar, Veli Deniz; Erkuş, Ahmet
Faculty of Economics, Administrative and Social Sciences, Bahçeşehir University, İstanbul, Turkey

ABSTRACT
This research investigates the reasons of employee well-being of expatriates and host country nationals who are working at the same project teams on Information Technology field. Cultural intelligence of expatriates are generally used in international HRM to analyze its effect on the adaptation process, but there is no earlier study about its relationship with well-being of both expatriates and host country nationals working in the same environment. Employee well-being is measured on three levels (Life well-being, Work well-being, Psychological well-being). Not only the work well-being but also life and psychological aspects of well-being is measured in order to see all types of influences on employees who are working with people from different cultures.

“Even with a low score of Cultural Intelligence, can Professional Commitment make employees satisfied about their inter-cultural assignments and still keep them happy?” was another question of the research, thus professional commitment of participants are also measured.

The research was made with 152 expatriates and 183 host country nationals in Turkey. Research questionnaires were English for expatriates and Turkish for host country employees. Questionnaires were distributed after one to one explanation of the research to each of the respondents who had mainly engineering background. The present study contributes to the cultural intelligence theory and has practical usefulness on international project assignments.

Keywords: Cultural Intelligence, Professional Commitment, Employee Well-being, Expatriates, Host Country Nationals
ABSTRACT

Group decision-making and stock price predictions are topics that are interesting for academic research as well as for business purposes. A myriad of studies have already been conducted to assess the quality of forecasts by financial analysts (Aiolfi, Rodriguez, & Timmermann, 2009; Bolliger, 2004; Clement, 1999; Fleischer, 2005; Roger, Roger, & Schatt, 2015; Stanzel, 2007), but in general these studies still show little evidence that it is possible to generate accurate predictions that in the long run create, after transaction costs, profits higher than the market average (Malkiel, 2007; Stanzel, 2007). This research project investigates group decision-making as an alternative approach to traditional financial analysis, based on Internet group decision-making, and follows the suggestion that a group decision is better than the decision of an individual (Page, 2008; Sunstein, 2008; Surowiecki, 2005). This approach can be seen as a variation of a group decision-making process as suggested by Kaplan (2001). The overall aim of the study is to explore, analyse and compare the quality of equity predictions of individuals and groups who are using the Internet in order to build theory of process. The research project follows a mixed-methods approach (Creswell, 2009; Johnson & Onwuegbuzie, 2004) in the form of a sequential study with a field experiment. Different groups—consisting of lay people, but also financial professionals—were formed purposefully in different group designs to generate equity forecasts. The field experiment was conducted following an e-Delphi approach with online questionnaires, and in-depth interviews with all participants. Data from financial analysts was used to compare the predictions from the groups with actual results of share prices (Endress, 2015). The data from the experiment suggests that there are different variables, in terms of the individual characteristics of the participants, which indicated a significant impact on the quality of equity predictions. The predictions of some participants (e.g. “PID-S-plus” rated participants) are apparently of significantly higher accuracy (Endress & Gear, 2015). The findings from the study indicate that intuition plays a significant role in the decision-making process not only for lay people, but also for financial analysts and other financial professionals. However, there are observable differences in the intuitive decision-making of lay people and experts. While it was possible to observe that intuition is interpreted as “random guess” by poor predictors, it was found that good predictors base their intuition on several factors—even including fundamental and macroeconomic considerations. The findings of the experiments led to an explanatory model which we introduce as ‘Deliberated Intuition’ (Endress, 2017). The model of deliberated intuition which is proposed here views prediction as a
process of practice which will be different for each individual. The model proposes that a predictor will decide, consciously or semi-consciously, when they feel ready to rely on gut-feeling, or to undertake more analysis. Generally, it appears to contribute to a good prediction to think about the problem in different ways and with various techniques. The model may help to improve group settings and prediction quality. Apparently a combination of rational and intuitive techniques leads to better prediction quality.

THE IMPACT OF STUDYING IN A SOCIOECONOMICALLY DIFFERENT SOCIETY COMPARED TO THE HOME COUNTRY ON WORK RELATED VALUES: EVIDENCE FROM CYPRIOT WORKERS WHO WERE EDUCATED IN THE UK

Epaminonda, Epaminondas
Management and MIS Department, University of Nicosia, Nicosia, Cyprus

ABSTRACT

BACKGROUND
This paper analyses the impact of education in a country that differs in key socioeconomic indicators compared to the home country on work related values. Studying this topic is considered theoretically interesting and important for two main reasons. First, because even though there are many studies that focus on the impact of the socioeconomic environment of a society on the importance of job characteristics, there seems to be a lack of studies on the values of workers who studied abroad in a socioeconomically different country compared to their home country and then returned home to work. Second, the above scenario is very common in the world today and results could potentially be generalised to several cases.

METHODS
To achieve the objectives above, first, work related values of Cypriots who studied for more than four years in the UK were compared with respective values of Cypriots who did not study abroad through a values questionnaire and, second, interviews with Cypriots who studied in the UK focused on processes of value change during their time abroad. The number of correctly completed questionnaires of locally trained employees were 110 and those who were educated in the UK 100. Fifteen (15) interviews were conducted. Cyprus and the UK are considered ideal cases to be used for the question at hand because they differ on key sociocultural factors that influence work related values, i.e. national wealth, individualism, power distance, uncertainty avoidance. The differences in all four of these factors (national wealth and individualism higher in the UK, power distance and uncertainty avoidance lower) were likely to make intrinsic job characteristics, e.g. challenge, recognition and autonomy more important in workers who were educated abroad.

RESULTS
Questionnaire results suggest that intrinsic job characteristics seem to be more important for workers who studied abroad while extrinsic job characteristics get higher scores in the group of locally trained employees in most of the items included in the questionnaire. More specifically, the importance attached by foreign trained employees to intrinsic items ‘challenging job’, ‘training opportunities’, ‘the freedom to adopt own approach to the job’ and the ‘extent to which skills and abilities are being used’ is higher than the importance given by locally trained employees. On the other hand, locally trained employees give more importance to extrinsic items ‘security’, ‘pay’ and ‘fringe benefits’ compared to foreign trained employees.

Analysis of interview results suggests that work related values of workers who spent time studying abroad have been influenced by a variety of factors, including foreign students’ and tutors’ attitudes and behaviour; foreign society’s general attitude; and the education system abroad. Workers who studied abroad mentioned for example foreign students’ job choices, comments, and attitudes toward educational work as factors that might have influenced their values. The processes that seemed to have been taking place were dissonance and internal and external accountability. Accountability refers to the need to justify one’s thoughts and actions to significant others, and accountability pressures can be both external and internal. External pressures arise when the environment influences towards behaving in a particular way whereas internal changes occur when some modes of behaviour have been adopted by the individual and considered preferable compared to others. Being accountable to audiences with different values is expected to lead to dissonance, and by repeatedly resolving conflicts between diverse values, individuals move through the process of changing their values.

CONCLUSIONS

This paper attempted to answer the question of whether there are differences in work related values between Cypriot workers who were educated in the UK and Cypriots who were not educated abroad, and analyse the process behind any observed changes in workers who were educated abroad. Results suggest, first, that there are differences in the values of these two groups of employees. Secondly, the process of change in the workers who studied abroad seems to involve primarily resolving conflicting values due to dissonance because of internal and external accountability. These findings add to the knowledge of the impact of education in a socioeconomically different society on work related values and may be relevant for organizations today that employ workers with diverse experiences in different socioeconomic contexts.

Keywords: Work related values, change, culture, education, Cyprus, UK
ABSTRACT

User interfaces (UI) are evaluated by potential users in order to conclude the quality of systems, and how well these systems are expected to support task completion. While traditional models emphasized the instrumental qualities such as usability and usefulness, contemporary models accentuate hedonic aspects of the UIs (e.g., Islam and Bouwman, 2016; Mahlke et al., 2007). Hedonic needs are quality aspects that go beyond the instrumental value of a system. While instrumental attributes are aimed at fulfilling pragmatic needs, hedonic attributes emphasize the users' psychological well-being. In line with this approach, models depicting the system evaluation process include conceptually distinct aspects of UI evaluation: instrumentality, aesthetics, and symbolism (Rafaeli and Vilnai-Yavetz, 2004). Instrumentality refers to the usability and functionality of the system. Aesthetics refer to the sensual experience elicited by the visual design (Tractinsky, 2013). Finally, symbolism refers to the meanings and associations that are evoked by the system (e.g., Mahlke et al., 2007; Tractinsky and Zmiri, 2006). While this paper agrees that all three aspects are theoretically distinct, it argues that perceived aesthetics and perceived symbolism may converge. In previous research these attributes were reported to be highly correlated. Mahlke et al. (2007) report a correlation of .54 while Tractinsky and Zmiri (2006) report a correlation of .72 between these attributes. Eco (2004) explains that in some periods in history these two concepts were considered synonymous. Unraveling the interrelations between these perceived attributes may help find remedies for data problems that may arise from their convergence, and help include both attributes in preference models.

In a series of five studies, a total of three hundred undergraduate students rated popular web pages, general control panels of information systems, and control panels of household appliances. Items measuring usability, functionality, aesthetics, and symbolism were generated based on a literature review (Rafaeli and Vilnai-Yavetz, 2004; Tractinsky and Zmiri, 2006) and assessed for reliability and validity. Separate exploratory factor analyses with maximum likelihood analysis extraction (eigenvalue > 1) method, and oblique rotation (direct oblimin with Kaiser Normalization) were applied to the responses. When eigenvalue was greater than 1, items were loaded on three distinct factors: usability, functionality, and a factor of aesthetics-symbolism. Imposing four factors did not indicate more than three clear factors. Items of both aesthetics and symbolism were loaded together on one factor. These results were replicated across five consecutive studies that tested attribute judgments to different
stimuli analyzed. When these factors were included in a regression model where preference was the
dependent variable, both usability and aesthetic-symbolism factors were salient predictors of
preference variance across all studies, regardless of the stimuli presented.
The paper concludes that although aesthetics and symbolism are defined in the literature as
conceptually distinct (Rafaeli and Vilnai-Yavetz, 2004), when participants rated these attributes, they
perceived them as similar. Thus, while usability and functionality items were loaded on two distinct
factors, all aesthetics and symbolism items were loaded together on one factor. This strong association
between aesthetics and symbolism is reported in other fields of research. Dion et al. (1972) reported that
what is beautiful is good. Eagly et al. (1991) demonstrated that physically attractive people were judged
as more intelligent. The implications of these findings are that people do not only associate between
beauty and goodness, but rather they perceive beauty and goodness similarly. The managerial
implications should therefore be, that a meticulous design of a product is crucial in order to make
potential users appreciate its quality.

STUDENTS’ PERCEPTIONS ON SMART CITY INITIATIVES: EVIDENCES
FROM ITALY AND RUSSIA

Ferraris, Alberto; Belyaeva, Zhanna

1Department of Management, University of Torino and Laboratory for International and Regional Economics, Graduate School of Economics and Management, Ural Federal University;
2Graduate School of Economics and Management, Ural Federal University

ABSTRACT

INTRODUCTION

Smart cities are nowadays recognized as important “locus” of innovation. Many heterogeneous and different stakeholders such as firms (SMEs and MNEs), local governments, Universities and research centers co-develop “smart” innovations that aim at increasing citizens’ life quality. In this context, students have a major role to play in smart cities as part of the citizens of today and, mostly, of the society of the future (Vanolo, 2016). Their role can be instrumental in addressing societal issues and challenges in the implementation of smart city projects as because they are part of the citizens that represent the stakeholder to which every smart city projects should look as end user (Espejo and Mendiwelso Bendek, 2011). However, very little is known about how citizens (and in particular students) perceive, and how they might respond to the opportunities that smart city technologies offer. This paper reports the results from a survey (n=200, pilot survey at this time) that took place in Italy and Russia. The University of Turin (Italy) was represented by the School of Management and Economics while the Ural Federal University (Russia) was represented by the Graduate School of Economics and Management. This contributes to the literature by providing a better understanding of the perceptions and behaviour of actual and future “smart” citizens about the possible deployment of smart city initiatives.

BACKGROUND & RESEARCH OBJECTIVES

The planet has gone through a process of rapid urbanization over the past decades and nowadays more than 50 per cent of the world’s population is urban. Over the coming decades, the level of urbanization is expected to increase in all regions, with Africa and Asia urbanizing faster than the rest. Furthermore UN (2014) predicts that the world’s population living in urban areas will reach 66 percent by 2050. In this context, the search for more efficient organization of the city, and of its services, has led local and national governments, and supranational organisms to approach the management of cities in a more “smart” way (Scuotto et al., 2016). For example, the European Union...
recognizes that the concept of smart city means smarter urban transport networks, upgraded water supply and waste disposal facilities, and more efficient ways to light and heat buildings (Caragliu et al., 2011). And it also encompasses a more interactive and responsive city administration, safer public spaces and meeting the needs of an ageing population.

The spread of smart city’s technologies and solutions looks like socio-technical transitions, since it requires the development of areas in which the collaboration between the various actors (such as governments, businesses and citizens) is facilitated (Ferraris and Santoro, 2014), in order to test and refine solutions aimed at scalability (Sandulli et al., 2016). The niche experimentation is crucial to promote the socio-technical change and the introduction of new technologies in society.

This experimentation require the participation of the stakeholders that will ultimately benefit from this new “smart” services, i.e. the citizens (Caragliu et al., 2011; Belyaeva, 2016). In this context, students (and theirs perceptions) have a major role to play in smart cities as part of the citizens of today and, mostly, in the society of the future. Despite the perceptions of the students are deeply analyzed and taken into consideration in other related fields, such as on the University social responsibility. This is the research gap that we would to fill up with this research.

So, the main aim at this study is to understand the perceptions of students of two different big Universities situated in Italy and Russia regarding the Smart Cities emerging phenomenon. This allow us to propose fresh insights in this emerging and relevant new stream of research from a new perspective of analysis. This paper may also help in building and aligning new curricula within Universities in order to better address the phenomenon of Smart Cities (Grimaldi and Fernandex, 2016). At the same time, some policy implications along with future line of research will be proposed based on the evidences of this survey.

ADOPTION OF RISK MANAGEMENT IN SMES: A SYSTEMATIC LITERATURE REVIEW

Ferreira de Araújo Lima, Priscila; Verbano, Chiara; Crema, Maria

Department of Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

BACKGROUND
In the last years, Risk Management (RM) has been a major issue for companies to ensure their survival and overcome uncertainties to reach their goals. RM has considerable implications for competitiveness and business; it enables, for instance, the development of a strategy to reduce potential losses while exploiting new windows for opportunities (Radner and Shepp, 1996).

Notwithstanding, still nowadays, RM implementation in the companies is inconsistent (Faisal, 2007). Many firms lack knowledge, resources and reliable mechanisms to support their RM application, and this is particularly notable for Small and Medium-sized Enterprises (SMEs) (Brustbauer, 2014). SMEs are more vulnerable to risks and should be more engaged into applying RM (Alquier and Tignol, 2006).

SMEs are companies with limited resources and with more difficulties to overcome risks due to their limited size. As stated by many researchers, the literature has focused on large companies, leaving a lack of empirical evidence addressing small companies (Kim and Vonortas, 2014). There is a gap of research in RM in SMEs and few academic studies have addressed the theme (Rostami, 2015; Thun, 2011; Marcelino-Sadaba et al., 2013; Toulова et al., 2016; Ellegaard, 2008), despite the increasing number of SMEs in Western economies.

Moreover, this lack of studies is relevant because SMEs are considered the backbone of EU countries’ growth: they represent 99% of the enterprises and 67% of all employment in the EU (OECD, 2011). Therefore, improving SME’s managerial knowledge and competencies is crucial to leverage the development of the whole economy (Hussain et al., 2006; Porter, 2006).

Knowing the importance of SMEs and the overmentioned significant gap in the literature, this research intends to collect and analyze the existing relevant studies on risk management applied in SMEs through a systematic literature review.
OBJECTIVES

The aim of this research is to define the state of the art about RM applied to SMEs and identify the most relevant gaps in the literature. Once they are identified, it will be possible to determine the directions for future researches in the field. In order to do that, a database containing the significant published articles that address RM in SMEs has been built. The academic databases (DB) used in this search were Scopus and Web of Science Core Collection. Different set of keywords (mainly considering “Risk Management” and “SMEs”, or “Small Business”) were combined to extract the results.

A total of 621 papers were found, being 113 papers in Scopus and 508 in Web of Science. To narrow down the searching results, a selection process was performed using the following filters: exclusion of proceeding papers, editorial materials and notes; exclusion of articles that are not in English, exclusion of the duplicated articles obtained through the different queries and of the duplicated articles between both databases. To conclude the selection of papers, the abstract and, finally, the full-text of the papers were read, excluding those that did not regard RM in SMEs and those that were not scientific, obtaining a final database of 57 articles.

In order to assess the quality of the database that was built, the Journal Citation Reports Impact Factor (JCR-IF), the Scimago Journal Rank (SJR) and the “Associazione Italiana di Ingegneria Gestionale” (AiIG - Italian association of management engineering) ranking have been reported. Then, a descriptive analysis of the database was executed, which consisted of collecting the information regarding the year, the author, the country where the first author works, the country where the study has taken place and the type of research methodology adopted in each paper. Finally, a content analysis was performed using the variables RM stream (Verbano and Venturini, 2011, 2013), RM process phases (Rabechni and Carvalho, 2013; Cagliano et al., 2014) and the risk types (Casualty Actuarial Society, 2003; The Institutes - Risk & Insurance Knowledge Group, 2009), with the final intent to identify the existing gaps in the literature regarding RM in SMEs which will address potential future research.

PRELIMINARY FINDINGS AND DISCUSSION

The database with the selected papers contains articles from 1994 until 2016, but only in the last four years a growing trend can be identified.

Almost 83% of the papers in the database are published in journals classified in the first 2 quartiles for JCR-IF; 58% are in the first two quartiles considering SJR; and 65% of the articles are on the top journals (gold and silver) referring to the AiIG ranking, certifying the high quality of the database. No particular journal is specifically devoted to the topic, but these two have published more articles than the others: Production Planning & Control (4 papers) and International Journal of Entrepreneurship...
and Small Business (3). The 6 most cited articles (written by 5 different authors) correspond to 47% of all the citations in the database. These authors are: Labodova (2004), Faisal (2006; 2007), Finch (2004), de la Torre (2010) and Wu (2009). The first authors of the papers in the database work mostly in the United Kingdom (8), in Germany (6) and in the United States (5), while the most productive authors are Thomas Henschel, from Germany and Mohd Nishat Faisal, from India with 3 papers published each. More than half of the researches (52%) were applied in Europe, mainly in the United Kingdom and in Germany, while 22.2% were applied in Asia, mostly in India.

Regarding the research methodology, the great majority of the papers are empirical (89%), while 7% are conceptual and 4% are literature reviews. Among the empirical ones, 21 are surveys, 15 are case studies, 3 mix both the previous research designs, 9 are modeling tests and 1 is an action research.

Since the aim of this research is to define the state of the art related to RM in SMEs, it was also important to analyze which RM streams, risk types and RM phases have been studied. The main studied risk management streams are financial RM (25%), strategic RM (25%) and enterprise RM (23%). Less studied are the supply chain RM (12% of the papers) and project RM (11%), while the engineering RM stream is not studied in any of the articles and the disaster RM stream is focused on 2 papers only.

As for the risk types, the financial and operational ones are studied in 30% of the articles each, strategic risks are considered in 25% of the papers, while hazard risks are the less studied ones (15%).

When considering the risk types and their subcategories, there is a clear evidence that the credit risk in the financial risk type is the most studied category among all, followed by the business operations risks in the operational risk type. Among the strategic risks, those linked with information technology are the most evident, while in the hazard ones the occupational risk is the most considered one.

As it was expected, due to the results obtained from the RM stream analysis, most of the researches took place in the financial sector and they are related to financial RM stream. When analyzing other industries and the correlated RM stream, it is also possible to notice the following relationships: Project RM in the construction industry, supply chain RM in the automotive industry and strategic RM in the financial and manufacturing industry.

Approximately 35% of the papers regard all the RM phases. The evaluation of risks is the most studied phase as it can be found in 33% of the articles, followed by the risk identification (30%). This may be due to the fact that identification and evaluation are the first two steps of the RM process, but it is also possible that the real reason is that, since these phases are considered by many authors to be the most critical ones, the SMEs have been putting more effort into implementing them. Other analysis will be conducted to deepen the literature review, in order to offer a complete synthesis for scholars interested in this topic and to highlight future research opportunities.

THE COST OF EQUITY OF TOO BIG TO FAIL BANKS (TBTF). A COMPARATIVE STUDY BETWEEN CAPM, THE METHOD BASED ON THE RECIPROCAL OF P/E MULTIPLE AND ACTUARIAL METHOD

Fontana, Stefano; Coluccia, Daniela; Solimene, Silvia; Rosati, Serena

Dept. Business and Law, Sapienza University of Rome, Italy

ABSTRACT

The cost of equity is typically defined as the expected return that investors require to purchase common stock in a firm. It is therefore an important input for bank management when raising capital and making investment decisions and for investors when they value equity securities and construct their portfolios. The Capital Assets Pricing Model (CAPM) method remains the one most commonly used by practitioners and financial advisers to estimate a firm’s cost of equity, as shown in surveys by Brunner et al (1998) and Graham and Harvey (2001).

This paper provides a comparative analysis of different methods for determining the cost of equity according the following methods: the Capital Assets Pricing Model, the Actuarial Method, (Oricchio, 2012), based on the probability of default (PD) and finally the method based on the “price to earnings” multiple (P/E), (Zimmer and McCauley, 1991).

This comparison has been carried out on 24 large international banks (the so called “Too Big to Fail”) from 2012 to 2014.

The selected banks in the sample belong to eleven different countries.

The first phase was aimed at measuring the risk premium of the banks through the use of the CAPM method. This model estimating the parameter of the risk premium as resulting from the product of beta coefficient and the equity risk premium (ERP).

Beta factors, provided by the Datastream-Thompson Reuters Company, covered the period 2012 - 2014.

The second phase determined the probability of default of the selected banks, for a period of three years, providing estimates on the basis of the credit rating of each financial institution analyzed. This method is based on the use of 10 years cumulative PD from the Moody’s database.

Finally, the “cost of equity” of selected banks was measured through the alternative approach based on the reciprocal of the multiple “price to earnings”. However, an important assumption needs to be introduced in order to use this method for estimating a firm’s cost of equity. This is that the current profit rates represent a good estimate of the expected long-term sustainable ones.

These three methods have been used during the overall analysis process, exclusively focusing on market data, and through these data it has been possible to estimate “the cost of equity”.
A comparison has been carried out between three models in the following way:

- Determining the difference between the values obtained by CAPM method and the values resulting from the use of Actuarial Method;
- Determining the difference between the values obtained by CAPM method and the values resulting from the use of reciprocal of “price to earnings” multiple (P/E).

The trends of cost of equity, calculated with the three methods, were observed, and after such analysis, the results have been examined and possible differences of values have been explained.

Keywords: cost of equity; CAPM, price to earning; probability of default

RETAILERS’ INVENTORY STRATEGY ON PURCHASING-CONSUPTION CYCLE MODEL OF CONSUMERS

Fujimoto, Hisao
Department of Information Technology and Social Sciences, Osaka University of Economics, Osaka, Japan

ABSTRACT

This paper explores the importance of consumers’ inventory for distribution channels. For this purpose, this study approaches consumers’ purchasing and consuming cycle, and the changing relationships between distribution channel members in Japan. In addition, this study based on a buying behavior model and the data of local consumers’ buying behavior of Japanese consumers, focusing especially elderly people, suggests that Japanese consumers can offer opportunities to local small retailers.

Bucklin (1963) and Tamura (1982) defined that retailers provide “retail services” for consumers. According to them, these services can be classified into the following four types:

1. Reduction of buying lots
2. Shortening of trading and delivering time
3. Assortment of goods
4. Providing of accessibility

Consumers usually make their buying plans before the shopping trips. Considering whether their buying actions are done as designed or not is an important criterion, because the buying plan prescribes the consumption interval of goods.

The consumption interval consists of three time stages:

1. Time of decision to what goods or brands should buy.
2. Time of action to get goods.
3. Time of using and consuming the goods.

Especially, the first time stage is decisive on this issue, and two factors have effect on this stage. The first factor is the “sense of stock in house”. If a consumer lays stress on the extent of the stock of goods in house, the buying plan on these goods is designed as a long-range and firm schedule. The second factor is the “synchronization of the consumption interval”. In generally, a consumer buys many kinds of goods at one shopping, because the buying or trip cost per one goods can be decreased. The more a consumer purchases many goods at one time, the more he can be benefited over the shopping cost.
This paper uses two dimensions: “the axis of space” and “the axis of time”. The space axis is a criterion of judgment on consumer’s accessibility to retail store. At one side of this dimension is the “decentralization”, which means the store’s location to be decentralized in a given market area. When a consumer chooses a store located close to him, it reflects that he lays stress on the accessibility. At the opposite side is the “centralization”, which means the centralized retail location, as a commercial center or shopping center, at one district in a given market area. The type of consumption interval is determined by time dimension. When the interval is short, it is categorized as the “frequent buying”. If the interval is relatively long, it is assumed the “non-frequent buying”.

We describe following four types: (1) Frequent centralization buying, (2) Frequent decentralization buying, (3) Non-frequent centralization buying, (4) Non-frequent decentralization buying.

In order to explain the reasons that the number of small retailers could occupy the majority in Japanese retail structure for long time, some researchers have introduced several consumer behavior approaches. For example, Maruyama (1992) and Naryuu (1994) insist that Japanese consumers have a strong taste for fresh products, such as raw fish and fresh vegetables, instead of processed foods like canned or frozen foods. All the products are perishable, preserved only for a short period of time even in a refrigerator. They also argue that the average house space in Japan is generally narrow. Therefore, the cost of inventory stock of goods in house is rather high. Because of these points, they conclude that Japanese consumers go shopping frequently in small lots at each purchase. It leads to the retail structure with a large number of small retailers densely located near to residential area.

Their model apparently assumes that Japanese consumers carry out shopping by foot. However, motorization in Japanese society had been developed enough. As in other countries, many consumers use cars for daily shopping and go to giant retail stores beyond the local marketplace. It means that local small retailers in one district have to compete with giant stores located in the same district and/or outside of it.

The consumers’ shopping pattern, which can be grouped as the “frequent centralization buying” and the “non-frequent centralization buying”, can be supposed to have the effect to reduce the survival rate of local small retailers.

Retailers have to focus their attention on the particular consumer segments to develop effective strategies. In this paper, the authors tried to classify the consumer buying behavior as a base for developing strategies. As the result, consumers who carry out the “frequent decentralization buying” are congenial to small residential retailers. These consumers tend to complete their daily shopping within their local communities.

The study suggests that elderly consumers can be a promising segment to become potential customers for local small retailers. Their behavior can be classified into the “frequent
decentralization buying”. They may be not so conscious of price, but conscious of high level services. Small retailers can provide them with many kinds of services as important social supports. Several small retailers already have begun to recognize the importance of elderly consumers and grapple with new retail services such as the convenient ordering and delivery systems. When retailers can serve to consumers’ access and frequent buying, it can reduce the burden of consumers’ stock keeping.

The economic activities involved in the consumer-retailer exchange are embedded in the community’s social structure. Rural small retailers are encouraged to focus on a specific segment that has a majority in the community, and to increase their own involvement in community activities. Elderly consumers who have been considered as the economic and social minority will become the important segment of market and local small retailers in 21st century.

THE ROLE OF CENTRAL BANKS IN THE RECENT FINANCIAL CRISIS.
CAUSES AND CONSEQUENCES OF THE CRISIS AND COUNTERMEASURES TAKEN

Georgakoulis, Athanasios; Koulakiotis, Athanasios

School of Economic and Regional Studies, Department of Balkan, Slavic & Oriental Studies, University of Macedonia of Economic and Social Sciences, Thessaloniki, Greece.

ABSTRACT

The objective of this paper is to show the importance of central Banks’ operations regarding the recent financial crisis. Firstly, we considered the existence of central banks and how their operation and administration enhance economic performance; how do central banks influence the everyday life of citizens. The targets and main role of central banks apart from the fact that they influence the fixing of interest rates, they also apply more extensively the monetary policy from different aspects, such as the FED combats credit contraction and ECB combats excessive credit expansion. How did Central Banks act in the Credit Mess in 2008 and how targets come in contrast between each other, as coping with by the Central Banking system? In this paper, we examined the instrument or better to say the mechanism of the Lender of last resort on behalf of the central banks and the crucial concept of Moral Hazard on behalf of borrowers, that is, the commercial banking system: what are the repercussions of it for the financial system? J. M. Keynes’ proposals are examined and Milton Friedmans’ views regarding credit creation, inflation and money supply. What were the features of the cases: Bear Stearns and Northern Rock during the crisis and how the mechanism of credit creation worked for borrowing and lending? J. M. Keynes’ “Paradox of Thrift” and Minsky’s “Paradox of Gluttony” are considered in relation to business profits.

Secondly, we considered the causes and consequences of the financial crisis and what countermeasures have been taken. The psychology of the investors and the perception of risk are reviewed during the period of August 2007-2009 and how the bond spreads and policy interest rates varied. A very important cause of the financial crisis was the lack of financial regulation which favored the “Affordability Products”, the Subprime Mortgage Loans and the concept of low risk in relation to the low interest rates in the medium and long run period. The above “products” allowed households to pay the very high price of houses, because it was required by mortgages houses a very low or no deposit of money in the banks for financing or refinancing reasons. The main features of subprime borrowing, supported by low quality guarantees for coping with the higher credit risk. At the beginning of the financial crisis there was a mess; the installments were not paid for borrowed money, the arrears rate started to raise, something that neither lenders nor investors could expect.
Many mortgage lenders went bankrupt because of the very early defaults of borrowers, not paying even the first payment in banks for what they borrowed. Money Market Rates did not follow the Policy rates of the central banks as it usually was and this relationship stopped, in August 2007, between the two kind of Rates. Investors did not demand certain kinds of Mortgage-backed securities against liquidity and this situation created the shortage of funding for the lenders who depended on short-term money markets or on Securization of the funds they lent for household mortgages.

As far as the Stock Market concerned, Banks’ share prices fell sharply, when Lehman Brothers declared losses, from July 2007 and fell even more when Lehman Brothers failed. Customers lost their confidence, regarding the solvency of the above institution and they invested in safer securities like the US government bonds. The new classes of assets were affected by the change of the risky price.

Thirdly, there were large consequences on the matter of confidence: spending vanishes when companies and consumers do not trust and do not feel secure in the economic environment where they act and operate. Lack of adequate regulations converted the US mortgage crisis in a banking crisis in the north part of the continent and this crisis was extended into a global one. Many macroeconomic indicators deteriorated because of the intensification of the crisis (2007). There was an acute contraction of industrial output, and as a result the prices declined tremendously until the end of 2007. Borrowers found it difficult to honor their debts. In 2009, because of the down-turn of the world economic outlook bad loans rose, as a percentage of total lending, and profitability of banking sector decreased in USA, Europe and Japan.

Finally, as far as countermeasures are concerned, policy makers focused on banking system, especially central banks stimulated their economies by following an easy-going fiscal and monetary policy: an additional liquidity for the banks was provided for extra lending to economy. The restoration of the financial system was consisted of the support of the financial Institutions and financial Markets. Financial Institutions were guaranteed by the governments, for their funding through the issuance of debt. Some governments supplied capital to the banks and others helped the banks to reduce the grade of risk over the banks’ assets underwritten in their balance sheets. Governments bought the assets of the banks outright by supplying liquidity to banks immediately.

Nevertheless, the financial system remained fragile as far as confidence is concerned, but some market indicators improved in March 2009. Money market spreads decreased greatly after what happened with the Lehman Brothers bankruptcy. Stock Exchanges partially returned back to reasonable levels after the US government released its detailed programs for de-risking the balance sheets of the banks.

Reforms to the financial system were considered, in order to prevent similar crises again. Policies under discussion referred to the changes to the regulation of Credit Rating Agencies, the payment incentives of the Staff of the Financial Institutions and the regulation concerning the banks’ capital.
and liquidity. The Financial Stability Board and the Basel Committee on Bank Supervision developed the above-mentioned initiatives. Both groups membership expanded, in particular by major emerging economies.

The global financial system was facing a period of change. The easy conditions of Credit Markets excesses did not seem to return back soon. Credit conditions started to be tight and the finance for buying assets back became tighter.

As it is obvious from the above mentioned, the current research work, at the moment, is focused on a theoretical grounds. Consequently, the used methodological approach is a qualitative one, centralizing on the 4 aforementioned pillars/axons, relying, mainly, on the role of central banks during the recent global financial crisis and more specifically on the comparison analysis between the applied strategies of monetary policy, by FED and ECB.

Keywords: financial crisis, moral hazard, credit driven bubbles bursts, monetary policy, credit creation, money supply.

BANK COMPANY RELATIONSHIPS FOR STRENGTHENING AN INTERNATIONAL COMPETITION. ANALYSIS OF ITALIAN CONTEXT

Giacosa, Elisa¹; Mazzoleni, Alberto²

¹University of Turin, Department of Management, Turin, Italy
²University of Brescia, Department of Business Administration, Brescia, Italy

ABSTRACT

In the current scenario, a disengagement of the banking system emerges, in addition to a cultural unpreparedness and economic, financial and patrimonial inadequacy of the companies, the presence of regulatory interventions lagging behind the companies’ needs and a debt/capital market still underdeveloped in comparison to the potential demand.

Therefore, the objective of the paper is to suggest the Italian small and medium companies which funding resource would be the most appropriate to their particular economic, financial and patrimonial situation.

We referred to Giacosa and Mazzoleni (2016), who proposed a model that classifies the companies according to their profitability, capacity to repay financial debts and a growth.

From the analysis carried out in Italian context, it turned out that around 63% of Italian companies can recourse to the bank loans without problems, while in case of about 37% of companies an access to bank loan as the main source of funding is or will be limited.

It appears a relevance of the issue and necessity, from one hand (in medium-term) to change the management behavior and to try to conquer economic fundamentals consistent with banks’ expectations. In the immediate future, the companies should improve to learn about and to use a non-bank financial instruments.

GLOBAL BANNING OF A DIFFUSED CONTROVERSIAL PRACTICE:
DEINSTITUTIONALIZATION IN THE SOCCER INDUSTRY

Gurses, Kerem1; Giones, Ferran2; Mehtakumar, Kandarp3

3Department of Entrepreneurship, IESE Business School, Barcelona, Spain

ABSTRACT

We study the deinstitutionalization of a controversial practice that had previously reached a level of international diffusion. We draw on international diffusion and deinstitutionalization theory to study the emergence and diffusion of the third-party ownership practice in the soccer industry. We use an inductive case study combining archival and interview data to study the determinants of the international diffusion of a controversial practice at a global scale, the contestation, and finally the deinstitutionalization process that resulted from the ban of the practice. We find that the opacity of the practice can be a diffusion driver, locally and at the international level, nevertheless the opacity also may lead to different meaning creation attempts and potential discursive battles between actors, and eventually to deinstitutionalization of the practice. This article advances our understanding of how controversial practices fare in different institutional environments.

INTRODUCTION

The striker Radamel Falcao of Atletico Madrid, was transferred in 2011 to AS Monaco for a whopping fee of $70 million. Atletico Madrid, despite being in financial trouble, had acquired Falcao from Oporto FC (Portuguese club) for $45 million only a year ago, in 2010. How could a financially troubled club like Atletico have acquired the star player that helped them to generate an additional income of $25 million? As the financial crisis hit Portuguese and Spanish soccer clubs, limiting their options to raise debt to bring in new talent, investment groups stepped in to help the clubs to participate in the lucrative European transfer market. The investment groups used an innovative practice common in Brazil and Argentina. The investor would alleviate the financial strain of the club in exchange of a share of the player’s economic rights. The practice, known as Third Party Ownership (TPO) describes the arrangement that allows for a third-party ownership on a professional soccer player. As the practice diffused, it started to raise concerns in some of the soccer institutions in Europe (UEFA) on the possible manipulation by external investors in the fairness of the competitions and the transparency of the transfer market. As a result of a lengthy contestation process, FIFA (top international institution in soccer) instructed a global ban of the practice to take effect in 2015 (FIFA,
Prior research has explored the fate of institutionally contested new practices such as the one described above (Jung and Mun, 2016; Reinmoeller and Ansari 2016; Sanders and Tuschke, 2007; Briscoe and Murphy, 2012; Davis & Greve, 1997; Fiss, Kennedy, & Davis, 2012). However, much of this work conflates diffusion of these practices and their institutionalization (for exceptions, see Jung and Mun, 2016; Reinmoeller and Ansari 2016) although, recently few authors argued that these processes are analytically separate (Colyvas and Johnson, 2011). In addition, most of these studies shed light on how these practices evolved in a single institutional environment, providing little information on how they may fare in multiple institutional environments. Furthermore, we know very little about how key international constituents interpret and respond to the diffusion of institutionally contested practices due to differences of norms and values in their corresponding international context.

In order to follow the full life cycle of an institutionally contested practice in different institutional environments, we conducted an inductive study (Eisenhardt, 1989) documenting the advent of the third party ownership practice (TPO) in Latin America starting from the 2000s and its subsequent diffusion and deinstitutionalization in Europe in 2015 due to the contestation by key international constituents. To answer our multi-faceted research question, we combined archival documents and 17 interviews with key informants in the soccer industry. Our findings show that institutionally contested innovative practices may diffuse and get institutionalized within their local markets due to the effort of the diffusing actors, however, they may face contestation by other actors and international institutions when they are diffused to international markets, leading to their eventual deinstitutionalization. We uncover the mechanisms of diffusion and deinstitutionalization, and while doing that, we also provide a multi-faceted account of different institutional actors, some supporting, some opposing this practice. Furthermore, we depict that the opaqueness of the practice helped the diffusion process as predicted by the previous literature (Briscoe and Murphy, 2012, Reinmoeller and Ansari, 2016) but the opaqueness also allowed the opposing parties to construct negative interpretations of the practice within the field. The power imbalances between actors generates a hierarchical contestation process, which can lead to the deinstitutionalization of the practice.

CROSS-BORDER MERGER AMONG NORDIC BANKS – A LONGITUDINAL STUDY

Hyder, S. Akmal; Osarenkhoe, Aihie

Department of Business and Economic Studies, Faculty of Education and Business Studies, University of Gävle, Sweden

ABSTRACT

Researchers have found that even international mergers are popular, they usually fail for its complexity. Recently few studies have tried with process perspective to penetrate into merger integration without much success. We argue that focus on pre- and post-merger stages is good but not enough to provide a total picture of the process. By using a longitudinal approach this study analyzes the establishment, development and consolidation of a cross-border merger between banks from four countries.

Based on theories on strategic motives and culture, a theoretical framework has been developed showing how merger process can lead to better competitiveness and performance. Data has been collected through semi-structured interviews with officials from the merging firms, and secondary materials during 1997-2015. The merger is described in four stages. The first stage deals with the initiation and establishment of the merger. Critical period and cultural clashes are covered in the next stage. The third stage concentrates on the development of synergy. The final stage reflects on how the process has consolidated and what result it has so far achieved.

EMPIRICAL STUDY

Merging stage (1997-2000)

This is a period when the mergers among the four Nordic banks from Sweden, Finland, Denmark and Norway took place. The founder CEO identified four specific motives: growth; flexibility; increased sales and synergies. When the banks entered they brought with different national and organizational cultures with them. Initially the differences were not perceived as a big issue due to the geographical closeness. But already in the first merger between Finland and Sweden, conflicting issues including language, decision making, organizational structure and implementation of decisions came out. In 1999, the management organized cultural seminars to identify and minimize gaps. With the inclusion of Danish and Norwegian banks, the official language was changed from Swedish to English to facilitate communication.

Critical stage (2001-2004)
Several concrete motives including reduction of cultural and organizational gaps, integration of the diversified activities, delivery of synergies and application of best practices to generate most value for the clients had been set. For this, three issues were found important: (1) one Nordea business model; (2) one way of doing business and (3) developing one Nordea business support system. When internal decision-making started during 2001-2002, it was realized that merging partners had different opinions on decision-making and implementation. Due to national feeling and experience, partners considered their own solutions better than the other. In 2001, a group of executives from the four countries were assigned to identify what unique and successful concepts they had and how they could implement those solutions in the whole organization. Cost for different activities went up quickly and more time was engaged in solving differences.

**Development stage (2005 - 2010)**

Situation gradually improved in 2005 and onward due to cost reduction and internal efficiency. By the end of 2007, the number of systems used in Nordea was down to four. Retail banking was an important area of expertise at the Danish partner that came to be widely used elsewhere in Nordea. An effort was made to find ways how to implement a common retail banking system across the Nordic countries. Cultural differences, which were initially painful, made a substantial contribution to realization of synergy in Nordea. Slow Swedish processes speeded up due to pressure from the Finnish side, while the Swedish humanistic view became an important part of management to deal with customers and employees. The critical way of looking at things by the Danes got others thinking about the true complexities of international business and the need to be more cautious to remain competitive. The bank’s post-merger activities concentrated on creating more value for the customers than the pre-merger partner banks had offered individually.

**Consolidation stage (2011 – 2015)**

The previous country managers had a limited focus. Over time the situation changed as activities were distributed according to functional areas, such as production, IT and business support, HRM, and accounting. All CEOs used different strategies to make the integration process successful without hampering financial position of the bank. The aim was to build one integrated bank. Harmonization and one way of doing things required top management to know how things were done in the four different countries. Having functional cross-border managers also required close contact with managers from other Nordic countries. The previous values – “focus, speed, and performance” – served their purposes, and the new values – “great customer experience, it’s all about people, and one
Nordea team” – were introduced to unite the banks under the same umbrella and with the same identity.

CONCLUSIONS

This study has shown how different banks engage in merger to become a new integrated organization. Although the potential of growth has been high, the process of achieving the goal is difficult. It is found that even cultural differences can play a complementary role if the merging partners work for the same goal and identity. This case suggests that managers must be dynamic and compromising to succeed in a merger of many partners.

CUSTOMER RELATIONSHIP MANAGEMENT TECHNOLOGY USE OF
SALESPEOPLE
Itani, Omar S.
Department of Hospitality Management & Marketing, Lebanese American University, Beirut, Lebanon

ABSTRACT
In today’s market, business-to-business organizations’ are challenged with soaring competition and their success is more and more associated with effective implementation of technology such as CRM technology to support customer-centric and relational-focused business models. With that said, two major concerns are still raised up by B2B selling organizations and their sales forces regarding the use of CRM technology.

First, despite the importance of CRM technology, not all salespeople are using it optimally when deployed by their organizations. Thus, it is important to provide more answers on why salespeople differ in their use of CRM technology? Second, not all organizations and salespeople are convinced with the outcomes of CRM technology. For that, it is of great importance to find different ways to boost CRM technology outcomes. What are some of the managerial strategies that selling organizations can implement to enhance the outcomes of CRM technology used by salespeople? When CRM technology deployed fail, organizations face the possibility of high loss.

The purpose of this study is to address these concerns by developing and testing a model of different antecedents and outcomes of CRM technology. Specifically, the study examines (a) the effects of different orientations of salespeople on CRM technology use, and (b), in turn, the effect of such use on service behavior taking into consideration managerial-specific factors that may moderate the relationship. To test the model, time lagged and multi-sourced data were used. The findings support the relationships hypothesized between relational and transactional orientations, each individually, and CRM technology use. Further, the findings demonstrate that CRM technology use with support of job autonomy do enhance salesperson’s service behavior.

TOURIST EXPERIENCE AND VIRTUAL REALITY: THE CASE OF NURAGICA PROJECT

Izzo, Filomena

Economics Department, University of Campania ‘Luigi Vanvitelli’, Capua, Caserta, Italy

ABSTRACT

Cultural heritage comes alive if it can effectively communicate knowledge and contribute to the cultural development of society. Communication is therefore essential for disseminating knowledge to visitors, especially tourists. In this respect, information technology plays a key role in communicating with consumers in the heritage sector, offering a wide variety of channels through which information can be provided. In recent years, technological innovations capable of improving the level and quality of visitors’ interactions with heritage, such as Virtual Reality (VR), have increased.

A recent survey on strategies implemented in major museums worldwide with regard to the digitization process, the use of these instruments and the reassessment of websites carried out by Axiell in 2016 for the Museums and the Web Conference shows that the use of integrated ICT applications had a significant impact on the public: 48% of the museums saw an increase in physical visits, 50% saw an increase in the number of visits to their websites, and 82.3% of the museums recorded an increase of social media visitors.

In this context, this paper describes the case of Nuragica Project, it is a joint project between Olbia Archaeological Museum, Sardinia Experience Company and different municipalities of Sardinia. The paper takes an in-depth look at the opportunities provided by new information technologies to enhance the cultural heritage experience. In particular, the article examines information and communication technology (ICT) opportunities for museums, which can leverage these technologies to ‘break free’ and improve the accessibility and communication of their collections and exhibitions, establishing a more intense dialogue with the visitor (Cataldo, 2011; Cataldo & Paraventi, 2007; Hazan, 2011; Izzo, Mustilli, & Guida, 2015; Solima, 2014; Izzo, 2017a,b,c; Izzo & Deva, 2016). ICT enables the expansion of the customer base, complementing traditional cultural institutions in the performance of their educational duties and learning with new forms of active and participatory learning by the community. From this perspective, due attention is given to visitors’ needs and expectations.

PROJECTIFICATION OF THE NON-GOVERNMENTAL SECTOR IN POLAND

Jałocha, Beata; Bogacz-Wojtanowska, Ewa

Faculty of Management and Social Communication, Jagiellonian University, Kraków, Poland

ABSTRACT

INTRODUCTION

Project management is one of the main forms of executing activities by non-governmental organisations (NGOs) and it has been used by them for many years (Lindenberg, 2001). The consequence of the widespread use of projects as the main method of implementation of the tasks is called projectification. This paper aims to contribute to the research on NGO sector projectification. The focus is set on the impact of projectification on working conditions in NGOs. This article is a part of a wider research project that deals with the issues of projectification in non-governmental sector. So far, partial results of the above mentioned research, which concerned the processes of projectification in social enterprises have been published (XXX, 2016). Next, we want to focus on investigating the phenomenon of projectification in various types of non-governmental organizations.

PROJECT MANAGEMENT IN NON-GOVERNMENTAL SECTOR

Due to the distinctness of objectives of non governmental organizations and the plurality of stakeholders, projects conducted in the third sector are very diverse. However, professionalization of third sector entities in general, causes that many of them start acting like companies in regard to their managerial practices. This means that they adapt a range of business tools, including professional project management. Being very diverse, NGOs are also distinctive with regard to what standards, methods and techniques of project management they adopt as optimal. Even within one NGO various project management standards may appear – this may depend on client’s requirements or expectations of external funding organisations. It is similar with project management instruments and techniques – some of them are more frequently and willingly used than others (Golini et al, 2015). Regardless of the project management maturity of an NGO, project management is not a solution to all the problems of management in the third sector organization. Projects tend to be increasingly criticized due to the fact that they e.g. limit planning of long-term goals of the organization, because managers are too focused on achieving short-term tasks and project indicators. In addition, as the experience of the practitioners shows (Banaszak, 2015), projects can destructively affect the working conditions of employees in the third sector.
PHENOMENON OF PROJECTIFICATION

Projectification is an issue more and more often subjected to scientific reflection (Midler, 1995; Packendorff & Lindgren, 2014). The most popular definition of this phenomenon says that, it is a process related with execution of an increasing number of tasks in a form of projects replacing long-term, repeatable activities. The presence of projectification had been at the beginning noticed at an organisation level, however, it soon turned out that it also applies to individuals and whole societies. Beside the general admiration of project work, it is not only about flexibility and freedom - on the contrary, it may bring a series of negative consequences for the people involved in it.

PROJECTIFICATION’S IMPACT ON POLISH NON-GOVERNMENTAL SECTOR AND PEOPLE INVOLVED IN ITS ACTIVITIES

Projects are crucial for most non governmental organizations in Poland. We can observe a variety of indications which confirm projectification of this sector, e.g.: in case of Polish NGOs, more than 60% of their funding comes from the public sector. It means that all these money must be spent in the form of projects, because this is the only way public funding can be transferred to third sector (Adamiak et al, 2015). Majority of new jobs in the third sector is offered through projects, especially in recent years within the EU framework funding. One of the consequences of the dominance of project work in this sector is the lack of stability of employment. It manifests itself, among others, by prevalence of short term employment contracts over the contracts for an indefinite period. According to data, in 2008, the NGO sector in Poland employed about 71 thousand employees (Zielińska, 2012). However, the most popular forms of the job contracts in Polish NGOs are part time job contracts and new jobs are created mostly for the needs of projects. It means that majority of NGOs paid employees are hired only if the organization receives project funding and lack stable, continuous employment. Temporary employment for the period of projects is characterised by a limited time of employment and a specific relationship between the employee and the employer. Usually NGO employee does not take advantage of the terms of employment according to the same rules as in the case of persons who have permanent job contacts. Conditions characterizing the work of the precariat class to which temporary project workers are subject in the non governmental sector include also low remuneration, the lack of protection against the ceasing of employment and lack of access to welfare. This may cause that they became a part of the new class – projectariat (Banasiak, 2015; Szreder, 2016).

CONCLUSION AND FURTHER RESEARCH
Projectification pervades all areas of organisational activities and surely has an impact on non-governmental sector and social NGOs operating therein, predominantly, by introducing a manner of distributing financial resources for development thereof through projects. Observation of pathological phenomena, such as the emergence of projectariat, is therefore extremely important. However, generally agreeing that projectification has plenty of negative effects, our previous research conducted in third sector also enables us to conclude that we still find organisations that benefit from this process and, at the same time, do not subject completely to negative effects thereof. Widespread projectification is therefore an ambiguous phenomenon, carrying not only positive but also negative effects. Hence, it is hard to unequivocally consider it as a pathological phenomenon, and at the same time one can not state that it has only positive dimension. To counter the pathological changes, phenomenon of projectification should be carefully identified through research. Although we can identify examples of research project work on NGOs or critical success factors of non-governmental projects, there is a research gap which we would like to address in further research project: very limited research on projectification of the non-governmental sector in Poland.

EMERGING MARKET MULTINATIONALS FROM LATIN AMERICA: ANALYZING THE INTERNATIONALIZATION PATTERNS AND M&AS CORPORATE STRATEGIES OF MEXICO’S LARGEST COMPANIES.

Jarque, Eduardo

Japan Center for Latin American Studies (JCLAS), Fukuoka, Japan

ABSTRACT

In the past decade, multinationals from emerging market economies—the so called emerging-market multinational enterprises (EMNEs)—have taken an important role in the global economy (Ramamurti and Singh, 2009a); (Jarque, 2011); (Yaprak and Karademir, 2011). Understanding the way they emerge, grow and generate advantages to compete and succeed in domestic markets first and then internationalize (or the other way around, in some peculiar cases) has been of particular interest of scholars, since the generally accepted wisdom on traditional western multinational enterprises (MNEs) seems not to be useful to explain the phenomena of such successful global-firm players from the emerging world (Ramamurti and Singh, 2009b).1 Utilizing a unique data set based on companies’ annual reports and local leading financial publications; data from privatization of state-controlled enterprises; world merger and acquisitions (M&As) and financial data from the Mexican (BMV) and New York (NYSE) stock exchanges, this paper studies and compares the major internationalization patterns of M&As of Mexico’s 2 largest, yet contrastingly different companies, world class leading firms in their respective industries (Mobile telephony and cement production) in perspective with the rest of the largest 20 indigenous business groups in Mexico over a 22-year period concluded in 2010.

The companies analyzed here have become “emerging giants” competing at home (Ramamurti and Singh, 2009a). These companies, after establishing a dominate position in their home countries, have been able to access international capital markets and technology by making a series of strategic acquisitions (documented here) that allowed them to consolidate their respective industries regionally (in Latin America), and to become important world players.

1 In line with the international business literature, we mean by western MNEs such multinational enterprises from Western Europe, USA, and, in this context, MNEs from Japan.

AN INVESTIGATION OF WAITERS’ OCCUPATIONAL IDENTITY (WOI): A LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK

Jerez, M.J.; Melewar, TC; Foroudi, P.; Stylidis, D.

The Business School, Middlesex University, London, UK;

ABSTRACT

The creation of occupational identity includes mending, developing, reinforcing, preserving or reviewing current identities (Ashforth and Schinoff, 2016; Cameron and Spreitzer, 2011; Costas and Fleming, 2009; Snow and Anderson, 1987). Consequently, instead of considering the formation of identity as a simple procedure of embracing a work position, occupational identity is an interactive and problematic procedure (Pratt et al., 2006). Most research has either focused on the merely operational qualities of worker’s jobs, and has not considered waiting as a sub-sector in its own right (Fine, 1996; Newkey-Burden, 2009; Paules, 1991; Sekara and Sevcikova, 2011; Sukhu et al., 2017; Ukandu and Ukpere, 2011). However, this research will provide an emphasis on waiters’ sense of self and their identity in the place of work.

The suggested research conceptual framework investigates waiters’ occupational identity, its antecedents (interaction, interferences, self-concept, authenticity, employer branding, inter-groups and stereotyping) and how this relationship, between antecedents and occupational identity, influences work engagement and employee turnover. Salience is used as a moderator of this relationship, to simplify the meaning of the stimuli (Figure 1).

Figure 1: Research conceptual framework

The complication of the ‘occupational identity’ relationship between individuals and aspects of the social environment of the restaurant, strengthens the case for the use of mixed methodologies, where qualitative and quantitative methodologies are used concurrently to gather waiters’ knowledge and to identify individuals’ perceptions, unencumbered by “what we expect to find or what we have read in
the literature” (Creswell, 2013, p.48; Wild et al., 2017). This is an argument that has given limited consideration to date (Nelson and Irwin, 2014). When it is essential to explain what establishes a phenomenon, qualitative methodology is more appropriate (Carson et al., 2001; Khan, 2014). Focus groups will involve discussions with crucial participants, such as managers of marketing and human resources restaurant departments, as well as hospitality lecturers. Semi-structured in-depth face-to-face interviews will be managed including waiters as participants, who originate from Michelin-starred restaurants in London. These two approaches will contribute to the study of waiters’ sense of self and in comprehending how waiters construct their own authenticity on the basis of an individual framework influenced by its antecedents.

Nevertheless, the main research technique in this investigation is the survey as the quantitative method, which will be guided to test the research hypotheses and the designed conceptual model; for this, a questionnaire will be distributed among waiters. The combination of quantitative and qualitative approaches might, therefore, contribute a richer scenario regarding the process of identity construction and the work environment of waiters, by obtaining the feelings and thoughts from waiters about their own work, as well as trustworthy and accurate data from the participants (Malhotra et al., 2012).

The present study is significant because the importance of perceptions, such as identity and knowledge for forming specific job roles, is still under-examined in specific situations. Managers need to work with and understand the individual framework of waiters’ innate in job roles because these have an influence upon principal interests, such as work engagement and turnover of waiting employees. The result of this research will contribute to the academic body of understanding for scholars, by examining the role of work in identity construction of waiters. This research endeavours to address the research gaps, particularly in the field of occupational identity construction (Jung, 2010; Loncaric, 1991; Van der Zee et al., 2004; Walsh and Gordon, 2008). Moreover, this study will evaluate and present a model which defines the relationship between the constructs of occupational identity, the characteristics that influence occupational identity and its consequences.

The outcome of this research can contribute effectively when working with government policymakers to develop what is called ‘working futures’, a regularly updated forecast of skills in the UK labour market (Warhurst, 2017). With regard to possible managerial implications, one of the influences of employee turnover and work engagement is the negative judgement that society has of working in restaurants in the UK (Wildes, 2005). A possible solution within the research can be gained with the formation of an agentic role on the construction of occupational identities; this will provide the right characteristic model in order to maintain the principal abilities of an occupational identity intergroup.
Occupational identity is suitable to many significant areas in the restaurant sector, such as the quality of service delivered, which is a feature of massive competitive benefit in today’s global market. Also, as some waiting staff are against globalisation and homogenisation (Cameron, 2001; Palmer, 2010), by recognising standardisation of the brand and the attractiveness of job authenticity, some potential outcomes can be offered.

**Keywords** - Occupational identity, work engagement, employee turnover, waiters.

ABSTRACT

This extended abstract summarises a research proposal which aims to investigate a potential move into the international delivery of specialist nutritional advice on behalf of a consortium of independent nutritionists based in Cyprus. The consortium operates out of a medical centre based in Nicosia, Cyprus. The nutritionists who are organised into the consortium are well qualified and experienced in their professional field and they offer specialisms within the general area of nutrition but they are confronted by a degree of market saturation for nutritional advice services in Cyprus. One logical response to this situation might be to extend the service into the international market through the use of digital technology. Such a service could be delivered on an individual basis via Skype or similar platforms.

As the consortium members are fluent in Greek and English opportunities may exist in market expansion into Greece and the United Kingdom (U.K.). The purpose of this particular research project is to undertake exploratory research into the potential U.K. market for Cyprus based nutritional advice.

The research question is, ‘To investigate the potential for the delivery of nutritional advice via digital technology between Cyprus and the U.K.’

The proposed research can be termed marketing research as it is intended to inform business development.

A mixed method approach will be adopted involving questionnaires and a small number of online interviews. The approach will derive from the interpretivist tradition and will be broadly inductive in nature as such an approach is consistent with the use of a mixed-method approach (Saunders, Lewis and Thornhill, 2016). The proposed research can aptly be termed applied research (Easterby-Smith et al, 2012).

A report by the Health and Social Care Information Centre (content.digital.nhs.uk) states that obesity is a major public health problem in the U.K. due to its association with type 2 diabetes, hypertension and hyperlipidaemia which are all serious chronic diseases. The document reports that in 2014, 58% of women and 65% of men were overweight or obese in England. Poor diet and nutrition have been
recognised as major risk factors for ill health and premature death (content.digital.nhs.uk). This suggests that there is a compelling need for appropriate nutritional advice in England and the U.K.

Exactly comparable data from Cyprus is not available but according to the World Health Organization, estimates suggest that in 2008, 58.8% of the population was overweight and 25.5% were obese (euro.who.int). The prevalence of being overweight was higher amongst Cypriot men at 66% than amongst Cypriot women at 52.1%.

These figures suggest that although the prevalence of being overweight or obese may be lower in Cyprus than in the U.K. (given that directly comparable figures are not available from the same year), nutritionists in Cyprus are likely to have experience of treating consultees facing similar challenges to those in the U.K.

Accurate comparative figures for the number of practising nutritionists and dieticians in the U.K. and Cyprus are also difficult to obtain. The London based Association for Nutrition, which is the custodian of a voluntary register of Registered Nutritionists and Registered Associate Nutritionists listed some 1970 registrants at the time of writing although some 10% of this number are thought to be overseas practitioners (associationfornutrition.org). The Association of UK Dieticians has 9,000 members (bdaku.com). There are thought to be 500 nutritionists and dieticians in Cyprus but not all of these are registered with the appropriate body. The U.K. population numbered approximately 65 million in 2015 (ons.gov.uk). By contrast the population of the Republic of Cyprus was approximately 848,000 in 2015 (cyprusprofile.com). Even allowing for considerable error these figures suggest that there are many more nutritionists and dieticians per head of population in Cyprus than there are in the U.K.

Cyprus is associated with the Mediterranean diet which has been linked with good health and a healthier heart (nhs.uk). Cyprus based informed nutritional advice related to the Mediterranean diet could offer valuable health and other benefits to U.K. nationals and this research seeks to investigate whether there is a demand for such a service.

The research will utilise both primary and secondary sources. Secondary research will draw upon resources such as Mintel and Keynote which are both collections of market research information.

Niche marketing is an appropriate strategy for smaller organisations entering into international markets and several U.K. market segments may be worthy of investigation. These are Cypriot nationals living in the UK or those of Cypriot origin, people who have holidayed in Cyprus or who intend to holiday in Cyprus and young professionals in demanding jobs seeking nutritional advice on what kind of food to eat to reduce tiredness and increase work performance.
Another segment which may have an interest in pertinent nutritional advice is U.K couples planning to marry in Cyprus. The U.K. has witnessed dramatic growth in the number of couples who elect to marry abroad and Cyprus is a key destination for overseas marriages. A 2013 survey by Liverpool Victoria (lv.com), the U.K.’s largest friendly society and a leading financial mutual organisation, reported that one in six British weddings now take place abroad. The survey found that 280,000 people had married abroad in the previous five years and that this represented a 20% growth rate over the previous decade. Cyprus was the fourth most popular destination for an overseas wedding after the U.S.A., Spain and Italy. The survey established that 3.7 million Britons (8% of the total population) had attended a wedding abroad in the previous 5 years and a further 11% had received an invitation to a future wedding. Overseas weddings tend to cost less than those conducted in the U.K. although the cost to wedding guests may be considerably greater. However a recent fall in the value of sterling versus the U.S. dollar and the euro may have impacted on the number of destination weddings.

Opportunities to add value to the nutritional advice service could be offered through packages which allowed couples (and/or their guests) to gain hands-on experience in the preparation of traditional Cypriot foods in atmospheric environments.

The proposed service delivery mechanism (Skype or similar) is likely to appeal to those who are comfortable with this technology.

Those who grew up with digital technology are known as ‘digital natives’ and those adults who have adopted new technologies as they have emerged are known as ‘digital immigrants’ (Prensky 2001, cited in Colbert, Yee and George, 2016). Both these groups are heavy users of technology and they are increasingly au fait with emerging technology and reliant on what it can deliver. Very large numbers of digital natives and digital immigrants are present in the U.K. and these groups are likely to be receptive to real-time communication platforms which permit consultations across international borders.

Facebook Business will be used to survey samples of the identified target audiences initially through the use of an online questionnaire. By using Facebook Business it will be possible to segment the audience by location, demographics, interests (based on the interests, hobbies and pages they ‘like’ on Facebook). Other information may be drawn from the samples’ interests, activities, education and job titles, from their online purchasing behaviour, device usage and other activities. For instance, partner categories such as ‘health and fitness’, ‘destinations’ and ‘weddings’ could be selected under behaviours. It will then be possible to overlay additional targeting options such as men or women aged between 20 and 40 years of age.
Using this approach it should be possible to assess demand for an international nutritional advice service with some accuracy. In addition to asking questions designed to assess demand for the service the questionnaire will also seek to gauge attitudes towards remote face-to-face nutritional consultations. Once the preliminary data has been obtained the intention is to conduct semi-structured online interviews with a small purposive sample of informed individuals in the U.K. In parallel with the online research a series of nutritional consultations will also be carried out with a U.K. resident via Skype as a pilot study.

The research is expected to contribute principally to practice but it may also contribute in developing theory related to the entry of micro and small businesses into international markets.

THE IMPACT OF SOCIAL MEDIA BRAND COMMUNICATION ON BRAND EQUITY FOR YOUNG CONSUMERS: INTERNATIONAL HIGH STREET FASHION BRANDING IN CHINA

Kan, Yuna; Dennis, Charles; Melewar, TC; Foroudi, Pantea

Department of Marketing, Branding and Tourism, Business School, Middleses University, London, UK

ABSTRACT

Due to the intense competition in the marketplace, nowadays, customers are exposed to numerous brands from across the world, and, therefore, building brand equity has become an important source of differentiation. Although research has demonstrated that marketing communication has a positive impact on brand equity, previous studies concerning the relationship between marketing communications and brand equity mainly focused on the traditional instruments of marketing communications, and only a few focussed on social media platforms (e.g. Schivinski and Dabrowski, 2015). Thus, identifying the relationship between this new means of communication and brand equity is vital. Social media offers an opportunity for consumers to talk to hundreds or even thousands of other consumers around the world, and, hence, is changing the traditional marketing communication as companies are no longer the sole source of brand communication. Therefore, some academic research has been conducted to differentiate between firm-generated and user-generated social media brand communication and examined the impact of these two forms of social media communication (e.g. Bruhn et al., 2012). These studies, however, consider firm-generated and user-generated social media brand communication as separate independent variables, whereas, in fact, firm-generated social media communication has a certain ability to influence consumer-to-consumer communications. Hence, it is crucial to investigate the co-creation of user-generated and firm-generated social media brand communication.

Moreover, for the past decade, China has become the focus of considerable business activities and has been receiving growing attention from academics and researchers. With the growing trend of globalisation and the progressive opening of China as a market, multinational corporations have entered China with increasing regularity, thereby bringing their brands and products to increasingly brand-conscious Chinese consumers. This is particularly so for young adult consumers, as, in China, young adult consumers have a higher propensity to spend (Stanat, 2006) with an increasing focus on fashion and brands (McEwen et al., 2006). Therefore, understanding the behaviour is crucial for businesses targeting this young adult consumer segment.

Accordingly, the objective of this study is to examine the relationships between the social media brand...
communication and customer-based brand equity and the relationships between the customer-based brand equity dimensions. Therefore, this study adopts the mixed-method research design that is consisted of two phases. The first phase is using qualitative research method to gain a deeper insight into the notion of social media brand communication and customer-based brand equity and refine the conceptual model that has been developed on the basis of existent literature. In the second phase a main survey will be conducted to test the research hypotheses and the proposed conceptual framework.

NATIONAL INNOVATION SYSTEM IN SMALLER NATIONS; THE CASE OF MONTENEGRO

Karadzic, Vesna¹; Manijeh, Reyhani²

¹Faculty of Economics, University of Montenegro, Podgorica, Montenegro
²Business School, University of Western Australia, Perth, Western Australia, Australia

ABSTRACT

There is a global recognition that innovation is a key driver of international competitiveness. Since the 1980s attention has been given to the concept of the National Innovation System (NIS), in which a range of public and private institutions interact with each other to foster innovation and diffuse new technologies. The concept of the National Innovation System (NIS) emerged in the 1980s with the work of Freeman (Freeman, 1987) and Lundvall (Lundvall, 1998). It was the success of economies such as Japan, Germany and the United States in linking their public investment in research and development with the growth of successful technological innovation that triggered strong interest in the NIS concept (Lundvall, 2007). Interest in the NIS concept has continued steadily over the past 30 years, and is now officially recognised by many nations (OECD, 2006). In small nations however this is taking time to develop.

A key area of interest within NIS studies is the role played by universities in their interactions with industry. According to Lundvall (Lundvall, 2007) this nexus between industry and universities for the transfer of technological innovation has been based largely around the experience of the biotechnology and pharmaceuticals industries in the United States. The success of such networks elsewhere around the world has been less clear, although it has not stopped its emulation – with some success – in a number of other countries (OECD, 2012).

Since the 1970s governments throughout the industrialised world have launched a range of initiatives designed to link universities more closely with industry in the process of innovation. These initiatives generally seek to stimulate local economic development by encouraging universities to transfer out their technology to industry. Engaging the inventors in this commercialisation process has been viewed as important (Alexy and Joachim, 2008). This is due to the recognition that many new technologies are highly complex and may not be fully understood by industrial end-users (Linton and Walsh, 2004). Universities have been viewed as having a role to play in this technological development (Styles and Genua, 2008).

In the knowledge economy that has emerged over the past 20 years, universities, as major centres of learning and research, are becoming increasingly important as the source of ideas that can be turned into new products, processes and systems (OECD, 2012). This is particularly so in the enabling...
technologies such as information and communications technologies (ICT), biotechnology and nanotechnology.

Innovation is the key to ensuring the long-term economic prosperity of any nation. A more complete understanding of business innovation and its management, particularly within government, enhances policy frameworks that may assist countries to achieve greater innovation success. In particular, it enables public policy to take a broader, more holistic view of the range of policy structures that influence business innovation, rather than a narrow focus on science and technology policy. Research managers often find themselves attempting to promote and facilitate industry engagement with universities while knowing relatively little about the nature of such relationships (Freeman and Soete, 2009). Of particular importance is the ability of academics to adopt a more entrepreneurial approach to the commercialisation of their research, with research findings that suggest a positive correlation between entrepreneurial activity and research productivity (Van Looy et al., 2011).

Despite its relatively small population, approximately 620 thousand people, Montenegro’s university sector is active in collaborating with industry and the government encourages such plans. For example, University of Montenegro has been actively involved with PACINNO project (Cozza et al., 2016) which is a collaboration platform that connects into a single, regional innovation system the academic and research institutions, policy makers, and innovative companies of eight countries belonging to the Adriatic region (Albania, Bosnia-Herzegovina, Croatia, Greece, Italy, Montenegro, Serbia, Slovenia).

Research shows that the level of received support through innovation incentives from the government, regional authorities and the EU is low and the total number of new PhD graduates, as to the total share of the active population, is significantly lower than the Region and the EU (Karadzic et al., 2016).

In Montenegro, there are several important factors that should provide the right conditions for the development of the National Innovation System. The most important factors are the development of human resources for research and development, and the education and training of the employees in the private sector. For this purpose, equipment for scientific research and appreciation for higher education is required. It is important for the university management to interact with industry and government for socioeconomic development which requires changes in the functions and structure of the universities and the development and functioning of Science and Research System in Montenegro. Research also points out that the most important for Montenegro is also: The formation and development of scientific human resources; Building of a scientific research infrastructure and entering more into the international scientific research cooperation (Tinaj et al., 2013).

IDENTIFYING SUCCESS FACTORS IN FOOD EXPORTS: AN APPLICATION OF THE BEST-WORST SCALING METHOD

Karipidis, Philippos¹; Chrysochou, Polymeros²; Karypidou, Ioanna³

¹Department of Agricultural Technology – Agricultural Economics, Alexander TEI of Thessaloniki
²Department of Management, Aarhus University, Denmark
³Applied Economics and Finance, University of Macedonia, Thessaloniki, Greece

ABSTRACT

Taking into consideration the major contribution of food exports in the development of Euro-Mediterranean economies, the present study aims to analyse export performance at firm level and assess the importance that food-exporting firms assign to drives and barriers of export performance. Building on exploratory findings from an earlier study (Karipidis et al., 2016), the present study examines two sets of factors connected with the primary production that are considered to impact export performance of food firms. This exploration is especially useful taking into account the structural characteristics of the Euro-Mediterranean agriculture, which is characterised by the small size of farm businesses and the overall conditions of the agricultural production. The first set of factors comprises of reasons that influence export performance positively (success factors), whereas the second includes those with a negative impact (barriers).

We adopted the Best-Worst scaling method Marley and Louviere, 2005) due to its ability to provide a better discrimination of the factors analysed, and its simplicity that makes a significant contribution to practitioners. The method has been applied in the study of consumer preferences towards wine and other food products (Chrysochou et al., 2012; Chrysochou, 2012; Cohen, 2009; Lockshin et al., 2016; Rezaei et al., 2016). We distributed our questionnaire to food exporting firms in Greece and across the following sectors: fruit and vegetables, wine, dairy, animal products and olive oil. The questionnaire included a list of performance measurement indices, the two lists of success factors and barriers, and questions related to the background of the firm. Our respondents were staff members of each exporting firm.

At the time of writing this abstract, data collection is taking place after sending electronically the questionnaire to more than five hundreds of food exporting firms. A preliminary analysis of responses from 59 completed answers shows that the Best-Worst method can be effectively implemented to identify the drivers of the food exporting firm performance. The preliminary results indicate that the big majority of exporting firms are small and too small and that they export their products in several export markets. Food exporters are viewing export performance to be composed of a set of seven indicators associated with entering in new markets, gaining of new customers, export volume and...
value, market position and profitability and the big majority of them perceive the performance to be enhanced last three years. Among the most important success factors between the thirteen factors related to the primary production examined are raw product quality and safety, and quality controls exerted by firms in purchased products. In regards to the barriers, the most important factors between thirteen factors related to the primary production examined are the quality-related uncertainty of raw products, the high cost of purchasing and collecting products by farmers, and the high producer prices.

*Key words: Best-Worst scaling, export performance, barriers, food supply, primary production*

TITLE- DEVELOPMENT AND VALIDATION OF A SCALE FOR TEAM TASK ROLES, TEAM TASK TYPES AND TASK INTERDEPENDENCIES

Karve, Shailaja1; Pandey, Aparna2; Malankar, Shweta3

1K.J. Somaiya Institute of Management Studies and Research, Mumbai, India
2ITM University, Raipur, India
3Marsh India Insurance Brokers Pvt. Ltd, Mumbai, India

ABSTRACT

This paper describes the development and validation of a scale for Team Task Roles, Team Task Types and Task Interdependencies. This scale is based on Mumford et al, (2006) team task roles. The authors opined that when individuals work in teams, they take on team roles, perform team tasks, and task have interdependencies.

The three constructs for the scale are Team Task Roles, Team Tasks and Task Interdependence. Team Task Role is unique behavior displayed by a team member for accomplishment of team goals in specific situations and responsibilities (Stewart et al, 2005). Team Tasks were classified by various researchers according to task features related to task structure, technology requirements, complexities, abilities required etc. for task completion (Devine, 2002). Team task interdependence is a distinct feature of the team tasks, as tasks are collective responsibility of the team members who use their shared or combined intellectual as well and technological resources for mutual as well as team benefit (Van der Vegt and Van der Vliert, 2002; Rossi 2008).

The scale covers five team task roles (Creator, Critic, Contractor, Contributor and Completer; Mumford et al, 2006), three team tasks types (idea generation, production and problem solving) and three task interdependencies (pooled, sequential and reciprocal) and the interplay between the three.

The following questions guided the research -

1. What Team Task Roles do the team members naturally adopt?
2. What is the relationship between Team Task Role and Team Task Type?
3. How do Team Task Interdependencies influence Team Task Type?
4. What is the relationship of Team Task Role with Task Interdependency?

Hypothesis: Team Task Role, Team Task type and Team task interdependency are interrelated.

The nomological networks were examined amongst dimensions of Team Task Roles, Team Tasks and Team Task Interdependency by mapping each team interdependency type with each team task type and each team task role type (Figure 1).
The authors developed an initial scale of 240 items and subjected it to reliability and validity tests. The definitions and situational possibilities of each task role (Mumford et al. (2006) and Hackman’s Task Definitions (1990) and Task Interdependencies (Thomson, 1967) formed the basis of the scale. Content validity to ensure qualitative instrument output for team task role, team task type and team interdependency items generated for the scale was done by a panel of experts including academicians, industry and language experts by convenience sampling. SME panel helped evaluate item pool compilation by Delphi technique for conformity and redundancy. Final restructuring and regrouping of item subsets was based on the feedback of SMEs and helped refine the item pool to 240 items to be tested for reliability analysis. Exploratory (EFA) and Confirmatory factor analysis (CFA) was done (Table 1). Cronbach alpha was computed for the scale 0.973 as well as the subscales. The purified scale items include (five Team Task Roles; three Team Task Types and three Team Interdependencies $5 \times 3 \times 3 = 45 \times 2 = 90$). The final scale with 90 items has a cronbach alpha reliability of 0.973 after CFA and is named as Team Task Roles and Task Interdependency Scale.

*Table 1 – Initial Items, items after EFA, and items after CFA*

The theoretical foundations this instrument is based on a conceptual model of the Team Task Roles of Team members as defined by Mumford et al (2006), Team Tasks and the interdependent nature of the tasks. It aims to be used for assessing the relationship between Team Task Roles, Team Tasks and Team Task Interdependencies. It can be used for diagnostic profiling of the Team members for task roles and be used for forming teams that require or display interdependent task responsibilities. Team members with complimentary capabilities can be selected for a particular team task, backed with an understanding of the core team task role and interdependent team task type requirements.

This framework has distinct characteristics providing a definitive structure for the instrument at individual team task roles, team task types and task interdependency levels. It takes Mumford et al
research a step forward by outlining how individuals respond to different task types and task interdependencies and what role behaviour they display while performing these interdependent tasks. It displays its potential helpfulness by combining team task role knowledge with task types in interdependent work situations. The resultant model not only recognises the three main constructs and their unique contribution to team behaviour and effectiveness but also integrates the main theoretical framework by specifying their relationships and the implications of results for selection and team building are discussed. Incremental value to validity of the instrument may be gained by furthering research of team task role from compilation to sufficiency to proficiency/expertise.

SPONTANEOUS VS. INDUCED CLUSTERS: NETWORKS AND COMPETITIVE ADVANTAGE

Kavadarlı, Altun; Öz, Özlem

Department of Management, Bogazici Univ., Istanbul, Turkey

ABSTRACT

Clusters, defined as a geographic concentration of interconnected businesses, suppliers, and associated institutions, have attracted increasing attention in the management literature (e.g. Beal and Gimeno, 2001; Öz, 2004; Porter 1998). In the strategic management literature, the term “cluster” has been popularized by Michael Porter (1998), who claims that clusters have the potential to affect competitive advantage in three ways; by increasing the productivity of the companies in the cluster, by driving innovation in the field, and by stimulating new business formation. Social capital theory, on the other hand, suggests that a firm’s external networks play a major role in contributing to its performance (Leenders and Gabbay, 1999). There is a growing literature that claims that the effectiveness of localized networks is related to social capital, which covers cultural norms of trust, cooperation and reciprocity (Fukuyama, 1995). The available literature also shows that a firm’s existing network enables it to establish new linkages through referrals by its current partners as well as the visibility that the network ties provide (Gulati, 1999).

This study aims to define the network patterns of firms in spontaneous versus induced clusters deriving from the cases of two hosiery clusters in Istanbul, located in Ikitelli Industrial Zone Corapcilar Sitesi (the induced cluster) and the Yesildirek district (the spontaneous cluster). As a sub-sector of the competitive Turkish clothing industry, the hosiery industry ranks the 2nd in the world hosiery production, just after China. According to ITC Trademap statistics, the Turkish hosiery industry is the 3rd largest exporter in this sector, with a share of 7.7%, following China and Italy. The Turkish hosiery industry exports its products to nearly 130 countries worldwide, and the EU, with a share of about 90%, is the most important market. Face-to-face, in-depth semi-structured interviews with hosiery firms located in the above stated two clusters in Istanbul (where the majority of manufacturers are located) provide both a general understanding of the existing network patterns and also how these networks help promote competitive advantage. An analysis of the linkages among hosiery firms in these clusters reveals that networks are denser in relative terms in the spontaneous cluster when compared to the induced cluster. The relations in the induced hosiery cluster are rather weak and resemble what Uzzi (1997) describes as market or arm’s length relations. Specifically, inter-firm relations in this cluster are characterized by low mutual dependence, a finding that implies being in the same location is not enough, in and of itself, to develop dense relations with the neighboring
firms. Firms in the spontaneous cluster, on the other hand, much emphasize the importance of linkages, especially with regard to the importance attributed to cooperation and trust, knowledge sharing as well as long-term ties. These dense interpersonal networks among firms in the spontaneous cluster have in turn created a strong base, generating knowledge spillovers and reinforcing competitive advantage. Moreover, the analysis conducted reveals that strong ties, in terms of time and energy invested in the relationship, are considered vital for firms in Yesildirek, the spontaneous cluster, whereas weak ties are seen as just acquaintances, a finding in line with Granovetter (1973).

THE IMPACT OF DIGITAL NETWORKS ON MANAGERIAL DECISION MAKING: PRACTICALITIES AND PARADOXES

Kay, Avi
Jerusalem College of Technology (Lev Academic Center), Jerusalem, Israel

ABSTRACT
A key element of management is to prepare for the future. This task has become increasingly difficult in this age of multiple disruptions. In order to navigate these disruption, decision makers are increasingly called upon to exhibit innovative processes and solutions. This research examines the potential role of digital networks in innovation. Specifically, it looks at the characteristics of these networks and the manner in which managers elicit, evaluate and engage in actions to mold optimal personal and organizational outcomes. Paradoxically, it seems that the very nature of digital networks and their by-products, simultaneously creates a situation in which managers have both potentially more and less discretion with regard to how they can act. Similarly, they seem to both increase and diminish chances that their actions will lead to desired outcomes. The first stage of this research program is to be the establishment of a background, theoretical understanding of the dynamics at play. Following that, the plan is to undertake empirical research within organizational settings.

INTRODUCTION
A key element of management is to prepare for the future. This task has become increasingly difficult in this age of multiple disruptions: social, economic, spiritual, and technological. Indeed, if there is one thing that characterizes the current era, it is “disruption.” The changes are coming “fast and furious” - creating what Bauman termed “liquid modernity” - “a situation in which the conditions under which its members act change faster than it takes the ways of acting to consolidate into habits and routines” (Bauman 2006, p.1).

As such, the need for decision makers to engage in innovative processes and solutions has become a progressively more crucial factor in the success or contemporary organizations. A central tool in the above are the emerging internet and digital networks. Lanier (2014) suggests that these ever more sophisticated digital networks will create a future that may seem unfathomable today. The exponential growth of digital networks and the information they contain will not only fundamentally change the developing future, but also the very way in which organizations - and those acting within them - respond to an unknown future.
Along the lines of work done by Leonardi and Barley (2008), Orlikowski (2009), the purpose of this research is to examine how digital networks and their accompanying characteristics impact the manner in which managers elicit, evaluate and engage in actions to mold optimal personal and organizational outcomes. More specifically, this work will establish the background, theoretical understanding of the dynamics at play. At the next stage, empirical research will be done within organizational settings.

Organizations can be viewed as techniques of assembling and arranging resources to deal with those future problems that may emerge. The reconfiguration of organizational capacities to deal with the future is a central focus in the context of the proposed research. It seems that, in the spirit of Tsoukas (1997), paradoxically; the very nature of digital networks and their by-products, simultaneously creates a situation in which managers have both potentially more and less discretion with regard to how they can act as well; as well as increased and diminished chances that their actions will lead to desired outcomes. For the networks and information flowing through them may - among other things - both increase and ingrain organizational routines and/or diminish and disassemble such routines, as the mechanics and the messages they transmit lead to a situation in which standard operating routines are increasingly upended (Feldman, Pentland, D’Adderio and Lazaric 2016).

Weick (1979) noted that all managerial actions begin with "sensemaking" - the efforts of the individual to extract meaning from their reality. In terms of managerial decision-making, hierarchy and organizational structures provide, filter and "condense" information (be it via market research, human resource management etc.). Digitalization allows managers to "directly" access relevant information without necessarily relying on intermediates. Thus, it can be argued that digital networks can, perhaps, enhance one's understanding of the surrounding reality in that they provide the individual with much more timely information. As such, they may provide a much more complete picture of one's experiences and current reality, one that simply "makes more sense."

The information afforded by these digital networks (eg. the famous "big data") may also augment the ability to understanding what possible "futures" may exist. Beckert (2013) suggested that behavior is guided by subjective, self-created "fictionalized futures." These subjective "fictionalized futures" both rest on past experience and are fueled by hopes and apprehensions regarding open possibilities. On one hand, digital networks may improve imperfect assumptions regarding the future turning them into objective, "nearly perfect" (or at least, "much better") predictions. As such, they allow managers with the possibility of getting much larger ROI from actions. On the other hand digitalization might lead to less constructive "fictionalized futures" that are more impervious to change and reexamination, as autonomous computerized decisions are made.
Digital networks may have another, unexpected, effect on the ability to respond adequately to the future. First, the individual’s actions and behaviors become increasingly more widely (and deeply) immortalized in digital network, a "sticky" type of digital identity (Beckert, 2013) may emerge - leading to more difficulty to "back out" of previous ideas and decisions. These widely available digital identities may further impair the ability of managers to achieve their future goals in, yet, a different way. For, both various stakeholders with whom managers interacts (i.e. employees, superiors, customer etc.) and possible business "adversaries" may be able to access information that will curtail the ability of managers to successfully negotiate with or otherwise "outwit" the above. Those sharing the business arena with the managers may simply be better prepared to guess the “next move” of the manager.

Clegg (1990) suggested that the transition to the bureaucratization of organizations was seen as "irresistible and inevitable." The impact of technology seems to be following a similar pattern. The "more advanced technology becomes, the more all activity becomes mediated by information tools" (Lanier, p. 16). This mediation of our lives is likely to have both beneficial and detrimental effects on the ability of managers - and the organizations they lead - to optimally negotiate the present future and the future present that awaits.

EMERGENCE OF COMPLEX NEW ARRANGEMENTS: THE STATE RESPONSES TO GLOBAL BUSINESS DIVERSITY

Kayasan, Oskar; Saghir, Nadine

European Research Centre, London, United Kingdom

ABSTRACT

This paper examines the potential prospect of change in the state business undertakings in response to complex new environments. The establishment of an effective authority between state and business has been one of the key challenges in current dilemma of global socio-economic political crises. Global business involve the urgent new framework in state-business affairs in the world, especially in the west. At present, ongoing debate about the role of the state lies at the heart of development economics. Much of this debate has been and continues to be dominated by the idea of “market failure”. The early development theorists (Rosenstein-Rodan, 1943; Hirschman, 1970) pointed to market failure as a reason for comprehensive planning. The actual experiences of the developing countries, in the context of problems associated with government intervention, and theoretical arguments against the role of the state, led to the recognition of government failure as an impediment to development (von Hayek, 1967; Bauer, 1984; Little et al., 1970). More recently, de Soto (2000) has made the argument that the lack of property rights is the fundamental reason for developing economies being unable to develop successful business and economics models. This paper analyzes the main futures of global market mechanism and reasonable basis of change within entangle state business affairs. However, it concludes that in view of the current dilemma in both global markets and state-business affairs may require rather socio-political imbalances to perceive any profound changes.

MARGINAL REVOLUTION: ROLE OF INTERMEDIARY IN INTEGRATION OF STREET VENDORS IN FORMAL ECONOMY

Kella, Chintan; Rimac, Tomislav; Gurses, Kerem; Turner, Karynne
Department of Business and Management, LUISS Guido Carli University, Rome, Italy

ABSTRACT

In this paper, using an institutional theory perspective, we contribute to the body of knowledge about the process of transition from informal to formal economy through the study of SEWA’s involvement in empowerment of street vendors in India. By situating our research in the context of institutional voids and deep poverty, we draw attention to the role of intermediary in empowering of disempowered actors in an informal economy. Through our case study, we identify three processes through which the non-marginalized actor achieves empowerment of the street vendors: (i) creation of collective identity among street vendors; (ii) regulatory entrepreneurship that involves initiating and influencing creation of national laws regulating street vendor activities; and, (iii) making sure that the law becomes available and meaningful to the vendors.

INTRODUCTION

Although there exists a diverse body of knowledge on informal economy, it still remains largely fragmented. Researchers working in various domains (e.g., anthropology, economics, sociology, etc.) have tried to understand the cause and effects of informal economies across the globe, so that possible solutions can be devised to transition it to formally economy. While sociology scholars have tried to explain informal economy with the perspective of empowerment or rather the lack of empowerment to participate in formal economy (Portes, Castells, & Benton, 1989), economists have tried to explain it from cost-benefit perspective for actors willing to enter and remain in informal economy.

Although the demography of actors participating in informal economy is similar across countries, the institutional arrangements and conditions differ substantially from country to country. Therefore, researchers have recently taken an interest in the informal economy from an institutional perspective (Ahlstrom & Bruton, 2006; Battilana, Leca, & Boxenbaum, 2009; Bruton, Ahlstrom, & Li, 2010; Bruton, Ahlstrom, & Obloj, 2008; Khanna & Palepu, 2010; Mair, Martí, & Ganly, 2007; Mair, Martí, & Ventresca, 2012; Stephan, Uhlander, & Stride, 2015; Webb, Ireland, & Ketchen, 2014) We build on existing research on institutions at various levels and the role they play for transition of informal economy towards a formal economy. Scholars have also started taking into account the
importance of intermediaries and institutions at meso level, because of a large gap between the macro level, consisting of state, legal frameworks, national financial institutions, and the micro level, i.e., individual, who are the actual actors in the informal economy (Battilana, Leca, & Boxenbaum, 2009; Lee & Hung, 2014; Mair et al., 2012; Seelos, Ganly, & Mair, 2006; Roelants, 2000). Studies so far have subtly established that role of meso level institutions is to reinforce informality (De Castro, Khavul, & Bruton, 2014) or at best to enable the marginalized citizens to access markets (Mair, Marti, & Ventresca, 2012; Martí & Mair, 2009; Seelos & Mair, 2007; Stephan, Patterson, Kelly, & Mair, 2016). While this is equally true depending on the meso institutions at work, with this study we present that such intermediaries at meso level can be crucial and highly effective in empowering the informal actors to move from informal to formal economy. Moreover, most existing studies tend to focus on either the meso level together with actors at the micro level, or the meso level and its relationship with the macro level (De Castro et al., 2014; Droege & Johnson, 2007; Roelants, 2000; Viterna & Robertson, 2015; Webb, Tihanyi, Ireland, & Sirmon, 2009), there is very little research on the bi-directional role of intermediaries at the meso level. The dual role that meso level intermediary can play to empower and improve the socio-economic conditions of the marginalized micro level actors and also to reshape the macro level, so that the government policies work for providing a better context for improving the conditions for marginalized actors is understudied.

Set in the context of India, its street vendors, the new Street Vendors act and the role of organization called Self Employed Women’s Association (SEWA) which acts as an intermediary, we study the role and mechanism employed by this intermediary to disrupt institutionalized structures of inequality and thereby transition to formal economy. We conduct 286 structured interviews with the street vendors, 12 semi-structured interviews with the street vendor leaders, and 4 semi-structured interviews with the SEWA team. We combine these interviews with archival data, which consists of 64 reports from SEWA and other related sources. Through our case study, we identify three processes through which the non-marginalized actor achieves empowerment of the street vendors: (i) creation of collective identity among street vendors; (ii) regulatory entrepreneurship that involves initiating and influencing creation of national laws regulating street vendor activities; and, (iii) making sure that the law becomes available and meaningful to the vendors. Thus, the non-marginalized intermediary diminishes prevailing inequalities by spanning macro and micro institutional levels, formal and informal economy, and enabling poor to become full citizens able to use local resources, realize choices, and enjoy their rights enshrined in the legal system.

SUPERVISOR COMMITMENT VERSUS ORGANIZATIONAL COMMITMENT

Kidron, Aviv
Dept. of Human Services, The Max Stern Yezreel Valley College, Yezreel Valley, Israel

ABSTRACT

The purpose of this paper was to analyze the relationship between psychological contract fulfillment, empowerment, participative decision making and supervisor commitment, as well as affective commitment. Supervisor commitment is considered a mediating variable since it emphasizes the importance of the supervisor’s role in the relationship between employees and the organization. The sample comprised of 522 employees from 11 organizations operating both in public and private sectors. Psychological contract fulfillment, empowerment, participative decision making are positively related to both supervisor commitment and affective commitment. Supervisor commitment was found the most significant predictor of affective commitment among employees. Supervisor commitment partly mediated the relationships between empowerment, psychological contract, participative decision making and affective commitment. The findings consistently accord with social exchange theory, which draws attention to the importance of the dyadic and interpersonal relationship between employees and their supervisor and the possibility that it leads to supervisor commitment. In practical terms, supervisors play a key role in upholding and maintaining the psychological contract and cultivating employee empowerment.

Keywords: supervisor commitment, affective commitment, psychological contract, psychological empowerment, participative decision making,
THE BUSINESS MODEL CANVAS AS THE KEY TO A COMPANY’S SUCCESS

Klimova, Olena
Department of Finance, Accounting and Auditing, Donetsk State University of Management, DSUM, Mariupol, Ukraine

ABSTRACT

The important management tool that simplistically describes the organization and operation of all activities aimed at creating the company’s values is the business model. The quality business model allows determining the value preferences of consumers and finding ways to meet them with the aim of adding values of the company. In addition, as experience shows, commercial success often depends on technological innovations, namely on building optimal business models.

There are many definitions of a business model. The business model is a conceptual tool to study a complex object (business system) reflecting the logic of business. The business model is a brief description of how the company operates. The value here is that you can use a business model to ensure a strategic fit between various activities. The business model is a role model. The value is that it can be used to describe how a company should function. For one and the same technology, product or service there is a large number of business models. And is there a business model for maximum success?

From the standpoint of system approach, the instrument for visualization of the logic of a company’s business model is the universal business model, so-called “canvas” (template) of the business model authored by Alexander Osterwalder and Yves Pigneur. Today it is the most popular solution in this area.

Having studied and analyzed the tens of universal business models of other authors, Osterwalder and Pigneur proposed a model the undoubted advantage of which was its original graphic solution, namely a matrix template, which they called The Business Model Canvas. Canvas is a schematic display on a single A4 page of the most important things for detailing of business processes, development scheme, plans, projects, startups. The canvas is a powerful tool for business modeling and innovation at the level of senior managers. Its potential is that it can capture a complete set of the most important elements of business modeling. Simply put, it displays them using visualization and simple charts, allowing managers to “create a business model on one sheet of A4 paper” (Coen et al., 2013).

Visually this template resembles a canvas, on which like part of a pattern for cutting fabric the components (in the author’s terminology – blocks) of a business model are placed.
The Business Model Canvas consists of nine main blocks (components). We present them in the order adopted by the Y. Pigneur and A. Osterwalder: customer segments, value propositions, channels, customer relationships, revenue streams, key resources, key activities, key partners and cost structure (Osterwalder and Pigneur, 2010) (Figure 1).

These blocks are grouped into four basic areas: consumers (clients), offer, infrastructure and profit formula. The presence of a selected client direction consisting of three components – “customer segments,” “channels” and “customer relationships” is, in our opinion, the main advantage of this model in the context of the objectives of the company for managing the client portfolio and client relations.

Thus, the Business Model Canvas is an overview on one page, which describes the current (or prospective) activities of the company and the steps to be taken. The visual format of this model is well suited to both already existing and new companies and provides a panoramic view of the whole business. Its uniqueness lies in the fact that all of the other business models require expensive and often inefficient solutions.

Keywords: business model, tool, success, value, canvas, Osterwalder’s business model, models of business evaluation.

ROLE OF DIGITAL COMMUNICATIONS IN SOCIAL SUPERMARKETS IN CROATIA

Knezevic, Blazenka; Skrobot, Petra; Delic, Mia

Faculty of Economics and Business Zagreb, University of Zagreb, FEB, Zagreb, Croatia

ABSTRACT

Social supermarkets emerged as the answer to economic crisis across Europe. Their main purpose is to serve those groups of customers which have low income or which are in severe material deprivation. They, mainly, collect donations in money, food and toiletries from traditional supply chains and distribute it for free or at extremely discounted prices to people in need. Holweg and Lienbacher (2011) define social supermarkets, narrowly, as food oriented retailers who sell food (not giving it for free) to a restricted group of people living in poverty. On the other hand, Maric and Knezevic (2014) emphasize that social supermarkets are a form of non-profit organizations which use the workforce of volunteers and generated income (if there is any) is used for charitable activities.

The purpose of social supermarket is twofold: (1) the poverty reduction through distribution of food and toiletries to needy people and (2) reduction of inefficiency in traditional (dominantly food) supply chains through removal of surpluses of produced food (and other goods).

Even though, the very purpose of social supermarkets is different in comparison to traditional retailers, their basic characteristics can be compared to traditional retail formats such as convenience shops, supermarkets and discount stores (for more details refer to Maric and Knezevic, 2014).

Intensive communication with users and donors increases operational efficiency of social supermarkets. The penetration of Internet and mobile phones within population in Croatia is in line with EU-28 average. Therefore, digital communication could become the vital part of communication mix in social supermarkets.

According to data available in Smigielska et al. (2016), digital communications already play a significant role in promotional activities of social supermarkets. However, in literature, the scope and role of digital communication usage in social supermarkets is not adequately analyzed and described. Especially two types of digital communications are important for social supermarkets operation; those are web sites and social media.

The aim of this paper is to show how social supermarkets use digital communications for interaction with interested publics, primarily, users and donors. The primary research will include analysis of good practices in social supermarkets in Croatia. Firstly, the structure of social supermarkets’ websites will be analyzed and compared. Secondly, the performance and the level of interactivity through social
media will be measured. Based on comparative analysis of good practices the conclusion about the intensity and importance of digital communication in social supermarkets operation will be derived.

CUSTOMER ORIENTED STRATEGY AND BUSINESS PERFORMANCE:
EVIDENCE FROM THE TOURISM AND HOSPITALITY INDUSTRY

Kriemadis, Thanos; Papaioannou, Alkistis; Rizos John; Koronios, Konstantinos
Department of Sport Management, University of Peloponnese, Greece.

ABSTRACT

PURPOSE OF THE STUDY
Customer orientation provides competitive advantage and increases profit of organizations (Shah, Rust, Parasuraman, Staelin & Day, 2006). Moreover, research has suggested that customer-oriented strategy creates value for the customers and increases customers’ loyalty (Macintosh, 2005, Shah et al., 2006) which in turn results in sales growth and hence firm performance (Asikhia, 2010). Since customer orientation affects customers’ loyalty and satisfaction, customer oriented strategy has become an essential ingredient for the long-term success of the organizations (Matin, Jandaghi, Khanifar & Heydari, 2009). However, research regarding customer oriented strategy in tourism and hospitality industry is still limited.

The primary purposes of this study were: (a) to determine the extent to which customer oriented strategy is implemented to five-star hotels of Greece, and (b) to examine the relationship between customer oriented strategy used by Greek five-star hotels and business performance (profit, ROI, sales volume and market share).

DESIGN/METHODOLOGY/APPROACH

The research was addressed to all five-star hotels of Greece (317 five-star hotels, which recognised by Hellenic chamber of hotels) and involved 317 experienced managers who were the most knowledgeable regarding marketing issues. Responses were received from 159 managers of 159 five-star hotels with a 50.2% response rate.

For the purpose of this study a 40-item questionnaire, was used (developed by Whiteley 1991) focusing on customer oriented strategy. The questionnaire was translated and modified by a panel of experts in the fields of hospitality marketing, business management and strategic marketing, in order to provide information on how managers see themselves in terms of the customer oriented strategy process, using a five point Likert scale. The reliability of the scale was found to be α=.89. Also, the particular research used the subjective way of measuring performance. This means that managers were asked to evaluate the performance of their hotel in relation to their current years’ objectives, in
relation to their last financial years’ objectives and finally, in relation to their major market competitors on a five-point Likert scale. On each of the three bases, performance was judged against four criteria two financial (profit and ROI) and two market based (sales volume and market share). The above criteria were adapted from the literature (Terzoudis, 2011). The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and Pearson correlation were used to examine variables relationship using SPSS software (version 22).

FINDINGS

The results (means) indicated that customer oriented strategy is applied to a great extent from Greek five-star hotels (M=4.44, SD=0.55). Also, there were significant and positive relationships between the customer oriented strategy and business performance in the Greek five-star hotels. More specifically, customer oriented strategy had a significant and positive relationship with: (a) profit (r=.209, p=.008), (b) ROI, (r=.305, p=.000) and (c) market share (r=.218, p=.006), as measured by satisfaction levels in relation to current year’s objectives. Furthermore, customer oriented strategy had a significant and positive relationship with: (a) ROI (r=.169, p=.033) and (b) market share (r=.171, p=.031), as measured by satisfaction levels in relation to last financial year’s objectives. Finally, customer oriented strategy had a significant and positive relationship with: (a) profit (r=.256, p=.001), (b) ROI (r=.263, p=.001) and (c) market share (r=.191, p=.016), as measured by satisfaction levels in relation to their major market competitors’ objectives. The findings of the present study are consistent with previous studies on customer oriented strategy and business performance, in service and business sector (Asikhia, 2010; Li & Zhou, 2010; Shah, et.al., 2006), and show that the level of customer oriented strategy which managers exercised in five-star hotels is related to the hotels’ performance. The present findings add credence to the argument that customer oriented strategy is a major factor for tourism and hospitality business activity, because it provides the Greek five-star hotels with a better understanding of their customers, which subsequently leads to enhanced business performance (Asikhia, 2010; Li & Zhou, 2010).

RESEARCH LIMITATIONS

The study was delimited to a questionnaire designed to collect data regarding customer oriented strategy according to Whiteley (1991).

The following were acknowledged as the limitations of the study:
The honesty, accuracy, and objectivity of the respondents when completing the questionnaire

The respondent’s level of understanding of the customer oriented strategy vocabulary.

Follow-up studies should be done to the same sample in three to five years to investigate possible changes in the utilization of the customer oriented strategy process. Areas of further research could also include measuring the impact of customer oriented strategy on the satisfaction and loyalty of customers.

ORIGINALITY/VALUE

This study is useful in extending the concept of customer oriented strategy to the tourism and hospitality industry. The study will be useful in helping managers to their further understanding of the customer oriented strategy process in their respective organization.

Keywords: Customer oriented strategy, tourism and hospitality industry, five-star/luxury hotels.

REMITTANCE BEHAVIOR OF PERMANENT MIGRANTS
Kushnirovich Nonna
Department of Economics and Management, Ruppin Academic Center, Emek Hefer, Israel

ABSTRACT
The growing literature on remittances is mostly devoted to remittance behavior of temporary migrant/guest workers and the impact of their remittances on macroeconomic variables. However, little is known about the remittance behavior of permanent migrants, who brought their families to the host country and did not leave households behind in the country of origin. This study aims to fill the gap by focusing on the special case of migrant citizens in Israel who live there permanently. The study examines remittance behavior of immigrants, determinants of their propensity to remit, and investigates the relationship between immigrants’ integration and maintaining social transnational ties focusing on their impact on remittance behavior.

Alternative models of remittance behavior are based on a concept of globalization and transcontinental life of migrants. Persons can migrate permanently, but developed communication and transportation allow them to keep in touch with their former home countries over the years. Members of this group are often considered “transnationals”, namely, persons who live in a host country but maintain social and economic ties with their country of origin (Glick-Schiller, 1999; Holst and Simpson, 2008; Sana and Massey, 2005).

Determinants of remittance behavior are widely discussed in the literature. Personal characteristics, such as age, migrant’s income, education, and time since arrival may affect remittance decisions (Amuedo-Dorantes and Pozo, 2005; Durand et al., 1996; Fairchild and Simpson, 2008; Sana and Massey, 2005), as well as return intentions, and maintenance of transnational social ties (Carling and Hoelscher, 2013; Fokkema et al., 2013; Loschmann and Siegel, 2015). The level of integration into the host country also should affect remittance behavior of immigrants (Holst et al., 2008). However, the relationship between integration and remittances is not unequivocal. On the one hand, integration leads to weakening ties to the country of origin and its community; hence, it should negatively affect
remittances. On the other hand, integrated immigrants earn more, and larger income is associated with higher probability to remit.

Immigrants from some countries remit more than others (Durand et al., 1996; Lopez-Cordova, 2005). For example, Holst et al. (2008) found that permanent migrants from former Yugoslavian countries showed a higher propensity to remit than Italians did. The study of Durand et al. (1996) revealed that economic conditions in the sending communities are significantly related to migrants’ remittances. According to Holst et al. (2008), “(Spaet)Aussiedlers”, most of whom are migrants from the former Soviet states, show a higher probability to remit to their countries of origin, many of which are low-income economies.

This study developed a model of remittance behavior adjusted to the case of permanent migrant citizens. According to this model, remittance behavior of permanent migrants is affected by their socio-economic characteristics, migration experience, integration in the host country, maintaining social ties with the country of origin, and intentions to leave the host country. The model was tested on the data of the 2011 Immigrant Survey that was conducted by the Israeli Central Bureau of Statistics. The sample of the survey was representative of the population of immigrants in Israel and included 3,952 immigrants from the Former Soviet Union (FSU), Asia and Africa, and Europe and America. The data were collected via a postal survey questionnaire, internet and telephone interviews. The study found significant differences in the likelihood of remitting between immigrants from different origins. FSU immigrants were more likely to remit than immigrants from the rest of the world. One possible explanation is that for FSU immigrants, economic aspirations were more important in their decision to migrate than for other groups of immigrants (Amit, 2010; Cohen, Haberfeld and Kogan, 2011). Permanent immigrants, who migrated for economic reasons, may be more inclined to remit because they want to support their relatives in the country of origin who could not migrate with them. The pattern of remittance behavior of FSU immigrants can be representative of other groups of immigrants worldwide, for whom economic and employment motives were important in their decision to immigrate.

Social integration in the host country had a positive impact on the propensity to remit, but the length of living in the host country has a negative effect. The findings of the study support the remittance decay theory. Overall, the study revealed that remittance behavior of migrant citizens who immigrated together with their nuclear families and have low likelihood to return to their countries of origin, is fueled by mixed motives: altruism and self-interest insurance. These motives are not necessarily exclusive and can intertwine. However, contrary to temporary short-term migrants, the altruism motive is dominant in the case of migrant citizens.
This study contributes to a better understanding of remittance determinants and provides a clearer view of the migrant’s decision-making process. Understanding the differences in remittance behavior between different groups of immigrants can help clarify the various economic and financial roles that these groups play.

The study had some limitations. The data of the Immigrant Survey does not contain information about the sums of remittances, nor the remittance rates of the veteran Israeli population, thus preventing comparison with remittance rates of immigrants. The study revealed that immigrants’ remittance rates drop with time, but the question whether they become equivalent to those of the veteran population or still remain higher remains unclear, and can be an issue for subsequent research.

INNOVATIVE SKILLS MANAGEMENT FOR THE AGRICULTURAL
ENTREPRENEUR
Lachapelle, Nathalie
Business School, TELUQ University, University of Quebec, Quebec, Canada

ABSTRACT
Entrepreneurship knowledge in the agricultural sector is limited. This contribution deals with the intrinsic links of the innovation process and management by the entrepreneur for the survival of his SME.

Our research aims at explaining the innovation process of Entrepreneurs by combining the different approaches in the field of Entrepreneurship presented in the Pyramid of Julien (2005) to the Knowledge Creation model of Nonaka and Takeuchi (1995). The theoretical framework is based on the model of Nonaka and Takeuchi but also fourteen other authors. The proposed conceptual framework incorporates three dimensions: 1) the Owner-Manager Entrepreneur, 2) the Organization and its Management of Knowledge, 3) the Environment, with its challenges and constraints. In order to test the conceptual framework, the Agricultural sector was chosen. Owners-Managers of Small and Medium-sized Enterprises (SME) have a specific Entrepreneurial culture, because this domain intrinsically imposes limits on product innovation due to its nature and Low Technological content. Yet little empirical research has been done in this industry to test the application of the Entrepreneurship disciplines in this sector. A multi-case methodology was developed for 11 SME producers and managers. The empirical study’s analysis of results supports the different approaches, interdependencies and variables on which the four Triangles (Entrepreneur, Environment, Community, Time) that make up the Entrepreneurial Pyramid are based. This contribution deals with the intrinsic links in the Innovation Process and Management by the Producer-Manager Entrepreneur in order to ensure the survival of his SME. Future research perspectives are suggested to further integrate the fields of Entrepreneurship and Innovation Management.

FOR THE STUDY OF DEVELOPMENT GOVERNMENTAL STRATEGY TO SUPPORT THE ENTREPRENEURIAL EDUCATION IN GEORGIA

Lekashvili, Eka
Economic Policy Department at Iv. Javakhishvili Tbilisis State University, Tbilisi, Georgia

ABSTRACT
At present Georgian Economy faces new challenges, among which is economic development and increased unemployment. Theoretical research (Solow, 1988, Romer, 1994, Mark Grant and Mac Millan, 2000, Aidis, 2005, and others) and practical experience prove that the development of entrepreneurship is the main solution to these problems. Propensity to entrepreneurship and entrepreneurial activities are different across countries. The positive job creation, innovation and competition effects gained from the development of entrepreneurship are further increased by economic growth gains, which are redistributed and controlled by the state. Generally, entrepreneurship and economic growth require that the need for economic education be generated. This goal can be achieved by means of effective educational and entrepreneurship development policies.

The goal of the research is to study entrepreneurship education problems in Georgia in frame of development governmental strategy.

The research objectives include: discussion of features of entrepreneurship in transitional period Georgia, based on which defined the policy instruments for transferring entrepreneurial way of thinking; Study the policy problems of transferring entrepreneurial education in Georgia; Make recommendations, based the experience of EU, for development governmental strategy to ensure entrepreneurship education in Georgia.

Development of entrepreneurship in Georgia was hindered underdevelopment of entrepreneurship education, absence of entrepreneurship culture which led to low quality of management and administration. Ineffective institutional reforms; imperfect entrepreneurship legislation, low degree of internationalization of functional levels of business; low tax culture and social responsibility, etc. By categorizing these problems it becomes obvious that the development of competitive business and entrepreneurship activities are impeded by low level of entrepreneurship education and way of thinking.

Implementation of the European approach towards entrepreneurship education needs systematization of inter-relationships and promotion of research activities; sharing European experience in the field of entrepreneurship education; adoption of new teaching methods and learning materials in entrepreneurship courses; creation of the grounds for sustainable cooperation; creation of the grounds
for action plan for future cooperation; intensification of the academic ties and transnational relationships, etc.

In order to upgrade entrepreneurship quality and culture it is reasonable to interfere in educational system and implement entrepreneurship education initiatives. Improvement of entrepreneurship skills and potential needs: Formation of entrepreneurship culture; Educational support; Support for entrepreneurship-related institutions; Support for mentor initiatives; Education and life-long learning; Workforce flexibility and employment; Generation and implementation of high tech knowledge; Financial support; Support for research initiatives; Protection of patents and copyrights, etc.

Thus at the current stage studying the European experience in order to upgrade entrepreneurship education the state should resolve the following concrete tasks: Develop governmental strategy to support the entrepreneurship education and declare it as one of the priorities of the state policy; Develop national strategies of entrepreneurship and implement them at every step of education; Take adequate actions at public, regional and local administration levels; Form coordinating groups at the state level consisting of civil organizations, businesses, educational institutions, students and representatives of other organizations; Promote teacher and student mobility among countries, higher educational institutions and private sectors in order to enhance the development of entrepreneurship education; Promote entrepreneurship education projects within the programs supported by the European funds; Finance and support for the educational activities which contribute to the improvement of entrepreneurship education; Work out and implement flexible financial, fiscal, tax incentives for entrepreneur agents in order to build contacts with Universities; Implement practice-based learning in entrepreneurship education by engaging students into certain entrepreneurship projects; Organize information actions at schools and public areas for the popularization of entrepreneurship; Engage entrepreneurs into educational programs; stimulate close relationships of students with companies and entrepreneurs; Help entrepreneurs and business people to develop pedagogical skills on the part of educational institutions; Implement adequate programs for self-employment and starting enterprises, etc.

After the entrepreneurship activity optimization, the state can expand entrepreneurship by means of entrepreneurship development measures, subsidizing, entrepreneurship risk reduction, entrepreneurship potential growth, and support for innovation adoption, entrepreneurship popularization and use of other supportive tools.

AVAILABILITY OF CAR RENTAL AS AN ALTERNATIVE OF CAR OWNERSHIP

Leontyeva, Yulia1; Mayburov, Igor2

1Ural Federal University named after the first President of Russia B.N. Yeltsin, Russia
2Ural Federal University named after the first President of Russia B.N. Yeltsin, Russia; Far Eastern Federal University, Russia

ABSTRACT

The article considers the issues of the availability of car rental in urban areas in different countries. An overview is done of scholarly work on the factors influencing people's decision whether to own and use a car. A conclusion is made that apart from the factor of cost the decision is shaped by the availability of alternative modes of transport. The authors prove that it is necessary to create an all-encompassing system of public transport that would provide alternative modes of transport, including taxis and car rental that target customers who are not prepared to give up personal cars. It is proven that the availability of car rental could serve as an alternative to car ownership for a certain part of people living in urban areas. The authors analyze types of car rental services and considers different levels of availability of the services to different categories of customers. The authors propose a method of conducting a comparative analysis of the availability of car rental services. The subject of the research is car rental services in three types of cities. The authors picked the cities with a high, medium and low intensity of private car use. The study assesses the cost of car rental in each city type under identical parameters of car brand and rental period and timing. A conclusion is made that there is a substantial difference in affordability and actual availability of car rental services. The authors substantiate an assumption that a wide range of car rental services and their affordability can be a significant alternative for city dwellers who do not use a car regularly. The article argues that car rental is not developed enough in Russian cities and analyzes factors that lead to the Russian cities lagging behind in adopting a systemic approach to the provision of such services. The aim of the research is to assess the availability of rental car and to establish the service availability factor as a crucial element of transport policy in urban areas that seeks to diversify modes of transport.
THE EFFECT OF DIGITAL VARIABLES ON PERCEIVED EMPLOYABILITY IN AN ETHNIC MINORITY AND HEGEMONIC GROUP

Lissitsa, Sabina1; Chachashvili-Bolotin, Svetlana2

1School of Communication, Ariel University, Israel
2School of Social & Community Sciences, Ruppin Academic Center, Israel

ABSTRACT

Introduction

Employability refers to an employee’s chance of finding alternative employment, either on the internal or external labour market (Forrier & Sels 2003). As a result of fundamental changes in the labour market, such as the growth in temporary employment, globalization and new technologies, along with organizational restructuring and downsizing (De Witte 1999; Quinlan et al., 2001) employability has become a key element in work life (Silla et al., 2009).

The diffusion of information and communication technologies (ICTs) demands changing work skills, which has the effect of expanding employment opportunities while imposing new demands on disadvantaged groups (Garrido, Sullivan & Gordon, 2010). The situation may get worse because of the fast pace of new technological developments, shortened 'lifecycles' of ICT skills, and the need for continuous learning (CEPIS, 2006). However, the impact of ICT adoption on employability has not yet received proper attention.

The current research is aimed at addressing this lacuna by examining the extent to which different aspects of Information Technologies (IT) diffusion (digital skills and digital uses) have modified perceived employability in a unique Israeli context which is characterized by a deep divide between the Jewish majority and the Arab minority.

Methods

This study based on data from a nationwide Annual Social Survey which was conducted by Israel’s Central Bureau of Statistics (CBS) using a representative sample of 7500 respondents. From the total sample, respondents aged 20-65 were filtered who were employed or self-employed. Our sample included 4,085 such respondents, of these 3,546 Jews and 539 Arabs.

Analysis

In order to understand which digital skills and uses, if any, might predict perceived employability, we ran an ordinal regression model in two stages. In the first stage we entered all demographic and labor
market variables. In the second stage digital variables were added. For a deeper understanding of the differences between Jews and Arabs in the effects of the independent and control variables on perceived employability, we conducted the regression analysis separately for Jews and Arabs.

Discussion

Our important finding is that digital skills were positively correlated with perceived employability among both groups. Therefore ICT skills can be seen as 'gateway skills' without which a person’s likelihood of finding employment would be significantly reduced (Green et al., 2012; Garrido, Sullivan & Gordon, 2010). Moreover, in contrast to other powerful factors impacting perceived employability (objective economic situation and personal perceptions, occurrences in the employee’s immediate private and organizational circle, personal traits) these factors can be altered with relative ease, if digital literacy becomes an important goal in the national agenda.

Our findings show the positive correlation between Internet use for study and perceived employability. Internet use for study provide users from the ethnic majority group with the opportunity to leave the cycle of failure by utilizing distance learning opportunities relevant for formal and informal education, which may increase employability in the short run and facilitate career advancement in the long run. However, among Arabs the effect of Internet use for study on the dependent variable was insignificant. We speculate that as a result of discrimination in the labor market, Arab respondents feel that the knowledge acquired through Internet use might not improve their chances in competition with the majority group.

Unlike the research literature, which indicates the effectiveness of “weak ties” (see Granovetter, 1983) in finding jobs, our findings show insignificant correlations between social media use and perceived employability in both groups. We can speculate that in the evaluation of their chances to find a comparable new job, employees base themselves on their human capital, labor market perception and perhaps on strong ties available offline, but not on weak ties created in the world of virtual reality. Another explanation may be that people are aware of the potential harm that exposing personal information in social networks may have on preserving current jobs and finding new employment, which offsets the usefulness of disseminating relevant information and developing weak ties that may assist in finding jobs.

Our findings show a negative correlation between e-mail use and perceived employability among Arabs and an insignificant association between these variables among Jews. In recent years, as social media have expanded, e-mail has become a more formal tool of communication, while social media have become staples of the more private sphere. We speculate that the negative correlation found among Arabs may be a strong negative reaction to multiple experiences of lack of responses
from potential employers to CVs sent by e-mail, as a result of discrimination in the labor market, which is reflected in lower perceived employability.

*Keywords*: perceived employability; digital inequality; digital skills; digital uses; social media; Jews and Arabs in Israel; ethnic minority.

EXPOSURE TO BULLYING AND JOB BURNOUT: THE PROTECTIVE ROLE OF JOB RESOURCES

Livne, Yael; Goussinsky, Ruhama
Department of Human Services, Yezreel Valley College, Yezreel Valley, Israel

ABSTRACT

INTRODUCTION
Workplace bullying, defined as repeated inappropriate and hostile behavior intended to harm, intimidate, degrade or humiliate others (Einarsen et al., 2003), is a major work stressor, bearing destructive consequences for targets as well as organizations. It is a widespread phenomenon in organizations and is especially common in the healthcare sector (Zapf et al., 2011). Exposure to bullying is associated with a range of negative outcomes, including impaired work performance and employee burnout (Nielsen and Einarsen, 2012). The experience of burnout by health care professionals can negatively affect the quality of care provided to patients (Sharma and Dhar, 2016). Therefore, it is of special interest to examine how the harmful effect of workplace bullying can be reduced.

The present study adopts the Job-Demands-Resources (JD-R) theory (Bakker and Demerouti, 2014) to examine the relationship between workplace bullying and employee burnout, and the moderating role of control-related resources in this relationship. Drawing on this theory, it is first hypothesized that workplace bullying will be positively related to burnout, since it constitutes a job demand that elicits an energy depleting process. Second, it is hypothesized that job autonomy and occupational self-efficacy will moderate the positive relationship between workplace bullying and burnout, because they act as resources that increase employees' sense of control over their work tasks, therefore allow them to defend themselves more assertively in the face of bullying (Rousseau et al., 2014), and elicit effective coping (Pisanti et al., 2008).

The present research aims to investigate the role of control-related resources, i.e., job autonomy and occupational self-efficacy, in the relationship of workplace bullying and burnout among health care employees.

METHODOLOGY
The study was conducted with two samples of healthcare employees in Israel; 309 workers of a mental health hospital from several occupational groups, and 105 students for bachelor’s degree who were
employed as nurses in various settings. Data were collected using anonymous questionnaires which were filled out during work hours (in sample 1) or during class hours (in sample 2).

**FINDINGS**

The hypotheses were tested using hierarchical regression analyses. First, workplace bullying predicted burnout dimensions even after controlling for negative affectivity in both samples ($\beta = .25, p < .001$ for emotional exhaustion and $\beta = .28, p < .001$ for depersonalization in sample 1; $\beta = .26, p < .05.$ for emotional exhaustion and $\beta = .24, p < .05$ for depersonalization in sample 2). Second, workplace bullying significantly interacted with job autonomy in predicting emotional exhaustion in sample 1 ($\beta = -.15, p < .05$), and in predicting depersonalization in sample 2 ($\beta = -.15, p < .05$). Specifically, workplace bullying was more strongly related to emotional exhaustion for employees with lower rather than higher than average job autonomy. Finally, the interaction of workplace bullying and occupational self-efficacy showed a significant effect on depersonalization in sample 1 only ($\beta = -.16, p < .05$ in sample 1).

**IMPLICATIONS**

This study adds to a growing body of literature suggesting that workplace bullying is a major stressor that detrimentally effects employees' well-being. Its main contribution is in pointing to the protective function of job autonomy and occupational self-efficacy as control-related resources that enable healthcare employees to reduce the detrimental effects of workplace bullying. Practically, the findings imply that to promote high-quality patient care, management should primarily act to prevent workplace bullying, alongside with increasing employees' job autonomy and occupational self-efficacy.

*Keywords: burnout, healthcare, job autonomy, occupational self-efficacy, workplace bullying.*

LOVE AND RESPECT IN THE SOCCER INDUSTRY

Loureiro, Sandra Maria Correia¹; Kaufmann, Hans Ruediger²

¹Marketing, Operations and General Management Department Instituto Universitário de Lisboa (ISCTE-IUL) Business Research Unit (BRU/UNIDE) and SOCIUS, Lisbon, Portugal
²University of Applied Management Sciences, Mannheim, Germany

ABSTRACT

PURPOSE

The aim of this study is to follow Roberts’ concept of Lovemarks and develop a scale to measure Lovemarks brands, using soccer context industry. For scale development, we followed the Churchill’s (1979) paradigm.

CONCEPTUALIZATION

Investing in consumer-brand relationships has become central to many brands seeking to build lasting and profitable links with their consumers (Pang, Keh, and Peng, 2009; Loureiro, 2015). The term Lovemark is associated, initially, with terms defined by Ahuvia (2005) as positive emotions such as brand response, brand connection, brand declarations of love. Carroll and Ahuvia (2006) also define brand love as an emotional bond between a consumer’ satisfied by a particular brand, assigning the concept with the name of Love to the Brand. Albert, Merunka, and Florence (2008), on the other hand, argue that brand passion is supported by three dimensions: cognitive - brand idealization and its presence in the consumer mind; Emotional - desire, attraction and link between the consumer and the brand; Behavioural - where the positive word-of-mouth is inserted, the purchase of the brand at higher prices and the persuasion of other consumers to buy it.

Lovemarks transcend brands. They reach something beyond their good performance. They aim to reach the heart as well as the mind, creating an intimate and emotional connection with the consumer. According to Roberts (2005), if a brand is discontinued from the market, consumers find a substitute. If a Lovemark disappears, consumers will miss them. Roberts’ (2005) theory point out two core faces of Lovemarks: love and respect. Love has been regarded as an emotion but also as a relationship (Batra et al., 2012). The respect associated with a particular brand ensure the type of emotional relationship that consumers develop with a certain brand in relation to a competitor (Bergkvist and Bech-Larsen, 2010).

We employ the Batra et al. (2012) prototype model of love to measure brand love, which presents seven dimensions of love: passion-driven behaviours (passionate desire to use, willingness to invest
resources, things done in the past); Self-brand integration (desired self-identity, current self-identity, meaning of life, frequent thoughts); Positive emotional connection (intuitive fit, emotional attachment, positive emotions); Long-term relationship; Anticipate separation distress; Positive attitude valence (liking); and Attitudes held with high certainty and confidence. The authors use a grounded theory approach to capture the uncovered consumer-experienced features of the brand love prototype leading to a much more comprehensive and integrated understanding of how consumers experience brand love than past research.

Brand respect comprises five components: Brand performance, Brand heritage, Corporate reputation, Brand trust and Brand co-creation. Brand performance, therefore, represents a tool to analyse the consumer’s experience, insofar as it evaluates the positive and / or negative physical and emotional benefits consumers have found in relation to the brand (Banerjee, 2008). Keller (2001) states that the consumer analyses and compares the value proposition of the brand with other competitors in the market and evaluates whether or not it holds a higher value. Brand heritage concept represents an overview of the past influencing long-term relationship, moments of the present and perspectives of the future (Urde et al., 2007).

Corporate reputation is built and fortified by representing a set of positive and / or negative ideas and impressions with stakeholders and allowing them to conclude about the company’s identity (Walsh and Beatty, 2007). Brand trust reflects the assumptions of trustworthy, honesty and altruism that consumers ascribe to brands (Loureiro et al., 2012).

Co-creation represents a common experience between the company and the consumer, in which there are a definition and solution of the problem together based on the exchange of ideas and innovative experiences. The passive consumer is replaced by the creation of active value, giving space for the consumer to interact with this type of processes, supported by constructive criticism and efficient solutions for the creation and / or optimization of products (Prahalad and Ramaswamy (2004).

Regarding nomological validity and predictive validity, we employed Mystery, Intimacy, and Sensuality as antecedents and behavioural intentions as outcomes. Mystery brings together stories, metaphors, dreams and symbols and increases the complexity of relationships and experiences since people are drawn to the unknown and have the desire for discovery. Sensuality comes from the senses. These senses work together to alert and stimulate consumers to new sensations, creating new memories and memories. Intimacy, in turn, can generate empathy, commitment, and passion. This component creates loyalty relationships between the consumer and the brand that can be remembered over the long term regardless of whether the functions and benefits have disappeared or not. Lastly, we expected that behavioral intentions –purchase intentions, willing to pay and word of mouth- is an outcome of being in love and respect a brand (Loureiro, 2015; Xie et al., 2015).
The scale was developed in the context of soccer industry. Collective sports at a global level, and soccer in particular are made up of activities and events mostly based in the service sector, lived in small periods of time, that instil subjective attitudes and behaviours in their consumers and which have unforeseen results given the existing competitiveness (Underwood et al., 2001). Soccer, as a collective sport, represents the most popular sport in the world (Cayolla and Loureiro, 2014). A team sport generates a social experience in which the whole is greater than the sum of all its parts. Soccer can be worth around 250 billion dollars worldwide. This value generates competitiveness not only within each modality but also between different sports (Cayolla and Loureiro, 2014). Soccer represents a way of life. Several feelings can be generated for one person, and the same feeling can be conveyed by many people (Keller, 2003).

The connection among fans is related to their loyalty and commitment. A kind of religious cult is identified for the club, which can overcome insufficient performance phases, scandals and negative publicity in the media, high ticket prices, among others. The representation of the colours of the club, the identification of places as sacred (stadium, museum), the organization and dynamism of cheerleaders, the purchase of allusive products (scarves, equipment, balls) reveal a strong and stable connection between the club and its adherents (Pimentel and Reynolds, 2004). The good results and success of a team can be rapid, but the loyalty and commitment present in the brand-consumer relationship can be slow to develop (Gladden et al., 2001).

**DESIGN/METHODOLOGY/APPROACH**

The process starts with an extensive literature review to identify the facets of Lovemarks regarding love and respect. We employed the short scale of eleven items provided by Batra et al. (2012) to measure brand love. Respect was conceptualized through five components based on Robert's (2005): co-creation, trust, heritage, performance, and corporate reputation. Each of these components was defined previously in the theoretical background.

We employed five items to measure co-creation based on Prahalad et al. (2004), four items for trust adapted from Chaudhuri et al. (2001), twelve items for measure heritage (Merchant and Rose, 2013), performance with three items (Luxton et al., 2015) and corporate reputation with 16 items (Walsh and Beatty, 2007). In order to measure drivers and outcomes, we used four items to measure mystery, three items to measure intimacy, three items to measure intimacy adapted from Roberts (2005) and Fournier (1998). Finally, we employed four items to measure behavioural intentions based on Xie et al. (2015).

Three-month surveys (from February 15, 2016, until May 15, 2016) were carried out through the online platform Qualtrics. It is a free and duly authorized program when registering through the academic
email address of ISCTE-IUL (mmgrs@iscte.pt). The use of Qualtrics has proven to be a relevant option in that it provides an accessible use for both researchers and respondents. The survey consists of three parts, structured in order to make it easier for the respondent to read: first, the brand community to which he belongs is questioned, as well as the degree of affinity he/she feels to the same; Second, seven randomly organized blocks of items (69 in total) representing the constructs under study are carried out; Finally, certain personal data are requested so that a sociodemographic analysis can be carried out on the sample. The analysis of the items had as a method of classification the degree of agreement and disagreement on the same, using the Likert scale with 5 points (1 - totally disagree; 2 - disagree; 3 - neutral; 4 - agree; 5 - agree fully). Statistical analysis, in a research dissertation of this nature, represents a fundamental vehicle for the development of the exploratory study, making possible the analysis of the data as well as the collection of the necessary conclusions.

The data collected through the preparation of surveys were analysed in their entirety by the IBM SPSS Statistics 22 tool. It is a software that contributes to productivity improvement and decision making using analytical techniques. Through the Qualtrics program used to create the survey, it was possible to transfer the collected data automatically to SPSS having facilitated not only in the speed of the process but also in reducing the risk of error. A sample of 348 completed surveys was used from 500 collected, representing 69.6% of the total.

Figure 1. Nomological framework

MAIN FINDINGS

Several aspects come from the study. First, sensuality stands out as the variable that best explains brand Love ($\beta=0.836$, $p<0.001$), co-creation ($\beta=0.486$, $p<0.001$), trust ($\beta=0.728$, $p<0.001$), heritage ($\beta=0.554$, $p<0.001$), performance ($\beta=0.500$, $p<0.001$) and reputation ($\beta=0.490$, $p<0.001$). Second, the three variables (mystery, sensuality, and intimacy) contribute to explain in 90.7% the variability of brand love, 62.5%. the variability of co-creation, 76.5% the variability of trust, 70.7% the variability of heritage, 65.5% the variability of performance and 64.0% the variability of reputation. Third, Intimacy does not explain the variability of trust and performance significantly

Fourth, considering love and respect, brand love is the one to have the higher explanatory power on behavioral intentions ($\beta=0.802$, $p<0.001$). However, 83.6% of the behavioural intentions are explained
by brand love and the five dimensions of respect. Heritage is the one with less explanatory power over behavioral intentions ((β=0.144, p< 0.05).

PRACTICAL IMPLICATIONS

Today's brands should increasingly focus on consumer needs, their expectations and desires as a way to develop long-lasting emotional and sentimental ties and bonds. The brand that does it the best reaches a special place in the head and the mind of the consumer, being titled Lovemark.

The fact that a brand achieves this status allows it not only to create loyalty for the consumer but also to generate a deep relationship. This situation implies, above all, that the brand maintains its quality standards and that does not disappoint the consumer, always meeting their needs.

Achieving a Lovemark implies a constant building of emotional bonds beyond brand-consumer reason, as well as the creation of differentiating factors, sustained by symbolic, emotional, and intangible characteristics based on well-defined strategies. Sensuality and mystery are key factors in building love and respect. Yet, more than respect, it is the relational love (the deep passion connection) that leads consumers to keep in close contact with brands, for good and bad moments.

These findings are quite important for brand management.

The present research was based on the behaviour of soccer club fans in Portugal, and it was interesting to analyse the pragmatism, desire, and passion demonstrated by the club fans. It would be interesting for marketing management to develop an analysis in another industry.

ORIGINALITY/VALUE

As far as we know, this is the first attempt to provide a full scale to measure love and respect following Churchill’s paradigm into the context of soccer industry. Even so, the scale must be tested and extended to other iconic brands in other industries.

Keywords: Brand love, Brand performance, Brand heritage, Corporate reputation, Brand trust and Brand co-creation

LOCAL COMMUNITY AND TOURISTS - PERCEPTIONS ABOUT THE IMPACTS OF TOURISM IN THE HISTORIC ZONE OF PORTO

Magalhães, Carla; Marques, Isabel; Candeias, Maria Teresa
Faculty of Economics, Social Sciences and Business, Lusófona University of Porto, ULP, Porto, Portugal

ABSTRACT

This investigation aims to study the perception that residents and professionals of the Historic Zone of Porto (HZP) have about Tourism in this area, taking into account the socioeconomic, cultural and environmental dimensions and following the analysis model of Andriotis (2003). For this purpose, a review of the literature on the subject was carried out and a questionnaire was applied to a sample of 287 workers and residents in the selected parishes of the HZP. The literature review allowed us to find three dimensions to be evaluated, adapted from the models of Andriotis (2003) and Dyera et al. (2007): the interaction between tourists and residents and the socio-cultural development of the city, economic development and local employment and the environmental dimension. Through the analysis of the collected data, it was possible to draw some conclusions about the way residents and local professionals of HZP perceive tourism. First, by analyzing the socio-economic dimension in detail, it was possible to verify that the respondent sample had a positive reaction, emphasizing that the majority of respondents considered tourism as a promoter of development in all areas, including those that are not exclusively linked to this sector. The main advantages include attracting new investors, creating jobs or developing the local economy. On the other hand, some respondents react negatively to the presence of the tourist sector as they consider that the cost of living has risen dramatically, in particular in general expenses and in the price of housing. As far as the socio-cultural dimension is concerned, it is evident that, along with the socio-economic dimension, it is positive for the group under study. It should be emphasized that, in general, a large number of individuals agreed with the statement "Meeting people from other places helps to better understand the culture and society of other countries." The participants demonstrate pride in the traditional culture of Porto, when they see tourists in the city, and consider that the increase of tourism is creating a new dynamic of animation in the HZP. On the other hand, the item with less consensus concerns its participation in cultural events in the Center of Porto (standard deviation = 1,175). The analysis of the socio-environmental dimension reveals less positive feedback compared to the other dimensions. They consider tourism an added value and think that Porto has the capacity to attract more tourists (the average of 4.24 reflects this opinion). It also has advantages in other aspects, such as the general improvement in the city, the revitalization of the historic center, the improvement of accessibility and means of transportation or the restoration of historical buildings in the city center. In general, through
this study, it was possible to verify that the sample surveyed evidences a positive perception regarding the development of tourism in the city, demonstrating that the local stakeholders of the HZP are pleased with the presence of companies and practices related to Tourism in this region. There is also an agreement on a larger scale regarding the socio-cultural dimension, proving that the community feels comfortable and open to the contact with other people and cultures. It was also tested the possibility of finding differences in the perception of the impact of Tourism in the HZP according to gender, age, place of work and place of residence. The results point out that there are no differences in the evaluation of tourism impact in relation to the studied factors. However, in the case of the perception about Animation and Culture this is more positive for who resides in the Center of the Porto but works outside this area of the city. Thus, the present study allows us to conclude that the respondents consider that Tourism in Porto is growing in a harmonious way with the city and had a direct influence on the overall improvement of the HZP. Respondents value positively the Tourism in the city, and the component that had a greater relevance in the positive perception about this activity in the city is the good interaction between tourists and residents that, taking into account the studies of Cohen (1984) and Kim, Uysal and Sirgy (2013, apud Vargas-Sánchez et al, 2014) may be due to the fact that the city of Porto is still at an early stage of tourism development, in which tourists are considered as an important part of social relations and by whom the local community feels a great proximity and appreciation, thus favoring the hospitality.

STAKEHOLDER’S PERCEIVED REPUTATION OF LOCAL GOVERNMENT OF SOUTH AFRICA

Maleho, Lazarus Mohapi

Department Of Hospitality, Tourism And Public Relations Management, Vaal University Of Technology, South Africa

ABSTRACT

The purpose of this study was to assess how internal (municipal employees) and external stakeholders (community members) of a South African district municipality perceive the corporate reputation of that municipality. Generally, the issues that have been pointed out to the municipalities by the disgruntled stakeholders have reportedly been in the areas of dissatisfaction with service delivery performance, from media reports of protest action, which impacts negatively on the reputation of the local government. To address this problem this study therefore used the Harris-Fombrun Reputation Quotient (RQ) to investigate stakeholders’ perceived reputation of the Fezile Dabi District Municipality, formerly known as Northern Free State District Municipality and includes two towns in each of the four local municipalities, namely, Kroonstad, Steynsrus, Heilbron, Parys, Sasolburg, Orangeville, Villiers and Frankfort. Forty employees were randomly selected in the offices of the different municipalities and 240 participants from eight towns were conveniently selected. Questionnaires containing items based on the Fombrun’s six Reputation Quotient dimensions were used. Three fundamental questions were asked and addressed in this study.

- What are the perceptions of external stakeholders (i.e. community members) with regard to the reputation of Fezile Dabi District Municipality (FDDM), as measured collectively in terms of the six dimensions of the Harris-Fombrun Reputation Quotient?
- What are the perceptions of internal stakeholders (i.e. municipality employees) with regard to the reputation of Fezile Dabi District Municipality (FDDM), as measured collectively in terms of the six dimensions of the Harris-Fombrun Reputation Quotient?
- What differences can be observed between external stakeholders (i.e. community members) and internal stakeholders (i.e. municipality employees) in terms of their perceptions of the Fezile Dabi District Municipality (FDDM)?

SMES FARMING SUSTAINABILITY: THE ROLE OF AGRIFOOD HUBS

Malindretos, George ¹; Moschouris Socratis²; Kinanlis Panagiotis¹

¹School of Environment, Geography and Applied Economics, Harokopio University, Athens, Greece
²Department of Industrial Management and Technology, University of Piraeus, Piraeus-Athens, Greece

ABSTRACT

The main objective of this research concerns the sustainability performance with specific focus in the Agrifood industry. In particular, the Agrifood Hubs (AH) have contested over the last decades within the academic and public institutions as main enabler of the economic, social and environmental sustainability of SMEs in the dominated surrounding conventional agri-food system in developing countries.

The majority of research in SCM in the past focused on large organizations, while the benefits of SCM that can be realized by small businesses are not clear enough. Arend & Wisner (2005) have argued that SCM can provide quality, cost, customer service, leverage and even risk mitigation benefits. Provided properly integrating SMEs, barriers to internalization and competitiveness may be eliminated and pave the way for collaboration among supply chain partners (Hoppe, et al., 2010; Davidova, and Thomson, 2014). A road-map has been proposed to integrate supply chain strategies with the competitive strategies of SMEs for effective value chain management (Franklin et. Al., 2011). In the increasingly globalizing market, innovation and use of appropriate methods and processes with trustful co-operation can contribute overcome the barriers chain networks of SMEs and to the enhancement of the innovation capacity (Kühne et al., 2010; Porter and Kramer, 2011). To increase the small share due to lack of efficiency, the implementation of supply chain and supply chain management by SMEs will lower costs and increase efficiency.

In particular, although managers of small firms as a rule suggest that the majority of the benefits of SCM are within their reach and that the barriers to implementation do not intimidate them, they are not actively pursuing SCM as a strategic weapon. The best way to avoid this is to create the ‘collaborative capabilities’ for promoting SCM, for the choice among alternative holistic SCM strategies based on the small firm’s participation (Fawcett et al., 2009; Oreszczyn et al., 2010; Diamond and Barham, 2012). The exploitation of synergies throughout the building-up of a value chain is critical for the sustainability goals of SMEs in the agricultural sector. New ‘strategic thinking’ can initiate collective innovation, leaving aside attitudes and practices dominated in the past. The on-going assessment is expected to be embedded by alignment of the ‘triple line approach’ of sustainability with the so-called ‘three Ds’ triangular analysis (Decentralization-Democracy-Development).
In this direction, AH provide knowledge and information for potential markets throughout the world and value adding services, promoting collaborative action/synergies and enabling market thus access particularly for SMEs through integrating agrifood supply chains, bridging small producers and the consumers—individuals and families as well as big buyers (Ploeg, et al. 2012). This is inescapable for escaping from inevitable agricultural abandonment: because, the globalization phenomenon has increased barriers to market access aggravating the farms’ declining share of profit and the cost-price squeeze of commodity production (Breustedt and Glauben, 2007; European Commission, 2011; European Parliament, 2013; Berti and Mulligan, 2016; Schneider et al., 2016).

The main focus is given to the methodology and literature intermix concerning AH, in a shared knowledge driven research, to motivate “Responsible Research and Innovation” (RRI), with a dynamic interactive R&D process. This accommodates the SD UN concept and the advance of Logistics to integrated SSCM (Sustainable Supply Chain Management). Moreover, the paper through a critical literature review, presents different approaches/types of AH within the framework of sustainability, value supply chain and digital era. More specifically, it aims at a taxonomy analysis of the AH in terms of institutional, functional and other factors met in the literature of AH, while a holistic model of AH will be proposed, incorporating main principles and functional guidelines meeting sustainability imperatives, exploiting value supply chain technologies, methods and practices. (Bloom, and Hinrichs, 2011, Beckie et. al., 2012).

This study identification is in line with the demographic, economic and social prospects for the 2050 and the European Economic and Social Committee decision acting under Rule 29(2) of the Rules of Procedure, for “An EU Industrial Policy for the Food and Drinks Sector’ adopted on 4 May 2015 (2015/C 332/04).

THE RIGHT TO CONTAINING CLIMATE CHANGE (CCC)

Maniatis, Antonios

University of Applied Sciences, Athens, Greece

ABSTRACT

INTRODUCTION: THE GROUP OF RIGHTS TO ENVIRONMENT, WATER AND CCC

4G fundamental rights have begun to be recognized from about 1995 and on. Some dynamic modern groups are formed, comprising new and older components, like the ecological group “Environment, Water, Containing Climate Change (CCC)” (Maniatis, 2017). For instance, the 3G universal right to water has acquired an autonomous constitutional status through decision 1906/2014 of the Plenum of the Council of State in the Greek legal order.

We suppose that the right to CCC, is an autonomous 4G fundamental right.

A JURISPRUDENTIAL REVOLUTION ON THE 4G RIGHT TO CCC

The right to CCC was in the process of becoming a judicially protected right in an autonomous way against the general 3G right to the environment, shortly before the adoption of the Paris Agreement on Climate Change. According to the doctrine, the Climate Change Law was then gaining its own autonomy in the jagged context of Environmental Law (Nespor, 2015). According to the Oslo Principles on Global Climate Change Obligations, presented on 30 March 2015, as scientific evidence is constantly evolving and improving, lawmakers, policymakers and tribunals have a duty to inform themselves of and base their actions – in good faith and respecting justice and equity – on prevailing scientific knowledge and opinion. Threatened human rights include, but are not limited to, the right to life, the rights to health, water, food, a clean environment, and other social, economic and cultural rights, and the rights of children, women, minorities and indigenous peoples. Shortly afterwards, in June 2015, two judgments of national tribunals changed the history of climate law. Initially, the district Dutch tribunal of Aia imposed to the correspondent government to adopt stricter policies in the matter of climate change in order to protect the right of citizens to live in an environment unthreatened by climate alterations in the near future (Nespor, 2015). Holland till 2020 would achieve to limit down its greenhouse gas emissions to the maximum of 17% but this measure was insufficient in view of the importance of climate change, so the minimal reduction to achieve should be of 25%.

The government cannot justify its inactiveness by making use of the argument that the solution in the climate change problem depends only to a very small extent on Holland. For the first time,
worldwide, a judicial authority considered that CCC is not reserved to the discretionary faculty of the political (legislative or executive) components of a State but is a resource of rights of citizens, which countries should respect. The last ten years before this sentence, the ecological movement realized that it was unable to persuade the international community to adopt a legally binding agreement to CCC and modified its strategy, by emphasizing on the judicial way in the interior of single sovereign States, to obtain what they did not manage to obtain by the international community. Besides, some days after the publication of the Dutch sentence, a judge of the USA emitted a sentence on the recourse of young students and ordered the Eco-logy Department of the State of Washington to reconsider their application, presented in 2014 and rejected by the Department. It was about a proposal for the adoption of measures to reduce the greenhouse gas emissions in the interior of the State, on the basis of the most reliable scientific data. The verdict, in line with the jurisprudence of Holland, signalizes that the youngsters are endowed with a right to live in the future in a healthy environment and that the Ecology Department had in no way disputed the data which had been offered by the students and shared by the international academic community, in the matter of damage resulting from climate change. In a comparable way, a law adopted by the Finnish Parliament on 6 March 2015 previews a reduction in gas effect emissions of 80% against 1990.

The United Nations Framework Convention on Climate Change entered into force on 21 March 1994 and has actually near-universal membership. Due to the date of entrance into force, the UNFCCC ties in with the 4G character of the correspondent right to CCC. Furthermore, the above-mentioned Paris Agreement, which was adopted on 12.12.2015 and entered into force on 4.11.2016, provides an opportunity for countries to cope with the threat of climate change by keeping a global temperature rise this century well below 2 degrees Celsius and to pursue efforts to limit the temperature increase to 1,5 degrees Celsius. However, we have to signalize that it makes no explicit mention to the human right to water, despite the aforementioned precedent of the Oslo Principles on Global Climate Change Obligations. The contribution of each State to achieve the worldwide goal of the Agreement is determined by all States separately and is called “Nationally Determined Contribution (NDC)”. However, no mechanism has been previewed to force a State to set a target in its NDC by a specific date and no enforcement will be if a set target within a NDC is not met. There will be only a “name and encourage” plan. Unlike its predecessor, the Kyoto Protocol, which sets commitment targets endowed with a legal force, the Paris Agreement allows for voluntary and nationally determined targets.

In spite of this approach, the USA President announced in May 2017 the withdrawal of his country from the Paris Agreement, which inflicts ‘severe energy restrictions’ on the USA and ‘punishes’ it while ‘imposing no meaningful obligations on the world’s leading polluters’. This motivation is
wrong because the USA NDC was unilaterally offered by the previous national administration (not imposed by anyone) whilst India and China, singled out in President’s speech, have NDCs that are different from this NDC not because the Paris Agreement imposes a prescriptive burden sharing arrangement on countries, but because these countries have different national circumstances (Rajamani, 2017). Anyway, due to legal reasons the USA will remain to the Paris Agreement until at least November 2020...

CONCLUSION: NEW RIGHT AND BRANCH OF LAW ON CLIMATE CHANGE

In 1817 the invention of the bicycle was achieved, as a result of a climate change crisis. Two centuries later, a 4G right on the matter exists, which comes from international stage as it has been consecrated in the 1992 United Nations Framework Convention on Climate Change, put into force in 1994. In 2015, it was significantly promoted by pioneer jurisprudence whilst climate change law has recently gained its self-existence against the older branch of environmental law, through the Paris Agreement. Last but not least, it is recommended to explicitly recognize in Constitutions the universal right to CCC, like the right to water...

ABSTRACT
The present study connects individual and organizational level of successful entrepreneurial acting in hardly predictable markets in order to deepen the understanding of the relation between individual thinking and organizational acting. A theoretically derived research model is empirically validated by using survey data from 316 hotel companies in Germany of all size. Our empirical finding is that the variety of entrepreneurial thinking from an individual point of view is a co-driver for a company’s ability for entrepreneurial action together with the well-established organization related driver called Entrepreneurial Orientation. Moreover the different patterns within the entrepreneurial paradigm set do vary in their influence on entrepreneurial acting. This is relevant for entrepreneurship literature because it gives a better understanding of the entrepreneurial function which core element is described here as the relationship between entrepreneurial thinking at an individual and organizational level and the firm’s capability to act.

INTRODUCTION AND RESEARCH DESIGN
The literature on entrepreneurship shows the requirements for successful entrepreneurial acting from both the individual and the organizational point of view, since a new market or business entry, as the essential act of entrepreneurship, refers to actions that may be initiated by an individual, a small firm or the strategic unit of a large firm (Lumpkin and Dess, 1996). Thus, the entrepreneurial role stressed by Schumpeter can and must be performed whether by individuals, small groups or entire organizations (Miller, 1983) throughout a firm’s life cycle. With this study we want to shed more light on the question how and to which extend individual and shared cognitions of (top) executive managers enter into firm’s capabilities and activities that strengthen the firm’s performance. We focus on this relation as an approximation to the entrepreneurial function behind the entrepreneurial act. This question matters since a firm’s (new) entry may be considered as common but “its survival is not” (Sarasvathy, 2008, p. 123). Moreover this question is relevant for the literature on entrepreneurship ever since it emerged as the underlying core question of the Upper Echelons Theory.
by Hambrick and Mason (1984). This theory is based on the premise of bounded rationality by saying that (top) executive managers act on the basis of their personalized interpretations, which are a function of their experiences, values and personalities.

The assumption that situations are not knowable but rather interpretable (Hambrick, 2007) is closely related to the learning theory of constructivism, which states that all human experience and learning is (partly) based on individual constructive activities, which are influenced by neuronal, cognitive and social processes (Glaserfeld, 1995). Hambrick and Mason (1984) used demographic characteristics of executive managers to approach the executive’s cognitive frame. However, there has been a remarkable approach by Sarasvathy (2008) who describes entrepreneurial thinking at an individual level as a combination of effectuation and causation logic which both sum up in an entrepreneurial paradigm set. We consider the concept of entrepreneurial thinking by Sarasvathy as an appropriate and close approach to the executive’s cognitive frame according to Hambrick and Mason. The proportion of both logics within the frame may vary significantly due to factors like personal preferences of the manager and the firm’s life cycle (Sarasvathy, 2008), the organizational background and the branch of the firm (Brettel et al., 2014) and, thus, can be adopt and described for all kinds of manager in certain companies or branches.

A sub-idea of the Upper Echelons Theory states that leadership of a complex organization (like a company) is a shared activity (Hambrick, 2007). Thus, we must consider too concepts that describe dispositions for entrepreneurial thinking on a firm-level. We found this in the theory of Entrepreneurial Orientation (EO) (Miller, 1983; Lumpkin and Dess, 1996). EO is seen as a firm-level disposition to engage in proactive, risk-taking and innovative behaviors that lead to change in the organization or market place (Covin and Slevin, 1991).

Finally, we know from work psychology that (vocational) thinking regulates (vocational) acting (Arnold et al., 2016). Thus, the entrepreneurial expertise (Sarasvathy, 2008) on an individual level and firm-level influence the way a company acts. In this study entrepreneurial acting is represented by the concept of Absorptive Capacity (ACAP) by Cohen and Levinthal (1990). It is seen as a dynamic capability that enhances a firm’s ability to gain and sustain a competitive advantage including knowledge creation and utilization (Zahra and George, 2002). We have chosen this concept for several reasons: First of all, it is well described in its ability to strengthen firm performance (Ebers and Maurer, 2014). Second, it is a very precise description of the firm’s capability to act in the field of marketing and therefore it can be seen as a valid approximation to entrepreneurial acting on firm-level (Engelen et al., 2014). Third, it is theoretically inappropriate to link the entrepreneurial paradigm set directly to firm performance or firm success (Sarasvathy, 2008).
In order to reframe the entrepreneurial function, we include in our research model the relationship between entrepreneurial thinking on individual level and firm-level (entrepreneurial paradigm set and EO) and entrepreneurial acting (ACAP) and link it to firm performance, predicting that a wider variety of entrepreneurial thinking strengthens entrepreneurial acting which leads to a better firm performance. In order to address the combination of both the effectuation and causation logic to the entrepreneurial paradigm set, the construct of Brettel et al. (2012) was chosen. It consists of four components and each of them is a bipolar combination of both logics (means vs. goals, risk reduction vs. risk avoidance, uncertainty tolerance vs. certainty orientation, failure avoidance vs. success orientation).

Besides we include the recognized market ambiguities by (top) executive managers into the research model, because these ambiguities are considered as a strong driver for the use of effectuation logic among managers (Sarasvathy, 2008) and for the supportive effect of EO on firm performance (Engelen et al., 2014). They are likely to appear more often in rather dynamic and changing markets. The hotel market in Germany belongs to those: Its dynamic development results from growing number of market segments, concentration tendencies due to hotel chains and substitution tendencies due to private suppliers (IHA, 2016).

Finally, the following research model was theoretically derived:

![Research Model Diagram]

**Figure 1. Research model**

We assume first that the higher the variety of the entrepreneurial paradigm set gets the higher is the ACAP of the hotel (Hypothesis 1). Further we assume that the higher ACAP gets the higher is the firm performance (Hypothesis 2). We include the well-tested construct of EO by Miller (1983) in the...
research model and assume that the higher EO gets the higher is the firm performance (Hypothesis 3a). Furthermore we argue that the higher EO gets the higher is the ACAP of the hotel (Hypothesis 3b). Finally, we assume that the stronger the realized market ambiguity gets the higher is the EO (Hypothesis 4), the higher is the variety of the entrepreneurial paradigm set (Hypothesis 5) and the higher ACAP gets (Hypothesis 6).

In applying this research model, we are able to address two questions to the literature, which are still underexplored: 1. How and to what extend does entrepreneurial thinking on individual level and firm-level influence the firm’s capability for entrepreneurial action? 2. How and to what extend is this relationship influenced by realized market ambiguities at an individual level? This is important especially for branches which are considered to have a rather low level of entrepreneurial expertise but a rather high level of emerging market turbulences. Again this applies to the hotel market in Germany since the majority of its provider (small and medium sized hotels) are considered as rather conservative and little innovative.

**METHOD AND RESULTS**

An online-questionnaire for hotel managers was designed. It contains seven chapters with a total of 32 questions which include all constructs from the research model. A pretest took place in September 2015 among 16 executive managers in top, middle and lower management positions in German hotels. As a result, we found out that participants took on average 15 minutes time for answering although the calculated duration was 20 minutes. In order to get a preferably valid overview about the chosen market we had to find a compromise between the intended depth of the survey and the estimated working time of potential participants. This was solved by programming a random sample of 4 items on average for each part of the complex construct architecture of ACAP, Entrepreneurial thinking and of EO. To reach enough participants all over the German hotel market the invitation link was spread via E-mail by trade-specific multiplier (such as HRS and DEHOGA), among general and other top managers. Between October 2015 and March 2016 a total of 316 filled questionnaires were collected.

First, the sample composition was analyzed. An evidence for non-response-bias could not be found (Whitehead et al., 1993). Second, a descriptive statistic was prepared, a confirmatory factor analysis for every construct was made and construct intercorrelations were examined with satisfying results in each step. Then, different path models were shaped in order to test the validity of the research model. Two groups of path models were designed: one group to describe the relationship between entrepreneurial thinking and the capability for entrepreneurial action (as an approximation for the entrepreneurial function) and one group to describe the influence of realized market ambiguities on this relationship.
As a result the overall path model (Figure 2 and Table 1) shows that both the variety of entrepreneurial thinking and EO have a significant supportive effect on ACAP. Besides a significant positive effect of ACAP on firm performance occurs. The variety of entrepreneurial thinking was measured as the standard deviation of all means of the paradigm set. Since the model fit test shows an acceptable model quality both overall (RMSEA) and for its composition (SRMR) Hypothesis 1, Hypothesis 2 and Hypothesis 3b are supported while Hypothesis 3a is not supported clearly by our data (Hair et al., 2014).

Furthermore we found that the different components of the entrepreneurial paradigm set have a different influence on “ACAP” (Table 2): The pattern “Means vs. Goals” and “Failure Avoidance vs. Success Orientation” significantly support ACAP when the causation part gets higher and the effectuation part gets lower. The pattern “Uncertainty Tolerance vs. Certainty Orientation” significantly reduces ACAP under the same conditions. The pattern “Risk Reduction vs. Risk Avoidance” shows no significant effect on “ACAP”. Since the model fit test shows an acceptable model quality both overall (RMSEA) and for its composition (SRMR) these findings refine Hypothesis 1.

Finally, with the ongoing shaping of the second group of path models we found that the realized market ambiguities have a slight supportive effect on EO and, much weaker, on the variety of entrepreneurial thinking. Furthermore our results show no significant effect of the realized market ambiguities on ACAP or firm’s performance.

Table 2. Subsidiary estimates for relationship between ACAP and entrepreneurial thinking in Path Model 1

**DISCUSSION AND LIMITATIONS**

The results show for established hotel companies that the combination of effectuation and causation logic together with EO is able to enhance the firm’s capability for entrepreneurial action. This is a promising first step to build a better understanding of the entrepreneurial function because we gained a more detailed understanding about certain components of the entrepreneurial paradigm set that strengthen or weaken the ACAP according to their causal or effectual shift. The role of ACAP as a mediator of the EO-performance-relationship is stressed here. Most importantly, the overall variety of causal and effectual shifts within the entrepreneurial paradigm set does strengthen the hotel’s ACAP.

With these results a more sophisticated analysis, description and evaluation of the firm’s entrepreneurial function is provided. We conclude that in branches where casual shifts in entrepreneurial thinking dominate (especially the “orientation on goals and success”) like in the German hotel market, effectual shifts are not absent or irrelevant. In fact when these shifts enrich the entrepreneurial paradigm set (especially “toleration of uncertainty”) it leads to strengthening of the firm’s ACAP which is one of the most important enabling factors for entrepreneurial action. That is why we state that companies in those branches should become more familiar with effectuation logic in order to be able to enlarge the variety of entrepreneurial thinking among their (top) managers and employees on an individual level in the first place.
Nevertheless our study faces different limitations due to the chosen methodological approach: All data from the questionnaire are self-referred and were not elevated objectively. Due to the temporary willingness for participation during the pretest we decided not to measure all constructs in full length but to use random selection for items instead. Besides this is a single survey in the field that represent a snap-shot only. That is why we consider this approach as a first look on the surface of the entrepreneurial function that has to be deepen in further studies. First of all we recommend to measure all constructs in full length by using a smaller random sample in selected target markets. Then, we recommend to measure periodically after several years within these target markets in order to analyze and understand the effect of recognized market dynamics in changing market environments better.

FREEDOM AND PROSPERITY: COMPARATIVE ANALYSIS OF POST-COMMUNIST NATIONS

Mardanov, Ismatilla

Department of Management and Marketing, Harrison College of Business, Southeast Missouri State University, Missouri, USA

ABSTRACT

Prosperity is possible only if political and economic freedom is ensured. Despite the overwhelming evidence from advanced nations, many countries disregard the best practices. The main reason is that those countries are governed by a small group of people who abuse power and benefit to a great extent from this abuse. Economic prosperity has its determinants: political and/or economic freedom. The competition among political forces in free societies helps find best solutions to contemporary problems. If one party is ineffective and inefficient, another is both effective and efficient. In terms of economic freedom, despite the liberal regulations, advanced nations are in a much better position than nations with authoritarian regimes. The reluctance of the majority of emerging and developing nations to focus on freedom and prosperity is the cause of massive poverty on almost every continent. Therefore, a study of the causes of prosperity remains one of the important topics. Based on the data on 27 post-communist nations (PCN), I analyzed the impact of political and economic freedom on economic prosperity in the two groups of PCN: politically free and not-free.

LITERATURE REVIEW

Friedrich Hayek (1948) indicated that economic arrangements determine political decisions. So thought Karl Marx and Friedrich Engels (1848). Milton Friedman (1962) indicated that economic means determine political decisions and social life; however, political arrangements determine economic outcomes. Capitalism was the preferable economic system which is capable of utilizing freedom for prosperity, enacting maximum incentives and motivation to work. There is not much recent literature that discusses the freedom and prosperity linkages because it is obvious that free societies achieve much prosperity despite a huge income inequality gap. In developing countries, governments often fail to implement their own laws and regulations which are sometimes right. The literature indicates that political and economic freedom facilitate economic growth (Vega-Gordillo & Alvarez-Arce, 2003, and so many others). Obviously, economic growth leads to prosperity. The growth and status of GDP per capita indicate prosperity. Some other social variables such as education, women involvement, access to means of communication, and other variables help measure prosperity. Economic freedom is the key to prosperity (Faria & Montesinos, 2009).
HYPOTHESES

Hypothesis 1: The free political system will be positively related to economic freedom more strongly than the not-free political system. Hypothesis 2a: The “civil liberties” attribute of political freedom will be positively related to economic prosperity in the free nation more strongly than in a not-free nation. Hypothesis 2a: The “political rights” attribute of political freedom will be positively related to prosperity in a free nation more strongly than in a not-free nation. Hypothesis 3: Economic freedom will be positively related to economic prosperity in a free nation more strongly than in a not-free nation.

METHODS

I use the political freedom indices (the Freedom House), economic freedom indices (the Heritage Foundation) and Human Development data (the UN Development Program). Data for 2000, 2005, 2010, and 2014 were utilized. Correlations of these indices and the impact of political freedom indices on economic freedom indices as well as the impact of political and economic freedom indices on prosperity indicators were calculated. The advantages of the freedom indices are their objectivity in terms of actual state of freedom in respective countries, rather than what is written in laws that are always good and disregarded by local governments to a great extent in not free nations. The human development data include factual information about GDP per capita, GDP growth rates, education, gender issues, life expectancy, employment rates, trade data, and some other country parameters that measure life styles.

ANALYSES AND REPORTS

Analyses indicate that political freedom is correlated positively with many more economic freedom sub-indices in free nations than in not-free nations in 2000-2014. Specifically, property rights and freedom from corruption are correlated positively with political freedom and civil liberties in the free nations. In not-free nations, these correlations were almost entirely absent. Political freedom indices (political rights and civil liberties) and prosperity indicators are not correlated in not free nations, except employment and political rights and civil liberties. Economic freedom indices are correlated with prosperity indices occasionally in not-free nations while in free nations they are correlated often and in systematic ways. Specifically, GDP per capita is correlated positively with freedom from corruption in free nations, but never in not-free nations. Fiscal freedom (pricing freedom) is significantly correlated with the majority of prosperity indices in free nations. In not-free nations, this index correlated with the employment rates only.
The effect of political freedom on economic freedom was significantly greater in free nations than in not-free nations. In these nations, political rights and civil liberties had a significant and positive impact on economic freedom indices, except the labor and fiscal freedom. In not-free nations political freedom mostly did not impact economic freedom with the exception of financial and trade freedom among ten economic freedom sub-indices. Hence, Hypothesis 1 is supported. In terms of the relationships between political freedom and prosperity, in free nations, political freedom had a significant positive impact on the human development index, employment, access to mobile phones and Internet, as well as GDP per capita. In not-free nations, political rights and civil liberties had a significant positive impact on the employment rates only. Governments in unfree nations were focused on increasing employment rates as a function of political rights and civil liberties. It turns out that political rights and civil liberties are about employment only. Hence, Hypotheses 2a and 2b are supported. In free nations, many economic freedom indices had a significant impact on prosperity. Specifically, freedom from corruption did so there while in not-free nations that factor was insignificant because freedom from corruption does not exist. In these nations, financial freedom had a positive impact on prosperity; economic freedom had a significant positive impact on employment; and freedom from corruption affected education in a couple of years. Hypothesis 3 is also supported.

BRAND EQUITY: A PROBABILISTIC APPROACH ON BRAND PREFERENCE

Martins, Marta; Brandão, Amélia; Santos, Luís Delfim
Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

1. INTRODUCTION
The issue of Brand Equity has attracted much attention, both from an academic and a business management point of view (Aaker, 1996; Christodoulides and Chernatony, 2010; Keller and Lehmann, 2006; Yoo and Donthu, 2001). However, despite the unanimous opinion that the Brand Equity is an important intangible asset, the literature on this field is largely fragmented and inconclusive in terms of conceptual foundations, sources, essence and measures (Christodoulides and Chernatony, 2010; Davcik et al., 2015; Oliveira et al. 2015). This paper aims to identify explanatory factors from the consumer's point of view, which have a greater influence (positively or negatively) on the probability of choosing a brand. An Ordered Probit Model methodology was carried out. This study examines the relationships between the Brand Equity dimensions (following Aaker’s theoretical model: Brand Awareness; Perceived Quality; Brand Loyalty; Perceived Value; Brand Personality and Organizational Associations) and the probability of brand choice, which is used here as a proxy for Brand Equity.

2. THEORETICAL BACKGROUND
The importance of the concept of brand equity and, more particularly, its measurement is undoubtedly one of the most pertinent topics in the field of marketing, for both, scholars and for practitioners (Davcik et al., 2015). Although, the estimation of brand equity and the quantification of the return on marketing activities in financial terms it remains the major challenge for brand managers (de Oliveira et al., 2015). Two brand equity research streams are dominant: the customer-based and firm-based perspectives. Methodologies developed under the operationalization of CBBE can be classified as direct or indirect. Direct approaches attempt to measure the phenomenon directly, by focusing on consumers’ preferences (e.g. Park and Srinivasan, 1994) or utilities (e.g. Kamakura and Russell, 1993; Swait et al., 1993), while indirect approaches measure brand equity through its demonstrable manifestations (e.g. Yoo and Donthu, 2001; Pappu et al., 2005; Christodoulides and de Chernatony, 2010).

3. RESEARCH METHOD
The study focuses on a category of FMCG, through four widely known beer beverages brands, in the Portuguese market: Sagres, Super Bock, Heineken and Carlsberg. Representing 92,2% of the total market in Portugal. In order to achieve the proposed goal, this research is supported by a quantitative methodology, a questionnaire survey, which was directed to consumers (current and potential) of beer, residents in Portugal. A Factor Analysis was conducted after data collected, following the estimation of the proposed econometric model. In this study, the dependent variable is "the probability of choosing the brand X at the next purchase occasion" and the classes used in the model range from 1 (representing "Very unlikely") to 5 (being "Very likely/Certain"). As we are considering an ordinal qualitative dependent variable, the model should be an ordinal regression model, as this avoids the assumption of constant distances between the variable classes (Maroco, 2007). For this purpose, we used the Ordered Probit Model. In this model, it is possible to model the observed responses considering a latent variable $y_i^*$ which depends linearly of the independent variables $x_i$:

$$y_i^* = x_i^T \beta + \varepsilon_i$$

where $\varepsilon_i$ are independent and identically distributed random variables.

The quality of the model was analyzed, using a specific method: Prediction Evaluation.

4. RESULTS

Regarding the adequacy of the sample to perform the Factor Analysis, the results of the widely used measure of KMO suggest that the data is adequately adjusted. Among the KMO results presented, one can see that, apart for the Super Bock brand (which has a higher KMO 0.8), all other subjects have an excellent KMO (greater than 0.9). In an overview, we can notice that organizational associations are not statistically significant, which makes sense because these are brands that present a brand management at the product level and separated from the corporate brand. Comparing the two brands of high penetration (Super Bock and Sagres) we can see that the most recently consumed brand strongly influences the probability of choosing that brand, a situation that does not happen with the brands of low penetration (Carlsberg and Heineken), in which the most recently consumed brand is not statistically significant. As a point in common, the constructs of loyalty, awareness and quality are statistically significant for all brands.

5. CONCLUSIONS

This study concluded that there are significant differences between the brands in respect of the explanatory factors of the probability of choice. This study aims to contribute to a better academic and management knowledge on the topic of research, particularly by applying a methodology
uncommonly used in this research area, providing a refreshing and original insight into the problematic of Brand Equity. Additionally, from the management point of view, this study reveals some clues to the creation of more efficient marketing strategies.

INSTITUTIONAL PILLARS IN CSR IN THE RUSSIAN OIL INDUSTRY

Mathews, Martin; Benyaminova, Alina
Department of Marketing and Strategy, Westminster Business School, University of Westminster, London

ABSTRACT

In this paper we attempt to evaluate the institutional factors at work in the adoption and implementation of CSR practices in the Russian oil industry. As such we contribute to the growing literature examining the evolution of CSR as a function of institutional forces (Campbell, 2007, Bice, 2015). An institutional approach to CSR practices provides a new analytical lens which opens up interesting avenues for scholarly inquiry, notably in examining different reasons for CSR implementation beyond the usual business case arguments such as the (unproven) link between CSR and performance, stakeholder and ethical models. Our aim in this article is to explore how social mechanisms such as social norms, mimetism and normative learning influence CSR, defined as social, environmental and economic behaviours, of Russian oil firms (Bice, 2015).

Institutional theory looks to inform how rules, regulations bound behaviours and helps distinguish multi-layered agent intrinsic conviction from external pressures (Bice, 2015). In other words institutional approaches take into account varying degrees of agency, from highly strategic actors to ‘passive’ objects of isomorphism (Cambell, 2007, Tempel and Walgenbach, 2007). From an institutional perspective, it is argued that ‘CSR is located in wider responsibility systems in which business, governmental, legal, and social actors operate according to some measure of mutual responsiveness, interdependency, choice, and capacity’ (Matten and Moon 2008, 407), hence the variation of CSR across countries and institutional contexts (Chapple and Moon 2005; Campbell 2007). This study employs Scott’s three pillars of institutions; regulative, normative and cognitive to identify pressures on CSR actions (Scott 1995; Kostova and Roth, 2002).

According to a Bourdieusian perspective, human behaviour is influenced by the interplay of economic, social, cultural and symbolic elements. According to Bourdieu, individuals are motivated to engage in any practice that increases their economic, social, cultural and symbolic capital. Social practices are undertaken by individual managers to attain social power and improve their position in the organisational field. When considering the implementation of CSR projects, a Bourdiesian approach postulates that this behaviour is not driven by any economic impact as explained in instrumental approaches, nor by ‘intrinsic rationality’, as suggested by normative stakeholder theory (Aaken et al., 2013).

According to Bourdieu (2005) actors engage in practices to acquire monetary and non-monetary capital. He distinguishes between three types of capital; economic, cultural and social. Bourdieu
argues that unconsciously shared evaluation of various forms of capital is referred to as illusio. Illusio is described as an ideology explaining how individuals perceive the legitimacy of certain pro-social actions in a particular field (Abercrombie and Turner, 1978). This perspective provides a framework to examine why individual actors engage in CSR by underlining the interaction among economic and non-economic motives as well as recognising both micro- and macro-influences (Aaken et al., 2013). Bourdieu’s theory as a theoretical framework broadens the research scope to emphasise on the interaction between actors and organisations fields in the CSR context.

Institutional theory explores how companies’ choices are shaped by and negotiated in the institutional environment. In fact, institutional theory offers an explanation of individual and organizational behavior (Lee, 2008). Companies in different national contexts understand and apply CSR differently. This is explained by the contextualization of CSR in national institutional environment (Bashtovaya, 2014). Institutional theory is useful framework to understand how institutional environment influence CSR (Campbell 2007; Aguilera and Jackson 2010; Bashtovaya 2014).

Companies need more than material resources and technical information in order to survive and expand; they ‘require social acceptability and credibility’ (Scott 1995, 71). CSR is undertaken to improve perceptions of legitimacy by societal actors (Young and Makhija, 2014). Legitimacy is a generalised perception that a company’s performance and actions are appropriate and desirable in socially constructed systems of definitions, values, norms and beliefs (Suchman, 1995). Organisations develop rational and pragmatic strategies in response to the public expectations (Kuznetsov et al. 2009). According to Scott (1995, 45) legitimacy reflects ‘cultural alignment, normative support or laws’, which diminishes the possibility of societal penalties.

This exploratory study aims to investigate the institutional forces which influence how managers in the Russian oil industry and in particular we examine which of Scott’s (1995) institutional pillars seem to frame managers’ perceptions and actions.

The data collection process began with semi-structured interviews with employees of Russian oil companies. Participants were drawn from different departments and backgrounds, to ensure the diversity of perspectives. Following Miles and Huberman (1994), qualitative content analysis technique is used to analyse the interviews to identify themes in the data. Interviews were transcribed and coded manually. Codes are labels assigned to segments of documents such as paragraphs, sentences, or words (Miles and Huberman, 1994). This helps to catalogue key concepts.

Many Russian managers in the oil industry seem to believe that CSR is the ‘right’ thing to do.
'I think you can’t avoid this today. Civilized business cannot exist (without CSR), especially a big one, especially natural resources companies’ Manager G.

CSR projects, particularly in northern and remote regions of Russia, has become an ‘unwritten rule’ that must be obeyed.

'There are unwritten rules that are most important than written rules. And you need to follow these rules more strictly than written…. So the same situation here, no need to regulate CSR, it should be as unwritten rule, but should be obeyed as any other written rule. Any oil or gas company should be socially responsible.’ Manager G.

Perhaps this normative pillar is linked to a perception of the oil industry of being in need of reputation repair in Russia.

'Please understand, we all want to be good. Is it not nice enough to build a nursery, if you have money, if you have time.’ Manager A.

‘and there is moral aspect to this.’ Manager E.

Managers frequently invoke reciprocity, or ‘giving back’ which has become a norm.

'It is important to understand that business especially manufacturing, working with resources, you interfere with the environment and nature. You need to compensate to people. When you come to operate in regions, it is important to give something back.’ Manager A.

‘Companies should be working to benefit country, employees, community; companies should carry a responsibility. Not only making money, getting the profits, getting up and leaving.’ Manager N.

Manager O explains that companies need to obtain a licence to operate. However there is no legislation that makes companies to spend money on social matters. Although it would be ‘quite strange if an oil company did not consider any charity activities’. This is an expected role of a company in society.

Manager O explains that companies are considered as social care-takers, which is explained by the Soviet heritage. During the soviet times, towns were built and developed around ‘factories’. The companies had their operations in regions, which then would have become towns. Companies provided social benefits to the community in these towns.

‘Energy companies cannot operate without providing support to the local community. It is impossible. In this situation, a company comes to a new region with a licence, which concludes that a company can start the drilling. And now imagine, that a company doesn’t
have any social responsibility, and then starts drilling. This is just impossible! The local authorities will get involved, will get in touch with media, they will write everywhere stating they are not happy. Gubernator will explain that you can’t act like this here. ... These are unwritten rules.’ Manager O.

According to Scott (2001) normative systems define objectives and goals of the company, but also indicate appropriate ways to achieve these. Participants explain that there are social obligations and societal moral rules that each company have to conform to. By this, they explain companies need to meet expectations of internal stakeholders such as employees, and external such as community where the company wants to perform. This behaviour is considered to be morally appropriate, which directs further behaviour and how things should be done (North, 1990). The normative standards, which are widely, accepted by a society increase the likelihood of socially responsible behaviour. CSR programmes instigated by Russian oil firms are considered by managers as being ‘normal’, ‘moral’ and seem to be aimed at restoring trust between large companies and society as deep mistrust in the large companies continues in Russian society (Fifka and Pobizhan, 2014).

Our findings show that companies are now moving towards a normative model of CSR, rather than being influenced by the paternalistic approach that has continued in Russia during the recent transition period. Social obligation and societal moral rules play a role in driving the extent of CSR practices. Companies need to meet expectations of various stakeholders such as local government, local community and employees, which is considered as morally appropriate behaviour in the context. We conclude that although Russian oil companies operate in a political context where the State has extensive influence in economic performance, the normative social pressure and social mechanisms are effective drivers for CSR in post-communist economy.

This paper’s contribution is to demonstrate how normative forces shape the of CSR practices in this industry. This sheds light on the institutional logics that underline CSR practices, and puts forward implications for managers and policy makers to construct more effective CSR strategies. CSR needs to be contextualised and constructed with greater local sensitivity, and a better understanding of the local CSR values.

VERNACCIA DI SAN GIMIGNANO: A BUSINESS-CASE ANALYSIS TO RE-POSITION AN ITALIAN ORIGIN LABELLED WHITE WINE

Mattiacci, Alberto¹; Caratù, Myriam¹; Fisichella, Chiara²

¹Dipartimento di Comunicazione e Ricerca Sociale CORIS, Università La Sapienza, Rome, Italy
²Dipartimento di Marketing, comunicazione, comportamenti e consumi, Università Iulm, Milan, Italy

ABSTRACT

As every sector nowadays, Italian wine industry is facing the international economic crisis; however, it can be described as “in good healthy” and with lots of opportunities in a dynamic perspective. Italy seems not a country for white wines, both for production and for economic values, but this sector has started to collect interesting growing exchange values. In this context, in 2016, the Consortium of the Vernaccia di San Gimignano G.I. celebrated the 50th anniversary of its foundation: it is time to make a balance and think (or re-think) at the future.

This study starts from the analysis of the context of the Italian wine sector, with particular focus on still white wines sector, to outline a re-positioning to the market of Vernaccia di San Gimignano G.I. To achieve this purpose, we conducted a qualitative field research (interviews to experts) and an analysis of productive and economic data in a comparative way.

Signals from the GDO system – a mirror for consumer trends – show some opportunities for white wines: biological, typical and local (km0) products; trends in health consciousness and wellness. The conjunction of these factors, together with the growth of e-commerce, offers considerable opportunities for Italian white wines. But, in this general framework, for Tuscan white wines the challenge is greater: the reputation of the terroir principally concerned with the production of red wines.

This research outlines a profile of light and shadow for Vernaccia di San Gimignano G.I., with unexpressed potential assets that invest not only wine production but the territory as a whole (Castagno, 2016). The results of the interviews indicated that this wine is seen by local people – including political and economic institutions – as a secondary asset for tourism sector. Also some producers had a certain grade of scepticism about the potential economic value of this wine. The result is that today the Vernaccia di San Gimignano G.I. appears relegated to a passive niche in the Italian white wine’s sector.

Tring to synthetize the volume and value’s characteristic of the Vernaccia di San Gimignano G.I. we can say: 50 million of bottles; 10% of wine production is “reserve wine”; 720 hectares; 50% of the production bottled; 145 €/hl price for unbottled, among one of the highest in Italian still white wine sector; 5.9 million euro of production economic value (Ismea, 2016); ninth place in the ranking of bottled wines for
volume growth in the Italian GDO (Iri, 2016); a long documented historic wine; third place for awareness among Italian whites.

Then, Vernaccia di San Gimignano G.I. is a small production, geographically well-bounded and strongly identified with one of the major Tuscany historic city for tourism attractiveness. By contrast, no global wine player is present to create a successful commercial model, both wine and territorial, as in Montalcino for example (Mattiacci and Zampi, 2004); there is an insufficient quality reputation but a good awareness, that it is not properly activated. To conclude, the Vernaccia di San Gimignano G.I. seems to lie in a borderland between the “not yet” and “no more”: not a great wine, expression of the Tuscan ability to create excellent wines; no longer the “poor parent” of Chianti, but with still too many qualitative discontinuity problem and without a G.I. big player to be an example. The strategic path that we identify for this G.I is to define an active niche in the market of local still white wine, profiling an offer enhancing the distinctive characteristics of the grape variety (savory, minerality, etc.) and the extraordinary narrative potential given by its territorial heritage, a very important competitive factor (Rocchi and Gabbai, 2013; Moulard et al., 2015; Spielmann, 2015).

On these two primary assets, we can engage other two for a narrative and explication enrichment; Vernaccia di San Gimignano: is the only Italian DOCG white wine produced only in one municipality; is a wine easy to pair with food.

The analysis we conducted allows us to consider as a target for Vernaccia di San Gimignano G.I. a “male” profile, structured as follows: wine lover; male with more than 35; whole meal consumption patterns. The point of difference would be: for the product, longevity and savory; for the name, history and biological product. The price would be differentiated by type. Last but not least, the brand promise: a “solid white wine”. The path must be developed in a medium/long period, acting to the local community and to external stakeholders.

GENDER ASYMMETRY IN BEHAVIORAL RESPONSES OF TRANSPORT FEE PAYERS

Mayburov, Igor¹; Leontyeva, Yulia²

¹Ural Federal University named after the first President of Russia B.N. Yeltsin, Russia; Far Eastern Federal University, Russia
²Ural Federal University named after the first President of Russia B.N. Yeltsin, Russia

ABSTRACT

The article looks at how people react to the introduction to additional transport related fees when using private transport. The authors prove that a switch to road pricing and paid parking in urban areas is inevitable. An overview is done of scholarly work on the problem of people's behavioral response by means of sociological surveys and laboratory experiments. The authors analyze the methodological framework of laboratory experiments and improve the method of laboratory experiments. The proposed research method is a laboratory experiment based around a consumer behavior survey of students faced with the need to pay additional transport related fees. The article specifies the basic assumptions and variable parameters of the experiment, the key assumption being that all subjects own a car. At stage one of the experiment, the participants earn money; at stage two they decide on the most suitable means of transportation to make a given number of trips. The experiment stipulates the length of the trip, the size of the per-kilometer congestion charge, the parking fee, the price of gasoline, and the public transport fare. Following the experiment, the students' readiness to pay the additional charges or to use public transport is assessed. The gender of the students is the variable parameter of the experiment. Different levels of readiness to use cars instead of travelling by public transport are measured in female and male students in the case of the additional transport related charges. It is proven that women exhibit smaller levels of readiness to use public transport, while men are more likely to abandon their cars. Different levels of readiness to voluntarily pay the additional transport related charges are measured in female and male students. It is concluded that female drivers exhibit higher levels of propensity and compliance when it comes to paying transport related charges, whereas men need to be kept under tighter control because they are less inclined to voluntarily pay the transport related charges. The aim of the research is to develop a method of assessing behavioral responses of transport fee payers that will make it possible to differentiate between the responses exhibited by male and female inhabitants of urban areas.

Key words: Behavioral responses, laboratory experiments, public transport, private transport
ABSTRACT

The purpose of this paper is to highlight developments in ambient assisted living technology (AAL) so as to drive discussion towards a route to market framework for a European wide AAL solution. Due to time restrictions and the nascence of research in the area of route to market frameworks for AAL technologies models being applied to AAL technology assessment a secondary research approach was employed for this paper (Bryman and Bell, 2007).

Ambient assisted living technologies (AAL) is an emerging technological area that can provide assistance and support to persons suffering various diseases. The development of AAL technologies comes at a significant time with respect to world age profiles (Novitzky et al. 2014). It is estimated that there will be two elderly people to every young person in the European Union by 2060, with 10% of the population estimated to be over the age of 80 by 2060 (Eurostat, 2011). In some cases, the change is more immediate. By 2010, 23% of the population of Japan was 60 years of age or older and it is predicted to reach 39% within the next 40 years (SBJ, 2011). This unavoidable increase in the age profile of the population brings with it particular concerns. As age profiles increase so too does the prevalence of diseases associated with older age, namely mild cognitive impairment and cardiovascular disease (Novitzky et al. 2014). Our health care systems must be equipped with technologies to tackle these concerns. Recently, two Horizon 2020 funded research projects set out to develop AAL technologies that focus on two particular types of disease; cardiovascular disease (CVD) and mild cognitive impairment (MCI). AAL technological solutions aim to allow users suffering from a disease to aspire to an improved quality of life (QoL). Those suffering might enjoy the comforts of their own home. In addition, the application of AAL technologies can reduce the economic burden that currently rests on stressed health care systems, caregivers and patients.

In order for the lifting of economic burden and the destressing of health care systems to be realised, it is imperative that knowledge is developed with regard to the best routes to market for AAL technology solutions. An initial literature review of the healthcare delivery systems of partner countries within said projects elucidates the various and fragmented systems across Europe. Individual partner countries show varied combinations of public and private sector health care delivery systems (WHO, 2016). While literature relating to technology assessment for the purpose of route to market distribution does exist, (Kidholm et al. 2012; Janssen et al. 2013; Cusack et al. 2009)
none address the issue in a European wide context, further more existent literature is lacking in specific contemplation of AAL technologies.

The two Horizon 2020 projects related to this paper present a timely opportunity to build on existing literature associated with route to market frameworks for AAL technologies. Both projects have required the bespoke development of cost benefit analysis tools, total cost of ownership tools and business models for an emerging area, in addition to a comprehensive literature review of partner country health systems. At project maturity both solutions will have trialled suitable business models and commercialisation routes. It is now envisioned for two case studies on the respective experiences to be developed. Its purpose being to document the route to market experience of the solutions, culminating in a route to market framework being developed that can be employed in future Europe-wide projects dealing with healthcare delivery systems.

CONSUMER FAD DYNAMIC. THE GIN CASE

Meneses, Raquel; Almeida, Rui

School of Economics and Management, University of Porto, FEP – UP, Porto, Portugal

ABSTRACT

This study aims to characterize the consumption of an international consumer product fad. There is made a literature review of the concepts which can be related to an international fad. The review begins with the study of the product life cycle in order to evaluate which characteristics a life cycle has from the production point of view. The CAGE distances are also studied due to the particular importance of the cultural and geographic distance in an international fad. As for the social behavior, the herd behavior is studied to understand the process of sequential decision making and also the influence of the conformism. For the product, the way an innovation is perceived is also approached. To know more about the subject, the Gin case is presented. The quantitative study starts with an initial model with the variables which can have impact in the consumption of the Gin. Based in the initial model, a survey is built and conducted, obtaining 143 valid responses. The data is analyzed based in a structural equation modelling.

The results verify the positive impact of need for group differentiation in the consumption gin. The perceived newness has direct impact in it consumption. An international fad lasts while it is differentiator for the consumer, so the herd behavior influence is not validated.

ABSTRACT

The Islamic Corporate finance – understood as that whole things of Legal institutions, financial instruments, procedure, transactions and contracts that operate in accordance with the mandates and the traditions of the Islamic law (Shari’ah) – represents, in relative terms, almost the 3% of the worldwide finance and it's obtaining a more significant importance inside of the financial world system, with more than 20% of growth rates per year.

At the beginning of the 2017, the market value of the Asset Under Management managed by Islamic financial institutions was more than 2.500 billions of dollars, with growth estimates close to 3.000 billions of dollars. It should be underlined how the fundamental Sharia’ah precepts have not only limited significance between the God-Man relationship but they represent the principles of behavior for the community of believers in every aspects of the public life since they supervise the adjustment of all economic activities.

The key factor of the Islamic finance is not the “religion” but the component of “Economic Justice” which draws inspiration from the Islamic ethics. Shortly, the main regulations in the Economic-Financial field are attributable to the prohibition to apply a fixed and predetermined interest rate (ribā), guaranteed regardless of the investments performance; the principle of profit and loss sharing is also regulated by the Shari’ah, as the prohibition to implement economic practices that involve uncertainty (Gharar) and speculation (Maysir); in the end the ban to use, invest and trade forbidden activities. According to the principles of the Islamic law there is freedom in the negotiating and economic activities though the possibility to make the agreements between parties it could be exercised within certain limits.

This paper, on one side, aims to investigate and quantify the impact of some economic, assets and financial variables that they have on the financial structure of the companies listed in the Indonesia Stock Exchange and, on the other side, to compare companies Shari’ah compliant within companies not Shari’ha compliant that are listed in the same market through the capital structure analysis. In particular, the objective of this paper is to prove the influence of the debts (short and long run), the firm size (meant as revenue size) and the total assets into the performance valuation represented by
ROE (Return on Equity), ROA (Return on Asset) and the Market to Book Value of the companies listed in the Indonesia market.

It was used as primary source “Data Stream” from Reuters. The companies considered are the 525 firms that make the Jakarta Stock Exchange Composite Index and they have been divided into ten macro-sectors: Basic Materials, Communication Services, Consumer services, Consume Goods, Energy, Financial services, Industrials, Real estate, Technology and Healthcare. The companies in the Indonesian market have been split into Shari’ah compliant and not Shari’ah compliant, following the list of the firms which form the Indonesia Shari’ha Stock Index. These companies follow the Islamic law since their business is not connected with haram activities, for example the sale of alcoholic products, pork meat, porn industry, gamble industry and traditional financial-insurance services. The riba is also a prohibition for the capital structure of the companies, which can't be indebted through services by traditional finance. Few financial ratios have been established by the Islamic law with the aim to summarize and list the admissible situations and the forbidden from the Shari’ah rules about indebtedness. Some companies are excluded from this rule, to be precise: firms with debt on average market capitalization from the past 12 months is equal or above of 33%, firms that the sum of the cash and securities on market capitalization is equal or more than 33%, finally the companies which the credits into market capitalization are equal or more than 33%. All of these ratios have the aim to monitor the companies leverage since at the rising of it the companies automatically have a higher risk that is not allowed on the Shari’ha principles.

Starting from the approach used by Wan Shazlinda and Wan Shahdila (2015), it's been used a regression analysis to examine the data and to observe the possible correlation between those variable that were compared.

The timeline of reference is five years (from 2011 to 2015).

The results obtained reject the initial hypothesis. In particular, the empirical analysis made through the regression shows that the listed companies at the Indonesia Stock Exchange, both Shari’ha Compliant and not Shari’ha Compliant, are not definitely influenced by the variables observed about the corporate performance.

It is highlighted that the dependent variables are not explained by the independent ones, because the “R^2” of this regression sign in the most of the cases values around zero. The industries which the determination coefficient is close to “one” are those of the Healthcare, Real estate, Technology and Communication Services to whom the sample of analysis is small. A result around “one” is statistical significant regarding the variables considered. This feedback, indeed, is relatively remarkable since...
the statistical analysis made on a small number of companies is can’t be considered explanatory and representative. The relevance of this work, that wants observe the impact of some variables on the evaluation of the firms performance, can’t deduce by the size of the sample that has an high importance in order to provide an indicative and comparable result. What emerges from the other business is a lack of the influence from independent variables and dependent ones, with variation in the timeline considered, but overall it attests a non significant correlation.

This result follows the results from other multiple studies which focus on the same poll in different markets. Wan Shahzlinda and Wan Shahdila (2015) say that, in the case of Malaysian companies, the short debts, medium and long term and the totals debts do not affected the ROE and ROA of Shari‘ah compliant companies, as there is no influence from the total assets and total revenues on the dependent variables. The companies not Shari‘ah compliant report correlations coefficient equal as resulting in this study also in term of relevance of the debts on the ROA and the Market to Book Value. Similarly, Philips and Sipahioglu (2007) have analyzed the relationship between the financial structure and the firm’s performance; they also underlined the gap of statistical significance between the leverage and this performance. About the total assets, the results from this work are supported by the study done by Carpentier (2006), according to it this size do not influenced the ROE. Furthermore, from a study by Ebaid (2009) about non financial Egyptian companies, the financial structure does not impact on the firm’s performance in terms of ROA and ROE. The study performed by Mesquita and Lara (2003) on the Brazilian companies follows the same rules, through it the results allowed to realize that the long-term debts have not relevant influenced on the estimation of the performance of the ROE. Finally, Yadav (2012) have made a study on the Malaysian companies and he’s highlighted that there is not an impact on the Market to Book value on the ROA from financial structure of the companies.

In the future, it could be interesting doing the same analysis in different stock markets, considering a different timeline and using different variables for example the net income or the equity ratios.

HEDGE FUNDS PERFORMANCE TRACKING FOR CYPRUS, U.K. AND IRELAND

Mihai Yiannaki, Simona
Dept. of Accounting, Economics and Finance, European University Cyprus, Nicosia, Cyprus

ABSTRACT

Hedge funds global assets under management have been consistently increasing and at the moment have a value of over three trillion dollars (Prequin, 2016). The current study performs a comparative analysis of 10 hedge funds performance in each of the three countries: Cyprus, as the local market and Ireland and United Kingdom as the countries leading the hedge funds European industry. The sample size of the hedge funds selected totals Assets under Management of over 258 million euro in Cyprus, over 90 billion euros in the U.K., and in Ireland over 29 billion euro, which represent a significant 121-billion-euro sample of this market worldwide.

The analysed period of active returns is 75 months all through January 2010 to March 2016 for each hedge fund against the monthly returns of several benchmark markets via their index, as alternatives for investments: FTSE 100, S&P 500, ISEQ ALL and EURO STOXX 50., based on databases which include: Morning Star, Financial Times, Hedge Fund Intelligence ECB, CCB and CySEC.

The study presents the legislative background of hedge funds operations in the European Union, U.K. and Cyprus, compared to the U.S., trying though to focus on the management performance comparisons including their risk appetite analysis.

The main part of the analysis has collected, analyzed and interpreted data regarding the funds under examination, using the commonly use statistical measures of mean and standard deviation. In addition to Tracking Error of the active returns, the study’s methodological tools are the risk adjusted measures: the Sharpe ratio, its adapted version the Modigliani risk-adjusted performance measure M², and last but not least the Jensen’s Alpha coefficient.

Several t tests confirm and rejected the hypothesis regarding the performance of the funds under examination relative to above mentioned benchmark markets as alternatives for investments. The study findings show a relative under-performance of the Cypriot Funds compared to UK and Ireland Funds, overall, all the funds outperformed most of the benchmark markets that were compared to. The study limitations are the biases of the strategy used for investment of each hedge fund and on the variation of their regulatory base.

Keywords: hedge funds, active returns, tracking error, Modigliani Risk-Adjusted Measure, Jensen’s alpha, Sharpe ratio, Cyprus, U.K., Ireland, investments.

ABSTRACT

Family firms play a very important role in today’s international markets, especially because, among small and medium size enterprises (SMEs), they cover a high percentage in different European countries (e.g., Donckels and Frohlich, 1991; Surdej and Wach, 2012). During the years there was a growing interest on family firms’ internationalization (e.g., Graves and Thomas, 2008; Pukall and Calabrò, 2014). Some authors focused on discovering which variables influence the international expansion (Gallo and Sveen, 1991; Gallo and García Pont, 1996; Zucchella et al., 2007; Calabrò et al., 2016). However, the majority of contributions have been concentrated on gradual/step-by-step/Uppsala model type internationalization (Graves and Thomas, 2008; Kontinen and Ojala, 2010), while few studies have been tailored on born global family firms (Wach, 2014). The principal aim of this study is to examine how family firm’s characteristics and external factors can enable or limit the internationalization process of born global firms. To achieve our objective, we decided to adopt a multiple case study. Data were mainly collected through in-depth, face-to-face interviews with owners from two Italian born global firms located in Marche region. For data triangulation, we also collected data and information from other sources, such as annual reports, firms’ homepage, and other documents (Vissak and Francioni, 2013). For examining the different aspects and factors influencing the internationalization of these firms, we decided to create a more comprehensive framework based on Gallo and García Pont scheme (1996). In details, we considered three categories: strategic factors, family firms’ organization characteristics, and top management features. All categories have been divided into elastic and rigid variables. Preliminary results showed that variables stimulating the internationalization process were mainly related to the owners’ backgrounds and their past work experiences. Moreover, the presence of other businesses run by either the entrepreneur or his family members, for which relationships with foreign markets were already established, allowed growing up rapidly in international markets. Similarly, family members living abroad provided effective support in the search for foreign customers and made a valuable contribution to the firm’s international expansion. Furthermore, although the entrepreneur was the main decision-maker in the majority of international strategic decisions, other family members showed a similar approach, to that of the entrepreneur, towards international activities. With specific reference to entry barriers, they were mainly associated with import rules and bureaucracy, and less with the family business characteristics. The paper represents just the beginning of an in-depth analysis through which
understanding the dynamic of born global internationalization among family firms, but it is one of the first contributes to the studies of born global family firms.

THE EFFECT OF NEPOTISM / WASTA ON HR PRACTICES IN LEBANESE AND TUNISIAN COMPANIES

Nakhle, Samer F.¹; Yahiaoui, Dorra²; Vrontis, Demetris³; Naddour, Fadi⁴

¹Azm University, Lebanon
²Kedge Business School, France
³University Of Nicosia, Cyprus
⁴University Of Balamand, Lebanon

ABSTRACT

It is sometimes a premise in Middle East and North African countries that empty positions are not always filled on the basis of capabilities, experiences, high standards and elevated expectations. As a result, the reputation and even the quality of organizations in such region are sometimes not at the level of developed countries. Numerous companies in Lebanon & Tunisia are under corruption and bankruptcy. Along with that, there was continuous pressure on the top administrations of few companies in both the public and private sectors to provide jobs and in some cases, employing two candidates for the same position. Hence, there was a lot of interference, favoritism, cronyism and nepotism while filling vacant positions. Nepotism, as considered by several researchers as a corruption practice, was a problematic phenomenon in these countries in both public and private sectors. In the absence of a connection with the employer, be it social or familial, the candidate has a small or in some cases no chance in getting the job. In fact, Nepotism is the act of showing favoritism to a member of a relative, a friend or a connection by offering him/her a job or a certain position (Arasly et al., 2006) There are two types of Nepotism, the horizontal nepotism happens between counterparts such as business partners, friends and colleagues, and the vertical nepotism which is related to the superior and subordinate relationships (Khatri and Tsang, 2003).

From HR point Nepotism carries numerous issues with it, as it is seen as a work that holds nonobjective standards of recruiting in light of kin relations rather than objective standards that focus on knowledge, experience, abilities and capabilities. Bute (2011) showed that nepotism has significant negative effect on job satisfaction, organizational commitment and practices of human resource management. If employees are in competition with a privileged individual, their probability of promoting is low (Abdalla et al., 1994). Thus, Nepotism if based on kinship can cause family struggles, conflicts between generations, weakened organizational commitment and turnover of competent and high quality managers (Ozler at al., 2007).

Other views often see nepotism as an advantage to the association where some companies rely on nepotism in order to get the work done; Other positive aspects of nepotism can be that if a person is appointed through nepotism by using his relations in the organization, then he can probably have a...
shorter career development paths to go up to higher levels in the organization without the need to go through all the organizational routine steps. Another advantage is that hiring a friend/relative through nepotism means that you already know his capabilities and will allocate the correct task for every individual in view of the individual quality and weaknesses. Another issue is that a friend or family member may be familiar with the company and know how it function, so there is no need to spend as much time to train and mentor new employees with the work process in the company. Moreover, relatives and friends who are hired may possess a strong commitment to the company, where they might be ready to work additional hours or even ends of the week when important. Therefore, Nepotism is thought to be effective when it is utilized suitably. But when it causes irreconcilable situations, homogeneity and legitimate inconveniences, it is dealt with as inefficient nepotism (Khatri and Tsang, 2003).

In the Arab world, “Wasta” is the term used to refer to Nepotism/ social networks or connections (Cunningham and Sarayah, 1993). Historically, Wasta was used as a mean for managing relations between families and tribes in the Arab countries through the use of an intermediary usually referred to as the sheikh who would be called on to be the intercession or the Wasta between the conflicting parties (Cunningham and Sarayah, 1993). In fact, in these countries, there is a high need to establish trust so that business relationships can succeed. Trust is usually built at the personal level (Al-Hussan & Flether-Chen, 2014) and here “Wasta” plays a critical role (Al-Omari, 2008). It is clear that wasta affects heavily recruitment and selection among other HR practices. Wasta in the Arab world is also a critical component for career success (Singh et al., 2006).

While nepotism/Wasta has been a pervasive social phenomenon in every culture, prevailing in family businesses, the topic has majorly been a taboo for academic research. Although the phenomenon prevails in many organizations in Lebanon, Tunisia and the Middle East, the topic is still under researched. Most of the studies explore the factors behind nepotism in Arab countries including cultural, economic and social factors (Abdalla et al., 1998). There are no studies about nepotism/ Wasta in Lebanon and Tunisia and how it influences human resource practices.

Our research contributes to addressing the lack of researches dealing with the effect of nepotism on HR practices in Lebanese companies. The study is significant in the way it addresses the nepotism phenomena in Lebanese & Tunisian companies from different perspectives and shows how the different HR practices are influenced by this phenomenon. **Our research question will be: How does nepotism affect HR practices in Lebanese and Tunisian companies?**

To answer this research question, the qualitative research method was preferred as it focuses on meanings and understanding of a particular issue (Rubin &Rubin, 2005). Moreover, Nepotism as a
A sensitive topic is a common phenomenon yet concealed and avoided to be discussed (Jones, 2013) which requires a different level of interaction than in quantitative method. We adopt the semi-structure interview technique (face-to-face interview). A thematic analysis is done to analyze the content of the interviews conducted with respondent from different organizational industries in order to avoid a single view perspective of nepotism. Each organization is represented by the HR manager or supervisor from the human resources department. 20 companies from the educational, health, banking, NGO, chemical, automotive, electronic, oil, agro-food, ceramic industry, garment sectors were surveyed in Lebanon & Tunisia. Among these companies 13 are locals and 7 Western Multinationals.

All organizations considered that nepotism as a practice may foster inequality between employees if applied. In both countries, it is still a practice mainly found in the public organizations where fraud and corruption prevail. On the other hand, some organizations in the private sector are developing awareness about nepotism as a possible challenge and implementing anti-nepotism rules and regulations. Unfortunately, some organizations specially the locals still have the ideology that if you are not an individual from a specific political gathering, religion, or if you are not connected to someone with authority to influence the recruiting process or the HR decision, then you face no chance in being recruited. They claimed that favored employees recruited through nepotism can demonstrate a highly-motivated work drive since they want to prove to their employer that recruiting them was the right choice. Most of Western companies interviewed mentioned indirectly the use of Wasta through the personal network during our investigation of their HR practices. All interviewees agreed that nepotism could lead to a decline in the company’s and the HR department performance. They implied that it is an unprofessional act that can limit the HR’s decisions thus limiting their work and demotivating their department. Regarding the anti-nepotism policy, few organizations had the policy implemented in their organizations. Some of the policies where mentioned in their internal regulation booklet and in other organizations it wasn’t. Regarding organizations that apply anti-nepotism guidelines; all employees in their workplace had to submit a form, indicating the areas where their relatives are working. Only Western organizations are stricter in performing such mechanism than others.

Related to Khatri and Tsang, 2003, we notice a common use of horizontal Nepotism during the recruitment process through the use of personal network related to family, or friends belonging to the neighborhoods or to the school. The Wasta in this case is the only guarantee of trust and a predictability of others’ reactions which confirm the research of Al-Hassan et al. (2014). While the vertical nepotism is much more used during a contract renewal, a promotion, or even for training request and salary or bonus bargaining. Other cultural dimensions play a big role in this latest case to
justify the mobilization of Wasta by the subordinates and its acceptance by the superior such as: compassion, emotional relationship, loyalty, etc.

Our research shows the negative impact that nepotism could have on the employees morale and attitudes, and on the organization in general by affecting its performance and slowing down its advancement in reaching the goals. It is seen as a problematic phenomenon that nepotism can destroy harmony and motivation among employees, offering inequity, unfairness, inefficiency and the lack of dedication and engagement to the work. Along with that, there is a tendency that conflict can occur especially when there are favored employees who are treated differently compared to their colleagues.

The un-favored employees will be less satisfied and could engage in troublesome behavior which can affect the achievements of the organization and overall objectives. Such discontented employees will work below their optimal level, increase absenteeism and turnover (Ozler at al., 2007). Furthermore, employees will have a sense of insecurity where they might fear not having the opportunity to grow, develop or get promoted due to the absence of a connection with the stakeholders at their respective companies (Abdalla et al., 1994). Through this research we also confirm and describe the negative impact that could have Nepotism/wasta on different HR practices (Bute, 2011) such as recruitment, career management, training & development and compensation.

In order to start reducing this phenomenon in organizations, we advise human resources management to stay ethical and professional. HRM should know what role they have in an organization, the decision-making authority invested in them and be aware of the direct impact that could have nepotism/wasta on the organization performance as well as on its social climate. It is important for HRM to communicate with the CEO or manager on daily basis and trade information regarding employees and their progress.

THE VISITOR EMOTIONAL EXPERIENCE AT A HERITAGE SITE: A CASE STUDY – THE AUSCHWITZ-BIRKENAU DEATH CAMP

Oren Gila¹; Poria Yaniv²; Reichel Arie²

¹The School of Business Administration, The College of Management Academic Studies, Rishon-Le’Zion, Israel
²Department of Hotel and Tourism Management, Guilford Glazer School of Business and Management, Ben Gurion University of the Negev, Be’er-Sheva, Israel

ABSTRACT

The increasing number of visitors to sites of death and atrocities is a major growth engine in the tourism industry (Timothy & Boyd, 2006), yet little has been written about the onsite experience. Especially lacking is a conceptualization of the visitor experience as related to the emotional experience. The major limitations at the current state of the art in this area are:

1. The visitor experience has not been studied as a total hierarchical process.

2. Research on the emotional experience of tourism, especially heritage tourism, is sparse, with emphasis on positive emotions and fun seeking, ignoring negative emotions that could pertain to sites of death and atrocities.

These gaps led to a study of variables and behaviors linked with three timeframes: Pre-visit – motives for visiting, visitors’ perception of the significance of this heritage to their lives; Visit – emotional experience, the quality of experience; End of visit – perception of benefits gained from the visit.

The research hypotheses were investigated using a questionnaire (in Hebrew, English, German, or Polish) based on scales used in psychology and tourism: Self-perception of Heritage displayed – PSOH (Poria, Reichel, & Biran, 2006), meaning of life and the search for meaning (Steger et al., 2006), Positive Affect Negative Affect scale – PANAS (Watson, Clark, & Tellegen, 1988). Additional variables (e.g., motives for visit, quality of experience, and perception of benefits), were examined using questions based on the literature review and the preliminary qualitative stage (i.e. in-depth interviews with people planning to visit the site).

Participants were a quasi-randomly selected sample of 553 visitors age 18 and older, to the Auschwitz-Birkenau death camp in the summer of 2012. Participants received a questionnaire. The findings revealed an emotional duality, exposing the central role of negative emotions and their significant contribution to the perceived quality of the visit. This challenges a common notion in tourism research
which emphasizes positive emotions, and relates negative emotions to dissatisfaction with the visitor experience.

The findings indicate that the onsite experience is composed of an emotional experience, an intellectual one, an experience related to the visitor’s identity, and an experience that affects one’s worldview. The weight and importance of each of these experiences was linked to the visitor’s perception of the heritage displayed onsite as their own.

The findings underscore the need to examine the relationship between the visitor and the visited object (Collins-Kreiner, 2010), and support the distinction between heritage tourists and visitors to heritage sites (Poria, Butler, & Airey, 2003).

The study revealed the perception of three benefits derived from the visit: (1) cognitive benefits – expanding the visitor’s knowledge and better understanding the events that took place at the site; (2) heritage-related benefits – constructing the visitors’ identity as related to the site and exhibits; and (3) moral benefits – visitors attribute the visit with an effect on their attitudes and moral perception. The moral benefits, which the present study was the first to reveal, are of major contribution to the management of the visitor experience as well as to the understanding of the personal and social role of heritage sites in modern society. This study challenges the current approach to the conceptualization of the visitor experience. Researchers should note that basing a theoretical approach to heritage tourism on a corpus of knowledge related to leisure and recreation may lead to mismanagement and misunderstanding of this compounding social phenomenon.

The findings and conclusions have far-reaching managerial implications. The complex visitors’ experience requires adopting the experiential marketing approach, recognizing visitors’ broad interests. Moreover, visitor segmentation can be based on identifiable preliminary variables.

THE ROLE OF SELF AWARENESS AND SELF EFFICACY ON CAREER DECISION MAKING OF THE STUDENTS

Özek, Hande1; Ferraris, Alberto2

1Department of Business, Yeniyuzyil University, Istanbul
2Department of Management, University of Torino and Laboratory for International and Regional Economics, Graduate School of Economics and Management, Ural Federal University.

ABSTRACT

INTRODUCTION

The present study aimed at finding out the factors which are similar or different in the students’ career decision making between two different culture (Italian and Turkish) and the relevance of self awareness and self efficacy on their choices. Thus, the research evaluated the Career Decision Making Self Efficacy Scale- Short Form (Betz et al. 1996; Chaney et al. 2007) and the Situational Self Awareness Scale (Govern and Marsch, 2001). Responses are collected from 291 undergraduate students of Yeniyuzyil University in İstanbul and University of Torino in Turin. The objective of this study is to reveal significant factors to develop self assessment, career awareness and goal setting competencies of the students in different cultural contexts.

Overall, we are willing to add value to the literature by pointing out that high situational self awareness and self efficacy could lead a more conscious attitude of decision making. Moreover, we also want to reveal the differences between two different cultures and among different demographical factors (such as grade, gender, ecc.) in career decision making. The research would give a more explanatory information about the factors that have an effect upon career decision making in university students.

LITERATURE EVIDENCES & RESEARCH OBJECTIVES

There are significant number of studies about career in the literature as it is one of the main and essential subject in human life. Since the initial work of Hackett and Betz (1981), hundreds of studies have applied Bandura’s (1977) theory of self-efficacy expectations to the field of career development and counselling (Betz et al., 2005). Bandura’s (1977) concept of self-efficacy is “one of the most theoretically, heuristically, and practically useful concepts formulated in modern psychology” (Betz, Klein, & Taylor, 1996, p. 47; Chung, 2002). As originally proposed by Bandura (1977), self-efficacy expectations refer to a person’s beliefs
concerning his or her ability to successfully perform a given task and can be useful in understanding and predicting behaviours. Overall, low self-efficacy could lead to avoidance, whereas stronger self-efficacy expectations could lead to approach behavior (Betz and Luzzo, 1996).

Career plays a central role in people’s lives and it significantly impacts their economic and social status as well as emotional well being (Blustein, 2008). Providing guidance that can assist individuals navigate through the complex process of choosing a career can, therefore, help them to make better decisions (Gati et al., 2013). Today, the development of a career continues to be a priority and must be carefully addressed to effectively meet the career development needs of students (Hughey, and Hughey, 1999). So, preparing students for their future roles in the world of work has become increasingly important for educators generally. As a consequence, the need to understand better the factors that are effecting career decisions lead researchers to deepen the subject.

In our research we wanted to add a value to the literature by investigating the role of self efficacy and self awareness in career decisions of the students from different cultures. Regarding the first, Career Decision Making Self Efficacy (CDMSE) identifies the extent to which students have confidence (self-efficacy) in their ability to engage in educational and occupational planning and decision-making. The Taylor and Betz (1983) study identified five sub-scales: Self-Appraisal, Occupational Information, Goal Selection, Planning, and Problem Solving (Peterson and DelMas, 1998). Regarding the second, self-awareness is another fundamental element in shaping behaviours and implies “a deep understanding of one’s emotions, as well as one’s strengths and limitations and one’s values and motives” (Goleman et al., 2002, p. 40). Self-awareness incorporates the self-reflection capacity and thoughtfulness that Covey (2004) declared as necessary to discover one’s voice and, at the same time, incorporates the ability to understand one’s true nature and the freedom to choose how one consciously wishes to respond to life (Caldwell, 2009). This study aims to prove that this ability has an effect also in the career decisions of the students.

Moreover, not only self-awareness and self-efficacy but also demographical and cultural factors can affect the decision making of the students about their careers. Many studies have found that personal factors, such as gender, ethnicity, social status, personality, identity, and self-reliance, played a role in individual differences in career decision-making self-efficacy (e.g. Fan, 2016). Individuals in different countries are likely to make their career decisions differently. While some of these differences are based on the system of higher education (such as choosing a major before applying to college rather than after one’s first or
second year), other differences are more contextual, depending on the culture and its
different expectations of the individual (Willner et al., 2015).

Concluding, in this research we aim at highlighting the effects of these variables on career
decision making of undergraduate students in two different cultural contexts.

ORGANIZATION STUDIES MEET FILM STUDIES: THE CASE OF ISTANBUL’S FILM CLUSTERS

Özlem, Öz; Kaya, Özkarakalar

1Department of Management, Bogazici University, Istanbul, Turkey
2Department of Film and Television, Bahcesehir University, Istanbul, Turkey

ABSTRACT

Organization of economic activity in space has attracted increasing attention in the management literature in recent decades, and as with the management literature in general, the literatures on organization theory and strategy are becoming richer in respect of studies related to geographic clusters (e.g. Beal and Gimeno, 2001; ÖZ, 2004; Porter 1998). We know, on the other hand, that the film industry as an economic activity tends to be concentrated geographically but there is limited, though a steadily growing, literature on the emergence of film clusters (e.g. Dudrah, 2006; Scott, 2005). We employ an interdisciplinary approach in this paper that merges the perspectives of organization studies and film studies to better understand the evolution patterns of Istanbul’s film clusters. We tackle this challenging issue by concentrating on the production, exhibition and distribution ends of the sector. To this end, a detailed historical analysis is carried out by scrutinizing archival data, available statistical information on the sector as well as conducting in-depth interviews with the key actors of the sector.

For production, our analysis reveals that following the collapse of Yeşilçam -the historical center of Istanbul’s film industry-, two new clusters, one located in the vicinity of the old center (Beyoğlu) and the other in a rising commercial district (Levent), have emerged since the mid-1990s. By zooming into the specifics of the workings of cluster path evolution (Henning et al., 2013) in this instance, we have been able to uncover the fact that forces of agglomeration gave birth to “twin paths” via a branching process (Martin and Sunley, 2006) in the case of Istanbul’s film industry; one remembering and transforming the past and the other starting a new clustering in a novel destination. Exhibition, the last stage of film business in the production-distribution-exhibition chain, is by its nature - being the stage where the end product (film) finally reaches its customer (spectator) - dispersed rather than clustered while some concentrations are observed within its overall dispersion, as the main avenue of Beyoğlu had hosted a significant concentration of cinemas during the era of Yeşilçam even when cinemas had proliferated all around the city. In a similar vein, a concentration of cinemas is observed today in Levent as well when cinemas have penetrated even the distant suburbs of the city. The large-scale film studios and the technical equipment rental firms are typically located on the outskirts of the city mainly due to much lower rents compared to the ones in the city center. A more dispersed pattern
is also seen in the distribution end. “Being near the producers is not essential for us since we work with the finished product,” says the Turkish representative of UIP. Other concerns such as having lower rents, spacious offices and parking slots as well as avoiding traffic jams seem to be of determining importance for the case of the distributors, making them more dispersed in the city in relative terms. This pattern confirms Martin’s (2010) assertion that in many clusters, even those that have a high degree of specialization, there may be a number of activities, each with its own evolutionary path. Overall, we conclude that forces of globalization (e.g. improvements in transportation and communication technology) pulling towards a more scattered distribution of economic activity seem to have generated some dispersion for Istanbul’s film sector but this could not change the fact that it all remains in Istanbul and does still show a clustered pattern, especially with regard to production.

EXPLORING ATTITUDES AND RESPONSIBLE BEHAVIOR TOWARDS THE PHYSICAL ENVIRONMENT AMONG ELEMENTARY SCHOOL STUDENTS IN GREECE

Melanthiou, Yioula1; Papasolomou, Ioanna1; Kountouros, Haris2

1Marketing Department, University of Nicosia, Cyprus
2 Public Relations Officer, EPIO Athens, Greece

Abstract

The paper discusses the effort for creating a ‘new’ consumer culture towards environmentalism through instilling environmental values and attitudes among elementary school children. The paper argues that cultural institutions such as schools can cultivate environmental attitudes and responsible behavior among students through the creation of knowledge and understanding regarding the importance of resource usage and environmental responsibility among consumers. The authors carried out an exploratory study with the aim of revealing whether the attitudes and behavior among Greek elementary school students towards resource (energy) use and recycling could be positively influenced as a result of their teachers’ initiatives and guidance. The study focused on this specific age group since children represent the future custodians, planners, policy makers, of the environment and its issues. In addition, children’s perceptions and attitudes can be more easily influenced and changed than those of adults. The study sought to explore whether their perceptions, attitudes and subsequently their behavior towards actions that demonstrate environmental consciousness such as careful consumption of electricity and water, recycling and the planting of trees could be positively influenced and nourished. Although the findings are preliminary they suggest that social initiatives can create a ‘new’ consumer culture which is more sensitive towards the protection of the physical environment.

Environmentalism is an organised movement of citizens and government agencies aimed at safeguarding and improving people’s living environment (Kotler et al. 2005). It is perceived as an attempt to balance relations between humans and the various natural systems on which they depend in a way that fosters sustainability. It deals with the restoration and/or improvement of the natural environment, and may be referred to as a movement to control pollution or protect plant and animal diversity. According to Banerjee and McKeage (1994), “environmentalism” is enjoying a rebirth of interest in marketing and consumer behavior.

---

1 The author writes strictly in his personal capacity and views and opinions expressed do not necessarily reflect those of the European Parliament.
The evolution of environmentalism is characterized by two phases. The first one was driven by environmental groups and consumers that were concerned by the various environmental disasters in the 1960s and 1970s, such as strip mining, forest depletion, acid rain, loss of the atmosphere’s ozone layer, toxic waste and litter. Their concerns were also targeted towards the heightened health problems caused by bad air, polluted water and chemically treated food. The second phase was initiated by governments, which enforced laws and regulations during the 1970s and 1980s, controlling industrial practices that were impacting upon the natural environment. It is a fact that these legal regulation affected different industries in a dissimilar manner. For example, the car industry was required to introduce expensive emission controls in produced cars. The petroleum industry had to create new low-lead and unleaded petrol. At the same time, it is true that, typically, the industries affected most by environmental regulation were the greatest polluters. A third phase has now emerged, in which the corporate sector accepts responsibility of the environment, meaning that it pledges to act in a manner that does not endanger or harm the natural environment. Several corporations are beginning to adopt policies which encapsulate this environmental responsibility by focusing on the company’s profitability whilst being mindful of their impact on the environment (and seeking to preserve the natural environment).

Be that as it may, environmentalism impacts upon people’s personal values and behaviour. One could perhaps suggest that strong positive perceptions towards environmentalism can have a variety of consequence on a person’s product and brand purchase choices, consumption behaviour and lifestyle in general. For instance, people with a strong positive attitude towards environmentalism can show a preference towards the purchase of green products. They can also exhibit changes in lifestyle, like walking or biking instead of driving, or repairing and reusing products instead of purchasing brand new products are also possible. Other consequences are activism (e.g. signing petitions), joining environmental organizations, and keeping abreast of current environmental developments. In general environmentalists are not hostile towards marketing and consumption, they expect however greater responsibility from people and organisations towards the physical environment. One could argue that environmentalists act as watchdogs and pressure groups guiding corporate behaviour towards greater sustainability.

In an era of growing corporate social and environmental responsibility, the role of various governmental, social and cultural institutions and actors are crucial in shaping people’s values towards environmentalism. Specifically, schools and other educational institutions, a person’s family, a country’s legal framework, and voluntary initiatives aimed at protecting and ‘restoring’ the natural environment can play a critical role in creating a society with strong environmental values and,
therefore, behaviour. Instilling and nourishing a behaviour towards environmentalism at a young age can have implications for people’s consumption choices and behaviour in adult years. To this end, the parents, family, the society, educational institutions, and the government have a responsibility and even obligation to create, build, nourish and sustain a new generation of environmentalists.

The overarching aim of the study was to investigate whether the students at an elementary school in northern Greece were able and willing to embrace environmental values and actively engage in activities that demonstrate environmental consciousness and responsibility such as saving energy, careful water consumption, the planting of trees in their school, and recycling in their classrooms and schools. In particular, the key objectives of the study were to identify the students’ perceptions and attitudes towards the physical environment, the key reference groups and their impact on students’ perceptions towards environmental responsibility, determine the key motives, which can encourage students to become more environmentally conscious in terms of energy consumption and finally a preposition towards protecting the physical environment can be cultivated at a young age.

The research was guided by case study methodology since it focused on exploring the attitudes and behavior of the students in an elementary school in Greece as well as their parents and teachers towards environmental responsibility. Data was collected from three groups of participants: elementary school students (83), teachers (30) and parents (34) in order to cross-examine their attitudes, perceptions and behavior and the influence exerted on each other towards creating attitudes that are conducive towards protecting the physical environment.

The research findings suggest that although the students’ parents have never participated in actions that protect the physical environment, their students have actively participated in activities and initiatives such as planting trees and saving water, following their teachers’ encouragement which suggests that environmentally responsible behavior can be learned. The study demonstrates the strong influence that social institutions such as schools and reference groups such as teachers have on shaping people’s perceptions, attitudes and behavior. Reference groups such as teachers have the power to act as role models and guide their students’ behavior towards environmentalism. These findings provide some preliminary evidence suggesting that governmental and social institutions should launch and manage initiatives and actions that aim at educating and motivating children and young adults to adopt more responsible behaviors towards the physical environment thus positively influencing the future generation of citizens and consumers towards greater environmental responsibility.
ACKNOWLEDGMENTS

The authors would like to thank Ms Eleni Poppi for carrying out the data collection and analysis on which the abstract is based.

THE EFFECTS OF DOWNWARD LINE EXTENSIONS ON CONSUMER BRAND ATTITUDE: THE CASE OF THE EUROPEAN PREMIUM AUTOMOTIVE MARKET

Pedrosa, Gabriel; Nobre, Helena

DEGEIT, GOVCOPP, University of Aveiro, Portugal

ABSTRACT

In the automotive arena, several brands and segments interact in one of the most competitive markets in the world. The dynamics of this competitive context pushes premium manufacturers to use downward brand extensions into the previously unexplored small car segments, seeking growth while using and preserving brand value. However, great care must be taken on downward line extensions to ensure success by a good acceptation of the extension and keep parent brand value (Aaker and Keller, 1990; Chun et al., 2015; Royo-Vela and Voss, 2015). The acceptation of an extension can be measured by the brand extension attitude, and one of the most relevant antecedents is the extension perceived fit (also referred to as congruity, similarity or typicality) (Allman et al., 2015; Boush and Loken, 1991; Kim et al., 2001; Kim and Yoon, 2013; Lei et al., 2008; Riley et al., 2015; Salinas and Chernatony, 2004; Volckner and Sattler, 2006). Specifically, in the automotive market, a high perceived fit is indicated by research as desirable to ensure a positive brand extension evaluation (Heath et al., 2011; Riley et al., 2013) – hypothesis 1 (H1). The ownership status also plays a role in brand extension evaluation as owners tend to be more demanding about the sustainability and exclusivity of the brand (Fu et al., 2009; Grewal et al., 2004; Kirmani et al., 1999; Lei et al., 2008; Royo-Vela and Voss, 2015). On the other hand, non-owners tend to be more positive towards a downward extension as it gives them easier access to the brand (Truong et al., 2008). Thus, it is here hypothesized (H2) that the ownership status has an effect on the brand extension attitude. Consumers displaying a status-seeking behavior may also show a negative attitude toward the brand extension due to the perception of loss of exclusivity (Heath et al., 2011; Kim et al., 2001; Lei et al., 2008; Riley et al., 2013). This question is even more relevant in highly visible and durable items, like automobiles (Grewal et al., 2004; Truong et al., 2008). As it is here hypothesized that a status-seeking attitude is a moderator of the relationship between perceived fit and brand extension evaluation.

RESEARCH DESIGN

The hypothesis will be tested in an experimental research design with a 2 X 2 layout to test the effects of perceived fit (high or low) and ownership status (owner or non-owner) (e.g. Chun et al. 2015; Boush...
& Loken 1991; Riley et al. 2013; Riley et al. 2015; Fu et al. 2009). A premium automobile brand will be used as a stimulus in the experience. The automobile brand will be selected within European brands without an available brand-extension in the supermini segment. The data will be collected through online questionnaires posted on European online automotive forums to further gather respondents who are typically more involved and enthusiastic with automotive brands.

STUDY CONTRIBUTIONS

Research on line-extensions has been more limited in the literature than research on category extensions, although the topic proves to be relevant especially in cases of premium brands stepping down in high-visibility and durable items such as automobiles (Riley, Pina, & Bravo, 2015; Truong, Simmons, McColl, & Kitchen, 2008). This study aims to contribute to research and practice by (1) understanding further the consumer response to brand extensions, focusing on downward line extensions in premium automotive brands especially in the supermini segment and by (2) analyzing the role of consumer’s need for status and ownership status in the attitude towards brand extensions.

Keywords: downward brand extension, automotive original equipment manufacturer, minicar segment, ownership effect, need for status, extension attitude, brand attitude, parent brand, European automotive market

VALUE OF LISTED COMPANIES; ABNORMAL EARNINGS AND INNOVATIVENESS

Philipson, Sarah

University of Gävle, Sweden and Linnaeus University, Sweden.

ABSTRACT

CONSTRUCTS

ABNORMAL EARNINGS/MONOPOLY RENT

Goodwill has become an increasingly more important part of the valuation of companies. In a study of 528 companies on the London Stock Exchange (LSE), AbuGhazaleh, Al-Hares & Haddad (2012) found that the average share price was £5.21, while the average book value per share before goodwill was £0.79, and the average goodwill per share was £0.82 before goodwill impairment.

Goodwill has

“…four components: (1) the write-up of the target firm’s assets to fair market value (WRITEUP), calculated as the difference between the fair market value of the target firm’s assets and their preacquisition book value; (2) the value of the target as a going-concern, or stand-alone, entity (GC), calculated as the difference between the target’s pre-acquisition market value measured six days prior to the acquisition and the target’s fair market value of assets; (3) the market’s valuation of the synergistic value created by the acquisition (SYNERGY), calculated as the combined cumulative abnormal returns to the target and the acquirer for the 11 days centered on the acquisition announcement; and (4) any overvaluation of consideration and/or overpayment for the target (RESID), calculated as the purchase price less the sum of the preacquisition book value of the target’s assets, WRITEUP, GC, and SYNERGY Current GAAP records as purchased goodwill on the acquirer’s books only the aggregate of GC, SYNERGY, and RESID, if their total is positive.” (Henning, Lewis & Shaw, 2000:375-376).

It can be argued that points 2)-4) are the valuation of potential abnormal profits, and that the expectation of normal profits entails no market value above book value.

“The internally generated goodwill corresponds to the overall value of not recorded intangible assets available to an enterprise. This can be measured through the capitalization of expected flows of abnormal earnings”, Zanoni (2009:xi. cited after Paugam, 2011:351).

In accounting literature this is normally measured by the neo-classical Ohlson model (Ohlson, 1995; Lundholm, 1995; Bernard, 1995; Feltham & Ohlson, 1995; Lo & Lys, 2000; AbuGhazaleh, Al-Hares, &
Haddad, 2012, among others), which calculates the value of the company as the net present value of future abnormal earnings. The Ohlson model updated the Gordon model (Gordon & Shapiro, 1956, after Lo & Lys, 2000) with the Miller & Modigliani model (Miller & Modigliani, 1961).

"Abnormal earnings bear on the difference between market and book values, that is, they bear on a firm’s goodwill." Ohlson (1995:662)

However, the very fact that the model recognizes abnormal earnings, is a fundamental conflict within neo-classical theory, as they must abstract from its fundamental assumption of perfect markets. The Ohlson model is one of the most cited and respected models in the accounting literature, but it has one major flaw. Although the Ohlson model is an empirically well-validated prediction model, it fails to explain why these abnormal earnings exist. Classical economy gives such a fundamental explanation:

**INNOVATIVENESS**

Innovation makes it possible to reach abnormal earnings, AE, during the time that the innovation has not been imitated by competitors. This temporary monopoly gives monopoly rent (Malthus, 1798/1970; Ricardo, 1817/1971; Marx, 1894/1981; Schumpeter, 1907; 1942; von Hippel, 1988).

"Schumpeter argued that those who succeed at innovating are rewarded by having temporary monopoly control over what they have created. This control, in turn, is the lever that allows innovators to gain an enhanced position in the market and related temporary profits or "economic rents" from their innovations.” (von Hippel, 1988:43)

“Innovators capture temporary rents from their successful innovations by first establishing some type of monopoly control over their innovation and then using this control to increase their economic return.” (von Hippel, 1988:58).

Monopoly rent is what in accounting literature is called abnormal earnings.

The Ohlson model assumes that normal earnings are capitalized in the equity of the firm. However the theory of monopoly rent shows that there are no such things as normal earnings in a market, where a firm can reap abnormal earnings. The monopoly rent situation arrives by the re-distribution of profit in the market place, so that other actors get no or subnormal earnings. The following image shows how in 2007 Nokia held the lions share (60%) of the profits in mobile phone market and in 2011 Apple has taken over the position (with 75% of the profits), with Nokia’s profit reduced to zero. Three years later Nokia was no longer in the market.
This is one of the market dynamics that lead Marx (1894/1981) to suggest that the concentration of capital is an inherent tendency in capitalism. Glattfelder (2010) has given a modern validation of this, showing that 50 companies control 40% of global business. Fichtner, Heemskerk & Bernardo (2017) showed that three US companies controls 40% of the US capital.

CONSTRUCTS AND MEASUREMENTS

Market Value

The value of the company is the average share price the 31 December each year, multiplied by the number of outstanding shares.

“The increasing gap between firms’ market and book value has drawn wide research attention to exploring the invisible value omitted from financial statements (e.g. Lev and Zarowin, 1999; Lev, 2001; Lev and Radhakrishnan, 2003). Lev (2001, p. 9) documented that, over the period of 1977-2001, the market-to-book value ratios of US Standard and Poors (S&P) 500 corporations increased from slightly above 1 to over 5, implying that about 80 per cent of corporate market value has not been reflected in financial reporting.” (Chen, Cheng & Hwang, 2005:159)
Innovativeness

Innovation includes products innovation, service innovation, experience innovation, marketing innovation, organizational innovations, and business model innovation. Innovativeness is a complex construct that has been ‘measured’ both by objective and subjective scales.

Innovativeness as a construct has been extensively studied (Midgley & Dowling, 1978; Olson, Walker Jr & Ruekert, 1995; Hurley & Hult, 1998; Mairesse & Mohnen, 2002; Hult, Hurley & Knight, 2004; Tuominen, Rajala & Möller, 2004; Salavou, 2004; Hurley, Hult & Knight, 2005; Laforet & Tann, 2006; Santos-Vijande & Álvarez-González, 2007). Hult et al. (2004:430) hold that “Innovativeness is defined here as the capacity to introduce of some new process, product, or idea in the organization…”

The ‘ideal’ construct for innovativeness are the risk taking in the share of fixed production costs of total costs (Marx, 1867/1970, 1894/1981). These are the costs that the firm has to take before it can sell any item of the product or service. When Apple designed the iPhone it had to take all the design costs on an ‘architectural’ level and for strategic components, like the development of the glass together with Corning, the development of the operative system and some key applications that would run on that system. (Isacsson, 2011). A large part of the marketing costs were also taken upfront, as the lifecycle of each product is so short. but to measure these its only possible with access to internal accounting data.

Typical measures of innovativeness are diverse; patents (Acs. & Audretsch, 1989; Acs, Anselin & Varga, 2002), Intellectual capital (Bontis, 1998; Bollen, Vergauwen & Schnieders, 2005), consumer innovativeness (Goldsmith & Hofacker, 1991), and innovation performance (Tangen, 2004).

“R&D expenditure and advertising expenses, according to conservative accounting standards, are expensed as incurred, and thus are subtracted from the calculation of value added, which is the measure for firms’ total output in the VAIC calculation. However, both R&D and advertising expenditures play an increasingly important role in business nowadays. R&D expenditure is generally considered the drive for technological advancements and firms’ growth, and advertising expenditure is usually aimed at promoting the brand value of products and firms. Therefore, both expenditures, though expensed in financial reporting, should be viewed as asset-like investments.” (Chen, Cheng & Hwang, 2005:162)

Research of innovativeness has measured innovativeness by necessary antecedents, as research and development or patents and other intellectual property rights.

“Research has approached innovation performance measurement from two perspectives: the measurement of R&D (Alegre et al., 2006; Chiesa and Frattini, 2009; Chiesa et al., 2009; Lazzarotti et al., 2011; Cruz-Cázares et al., 2013) and the measurement of technological innovation capability (cf. Capaldo et al., 2003). In addition, conceptual models have discussed the essential elements of innovation that should be measured (cf. Muller et al., 2005; Adams et al., 2006; Saunila and Ukko, 2012).” (Saunila, 2017).
Measures like patents and R&D expenditure are problematic, as patents does not guarantee an ability to exploit these, as was the case with Xerox’ shown inability or even interest to exploit them (Gassmann, Enkel & Chesbrough, 2010:214), as with today’s frequent patent trolls (Magliocca, 2007). Hall, Jaffe & Trajtenberg (2005:33) show that

“…the presumed link between self-citations and market value may weaken with the size of the patent portfolio.”

Hult et al. (2004) recognizes these limits with R&D costs and intellectual property rights as a measure of innovativeness and operationalizes instead innovativeness as a self-evaluation of three variables, Market orientation (referring to Narver & Slater, 1990; Day, 1994), Learning orientation (referring to Argyris & Schon, 1978; Fiol, 1985; Cohen & Sproull, 1996; Crossan; Lane, & White, 1999), and Entrepreneurial orientation (referring to Slater & Narver, 1993, 1995; Lumpkin & Dess, 1996). These variables influence on innovativeness is hypothesized to be modified by market turbulence (referring to Han et al., 1998; Hurley et al., 1998; Miller, 1983; Miller & Friesen, 1978; Zaltman et al., 1973), reflecting

“…rapidly changing buyer preferences, wide-ranging needs and wants, ongoing buyer entry and exit from the marketplace, and constant emphasis on offering new products.” (Hult et al., 2004:432).

Even though Hult et al. (2004) recognize the modifying influence of turbulent markets, the destructive innovations of Schumpeter are difficult to identify:

“...it can always be understood ex post; but it can practically never be understood ex ante...”, Schumpeter (1947:150).

It is therefore highly unlikely that radical innovation is anticipated by the present market leaders. If the Nokia personnel had been interviewed a few years running up to Apple’s introduction of the iPhone in mid-2007, they had hardly anticipated the change.

As Leonard-Barton (1992) states the “...at the same time that they [the core capabilities] enable innovation, they hinder it. Therefore in their interaction with the development process, they cannot be managed as a single good (or bad) entity. They are not easy to change because they include a pervasive dimension of values, and as Weick (1979: 151) points out, ‘managers unwittingly collude’ to avoid actions that challenge accepted modes of behavior.”

**METHOD**

In this research we will measure innovativeness with with the variables suggested by Hult et al. (2004), but with expert respondents instead self-evaluation. These experts will be identified by a systematic sample, based on Urban & von Hippel (1998).
HYPOTHESES

The study will test the hypotheses that innovativeness drives the difference between market value and book value, where Innovativeness is a proxy of the competence to continuously being able to gain temporary monopoly rent and hence acquire abnormal earnings.

Figure 2. Model, own.

The study is intended to be a longitudinal study for ten years of X listed companies. Control values will be size, industry.

ANALYSIS METHOD

The intention is to use a dynamic linear model (LISTREL).

Keywords: Innovativeness; monopoly rent, abnormal earnings.

THE DETECTION OF FALSE FINANCIAL STATEMENTS USING ACCOUNTING RATIOS: AN EMPIRICAL INVESTIGATION

Pisciotta, Raffaella; Dicuonzo, Grazia
University of Bari Aldo Moro, Department of Economics, Management and Business Law, Bari, Italy

ABSTRACT

The issue of corporate frauds has been brought into the limelight, after the most important financial scandals that began to appear from late 2000. Frauds threaten the integrity of the company’s assets and generate negative consequences for all stakeholders who are interested in corporate organization. These phenomena increase the interest to develop a method to identify and avoid corporate failures. However, it is not easy to predict this kind of scandals due to several variables that affect frauds.

Previous literature tested different analytical procedures (e.g. analysis of trends and ratios) to identify signals of fraud. Examining a sample of US firms, some researchers find that financial ratios show a limited ability to detect and predict fraudulent financial reporting (Kaminski et al., 2004). However, there is a paucity of evidence in the European context.

The goal of this paper is to understand whether accounting ratios are able to detect an accounting fraud. Specifically, we aim to investigate whether accounting ratios of fraudulent firms differ from those of non-fraudulent firms. To this end, we select a sample of companies listed in the European stock exchange and we classified them in two categories: fraudulent firms and non-fraudulent firms.

We consider “fraudulent firms” those that engage in ascertained behaviours aimed to manipulate financial statements, while “non fraudulent firms” are the others. The sample selection of “non fraudulent firms” is based on firm size, time period and industry of “fraudulent firms”.

The exploratory study will be conducted for an eight-year period, between 2000 and 2008.

Keywords: Financial statement, Corporate fraud, Europe, Financial ratios, Accounting, Management performance

THE TREND OF HEALTH CARE TOURISM: LITERATURE REVIEW

Pjero (Beqiraj), Elenica1; Kamberi, Fatjona2; Mechili, Enkeleint Aggelos3

ABSTRACT

BACKGROUND

Health Tourism (HT) is a term used to describe the practice of travelling across international borders to obtain health care. HT one of the fastest growing segments in marketing, is becoming a worldwide multibillion-dollar industry today (Kai Ruggeri et al., 2015). According to World Health Organization (WHO), HT is a growing trend with enormous economic implications (Edward Kelley, 2013). Many countries are developing comprehensive plans to use this opportunity to improve their economy as well as the quality of medical care (Matthias Helble, 2011). Many capital-poor Third World nations in need of a profitable industry look to tourism as a solution to their economic problems. There are numerous (and often confusing) measures of the economic impact of tourism. The most important measures include tourism's impact on employment rates, GDP, and tourism's contribution to the balance of payments (i.e., repayment of foreign debts) (Harrison D, 1992). To attract more and more medical tourist from different countries the centre as well as the state government should take appropriate steps to improve all types of infrastructure facilities such as access roads, electricity, water supply, sewerage and telecommunications together with airlines, surface transport, safety, security, and accommodation. Apart from the above the government should also undertake capacity building programs to train paramedical and nonmedical staff of the service providers for cross-cultural sensitivities. The government should take steps in the role of a regulator and also as a facilitator of private investment in health care sector (Aparna Sharma et al., 2015).

OBJECTIVES

The primary objective was the review of published articles in relation to the trend of HT and identification of the main health problems associated with HT. Secondary objectives were to determine the benefits and the consequences of HT in health economy.

SEARCH METHODS
We searched the PubMed database for studies related to HT during the last 10 years. Research was independent of the three researchers. Key words were health tourism, medical tourism, trend, health economy, health problems related to HT, developing countries, health tourism marketing, as well as combination of them.

**SELECTION CRITERIA.**
The inclusion criteria were all published full articles or abstracts in English on the theme of HT. Review designs were not eligible for inclusion.

**DATA COLLECTION AND ANALYSIS**
Authors independently created a list of studies found and later sort them based on the inclusion criteria, extracted data and checked them for accuracy. The categorization of studies found, was based on the authors, the year of publication, and the place where the study was conducted, the health problem associated with HT and the impact on the health economy.

**MAIN RESULTS**
More than 30 potential articles were identified, but we reviewed the results of thirteen articles related to the theme of interest. The review evidenced that the main health problems related to HT were reproductive tourism (4 articles); cosmetic surgery (3 articles); hip and knee replacements; spinal surgery, and ophthalmologic procedures (2 articles); dental tourism, renal transplantation; cardiothoracic surgery, general check-ups and medical consultations respectively with 1 article, (Table 1). The main drivers of the growth of inbound HT to developing countries were lower costs, shorter waiting periods, and better quality of care. Most studies indicate the benefits of medical tourism in developing countries and more developed countries reflect the consequences of HT.

**CONCLUSIONS**
The trend of HT, especially towards developing countries, is high. Implications for the practice in Albania, to carry out an evaluation study of how present is HT in the health economy and its impact on health and medical tourism marketing.

ONLINE BUYING INTENTIONS OF WINE CONSUMERS: THE ROLE OF KNOWLEDGE AND SOCIAL MEDIA

Pucci, Tommaso¹; Casprini, Elena²; Nosi, Costanza³; Zanni, Lorenzo¹

ABSTRACT

INTRODUCTION AND CONCEPTUAL FRAMEWORK

The influence of social media in buying behaviour is attracting increasing interest from marketing scholars (Berthon et al., 2012; Hajli, 2014; Heinonen, 2008; Krishnamurthy e Dou, 2008). This influence is particularly important for complex products, such as wine. For these products, whose quality cannot be assessed before consumption, social media may represent an important external clue in driving consumers buying behaviour (Laverie et al., 2011; Szolnoki et al., 2014; Wilson and Quinton, 2012).

Extant research notes that social media may affect the several phases of the buying process, such as need recognition, information research, evaluation, buying and post-buying phases (Gatautis & Kazakevičiūtė, 2012), but scant attention has been deserved to the online buying intention. On the contrary, being able to depict if and to what extent social media may influence consumers online buying intention is crucial in developing new marketing strategies.

The aim of this study is to understand if and how using social media influences online buying intention of wine consumers. In particular, the study focuses on the moderating role of consumers’ knowledge. Knowledge is particularly important in consumer behaviour literature. Previous studies distinguish between objective and subjective knowledge (Aurier and N’gobo, 1999; Brucks, 1985; Dodd et al., 2005; Johnson and Bastian, 2007; Perrouty et al., 2008); objective knowledge refers to what a consumer actually knows, while subjective knowledge refers to “how much an individual thinks he knows about a product” (Johnson and Bastian, 2007: 186). We advance two hypotheses. First, the use of social media in information searching positively influences online buying intention (HP1). Second, objective and subjective knowledge moderates the social media-buying intention behaviour (HP2).

METHODOLOGY, DATA ANALYSIS AND RESULTS

A total sample of 2597 wine consumers is used: 2202 responses are collected via an online survey (administered between January and June 2016) and 395 responses are collected offline (control
The dependent variable (Wine_online_buying_intention) refers to online wine buying behaviour and it assumes 5 values (never; less than once/month; occasionally: 3-4 times/months; regularly: more than once/week; all days). The independent variable refers to the use of social media and it is represented by a 4-items construct that look at the degree of use of social media (on a Likert scale) for searching wine information. The items are drawn from Bruwer e Wood (2005), Chen et al. (2011), Quinton e Harridge-March (2008), Thach (2009), Reyneke et al. (2011), Wilson e Quinton (2012). The moderating variable refers to the objective and subjective knowledge and they are measured by multi-items (Likert scale) based on Dodd et al. (2005) and Vigar-Ellis et al. (2015). On the basis of objective and subjective knowledge we identify 4 clusters of respondents: “Experts” (high subjective and high objective knowledge - HH), “Self-overevaluated” (high subjective and low objective knowledge - HL), “Modest” (low subjective and high objective knowledge - LH) and “Aware” (low subjective and low objective knowledge - LL).
knowledge – LL). Control variables (age, gender, salary, educational level, frequency of online sales, wine consumption frequency, wine buying frequency, wine average price) are considered in the final model. Convergent and discriminant validities are performed for all multi-items constructs.

A multinomial logistic model is used. This model is preferred to the ordinal logistic regression since the parallel regression assumption is violated. Table 1 presents the results.

From the analysis, both hypothesis 1 and hypothesis 2 are supported. Consequently, the use of social media in information searching positively influences online buying intention. (Objective and subjective) knowledge moderates the social media-buying intention behaviour. The higher effect is for “Experts” consumers, i.e. those with high subjective and high objective knowledge, while the lowest effect is for “Aware” consumers, i.e. low subjective and low objective knowledge. The analysis shows that when knowledge grows, the influence of social media on buying intention grows. The post-hoc analysis also shows that the social media-buying intention relationship is influenced by socio-demographic factors (age and gender) and consumption-related factors (e.g., average price).

CONCLUSIONS

This study advances extant research on the influence of social media on online buying intentions, showing how social media use positively influences the online buying intentions. In particular, it extends previous studies in analysing the moderating role of subjective and objective knowledge. Managerial implications are threefold. First, despite e-commerce still does not represent the main acquiring channel according to the sampled respondents, social media may influence this choice. Second, from the data collected it seems that consumers who tend to acquire online are Experts, who are looking for medium-high or high wine quality. Consequently, wine marketing strategies could aim at increasing knowledge levels through information sharing on social media. Lastly, the study suggests that age has a quadratic effects and it is particularly important for those consumers who use social media. Future studies should further investigate the relationship between age, social media and use of online channels.

RELIGIOSITY AND ORGANIC FOOD CONSUMPTION. TOWARDS A DEEPER UNDERSTANDING

Raggiotto, Francesco 1; Mason, Michela Cesarina 1; Moretti, Andrea 1; Cardinali, Silvio 2

1Dept. of Economics and Statistics, University of Udine, Udine, Italy
2Dept. of Management, Università Politecnica delle Marche, Ancona, Italy

ABSTRACT

INTRODUCTION

The study analyzes the effect of three constructs as antecedents of organic food consumption: extrinsic religiosity, intrinsic religiosity, and individual attachment to a religious community.

Marketing and consumer research are aware of the potential impacts of religion on consumption choices since a long time. However, few are the studies approaching the matter of organic food consumption considering the effects of religiosity. The effect of three potential antecedents are there considered. Intrinsic and extrinsic religiosity are included in the analysis. A third antecedent regards individual attachment to a religious community. The impact of such perceived individual belonging is here considered for a more comprehensive analysis, and given the negligible attention the concept has received so far in the scarce available literature on the topic. Structural Equation Modeling has been performed on a sample of Italian individuals attending Buddhist pilgrimages. Preliminary estimations of the model show a good model fit; all the proposed hypotheses resulted significant.

BACKGROUND

Organic food consumption has experienced, especially in industrialized markets, a considerable growth (e.g., Richter, 2008; Paul and Rana, 2012). Among those studies devoted to investigating the antecedents of organic food consumption, few considered the potential implications of religious values. Religiosity is defined as «a belief in God accompanied by a commitment to follow principles believed to be set by God» (Vitell et al, 2005). It is well-known that religiosity influences everyday human behaviour (Weaver and Agle, 2002). Religion influences also consumption patterns of people (Essoo and Dibb, 2004; Doran and Natale, 2010). Religion is a clear determinant of consumer behaviour, given the pervasive nature of this cultural component, influencing several traits of societies and individual lives. The relevance of religiosity for marketers is straightforward: as noted by Kim et al (2004) religion is an enduring cultural factor, whose influences extend in the long term. In this sense, religion is very likely to influence marketing strategies and initiatives. Such importance of
religion in consumer behaviour and in marketing science has been long recognized by scholars (e.g., Allport and Ross, 1967; Hirschman, 1983). In consumer behaviour literature, several measurements of the religiosity construct have been proposed (e.g., Allport and Ross, 1967; Hirschman, 1983; Genia, 1993; Worthington et al, 2003; Kim et al, 2004). Following most of research on religiosity in consumer behaviour (e.g., Allport and Ross, 1967; Donahue, 1985; Vitell et al, 2005), the study includes intrinsic and extrinsic religiosity as potential antecedents of consumer behaviour related to organic food consumption. As a third antecedent, the study considers consumer perceived attachment to a religious community. The relatively scarce literature on the impact of religion on consumer behaviour has not devoted relevant attention, as far as it is known, to the impact of perceived belongingness to religious communities in determining individual consumer behaviour. (e.g., Lindridge, 2005).

**METHODOLOGY AND EARLY RESULTS**

Data collection was based on the administration of a questionnaire to individuals attending a Buddhist pilgrimage in Northern Italy. Known and validated scales were used for intrinsic and extrinsic religiosity. Due to the substantial lack of studies on the role of religious communities in consumption contexts, a modified version of Sierra et al’s (2016) measure of community attachment was adapted to the context of the Buddhist religious community, as a proxy of the individual sense of belonging with respect to religious communities. 310 usable responses resulted after data collection. SEM was performed on the collected data; early estimations of the model shows an acceptable fit (RMSEA= .046; AGFI= 907; GFI= .941). All the hypothesized relationships were found significant, confirming results of extant literature on the impact of intrinsic and extrinsic religiosity on food consumption (e.g., Mukhtar and Mohsin Butt, 2011), providing also evidence for the influencing role of perceived community belonging. Originality of results should be considered in terms of research context, which differs from the majority of existing research on the role of religiosity in food consumption, mostly related to Islamic contexts. These preliminary results also suggest to further explore individual importance of religious communities in consumption, adopting, for example, the lenses of literature on brand/consumer communities.

REDEPLOYMENT OF BRAND ASSETS FOLLOWING M&A BY EMERGING MARKET FIRMS

Rahman, Mahabubur

Department of Marketing, Rennes School of Business, Rennes, France

ABSTRACT

Studies have shown that firms from emerging countries have been increasingly engaged in cross-border mergers and acquisitions. In 2004, the deal value of cross-border M&A by emerging-country firms stood at $37 billion which skyrocketed to $182 billion in 2008 — a staggering increase of 392%. According to one report by Boston Consulting Group, top 100 firms from various emerging countries are expanding globally in a wide array of industries such as industrial goods, pharmaceuticals, telecommunications etc., and this global expansion is mainly happening through cross-border mergers and acquisitions. The report further showed that 57% of the cross-border M&A deals made by these emerging-country firms during 1985 to 2005 involved target firms from the developed countries (Emerging to Developed). Some of the major acquisitions by emerging country firms in the recent years include: Chinese automotive company Geely’s acquisitions of Volvo, Indian automotive firm Tata Motor’s acquisition of Jaguar and Land Rover, Mexico-based Cemex’s US $15.1 billion acquisition of Australia’s Rinker Group and most recently, Chinese firm Lenovo’s acquisition of Motorola for USD 2.9 billion.

M&A research in developed country context has demonstrated that firms in developed countries engaged in M&A for various motives such as to achieve economies of scale, economies of scope and market power. Put differently, firms engaged in cross-border M&A with diverse motives such as to leverage their current capabilities, expand their current businesses, expand market coverage etc. It thus appears that firms from developed countries engage in M&A mainly to capitalize on their existing competitive advantage such as strong brand names. Conversely, the scant research on M&A in emerging-country context has shown that firms from emerging countries engage in M&A predominantly to acquire strategic assets such as technological capability, brand assets etc. with the objective to reduce their competitive disadvantage. Extant research has shown that emerging-country firms suffer from significant competitive disadvantages vis-à-vis firms from developed countries. These competitive disadvantages arise from, inter alia, outdated technology, lack of knowledge about overseas markets, lack of internationally known brands. It therefore appears that the motives for engaging in M&A deals of emerging-market firms differ from those of developed-market firms.
While emerging-market firms are acquiring firms from developed-market so as to reduce their competitive disadvantage, acquisition of new strategic assets by itself does not guarantee the reduction of competitive disadvantage of these firms. Research has shown that strategic actions taken by the acquiring firm following acquisition largely determine the extent to which the acquisition benefits the acquiring firms. Specifically, post-merger integration strategy has a crucial impact on the success or failure of the acquisition itself. Thus far, nothing has been written in the academic literature as to how these newly acquired strategic assets help the emerging-market firms to reduce their competitive disadvantage. Moreover, the impact of these strategic assets on the marketing performance of the emerging-market firms in the post-merger years also remains unexplored. The main contribution of this paper is to fill this void. Capitalizing on resource based view (RBV), the paper develops a conceptual framework and demonstrates that the emerging market firms redeploy product attributes from the newly acquired brand to the existing brand of the acquiring firms in an effort to augment the brand equity and thereby improving the marketing performance of the existing brand. The papers develop the following propositions based on the conceptual framework which are yet to be tested.

**Proposition 1:** To gain synergetic benefit from newly-acquired strategic assets, the acquiring firm will redeploy product attributes from the acquired brand to the acquirer’s brand.

**Proposition 2:** Successful redeployment of product attribute from the acquired brand to the acquiring brand will be moderated by the level and quality of integration of the two merging firms.

**Proposition 3:** Redeployment of product attributes from the acquired brand to the existing target brand will increase the perceived quality of the target brand.

**Proposition 4:** The redeployment of product attributes from the acquired brand to the acquiring brand will lead to improved perceived quality of the acquiring brand and it will moderated by the change in the customers’ existing cognitive structure.

**Proposition 5:** Increased perceived quality of the acquirer’s brand will have a positive impact on the acquiring firm’s brand’s marketing performance in the post-merger years.

**Keywords:** Brand equity, Mergers and acquisitions, perceived value, Post-merger integration

WHY WE CONSUME FINANCIAL SELF-HELP? A THICK EXPLANATION USING CONSUMER TALES

Rahman, Kaleel
School of Economics Finance and Marketing, RMIT University, Melbourne, Australia

ABSTRACT
The demand for financial advice in general has seen significant increase in the recent years (Kramer, 2012). Yet, only a small percentage of population actually seek professional financial advice (Knutsen and Cameron 2012). Financial advice can broadly be categorised into professional versus non-professional advice. A vast majority of non-professional advice generally belongs to self-help sector. This research investigates why individual investors use non-professional financial self-help when they have access to credible professional financial advice in making investment decisions. Of particular importance is the trend that consumers spend considerable amount of money in self-help content in order to improve their personal finance despite increasing prevalence of scams. Financial self-help contents have had a consistently high rating in the recent the years (Bergsma, 2010). The following may be considered as some concrete examples of financial self-help contents: “Don’t Worry, Make Money”, a book by Richard Carlson; a youtube video on “How to Find Great Investments” by Robert Kiyosaki; “Wealth Mastery”, a 3-day seminar by Anthony Robbins. Financial self-help contents are a resource that consumers can use to help improve themselves by reading a book, following audio-visual materials, or attending a self-help seminar (e.g., “wealth mastery” seminar by Anthony Robbins) and they will be shown how they can enhance their personal financial position (Ebben, 1995). The professional finance sector generally considers financial self-help as a potential threat to their existence. For example, McDonald (1998) critiques Richard Carlson’s “Don’t Worry, Make Money” (book), which topped the New York Times business bestseller list. As McDonald argues, Carlson, a professional feel-good speaker and stress consultant who has a Ph.D. in psychology-but no background in finance - should not be in the business of advising on finances. However, giving that the current system in the professional financial advice in has a number of issues (Knutsen and Cameron 2012), consumers are increasingly being ‘sucked in’ to self-help systems due to a range of persuasive promotional techniques by non-professional self-help providers. For example, due to recent introduction of self-managed super funds in Australia, a large number of companies are promoting their products and services to individual investors via a range of seminars. Using phenomenological method (Russell and Levy, 2012; Thompson et al, 1989), combined with a thick explanation (De Munck, 1998), we investigated why consumers use non-professional financial self-help when they have access to credible professional financial advice in making investment
decisions. In this paper, a thick explanation of individual consumer tale is illustrated from four consumers. One summary is illustrated as follows:

Marty: a 47 year old Aussie IT manager, who became interested in IT during high school, and went on to earn a degree in this field and began his career in computing information system as a technical helper, and worked his way up to management, changing jobs along the way. Growing up, Marty had watched his parents invest in real estate, and talk about the value of money, which made him interested in his own finances and how he could increase his money. During university and his early career, Marty invested in shares. He was “interested in short-term returns, than long-term returns” wanting to “make quick money.” In the meantime, Marty fell in love and married Gina who was “living high”, “quite materialistic” and “wanted to best all the time,” and “spent too much”. The marriage broke. Marty then remarried Amanda, with whom things turned around. He started accumulating personal debts but managed to recover and started to meaningfully invest in real-estate, built wealth, and currently owns seven houses.

The presentation of this research focuses on a detailed analysis resulting in commonalities and diversities amongst the consumer tales, and provides insights for policy makers and businesses.

Keywords: self-help, consumption, financial services, financial literacy, marketing, Australia, thick description

A MODERATED MEDIATION MODEL FOR THE ROLES OF TEAM LEARNING IN PROMOTING TEAM INNOVATION IMPLEMENTATION AND PERFORMANCE

Rashkovits, Sarit¹; Livne, Yael²

¹Department of Health Systems Management, Yezreel Valley College, Yezreel Valley, Israel
²Department of Human Services, Yezreel Valley College, Yezreel Valley, Israel

ABSTRACT

INTRODUCTION

Innovation implementation is a major challenge for organizations in the contemporary dynamic environment. The present study responds to the need in investigating the role of team learning in team innovation implementation and the associated team performance. Team innovation implementation is achieved when the innovation is assimilated into team practices such that the innovation is widely, skillfully and consistently deployed (Klein and Knight, 2005). Team learning, i.e. the proactive spiral process of reflection and action performed by team members (Edmondson, 1999), assists in the innovation assimilation process by increasing team awareness of innovations in its environment, by promoting the quality of team decisions to adopt innovations, and by adjusting the team practices to the innovation (Tucker et al., 2006; Schippers et al., 2014; Zhu et al., 2006). Accordingly, it is hypothesized that team learning will have a positive effect on team innovation implementation.

Since innovation is a general prototype of an idea, practice, or the implemented innovation often needs to be adjusted to increase its fit to the specific team’s characteristics, mission and context. Team learning activity of reflection and experimenting with the innovation in its specific context, enables to adjust the innovation accordingly (Naveh et al., 2006; Tucker et al., 2006). Thus, it is hypothesized that team learning will moderate the relationship between team innovation implementation and team performance, such that this relationship will be stronger when team learning is higher.

Taken together, this study proposes a moderated mediation model that poses team learning as both facilitating team performance through team implementation, and moderating the path between team implementation and team performance. Accordingly, it is hypothesized that the indirect effect of team learning on team performance through team implementation will be moderated by team learning in the path from team implementation to team performance.
METHODOLOGY
The study comprised 525 employees from 77 work teams (448 team members and 77 team managers) in various service industries. The research variables were measured by validated questionnaires accompanied by a 7 point Likert scale (1=very inaccurate; 7=very accurate). Team members' responses for team learning (Edmonson, 1999) were aggregated after satisfying the required criterions of Rwg(j), ICC1, & ICC2. The team managers' responses were used for assessing team innovation implementation (Axtell et al., 2000) and Team performance (Zellmer-Bruhn and Gibson, 2006). We controlled for team size and team manager's tenure. Research hypotheses were tested using a moderated mediation analyses using Model 74 in SPSS PROCESS (Hayes, 2013).

FINDINGS
Team learning significantly predicted team innovation implementation (t=3.19, p< 0.002), supporting hypothesis 1. Additionally, there was a significant interaction effect between team innovation implementation and team learning (t=3.82, p<0.0003) on team performance, in support with hypothesis 2. Team innovation implementation was more strongly related to team performance when team learning was high rather than low. Finally, the indirect effect of team learning on team performance was stronger for high (mean +1SD) team learning (ab=.39, CI 95% [.12, 68]) than for low (mean -1SD) team learning (ab=.17, CI 95% [.06, 0.34]), supporting hypothesis 3. Accordingly, there was a significant moderated mediation effect of team learning on team performance (ab=.10, CI 95% [.03, 0.20]).

IMPLICATIONS
Team learning not only facilitates team innovation implementation, but also moderates the relationships between team innovation implementation and team performance. This moderated mediation effect shows that the routine use of the innovation (i.e., its implementation), is not sufficient for achieving maximum team performance gains. Rather, there is also a need in team learning behavior for enhancing the fit of the innovation to the specific team’s setting.

WHO BENEFITS MORE FROM TRANSFORMATIONAL LEADERSHIP? THE CASE OF TEACHERS’ BURNOUT UNDER NORMAL VERSUS EXTREME WORK DEMANDS

Rashkovits, Sarit1; Livne, Yael2

1Department of Health Systems Management, Yezreel Valley College, Yezreel Valley, Israel
2Department of Human Services, Yezreel Valley College, Yezreel Valley, Israel

ABSTRACT

INTRODUCTION

The benefits of transformational leadership are well-known, including its negative effect on burnout (Skakon et al., 2010). Recent studies show that the beneficial consequences of transformational leadership are contingent upon environmental factors (e.g., Den Hartog and Belschak, 2012; Schmitt et al., 2016). However, prior research neglected the intervening role of work conditions in the transformational leadership – burnout relationship. As transformational leadership transforms followers to rise above their self-interest by changing their values, beliefs, self-perceptions, and motivating them to perform above and beyond expectations (Bass and Avolio, 1990), it requires employees to invest high levels of effort in work. In terms of the Conservation of Resources theory (Hobfoll, 1989), the constant investment of effort leads to ongoing use of resources to cope with job demands, resulting in continuous resource loss and consequently in burnout. Therefore, we suggest that in extremely demanding work conditions the effect of transformational leadership on burnout is weaker.

Extremely demanding work conditions can be found in some schools. Specifically, efforts to prevent pupils from dropping out lead to the formation of separate schools for this population, which are characterized by high absenteeism, low achievement, feelings of alienation, social maladjustment, behavioral problems, and violence (McCluskey, 2008). Teachers who work in this type of schools are faced with an extremely demanding work environment.
Accordingly, the present study aims to investigate whether transformational leadership is equally effective in reducing burnout under the different work conditions of extreme versus normal demands. We suggest that the inspiring and motivating nature of transformational leadership should better inhibit burnout when teachers have more available resources to take advantage of their principals' leadership style, that is, when the working environment is not extremely demanding. Therefore, it is hypothesized that school type will moderate the relationship between school principals' level of transformational leadership and teachers' level of burnout, such that in extremely-demanding schools the negative effect of transformational leadership on burnout will be weaker than in normally-demanding schools.

**METHODOLOGY**

263 teachers participated in the study, of whom 72 worked in extremely-demanding schools and 191 worked in normally-demanding schools. Data were obtained using anonymous questionnaires and the study variables were measured with well accepted and validated scales.

**FINDINGS**

The hypotheses were examined using hierarchical multiple regression analysis. A significant effect was found for school type on teachers' burnout (β=0.454, P<0.0001), such that burnout level was higher in extremely demanding schools. A significant effect was found for transformational leadership on teachers' burnout (β=0.449, P<0.0001), such that as the manager's level of transformational leadership was higher the burnout level of the teachers was lower. Finally, a significant interaction was found between transformational leadership and school type in predicting teacher's burnout (β=0.465, p<0.05), such that the negative effect of transformational leadership on teachers' burnout was significantly stronger in normally demanding schools in comparison to extremely demanding schools.
IMPLICATIONS

The results expand our understanding of contingencies of the transformational leadership - burnout relationship, showing that transformational leadership is less effective in extremely demanding work settings, where employees' resources are depleted, therefore not allowing them to use the benefits of transformational leadership for burnout reduction. The findings suggest that in extremely demanding schools there is a need in implementing other burnout reduction mechanisms.

Keywords: burnout, transformational leadership, work demands.

ANTECEDENTS OF ORGANIZATIONAL FIELD REGULATORY CHANGE:
LINKING INDIVIDUAL PROFILES OF SOCIAL ENTREPRENEURS WITH THEIR REGULATORY NEEDS AND PRIORITIES?
Rimac, Tomislav; Gurses, Kerem
Department of Business and Management, LUISS Guido Carli University, Rome, Italy

ABSTRACT
In this paper, we focus on the interplay between social entrepreneurs and their organizations with the regulatory institutional context within which they work toward positive social change. We show that although regulatory context of the social entrepreneurship field is in its infancy, regulatory needs and priorities of the field are well-defined and heterogeneous. To explain the sources of the heterogeneity, we adopt a two-method strategy which combines traditional quantitative methods with qualitative case analysis. Based on the data about values, motivation, and entrepreneurial orientation of social entrepreneurs from four EU countries, we develop a typology of social entrepreneurs. By establishing links between identified profiles of social entrepreneurs and different regulatory needs and priorities we contribute to the institutional theory literature dealing with organizational field regulatory change. Furthermore, we provide valuable insights for policy makers in the social entrepreneurship field.

INTRODUCTION
Studies have shown that the institutional environment plays a key role for entrepreneurs in that it facilitates or hampers venture emergence and survival (Hwang and Powell, 2005; Pacheco et al., 2010). Within different aspects of an institutional environment, laws and regulations are known to be critical drivers of this process as regulatory actors can promote or hinder new products and services through the institutional mechanisms they develop (Edelman and Suchman, 1997; Russo, 2001). While regulated environments are known to be challenging for entrepreneurs, regulation-free environments are not problem-free either. It is relatively easy to observe how the relative lack of institutions and regulations can be an obstacle to entrepreneurs. However, it is less easy in the social entrepreneurship context to conceive how the lack of institutions/regulations can affect the development of social ventures since social entrepreneurship is more likely to occur where there are significant socioeconomic or cultural problems (Dacin et al 2010), Thus little is known about what are regulatory needs and priorities of social entrepreneurs and what determines these needs and priorities. Since there is no real consensus on what would the proper regulation for social entrepreneurship be, in this
study we propose that we might as well listen to the individual and collective voices of the community of social entrepreneurs and suggest policymakers formulate their regulations accordingly. We aim at improving our understanding of differences among regulatory needs and priorities of social entrepreneurs by looking at the link between configurations of individual profiles of social entrepreneurs consisting of their values, motivation and entrepreneurial orientation, and regulatory needs and priorities identified by these entrepreneurs. In other words, in this paper we are suggesting a motivated regulatory needs cognition argument that posits that differences in individual profiles of social entrepreneurs relate to specific regulatory needs and priorities. Furthermore, we suggest that within a broader community of social entrepreneurs there are specific sub-communities characterized by specific configurations of individual characteristics and regulatory needs and priorities. Specifically, we seek to achieve three main goals: first, we seek to establish a typology of social entrepreneurs based on their value profiles (Schwartz, 1994), motivation, and entrepreneurial orientation (Zhao, Seibert, and Lumpkin, 2009). Second, we aim to analyze and classify regulatory needs of social entrepreneurs. Finally, building on the typologies of individual characteristics of social entrepreneurs and classification of regulatory needs and priorities, we aim to establish a link between specific configuration at the individual level and specific regulatory needs and priorities.

In this study we rely on data from SELUSI database containing data on the population of social enterprises located in Hungary, Romania, Spain, and United Kingdom. The data was collected using two survey instruments – an online and a phone survey. The surveys were conducted during 2009-2010 (1st wave) and 2011 (2nd wave) either with the founder or the managing director. In total, the final sample has more than 500 social enterprises some of which were interviewed in two waves of data collection. In our data analysis we rely on the two-method strategy which combines traditional quantitative methods with qualitative case analysis, an approach that is becoming a powerful tool in social science research (e.g., Vaisey, 2007). Specifically, we rely on cluster analysis and fuzzy sets comparative qualitative analysis (Ragin, 2008) to reveal configurations of variables associated with specific policy needs and recommendations.

Benefiting from a diversity of personality profiles, organizational characteristics and regional and national regulatory environments in our data, we are able to capture configurations of individual characteristics of social entrepreneurs that are associated with specific categories of regulatory needs these entrepreneurs identify and prioritize. By showing that individual profiles determine how we see the institutional context, our theoretical contribution potentially could be applied to other type of communities. Finally, by conducting a research on social entrepreneurship and regulations we hope to contribute to the literature on social entrepreneurship as well as provide valuable insights for policymakers.

LUXURY CONSUMER-BRAND RELATIONSHIPS – THE IMPORTANCE OF SELF IN BRAND LOVE

Rodrigues, Paula1; Rodrigues, Clarinda2; Brandão, Amélia3; Costa, Paula1

1School of Economic and Management, Lusíada University North, Porto, Portugal

3Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

1. INTRODUCTION

Although the marketing and branding literature has seen a great deal of interest in the study of luxury brands (Kapferer and Laurent, 2016; Chandon et al, 2016), little is yet known of how luxury perceptions can elicit passionate feelings towards luxury brands such as brand love (Batra et al., 2012; Albert and Merunka, 2013). The purpose of this paper is to investigate the influence of self-congruency (Grubb and Grathwohl, 1967; Fugate and Philips, 2010) and self-brand integration (Mohammadian and Karimpour, 2014) on luxury perceptions (Hennings et al., 2013; Hampel et al., 2012). It also aims to investigate the direct and moderating effect of luxury perceptions on brand love.

2. THEORETICAL BACKGROUND

The traditional meaning of luxury is associated with excellence, creativity, exclusivity (Jackson and Shaw, 2009; Okonkwo, 2009), heritage of craftsmanship, recognizable style, premium price and global reputation (Nuemo and Quelch, 1998). Nevertheless, recent studies emphasize luxury as an experience that adds value to consumer-brand relationships and stress that luxury brands allow consumers to derive subjective intangible benefits beyond their functional utility (Vigneron and Johnson, 1999) and help them to reflect their self (Belk, 1998). In this regard, fashion goods such as shoes and accessories are used as a means to symbolize social status, prestige and success (Cheah et al., 2015).

Self-congruency theory states that consumers buy and use goods, which are somehow reflective of their own image or identity (Grubb and Grathwohl, 1967; Fugate and Philips, 2010). Given the importance of purchasing luxury goods for their symbolic meaning and their reflection of the individual’s self-concept, we believe that those consumers will be influenced to a greater degree by luxury brand perceptions when consumers relate to luxury brands. Specifically:

H1- H3: Self-congruency has a positive and direct relationship with prestigious perception of a brand, luxury brand perception and overall luxury brand perception.

The concept of brand self-brand integration refers to the ability of a brand to express consumer’s
actual and ideal identities (Mohammadian and Karimpour, 2014). According to Reimann et al. (2012) a brand is regarded as signifier of the self, allowing consumers to portray their individuality, exhibit their social standing or fulfill their experimental needs (Nuemo and Quelch, 1998; Vigneron and Johnson, 2004). Thus, we suggest that consumers tend to relate to luxury brands, which they perceive to be closer to their own-self image or better address their aspirational needs in the consumption process. Therefore:

H4-H6: Self-brand integration has a positive and direct relationship with prestigious perception of a brand, luxury brand perception and overall luxury brand perception.

Research shows that the concept of luxury is highly subjective, situational contingent and dependent on consumer experiences and individual needs (Wiedmann et al., 2007). Following this perspective, it is claimed that consumers evaluate luxury brands based on financial, functional and emotional attributes (ibid) and that they usually relate to brands, which are able to deliver sufficient value in accordance to consumer subjective expectations and individual perceptions (Dubois and Duquesne, 1993; Zhang and Bloemer, 2008). Therefore, we expect that the result of the perception of a luxury brand is reflected in the strength of consumer-brand relationships such as brand love. Formally, we then state that:

H7-H9: Prestigious perception of a brand, luxury brand perception and overall luxury brand perception has a positive and direct relationship with brand love.

3. RESEARCH METHOD

Luis Onofre is a Portuguese designer luxury brand created in 1999. Data collection was done using a structured questionnaire to final consumers, who frequently buy luxury fashion products. Its measurement was made using Likert scale of 5 points, where 1 corresponded to "strongly disagree" and 5 corresponding to "strongly agree." The Luxury Brand Perception (LBP) and Overall Luxury Value Perception (OLVP) was measured using Hennigs et al. (2013) scale the first with 4 items and the second with 3 items, the Brand Love (BL) was measured using the Carroll and Ahuvia (2006) scale with 7 items, the Self-Brand Integration (SBI) was measured using Mohammadian and Karimpour (2014) scale with 7 items, the Self-Congruency (SC) was measured using the Fugate and Phillips (2010) scale with 3 items, the Prestigious Perception of Brand (PPB) was measured using Hampel, Heinrich and Campbell (2012) scale with 4 items.

4. RESULTS

A total of 304 valid questionnaires were collected. Of the sample, 40% were male and 60%
female. The majority of respondents were aged up to 30 years (71.7%), representing the age range from 31 to 50 years, 21.4% and above 50 years, 6.9%. 73.4% of the respondents answered that they were single and 22.7% married or in union. The monthly net income of the household with the highest number of responses was between 1001 and 2000 € (31.9%), followed by those with less than € 1000 (27.3%) and those with above 2000 € 37.8%. Of the 304 respondents, 61.8% had secondary education, 33.9% had higher education and 4.3% had only basic education. To the question "Do you know the Luís Onofre brand?" 72.7% answered positively and to the question "Buy Luís Onofre brand products?" 62.55% answered negatively.

The survey questions were tested through exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). Beginning with the EFA and in order to simplify the findings, an estimation with principal components was performed on an initial factor solution. The criteria for acceptance of the results were the value of communalities is greater than 0.6 and the factor loading without rotation are greater than 0.70. Some items were eliminated. CFA was used to validate the measurement models consisting of six constructs. The level of Cronbach's alpha was measured for each factor to assess the internal consistency of the factor. The measurement model shows a reasonable fit when RMSEA is below 0.10 and the CFI are above 0.90 (Hair et al., 2010). Validation of the latent constructs is evaluated by convergent validity. All composite reliabilities are greater than the minimum criteria of 0.70 (Nunnally and Bernstein, 1994). The average variance extracted (AVE) provides evidence of overall convergent validity of each construct as it indicates the amount of variance explained by the construct relative to the amount of variance that may be attributed to measurement error, and should exceed 0.50 (Fornell and Larcker, 1981).

The results of structural equation model to test the hypotheses of the research is indicated in Fig. 1.

![Fig. 1 – Research Model Estimated](image-url)
As a result of testing the structural equation model, the model generated the following statistics:

$\chi^2 (165) = 1586.679$ (p = 0.000), CFI = 0.952, TLI = 0.915, IFI = 0.953 and RMSEA = 0.069. The model has a very good fit.

As shown in Fig. 1, all constructs measuring brand love have a positive and significant intercorrelation and the hypotheses were all most validated except the H4. Moreover, the dimensions of PPL, LBP and OLVP are positively related to brand love ($\gamma 1 = 0.185$, p = 0.000, H7; $\gamma 2 = 0.116$, p = 0.000, H8; and $\gamma 3 = 0.395$, p = 0.000, H9) but the influence of the PPL and LBP is smaller than the OLVP dimension. The influence of SC and SBI on LBP and OLVB is also demonstrated ($\beta 2 = 0.676$, p = 0.000, H2; $\beta 3 = 0.506$, p = 0.000, H3; $\beta 6 = 0.289$, p = 0.000, H5 and $\beta 7 = 0.485$, p = 0.000, H6), as well as the influence of SC on PPB ($\beta 1 = 0.297$, p = 0.000, H1). Only the influence of SBI on PPL was not verified ($\beta 4 = 0.032$, p = 0.535, H4).

5. CONCLUSION AND IMPLICATIONS

Brand love is a huge concept, on behalf of the brand management context. The literature review highlight the brand love as a construct intrinsically related to the emotions and customer engagement which adds value to the brand in terms of brand equity. The aims of this study is (i) to investigate the influence of self-congruency and self-brand integration on luxury perceptions and (ii) to investigate the direct and moderating effect of luxury perceptions on brand love. A proposal of a structural equation modelling (SEM) to assess the determinants and consequents of Prestigious Perception of a brand (PPB), Luxury Brand Perception (LBP), and Overall Luxury Value Perception (OLVP) was advanced and validated it in the context of marketing B to C. This study represents a contribution to the brand love research. Firstly, it points out the critical variables considered as determinants of the Brand Love in a new perspective, missing in the previous literature review. Secondly, the results consolidate the concept of Brand Love as a crucial construct in the long-term brand consumer relationship. Lastly, it provide key managerial insights answering how brand managers could capitalise brand through loved brands.

FROM EMPLOYEE SATISFACTION TO CUSTOMER TRUST: A MODERATED MEDIATION MODEL IN THE ITALIAN CHAMBERS OF COMMERCE

Romanazzi, Salvatore; Ambrosino, Gabriella

1University of Bari (Italy) and Italian Ministry of Economy and Finance
2University of Salerno (Italy) and Italian Ministry of Justice

ABSTRACT
The importance of employee satisfaction in enhancing customer satisfaction has been emphasized in past research, as well as the link between customer satisfaction and (external) customer trust. Yet there is limited research exploring the mechanism linking them and very little is known about moderators and mediators – if any – affecting in their relationship. As employees are mainly responsible for service delivery, the interpersonal interaction between customers and employees has been found to substantially affect customer perceptions of services and considered as the key to customer satisfaction. Past research also indicated that employee satisfaction can enhance customer-employee interactions, which, in turn, increases customer satisfaction. Thus, there has been dedicated scientific interest for exploring the mechanisms linking employee, customer satisfaction and finally (customer) trust.

Integrating the “congestion” of the service (number of firms / number of employees), this study attempts to bridge this research gap by developing and testing a framework that includes the mediating emotional mechanism through which employee satisfaction affects customer satisfaction in a public service context. Furthermore, the model investigates how customer satisfaction generates trust.

A theoretical framework was developed to explore the employee-customer satisfaction and trust mediated by customer satisfaction. Moreover, the FE ratio (number of firms / number of Chamber’s employees) was taken as moderator of the relationship between customer satisfaction and trust.

Survey data collected from a sample of Italian Chambers of Commerce was examined through structural equation modeling. Results show very interesting implications for both boards of directors and management of the Chambers of Commerce.

INTRODUCTION
Creating superior customer satisfaction has been the primary objective for service organizations. The importance of employee satisfaction in enhancing customer satisfaction has been emphasized in past research, as well as the link between customer satisfaction and (external) customer trust. Yet there is limited research exploring the mechanism linking them and very little is known about moderators and
mediators – if any – affecting in their relationship. As employees are mainly responsible for service delivery, the interpersonal interaction between customers and employees has been found to substantially affect customer perceptions of services and considered as the key to customer satisfaction (Brown and Lam, 2008). Past research also indicated that employee satisfaction can enhance customer-employee interactions, which, in turn, increases customer satisfaction (Homburg et al., 2009). Thus, there has been dedicated scientific interest for exploring the mechanisms linking employee, customer satisfaction and finally (customer) trust.

Integrating the “congestion” of the service (number of firms / number of employees) (Cachon and Feldman, 2011), this study attempts to bridge this research gap by developing and testing a framework that includes the mediating emotional mechanism through which employee satisfaction affects customer satisfaction in a public service context. Furthermore, the model investigates how customer satisfaction generates trust.

A theoretical framework was developed to explore the employee-customer satisfaction and trust mediated by customer satisfaction. Moreover, the FE ratio (number of firms / number of Chamber’s employees) was taken as moderator of the relationship between customer satisfaction and trust.

Survey data collected from a sample of Italian Chambers of Commerce was examined through structural equation modeling and thus we developed the following model:

![Research Model Diagram]

**RESEARCH HYPOTHESIS**

All above considered, and consistently with the previous literature frameworks, in order to test our model, we developed the following research hypotheses:

H1: Employee Satisfaction positively influences Trust

H2: Customer Satisfaction mediates the relationship between Employee Satisfaction and Trust

H3: The FE ratio moderates the relationship between Customer Satisfaction and Trust.
METHOD

In the proposed moderated mediation model (Picture 1) Employee Satisfaction is supposed to impact Customer Satisfaction (path a), which in turn should affect Trust (path b). Further we hypothesized that the link between Customer Satisfaction and Trust would be moderated by the FE ratio: we evaluated the mediation model at (1) high (above the average of our sample) and (2) low (below the average of our sample) values of the moderator (FE Ratio).

RESULTS

Overall, without considering the effects of the moderated mediation, Employee Satisfaction positively affect Trust $\beta = .27$, $p < .05$). Thus, H1 is confirmed.

However when the effects of mediation (Customer Satisfaction) were considered Employee Satisfaction was no longer significantly related to Trust (path c') $\beta = .01$, $p = .93$. In this moderated mediation model Employee Satisfaction is related to Customer Satisfaction ($\beta = .45$, $p < .001$), in addition the relation between Customer Satisfaction and Trust is moderated by FE Ratio ($\beta = .33$, $p < .05$).

Examining the model for high FE Ratio, we found that the higher the Customer Satisfaction the stronger the Trust ($\beta = .94$, $p = 0.01$). For those Chambers of Commerce with an high FE Ratio, the mediated path was significant $a^b = 28.01$, 95% CI= 9.55 – 52.29).

Next we examined the model for Chambers of Commerce with low FE ratio. We found that Customer Satisfaction was no longer significantly related to Trust for a low FE ratio ($\beta = 0.29$, $p = 0.91$). Evaluating the significance of the mediated pathway for those with low FE ratio, customer satisfaction did not significantly mediate the relation between Employee Satisfaction and Trust $a^b = -.866$, 95% CI= 0.63 -0.20).

DISCUSSION AND CONCLUSION
According to Keh et al. (2013), this study so far investigates the link between employee satisfaction and customer trust. We hypothesized that this relationship is mediated by customer satisfaction, as a development of a previous study (Ambrosino and Romanazzi, 2016). Moreover, we also considered the ratio between the number of the firms and the number of the Chamber’s employees as a moderator of the relationship between Customer Satisfaction and Trust.

Results show interesting and useful advances and suggestions for both academic and managerial purposes. In fact, results highlighted that without any mediating or moderating factor/effect employee satisfaction positively affects trust (Cho and Park, 2011). This of course suggests that managers should care about the satisfaction of their employees in order to enhance the Chamber of Commerce customer Trust. Despite what we hypothesized in H2, if the mediating effect of Customer Satisfaction is considered, employee satisfaction and trust are no longer so strongly related. This highlights something different to what we found in a previous study (Ambrosino and Romanazzi, 2016) where we just focused on the relationship between Customer Satisfaction and Trust. This could be due also to the different (and smaller) sample of Chambers of Commerce considered. Finally, we separately examined the model for (1) high FE ratio and for (2) low FE ratio, because of the not significant results we obtained considering them jointly. Thus, for high FE ratio we found that Customer Satisfaction positively affects Trust and the mediated path was significant. While, on the other hand, for low FE ratio we found that Customer Satisfaction was no longer significantly related to Trust and also in those cases Customer Satisfaction was found not to mediate the relationship between Employee Satisfaction and Trust.

This should suggest to Chambers’ boards of directors and management to take into a very high consideration the FE ratio (congestion of the service) when setting up their policies and strategies: they should be consistently differentiated and context specific, on the basis of the significantly different competitive scenario FE ratio could be a signal of.

AN EXAMINATION OF RESIDENTS’ SUPPORT FOR TOURISM DEVELOPMENT: A CASE STUDY IN THE CITY OF YOGYAKARTA

Roostika, Ratna
Department of Management, Universitas Islam Indonesia, Yogyakarta, Indonesia

ABSTRACT

Tourism is recognized as the strategic industry that has created jobs and generated incomes for the nations. Despite its potential, competition in the tourism industry among countries, regions, and cities is escalating due to the scarce resources. A place needs to acquire scarce resources like investments, companies, talented residents, tourists, big events, etc, to remain attractive. The tourism studies have admitted that residents are very important in tourism development because they are the main actors and they participate with tourism in many ways. Residents interact and share their local facilities, services, knowledge and talents with tourists. Residents are also those who receive most impacts from tourism in the long time and thus have more concern on the sustainability of their place. In managing tourism industry, support from the residents is necessary because successful operation and sustainability depend heavily on residents’ good-will. Due to the important role of residents, government policies in this sector should be aimed at residents’ well being and how tourism stakeholders particularly residents could participate in the development of the tourism industry. The competition between cities also justifies the importance in understanding the factors that may retain the residents to their city. Some studies have used psychological factors such as place attachment and the level of residents’ involvement in the tourism sectors. Residents’ satisfaction with their life is also factors that call interest among researchers in tourism study in determining their support on tourism development.

This study constructed a model of residents’ support for tourism development and its structural relationship with residents’ satisfaction, involvement, and place attachments. Using a valid sample size of 179 residents from 14 districts in the city of Yogyakarta, the findings revealed that support for tourism development are influenced by residents’ involvement and place attachment. Residents’ satisfaction did not affect residents’ support. Residents’ involvement in tourism influenced both residents’ satisfaction and place attachment. Place attachments influenced residents’ support on tourism development.

For the governments as well as tourism marketers, knowledge of the perception of residents towards the place they live is vital to the implementation of place and tourism development strategies. When people state “yes, I love to live in this place”, this may infer that they may have some memories, attachments, experiences and expectations to the place. This potential should be further explored for
place development. By doing this research, the contributions for the academic are enriching the empirical evidence in Asian context on the role of satisfaction with life, residents’ involvement, and place attachments in influencing residents’ attitude to support their government strategies/local communities in tourism development. For marketers, governments, and tourism planners, all elements of ‘satisfaction with life’, “involvement”, and “place attachments” should be creatively managed so that residents have the sense that their local tourism performance is of because their significant contributions, their life satisfaction would increase if they care with their environment as well as “the pride” they would receive if their place receives favorable image. While it cannot be denied that different tourism stakeholders view different perspectives from tourism, the priority of tourism development should be placed to the increasing prosperity of the local residents.

NETWORKING SMES FOR KNOWLEDGE SHARING: PRELIMINARY EVIDENCES FROM A SURVEY

Rossignoli, Francesca
Departmente of Business Administration, University of Verona, Verona, Italy

ABSTRACT
Previous literature has highlighted that SMEs face particular knowledge sharing challenges and claim that networks allow SMEs to overcome such limitations. Prior studies investigate the role of SMEs as active knowledge participants in networks. Nevertheless, scant empirical evidences are provided about the usefulness of networking among SMEs for knowledge sharing purposes and the literature calls for further investigate such phenomena. This research aims to provide an empirical analysis of whether and how networks enhance the knowledge sharing in SMEs. To this aim the following research question is investigated: how and in what extent networks can enhance knowledge sharing in the SMEs context? The empirical investigation is based on a survey questionnaire submitted to a sample of Italian SMEs. Preliminary empirical evidences about the benefits in term of knowledge sharing from network participation are provided. Beyond the acknowledgment of the importance of network belonging in order to share knowledge, the evidences allow to understand that different type of network serve SMEs for multiple objects and different benefits are achieved depending on the type of network. Opportunities for future research are identified in the field of knowledge sharing in SMEs.

BACKGROUND AND PURPOSE
Despite knowledge is the primary source of competitive advantage for SMEs (Coyte et al., 2012), SMEs have received little research attention from knowledge management literature (Cantù et al., 2009; Massaro et al., 2016). In general, previous management literature has highlighted the need to better understand how SMEs manage knowledge resources (Salojarvi et al., 2005; Ricceri et al., 2010). In particular, recent studies have point out that SMEs face particular knowledge sharing challenges (Zieba et al., 2016; O’Connor et al., 2017).

Networks are seen as tools that allow SMEs in knowledge sharing. Nevertheless, scant empirical evidences are provided about the usefulness of networking among SMEs for knowledge sharing purposes and the literature calls for further investigate such phenomena (O’Connor et al., 2017). The purpose of this research is to contribute to address these calls providing an empirical analysis of whether and how networks enhance the knowledge sharing in SMEs. To this aim the following
research question is investigated: how and in what extent networks can enhance knowledge sharing in the SMEs context?

RESEARCH METHOD

This study relies on a quantitative methodology based on a survey aimed at gathering data by means of closed-ended questions structured in a standard questionnaire layout. The survey has been conducted on firms located in North East Italy. We selected SMEs according to the definition provided by the European Commission and included in the sample companies ‘which employ fewer than 250 persons and which have an annual turnover not exceeding EUR 50 million, and/or an annual balance sheet total not exceeding EUR 43 million’. We excluded microenterprises with less than 10 employees and less than EUR 2 million annual turnover and/or annual balance sheet. SMEs were contacted via email at their institutional e-mail address, to the concern of the entrepreneur and/or top managers. We submitted the questionnaire to 1,674 firms and we received 411 completed questionnaires with a response rate of 25%. The responding firms reported their views about knowledge sharing in network, specifying whether or not they belong to a network of companies.

The first section collects information about the entity’s participation to network (currently or in the past) and the description of such network. The following sections are restricted to companies that currently belong to a network or have participated in a network in the past. The second section investigates the objectives pursued belonging to a network. The last section captures both the benefits and the difficulties emerging from the network participation. The responses to each question are based on a Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). A descriptive analysis was elaborated to draw the preliminary findings exposed in the next section. Further multivariate analysis are currently in progress.

PRELIMINARY FINDINGS

The respondents recognize the importance of networks (37.90%) for knowledge sharing, regardless their participation (current or past) in networks. This is confirmed by the acknowledgment that they need to join with other companies (42.74%) in order to overcome their knowledge limitations. Most of the respondents (60%) has an experience (current or past) as network participants: 55.56% of them are placed at a different point in the value chain, while 44.44% of them belong to complementary networks.

The respondents claims that among the reasons of the aggregation there is a willingness to share knowledge. In particular, network is considered an essential tool to overcome the limitations related
to knowledge and its dissemination. Thanks to knowledge sharing respondents claim that were able to develop new products (2.67%), new commercial policies and the entry into new markets (4.00%). Respondents conceive networks as a means through which they can: access knowledge not obtainable individually (11.11%), produce goods and services not achievable individually (33.33%), promote innovation, research and development (22.22%) and access to distribution channels (22.22%).

Sharing of information within the network is made with different types of subjects, and it is influenced by the type of network to which the SMEs belong: supply chain network or complementary network. Specifically the SMEs share knowledge primarily with suppliers (45.97%), with customers (37.90%), with other companies in the sector belonging to the network (35.48%) and complementary enterprises (20.97%).

CONTRIBUTIONS AND FUTURE RESEARCH

The findings show that networks enhance knowledge sharing that provides benefits to partners related to learning, to develop innovation capabilities and to improve efficiency. In the following, the findings are discussed according to the Möller et al. (2005) taxonomy, that classifies the type of networks according to three dimensions: benefits of knowledge sharing, types of relations among network partners and network goals.

Benefits in terms of knowledge sharing are pursued in terms of both acquisition of explicit knowledge and of dissemination and deployment of tacit knowledge in order to merge different competencies and to develop new vision and strategy. The relations established within the network involve different subjects such suppliers, complementary companies in the sector, competitors and others, both vertically and horizontally integrated with the SMEs. The goals pursued by participants overcome customer satisfaction and are also configured on R&D, promotion and innovation, access to resources and learning and exploitation of know-how.

All this considered, the evidence show that SMEs participants are engaged in “enhancing network”, despite the literature affirms that most SME networks are mainly hierarchical supply-chain networks established to sustain client satisfaction, where the knowledge sharing is limited to the distribution of explicit knowledge (Valkokari and Helander, 2007).

Opportunities for further research in this area emerge. The research is contributing to the attempts to capture how network belonging allow SMEs to share knowledge. Further research could measure the performance outcomes of belonging to networks and investigate relations between the types of network and the benefits gathered on knowledge incremental.

NETWORKING SMES FOR KNOWLEDGE SHARING: PRELIMINARY EVIDENCES FROM A SURVEY

Rossignoli, Francesca
Departmente of Business Administration, University of Verona, Verona, Italy

ABSTRACT
Previous literature has highlighted that SMEs face particular knowledge sharing challenges and claim that networks allow SMEs to overcome such limitations. Prior studies investigate the role of SMEs as active knowledge participants in networks. Nevertheless, scant empirical evidences are provided about the usefulness of networking among SMEs for knowledge sharing purposes and the literature calls for further investigate such phenomena. This research aims to provide an empirical analysis of whether and how networks enhance the knowledge sharing in SMEs. To this aim the following research question is investigated: how and in what extent networks can enhance knowledge sharing in the SMEs context? The empirical investigation is based on a survey questionnaire submitted to a sample of Italian SMEs. Preliminary empirical evidences about the benefits in term of knowledge sharing from network participation are provided. Beyond the acknowledgment of the importance of network belonging in order to share knowledge, the evidences allow to understand that different type of network serve SMEs for multiple objects and different benefits are achieved depending on the type of network. Opportunities for future research are identified in the field of knowledge sharing in SMEs.

BACKGROUND AND PURPOSE
Despite knowledge is the primary source of competitive advantage for SMEs (Coyte et al., 2012), SMEs have received little research attention from knowledge management literature (Cantù et al., 2009; Massaro et al., 2016). In general, previous management literature has highlighted the need to better understand how SMEs manage knowledge resources (Salojarvi et al., 2005; Ricceri et al., 2010). In particular, recent studies have point out that SMEs face particular knowledge sharing challenges (Zieba et al., 2016; O’Connor et al., 2017).
Networks are seen as tools that allow SMEs in knowledge sharing. Nevertheless, scant empirical evidences are provided about the usefulness of networking among SMEs for knowledge sharing purposes and the literature calls for further investigate such phenomena (O’Connor et al., 2017).
The purpose of this research is to contribute to address these calls providing an empirical analysis of whether and how networks enhance the knowledge sharing in SMEs. To this aim the following
research question is investigated: how and in what extent networks can enhance knowledge sharing in the SMEs context?

**RESEARCH METHOD**

This study relies on a quantitative methodology based on a survey aimed at gathering data by means of closed-ended questions structured in a standard questionnaire layout. The survey has been conducted on firms located in North East Italy. We selected SMEs according to the definition provided by the European Commission and included in the sample companies ‘which employ fewer than 250 persons and which have an annual turnover not exceeding EUR 50 million, and/or an annual balance sheet total not exceeding EUR 43 million’. We excluded microenterprises with less than 10 employees and less than EUR 2 million annual turnover and/or annual balance sheet. SMEs were contacted via email at their institutional e-mail address, to the concern of the entrepreneur and/or top managers.

We submitted the questionnaire to 1,674 firms and we received 411 completed questionnaires with a response rate of 25%. The responding firms reported their views about knowledge sharing in network, specifying whether or not they belong to a network of companies.

The first section collects information about the entity’s participation to network (currently or in the past) and the description of such network. The following sections are restricted to companies that currently belong to a network or have participated in a network in the past. The second section investigates the objectives pursued belonging to a network. The last section captures both the benefits and the difficulties emerging from the network participation. The responses to each question are based on a Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). A descriptive analysis was elaborated to draw the preliminary findings exposed in the next section. Further multivariate analysis are currently in progress.

**PRELIMINARY FINDINGS**

The respondents recognize the importance of networks (37.90%) for knowledge sharing, regardless their participation (current or past) in networks. This is confirmed by the acknowledgment that they need to join with other companies (42.74%) in order to overcome their knowledge limitations. Most of the respondents (60%) has an experience (current or past) as network participants: 55.56% of them are placed at a different point in the value chain, while 44,44% of them belong to complementary networks.

The respondents claims that among the reasons of the aggregation there is a willingness to share knowledge. In particular, network is considered an essential tool to overcome the limitations related
to knowledge and its dissemination. Thanks to knowledge sharing respondents claim that were able to develop new products (2.67%), new commercial policies and the entry into new markets (4.00%). Respondents conceive networks as a means through which they can: access knowledge not obtainable individually (11.11%), produce goods and services not achievable individually (33.33%), promote innovation, research and development (22.22%) and access to distribution channels (22.22%).

Sharing of information within the network is made with different types of subjects, and it is influenced by the type of network to which the SMEs belong: supply chain network or complementary network. Specifically the SMEs share knowledge primarily with suppliers (45.97%), with customers (37.90%), with other companies in the sector belonging to the network (35.48%) and complementary enterprises (20.97%).

CONTRIBUTIONS AND FUTURE RESEARCH

The findings show that networks enhance knowledge sharing that provides benefits to partners related to learning, to develop innovation capabilities and to improve efficiency. In the following, the findings are discussed according to the Möller et al. (2005) taxonomy, that classifies the type of networks according to three dimensions: benefits of knowledge sharing, types of relations among network partners and network goals.

Benefits in terms of knowledge sharing are pursued in terms of both acquisition of explicit knowledge and of dissemination and deployment of tacit knowledge in order to merge different competencies and to develop new vision and strategy. The relations established within the network involve different subjects such suppliers, complementary companies in the sector, competitors and others, both vertically and horizontally integrated with the SMEs. The goals pursued by participants overcome customer satisfaction and are also configured on R&D, promotion and innovation, access to resources and learning and exploitation of know-how.

All this considered, the evidence show that SMEs participants are engaged in “enhancing network”, despite the literature affirms that most SME networks are mainly hierarchical supply-chain networks established to sustain client satisfaction, where the knowledge sharing is limited to the distribution of explicit knowledge (Valkokari and Helander, 2007).

Opportunities for further research in this area emerge. The research is contributing to the attempts to capture how network belonging allow SMEs to share knowledge. Further research could measure the performance outcomes of belonging to networks and investigate relations between the types of network and the benefits gathered on knowledge incremental.

KINDNESS, FRED VERSUS NIC: MACHIAVELLIAN LEADERSHIP IN THE 21ST CENTURY

Rowland, Caroline¹; Thomas, Mike²

¹Business School, University of Central Lancashire, Preston, UK
²Executive Management, University of Central Lancashire, Preston, UK

ABSTRACT

“Three things in human life are important; the first is to be kind; the second is to be kind; and the third is to be kind.” - Henry James, as quoted in Edel, Henry James a Life, Vol V: The Master 1901 -1916 (1972)

Much has been written concerning leadership styles and practice (Bass and Bass, 2008). It is widely accepted that leadership has a crucial role in both the success of organizations and also in the wellbeing of society. Hence, leadership takes a central role in the public affairs agenda (Cameron, 2011; Thomas and Rowland, 2013). Little has been explored in relation to kindness and leadership yet poor relationships between leaders, managers and others is a major barrier to performance, wellbeing, and wealth creation (Robertson and Cooper, 2011: Rowland and Hall, 2013). This research reviews and investigates the role that kindness may play in establishing good management practice within organizations. It discusses the role of compassion and kindness in both past and current leadership theory and practice and whether these attributes have value in sustainable models.

In particular our work focusses on two opposing leadership philosophies: those of Niccolo Machiavelli (1988) and Frederick the Great of Prussia (1988). The original work by Machiavelli dates from 1532 and the work by Frederick dates from 1740 yet both their works remain in print and the impact of their beliefs still inform management and leadership practice today. Many leaders and managers have adopted Machiavellian strategies. Manipulation often by fear was his preferred model for leadership because he believed that fear was a much more reliable motivator than respect or affection. He stated unequivocally that it was better for a leader to be feared than loved. In 1740 Frederick published his essay “Anti-Machiavel” Frederick’s standpoint was very different. He argued that expediency was not morally right and that leaders should be both rationale and humane. He was highly critical of Machiavelli’s model (1988) which he suggested was leadership based on manipulation and fear and he proposed an alternative model based on kindness and mercy. Although his work is not as well-known as Machiavelli’s in terms of modern leadership he provides more insight into the motivation of people and the complexity of behaviours resulting from altruism and belonging rather than pure self-interest.

The methods used in this research were mainly based on the interrogation of literature. This paper mainly comprises a systematic review of published works on leadership focusing on the concept of kindness. The paper reviews a sample of published management works using concept analysis.
methodology to evaluate leadership characteristics and explore the concept of grace with its attributes of kindness and compassion. The sources yielded a total of 2,096 references and 3,016 identified interviews over a 15 year period. Direct observations by the authors and two small employer and employee purposive focus groups were also employed to gather data.

Initial findings were interesting and indicated that there was conceptual confusion regarding the definition of compassion and its application in leadership practices. Kindness is not discussed within the concept of compassion and kindness itself may be viewed as a weakness in contemporary self-selected leadership characteristics. Very few of the books and journals reviewed referred to kindness at all. Kindness does seem to have a positive energising effect, on both the kind individual and the recipient which does seem to have other benefits. Maslow, (1971) Fredrickson, (2009) and Algoe and Haight, (2009) all observed that when individuals observe acts of virtuous kindness then that appears to instigate feelings of compassion which creates improved inter-personal relationships and reinforces good deeds that drive and further reinforce more kindness behaviours. Armstrong, (2015) found that in a business or organizational environment, more compassionate staff were happier and more engaged with work, were more willing and able to foster teamwork and kept customers longer and better satisfied with the service. Research reported by Krakovsky, (2013) found that kind, generous and compassionate personalities are attracted to organizations that match their own personal values but inauthentic acts of kindness for the individuals own personal benefits are soon observed by working colleagues with a negative impact on working relationships. This is definitely a reaction against the instrumental acts of self-serving generosity advocated in Machiavelli’s Prince. Barsade and O’Neill, (2016), found a similar result with employees who were kind anyway gaining extra performance motivators from working in an organisation which shared their values.

Conclusions suggest that there is disconnect between contemporary models of leadership and calls for sustainable ethical leadership in the spheres of public and business environments. Compassion and kindness remain in the side-lines yet the implications for future trust and commitment are neglected in times where discretionary effort of workers and volunteers is crucial to goal achievement. Leaders have to spend more of their pressured time communicating and negotiating with staff to gain a wider acceptance and understanding of management practices which attempt to bring certainty in uncertain times. It is easier to spend less precious time by instigating hierarchical processes and procedures. This approach ignores major elements of pragmatic kindness and may be counter-productive. Signs such as curtailed meetings, curt emails, no discussion time, lack of humour, the reliance of process over interactions and spending less time receiving messages rather than giving them suggest leadership and kindness fatigue rather than a more efficient organization.
This research contributes to knowledge and understanding in a neglected area of international management discourse. In terms of practice it enables organizations to now appreciate the benefits of kindness by leaders in terms of both the “bottom line” and good citizenship. Consequently it may represent a step back to the future of less Machiavellian manipulation by leaders and result in organizational policies of more Frederickian kindness.

THE ADOPTION OF ACCRUAL ACCOUNTING IN THE PUBLIC SECTOR: A CASE WITHIN ITALIAN UNIVERSITIES

Rupo, Daniela; Loprevite, Salvatore; Sidoti, Salvatore

1Dept. Economics, University of Messina, Italy
2University “Dante Alighieri”, Reggio Calabria, Italy

ABSTRACT

Traditionally, the public sector adopt cash-based accounting systems, whose limitations have been broadly highlighted in literature, as they not provide the information that is necessary for a government to operate efficiently and effectively. The potential offered by the accrual accounting, that allows the measurement of economic results and of the assets and liabilities of the public entity, is the main reason behind the choice adopted by a growing number of countries that have decided to shift from cash-based to some form of accrual accounting in the public sector. The introduction of accrual accounting aims to improve the quality of information in terms of usefulness for decision-making, and to increase accountability and responsibility of public choices.

Relevant implications of the accrual accounting implementation in public entities are emerging in the perspective of budgeting and reporting, which ask for integrated information systems, in order to ensure the availability of useful information for decision making and for external stakeholders.

The paper intends to focus the attention on the adoption of accrual accounting in the context of public Italian universities, which become mandatory following Legislative Decree no. 18/2012, starting from 2015.

Moving from a practical experience at the University of Messina, the paper presents a case study as the result of close relationship between knowledge acquisition and action (“action research”).

The findings of the research outline some arguments about advantages and drawbacks of the actual implementation of accrual accounting, in the ongoing evolution of the legal framework in the field investigated. At the present stage, in fact, whereas universities are experiencing the first time adoption of consolidated financial statements, they cannot still refer to clear rules and accounting principles.

Moreover, the coexistence of cash based accounting, for the purposes of external reporting with the central government, provokes perplexity and requires further efforts in the direction of assuring reliable and coherent information for different users.

PERCEIVING DESTINATION QUALITY ON THE LEVEL OF THE ORGANIZATION/TOURISM SERVICE PROVIDER

Ryglova, Katerina 1, Rasovska, Ida 2, Králíková, Andrea 1, Stojaroa, Sarka 1, Sacha, Jakub 3;

1Department of Marketing and Trade, Faculty of Business and Economics, Mendel University in Brno, Czech Republic

3Department of Statistics and Operation Analysis, Faculty of Business and Economics, Mendel University in Brno, Czech Republic

ABSTRACT

The paper briefly summarizes the results of the research analyzing the viewpoints of tourism service providers in the Czech Republic concerning the quality in the destination. Principal quality factors of the destination are revealed, their importance is defined and the dependency of perceiving quality factors importance on the type of the provider, on overall destination quality evaluation or on the existence of destination management is examined. Primary data were obtained through a questionnaire survey with the quota selection of respondents. The nineteen research factors were designed on the basis of contemporary theories and on the qualitative research. Within the discussion the findings are compared with a similar research that focuses on the client/visitor to the destination and then the main discrepancies/gaps in perceiving the quality between offer and demand are determined. The visitors and the service providers in the destination agree on security to be the most important quality factor of the destination. The cleanliness of the destination is the second most important factor for the visitors whereas the service providers consider it to be the eighth most important factor and they have classified the quality level of the personnel to be the second. The obtained results can contribute to more efficient destination management and they are the part of the long-term research aimed at evaluating destination quality.

INTRODUCTION

So far, the quality of services in the Czech Republic has been one of the areas that evinces insufficiencies and in the long term its level is perceived to be lower – especially by foreign visitors. Mainly in regions big differences in the qualitative level of offered services can be observed. This reality is supported by the fact that almost two thirds of foreign tourists visit Prague only and they do not go to other regions. Quality is currently one of the priorities of the Conception of State Politics of Tourism for the period 2014-2020. For successful tourism management by means of increasing quality level in the destination it is important to be aware of not only the viewpoint of demand – wishes, needs and the perception of the performance itself by the client of the tourism service/the visitor to the
destination – but it is also inevitable to know the offer side – the possibilities and the specific quality perception from the viewpoint of tourism service providers themselves in the destination. The gap model was theoretically developed by Parasuraman, Zeithaml and Berry (1985, 1988). It is based on the presumption that the customer’s satisfaction reflects the difference between his or her expectation and perception of the obtained service level. In case of positive gap we talk about a satisfied customer, in other words the customer’s expectations have been fulfilled or the customer has even obtained more than he or she expected. If the client’s ideas and expectations have not been fulfilled, so called negative gap develops and the client probably acquires an impression that he or she has not obtained an adequate level of service for his or her money. The gap model is divided into two mutually interactive levels – these are a service provider level and a customer level – and it works with five contradictions that can cause the customer’s dissatisfaction. The foundation of the model is the presumption that the basic contradiction gap 5 between the perceived and expected quality is a function of four partial contradictions that can emerge during the process of planning and providing the service. In order to eliminate this most significant customer gap (gap 5) the company needs to close all the other gaps on the service provider’s side, which means from gap 1 up to gap 4 (Zeithaml, Bitner, 2000). The results of the long term research conducted by the authors focusing on destination quality management in the Czech Republic through gap 5 analysis have shown many negative contradictions (Ryglova et al., 2015, 2016; Rasovska et al., 2016; Stojarova, 2016), therefore it is inevitable to analyse other possible gaps and causes that induce the negative results of the principal customer gap. The text presents the results of the research that focuses on service providers and it identifies the gap 1 mentioned above that results from different images of customers and management/service providers.

METHODOLOGY, RESEARCH DESIGN AND DATA ANALYSIS
The 19 research destination quality factors used in the survey were chosen on the base of the theoretical and scientific research and models related to quality destination (Buhalis, 2003; Middleton and Clarke, 2001; Woods and Deegan, 2003; Grönroos, 2007) and own previous qualitative and quantitative research. Primary data were gained by means of questionnaire survey among 343 tourism service providers operating in the Czech Republic during 2016. The quota sampling has been used, based on organization/firm size and type of offered tourism services (characteristics published by the Czech Statistical Office and Eurostat for the year 2014). For testing the dependency of the results/the importance of the factors on the selected characteristics of respondents the Chi-squared test in the contingent table was used. For the gap 1 analysis the secondary data from the previous authors’
According to the service providers, the most significant factors of destination quality are the sense of security (F14; average evaluation 4.50 on the five-point scale), the quality level of personnel in tourism services (F13; 4.46) and natural attractions (F1; 4.45). On the other hand, the least important factor for the service providers was local transportation (3.08) followed by additional infrastructure (3.14). The differences in perceiving the significance of individual factors according to the type of tourism service provider can be seen in picture 1.

The dependency of perceiving the significance of individual factors on the type of business was confirmed on the 5% significance level in case of 13 factors out of the 19 evaluated ones. The strongest dependency was shown in case of the sense of security factor, which means that partial branches of tourism perceive the importance of security factor for the client in different ways; for instance, the mediators/cultural service organizers do not consider this fact to be important and place it on only the 15th position out of all the evaluated factors. The perception of the importance of 10 factors depends on the total evaluation of the destination quality. The strongest dependency was confirmed for the factor of the atmosphere in the destination/friendly acceptance by the locals. In case of 6 factors the dependency of the destination quality factors on the destination management performance in the area was confirmed on the same level of significance. For the three most important factors (F14, F13, F1) the dependency on the type of the service provider was confirmed, whereas the dependency on the overall evaluation of the destination was confirmed for factor F13 only: the quality level of personnel.
The dependency on destination management performance was not confirmed in case on any of these factors. In the picture below the values as well contradictions (gap 1) in perceiving the significance of individual destination quality factors between the provider and the consumer/client of tourism in the destination can be followed concurrently.

**Picture 2 – the comparison of the factor significance evaluation between the service provider and the client (gap 1); Service providers: n = 343; clients/visitors: n = 1097**

In most cases the service providers assign higher importance to individual quality factors than the clients do. The positive gap 1 is on average 0.3 points higher and the biggest difference can be seen in case of the factor of image where the provider assigns this factor with 0.9 point higher evaluation of significance than the client. This difference can be also observed in case of the order of individual factors importance when the image of the place is the 6th most important factor for the providers while for the clients it only takes the 15th position (Ryglova et al., 2015). The negative gap 1 that can be one of the stimuli causing the clients dissatisfaction emerges for three factors: F12, F15 and F16. The service providers do not fully appreciate the significance of the factors for their clients in case of the following factors: the level of prices of services and goods in the destination (F12, gap 1 = -0.54), the destination cleanliness (F15, gap 1 = -0.06) and the overcrowding of the destination (F16, gap 1 = -0.16). At the same time all these factors occupy higher positions in the order of all 19 factors from the client’s point of view; F15 is the second, F12 is the fourth and F16 is the 11th most important factor for the client. To reveal the causes of such lower satisfaction of the visitors to the destination with its quality in more detail it would be necessary to examine other gaps emerging during the process of service realization on the provider’s side as well.

The obtained results can contribute to more efficient destination management and marketing in general and they are the part of the long-term research aimed at evaluating destination quality. The revealed key factors of quality and their importance can simplify the application of scientific methods...
for example SERVQUAL or IPA analysis. The findings can also serve as input data for these methods that enable the evaluation of the actual qualitative level of the destination by means of customer satisfaction. Last but not least the research findings with revealed gaps in perception of the quality among clients and providers contribute to broadening the current studies with the destination quality and to better understanding of the behavioural mechanism and can be used by services providers to increase the efficiency of quality management to improve their competitiveness.

ACKNOWLEDGEMENTS

The results presented in this paper are part of the project No. 15-21179S „The Quality Evaluation of Tourism Destination“, which is conducted with support of Grant Agency of the Czech Republic.

EXAMINING THE IMPACT OF EMPLOYEE SOCIAL MEDIA USAGE ON
EMPLOYEE WORD OF MOUTH: THE ROLE OF BONDING SOCIAL TIES

Sakka, Georgia

University of Nicosia, Nicosia, Cyprus

ABSTRACT
Social Media (SM) are public e-platforms that enable users to interact in various ways and forms. According to Doyle et al. (2015) are divided into six categories such as blogs, content communities, collaborative projects, micro blogs and social networking sites (SNSs) that considered to be the most widely used category. A considerable number of studies during the last years are researching the way that these online platforms impact people’s live and behavior. This study will try to identify the way that employee SM social usage is affecting contemporary workplaces, by specifically examining their affect on the workplaces bonding social ties such as workplace friendship, teamness and socio-emotional support; plus researching its implications to employee WOM. This is because SM does not only impact employee’s ties and relationships but also transform essential organizational constructs. The main purpose of this study is to develop a framework that will help organizations to confront the possible negative implications of employee SM usage in the workplace, and to take advantage of the positives for enhancing the social capital ties of the organization and for pursuing positive WOM.

LITERATURE REVIEW AND GAP
SM researchers underline the need for additional research in the area mostly because the research results around SM employee usage seem to be contradictory (Schimidt et al., 2016; Kluember et al, 2016; Men and Muralidharan, 2017; Hanna et al., 2017). While there are studies identified negative impact for organizations and employees such as misbehavior and harassment in the workplace (Mac Donald and Thompson, 2016), there are others showing benefits such as employee productivity (Fraser and Dutta, 2008). Therefore it is argued that further research should examine the employee SM usage for identifying more clearly the implications for organizations, in order to take the necessary actions for reaching possible benefits and overcoming drawbacks (Kluember et al, 2016; Men and Muralidharan, 2017; Hanna et al., 2017).

Conferring also on the role of workplace social capital and SM, foregoing research principally examined quantitatively its effect on employees and organizations (e.g. Ali-Hassan et al., 2015), and mainly by focusing solely on bridging social capital instead of bonding (Xerry and Brunetto, 2010; Pinho, 2013; Kwahk and Park, 2015). In connection to this, there is also a debate on the issue if
workplace bonding social ties are affected by the employee SM usage (Bargh and McKenna, 2004; Ellison et al., 2007, Li and Chen, 2014; Neves, 2015). In responding to this research gap, this study will research qualitatively the way that SM employee usage affects the bonding ties of an organization. Further to this, it will also try to examine how it affects employee WOM through employee satisfaction. Previous research focused on the students’ SNSs usage, users’ relational social capital and electronic WOM (eWOM) and underlined the need for further research to connect SM usage with bonding social capital for identifying possible marketing advantages (Choi and Scott, 2012; Thoumrungroje, 2014). It has been suggested that positive WOM and eWOM could work as a mechanism for developing positive employee advocacy as an important marketing tool (Harris and Ogbonna, 2013; Huotari et al., 2015). This study will contribute to this aspect.

METHODOLOGY
The rationale of following qualitative research approach in this study is twofold. At first this approach is more appropriate for examining the sensitive bonding constructs included in this study such as socio-emotional support and friendship and secondly it will help the researcher to obtain a deeper picture of the phenomenon. Therefore the chosen data gathering technique for this study is depth semi-structured interviews and the sample chosen technique is the purpose sampling. The key informants that will take part in the research will be selected according to a purposive sampling criterion: the frequent use of any type of SM for social interaction with colleagues. Further as the preliminary framework of this study will be tested in the tertiary education in Cyprus, 30 interviews will be conducted including the eight recognized universities of Cyprus (according to the Cyprus Ministry of Education and Culture). This number is expected to be sufficient for reaching the required data (Creswell, 2007; Saunders et al., 2012). However the exact number of interviews will depend on the theoretical saturation that the researcher will follow (based on Eisenhardt, 1989). The university sample will include both administration and faculty members. Lastly, the interview questionnaire will include open-ended questions. The primary research of this study will take place at the beginning of 2018 and the results will be published thereafter.

Keywords: Social Media (SM), employee social media usage, workplace social capital, workplace social bonding ties, word of mouth (WOM), Human Resource Management (HRM).

DEFINING QUALITY OF LIFE INDICATORS FOR MEASURING CARE PROCESSES PERFORMANCE

Salvatore, Fiorella Pia1; Crema, Maria2; Contò, Francesco1; Fiore, Mariantonietta1

ABSTRACT

THEORETICAL BACKGROUND

According to World Health Organization (WHO), the assessment of life quality spent in good health is one of the most important indicators used for the evaluation of health care (WHO, 2012). Diseases and medical care deriving from nutritional problems, cause an increase in health care costs and worse the quality of life (Mancini et al., 2012; Marotta et al., 2014; Naughton et al., 2015).

Since care processes are linked to these problems, an assessment system would contribute to the measurement and monitoring of their performance in terms of care quality, which is defined as a measurement system that should be developed and adopted before and after the implementation of projects of process considering all the dimensions that compose the quality concept (Crema and Verbano, 2015).

In the healthcare sector, the quality of life evaluation is not spreadly adopted but there are many activities that allow evaluating the impact of illness and its costs on the health of the patients (Ware, 1987).

Mor (1987), has defined “the quality of life” as living aspects that are considered essential for living fully. It includes a huge amount of variables such as attributes regarding safety, job, level of education, living standards, wages and eating habits (Diener and Suh, 1997). All those measures can be used to implement a new performance assessment system. Performance measurement is a process that provides feedback to decision makers to assist them in improving performance and to report the company results to the key stakeholders. It is a fundamental to guarantee any good governance framework. From a practical standpoint, performance measurement is a process whereby the drivers and results of key activities are measured using different types of information (Barbuio, 2014). Besides understanding what information are needed and have to utilized, these measures permit to understand how processes are performing. In addition, based on the outcomes deriving from performance measurement system, resources can be allocated to improve the efficiencies and effectiveness of the reference system.
In the literature, there are different Key Performance Indicators (KPI), which can be adopted for the assessment and control of care processes (Arah et al., 2006). The Joint Commission on Accreditation of Healthcare Organizations has developed an indicator system widely used. This system provides that the indicators are divided in “Core Measures” (CM) and “No Core Measures” (NCM) (Vittadini et al., 2004). In addition, there are not standard models to evaluate the improvement of the care quality (Botje et al., 2016).

Typically, the performance measurement system needs to adopt different dimensions to assess the care process.

In this sense, the U. S. Department of Health and Human Services (2011), identifies 4 kinds of measures. They are: (1) process measures; (2) outcome measures; (3) balancing measures; and (4) structure of care measures. Quality-of-life (QOL) could be part of “outcome measures” because it tries to quantify the patient’s state of health and, at a later time, this can be compared to a standard care value (Higginson and Carr, 2001).

The papers about this topic recently published in academic journals, demonstrate that the concept is in developing. In particular, it could be adopted for assessing the health status of patients with cardiovascular diseases (CVD). Specifically, for measurement of the health-related quality of life in patients with CVD, the measures adopted are divided into generic and disease-specific. The measures in the generic group are: Sickness Impact Profile, Medical Outcomes Study 36-Item Short, Form Health Survey (SF-36) and Nottingham Health Profile (NHP). Instead, the measures in the disease-specific group are: Duke Activity Status Index (DASI), MacNew Heart Disease QOL Measure, Seattle Angina Questionnaire (SAQ), Minnesota Living with Heart Failure Questionnaire (MLHF) and Heart-QOL project (Thompson and Yu, 2003; Thompson et al., 2016; Tully, 2013).

Despite the widespread use of these different indicators, CVD in the European context, is growing and still represent the leading cause of death in the EU (Eurostat, 2014). For this reason, it is necessary to provide at the patients the right cares that will allow them to live a correct lifestyle which can be measured and monitored by QOL indicators.

Preventative actions could be performed based on the results of the adoption of a performance measurement system, saving a lot of money for our country and manage healthcare processes in the best way. In particular, in the literature there is not a standard model to evaluate the use of QOL as a dimension for the performance of care processes of patients with eating problems that provoke CVD.

For all these reasons, the purpose of this study is to investigate possible uses of the QOL indicators as an additional dimension to define healthcare performance of patients with CVD. Use of these indicators has already been suggested in the literature and, in this paper, the purpose that will be
pursued is to grasp from the literature review the information that have to be considered for successful implementation of QOL in the performance measurement.

RESEARCH OBJECTIVE AND METHODOLOGY

Due to the relevance of developing a performance measurement system, this study aims to understand whether and how QOL indicators for CVD can be used as a dimension of a healthcare measurement performance.

To answer our research question, we have carry out a structured literature review, following the methodology adopted by Khangah et al., (2016); Crema and Verbano, (2015); Pawson, (2006); Denyer et al., (2008).

The studies were identified via a search of two electronic databases, including Scopus and Web of Science (WOS). Both using reference lists and through meeting with experts, we have obtained information for the reference articles. The keywords searched has been the following: “quality of life”, “cardiovascular disease” and “indicator”. Moreover, we used inclusion and exclusion criteria in the following way.

As inclusion criteria, we only select papers that were published from 2000 to 2017, we used as subject area: “medicine”, “social science”, “economics, econometric and finance”, “engineering”, “cardiac cardiovascular system”, “health care sciences services”, “nutrition dietetics”, “multidisciplinary sciences”, “endocrinology metabolism”, “peripheral vascular disease”, “economics”, “primary health care”, “computer science” and “business finance”, finally, we only considered papers in English to obtain an international validity of studies. Instead, as exclusion criteria, we did not consider book section, conference proceedings, book chapters, special issues and dissertations.

By doing these searches we got 312 papers in Scopus and 83 in WOS.

After a descriptive analysis of the obtained database of international relevance, this will be analyzed though a content analysis which will provide to classify QOL dimensions referred to the cardiovascular pathologies.

EXPECTED FINDINGS AND FUTURE RESEARCH

It is expected to obtain a literature database that can be used to create a framework with QOL dimensions to study the performance of care processes of patients with cardiovascular pathologies. This result will meet the objective of research, including whether QOL dimensions are used, for what CVD and what results will be possible to obtain.
Ultimately, thanks to this framework, it will be possible to create a measurement system that can monitor CVD and this lead decision makers to intervene on processes but, above all, on the prevention of food-related illnesses. With this standardized system, it will be possible to avoid the population from aggravating their health status and thus, improving their quality of life. In the future, a similar framework, can be applied to nursing centers such as hospitals.

MORAL REASONING AND CORPORATE PLANNING

Santosuosso, Pierluigi

Dept. Law and Economics of Productive Activities, Sapienza University of Rome, Rome, Italy

ABSTRACT

Appeals for ethics in business, Codes of ethics, systems for reporting malpractice and other ethical compliance programs do not seem to reduce unethical behaviours and legal violations (McKendall et al., 2002; Webley and Werner, 2008; Brenkert, 2010). Various episodes of misconduct are reported in many companies around the world, such as the infringement of environmental standards, the violation of workplace health and safety rules, the mismanagement and misuse of organization’s resources and false or deceptive sales practices (KPMG Forensic, 2008; Ethics Resource Center, 2012).

To overcome the gap between ethical principles and practice within firms, two main approaches have been suggested. First, the creation of an ethical corporate culture has been proposed by the adoption of several measures such as the charismatic role of top managers and leadership styles (Ferrell et al., 2011), the rewarding of behaviours that support the importance of ethical values (Grojean et al., 2004), the discussion of moral issues as part of the manager’s job (Water and Bird, 1987), the ethics training (Valentine, 2009), the ethical climate of benevolence (Cullen et al., 2003). Although the ethical culture in an organization play an important role in ethical decision-making (Trevino et al., 1998), empirical studies have not yet provided conclusive results about its effectiveness (Loe et al., 2000; O’Fallon and Butterfield, 2005; Helin and Sandström, 2007; Kaptein and Schwartz, 2008). Second, several studies have suggested the development of an effective ethics policy by the integration of ethical values into corporate planning. Robin and Reidenbach (1987) examined the integration of ethical and socially responsible plans into strategic marketing planning. Guerrette (1988) set out a five-step development plan of management strategies emphasizing the need for continuing training and for reformulation of corporate strategy in accordance with a Code of ethics. Hosmer (1994) highlighted the role that planning has to enhance trust, commitment and effort among stakeholders. Rampersad (2003) provided a strategic management model in which the personal goals are integrated into the organizational Balanced Scorecard.

The purpose of the current study is to provide a theoretical framework for an integration of ethical values into corporate planning using Activity-Based Budgeting (ABB). ABB is a well-known approach that allows managers to create and simulate a model of business activities aiming to overcome the limitations of traditional budgeting (Hansen et al., 2003; Brimson and Antos, 1999; Bunce et al., 1995; Hansen et al., 2003). More specifically, we underline the key role that moral reasoning plays in
integrating ethical values into business activities and the role that ABB has vice versa in affecting moral reasoning by providing real and simulated information about firm and individual performances.

ABSTRACT

The pay gap between men’s and women’s salaries is another prime example of bias in the workplace. Women are more likely to have an advanced degree than men, are entering the workforce in nearly equal numbers as men, and are protected by the Equal Pay Act of 1963 and Title VII, yet the needle has barely nudged (Dworkin, Ramaswami, & Schipani, 2015). More than 50 years after the Equal Pay Act became law, women still earn 79 cents for every dollar men earn (“America’s Women and the Wage Gap,” 2016). In 2013, women made a median salary of $706, compared to a median salary of $860 for men (U.S. Department of Labor, 2015). The disparity intensifies among those with higher degrees. Men with bachelor’s degrees made a median of $1,246 per week, but the median of women with bachelor’s degrees was only $931. Among those with professional degrees, men received a median of $1,896, while women received a median of only $1,411 (U.S. Bureau of Labor Statistics, 2013).

While the above figures are based on median salaries of full-time workers, the discrepancies occur in a wide range of occupations where the comparisons in terms of education, experience, and other traits are easier to make. For example, female surgeons earn 71 percent of what male surgeons do and five of the 10 major occupational groups where women lagged the most were in finance (Miller, 2016). This is not an unusual discrepancy. A Wall Street Journal poll found that in many “elite jobs” and professions, women in these areas showed the biggest pay gaps (Adammy & Overberg, 2016). Additionally, women with children incurred a “motherhood wage penalty” up to five percent per child, further compounding how dangerous this disparity really is (Magid, 2014). This evidence exhibits just how insidious the gender divide remains.

Our methodology will involve synthesizing the available studies on the issue and collecting data on the supervisory and non-supervisory roles of women in comparison to men, to suggest ways to reduce the pay gap. With respect to data collection, we have conducted a survey of alumni of prominent business schools in the U.S. and Italy, which includes a question on supervisory and nonsupervisory roles in business. We will analyze this data for gender differences both overall and with regard to country differences. If women tend to hold significantly fewer supervisory positions than men, we anticipate the wage gap to continue to proliferate.
A preliminary suggestion to reduce the gap, based on our synthesis of current studies, is to promote, and perhaps achieve, transparency in salaries (Burkus, 2016). For example, one study suggested that transparent pay conditions tended to reduce the gender pay gap. (Belogolovsky & Bamberger, 2014) In another study such transparency gives legitimacy to an employee’s wage bargaining, and even just being aware of discrepancies can change norms. (Rosenfeld & Denice, 2015) Bargaining for better pay is something men are much more likely than women to do.

Perhaps the easiest is to make it clear that discussing salaries between workers is allowed. When employers have encouraged such discussions or provided information about pay scales, many misconceptions about pay are corrected (Burkus, 2016). Governments at various levels are also looking to transparency to help correct the gender wage gap.

Several other practices to narrow the gap have recently been suggested. One proposal is to ignore past salaries in order to avoid reproducing previous disadvantages. And transparency may not only help with pay gaps—it may also increase productivity. Emiliano Huet-Vaugh (2013) suggests that workers who know of their placement in the earnings distribution provide significantly more effort on average than those without knowledge of their peers’ earnings. Thus, despite the traditional mind-set against such comparisons, pay transparency would be good for business.

WORKING IN VIRTUAL TEAMS: THE ROLE OF TEAM CONNECTEDNESS, KNOWLEDGE SHARING AND TEAM DIVERSITY

Schreiber, Ezolda; Van Dijk, Dina; Drory, Amos

Ben-Gurion University of the Negev

ABSTRACT

INTRODUCTION

Employees working in global virtual space, who use technology to interact with one another across geographic and organizational boundaries, are growing in number and importance and becoming increasingly common strategic work units in global organizations (Colbert et. al., 2016; Gilson et. al., 2015; Jackson & Chen, 2007; Gibson & Cohen, 2003). Given the numerous technological advancements (e.g., Priem, Li, & Carr, 2012) a recent survey suggests that approximately 66% of multinational organizations utilize virtual teams (Society for Human Resource Management, 2012), and 80% of companies surveyed believe this number will continue to grow (Gilson et. al., 2015; Perry, 2008). Hence, researchers call to examine how technology is shaping employees perceptions, beliefs and values and how it changes the workspace and organizations (Colbert et. al., 2016). Particularly, research is needed to better understand how digital fluency and reduced face-to-face interaction may influence job performance and employees' effectiveness (Colbert et. al., 2016). Given what we know about the characteristics of the digital workforce and the increasing use of technology at work, the question remains regarding how organizations can most effectively manage the digital workforce and advantage technology while avoiding potential downsides. Research has only begun to provide guidance on these issues (Colbert et. al., 2016; Kirkman and Mathieu, 2005; Martins et al., 2004). To fill this gap, this study aims to explore some of the fundamental factors affecting the success of working virtually.

The virtual team efficiency is associated with the quality of relationships between the remote team members (De Jong & Elfring, 2010; Balkundi & Harrison, 2006) and the level of knowledge and information they share with each other (Haas, 2010; Cummings, 2004). Researchers have given considerable attention to how social process and dynamics, including social interaction (Ren & Gray, 2009; Richter et al., 2006), identification with the team (Ibarra & Barbulescu, 2010; Richter et al., 2006; and trust among team members (Renzel, 2008; Kirkman et al., 2002) are related to performance and effectiveness of organizations and in particular to productivity and quality (De Jong & Elfring, 2010, Hsu et al., 2007). Team members who interact identify and trust each other are more likely to engage
in productive interactions and teamwork processes that enhance team performance. In addition, the virtual team efficiency is also associated with how knowledge sharing process affects team/organizational effectiveness (Haas, 2010; Chudoba et al., 2003), as Nonaka (1994) noted: "knowledge is considered to be one of the most strategically important, and even vital, organizational resources" (Nonaka, 1994). Thus, it seems important to understand how the level of virtuality affects both connectedness dynamics and knowledge sharing processes and how those dynamics and processes affect employees' effectiveness.

The current study investigates how working from remote locations and communicating electronically affect the team’s connectedness dynamics and knowledge sharing processes (i.e., mediators), and how these dynamics are further related to employees' outcomes. The current study also explores the moderating role of key components that are influencing this process, specifically, task interdependence, employees' tenure in the team and the level of diversity in the team (in terms of demographics and values). The research model is presented in Figure 1.

Figure 1: The Research Model
METHOD

Sample: Our sample contains 867 LinkedIn members operating in virtual teams working in global high-tech companies. Nearly 20% work at IBM, 20% work at Cisco Systems, 14% work at Dell, and 12% work at Amdocs. Others (17%) work at other firms such as Atos, Oracle, and EMC, and 17% were not willing to disclose their employer. Nearly 40% of the respondents held managerial or executive positions. A total of 50% of the respondents reported being from the EMEA (Europe and the Middle East) region (e.g., Netherland, Poland, Romania, Israel); nearly 20% reported being from the Americas region (e.g., USA, Brazil, Mexico, Canada); and nearly 15% reported being from the Asia Pacific region (e.g., India, Australia, China) and 15% of the respondents were not willing to disclose their nationality. Nearly 85% of the reported were male and 10% female, 5% did not report their gender. The average virtual team tenure was 4.4 (SD=3.5) years. A total of 85% of the respondents were male and 10% were female. The average age of the respondents was 41 ranging from 20 to 79. About 65% reported being married with 50% having 1-3 children.

The data was collected using an Internet survey (Qualtrics) and was then aggregated into an SPSS file. All errors and wrong or outlier values were removed after which the data was analyzed using SEM procedure by Amos 17 software.

Measures: virtuality level was measured using empirical indexes based on definitions of virtuality taken from previous studies. Two indexes were used, reflecting different aspects of team virtuality level: 1. Globality, which reflects the geographical disparity of the employee from his or her other team members. 2. Channel Richness, which reflects the media channels that are used in order to communicate between the remote team members.

1. Globality was developed by aggregating two types of indexes a. Geographic Dispersion and b. Time Zone Differences: Geographic dispersion is the air distance (in kilometers) between the respondent’s location and that of his/her other team members. Time Zone Differences is the time zone’s lag between the respondent’s location and his/her other team members. In order to calculate the Geographic Dispersion and the Time Zone Differences, the respondent was asked to indicate the total number of site locations, the location of each site, and the number of team members at each site location. The values of both geographic dispersion and time zone differences between two sites were taken from the Google Map website. For each respondent, the total geographic dispersion and the total time zone differences were calculated as a star network. These measures take into consideration both the number of locations and the number of individuals in the team, residing at each location (O’Leary & Cummings, 2007).
2. Channel Richness score measures the frequency of use of each communication channel, as a function of channel richness: i.e., the ability of the communication channel to transmit multiple cues, transmit immediacy feedback, and focus on the other person (Daft & Lengel, 1986). The channels available to communicate and collaborate with the other team members are: face to face, video conference, telephone calls, telephone conference, chat, and email, on an ordinal scale, so that: face to face communication is considered to be the richest form, while email is considered to be the leanest form (Daft & Lengel, 1986). In order to calculate the Channel Richness score, the respondent was asked to rate how frequently he/she uses each communication channel to collaborate with his/her other team members on a 7-point Likert scale. The frequency of use of each communication channel was multiplied using an ordinal factor creating a 0-100% continuous Channel Richness score. Higher scores indicated using richer communication channels included face to face interaction and video conferences, whereas lower scores indicated using leaner communication channels such as phone calls and emails.

3. The other variables of the model - connectedness (social interaction, identification, and trust), knowledge sharing, outcome measures (productivity, quality), and the moderators (task independence, tenure in the team, team diversity) – were measured using reliable and valid self-reported scales.

RESULTS

Our results confirmed the relationships between virtuality level and connectedness only for the ‘channel richness’ index of virtuality but not for globality index. To sum up our main results:

1. Channel richness was positively related to connectedness (i.e., social interaction, identification with the team, trust). 2. Connectedness and knowledge sharing were both positively related to the outcomes measures (i.e., productivity and quality). 3. Connectedness, (including social interaction, identification with the team, trust) mediated the relationships between channel richness and the outcomes measures. Also, 4. Connectedness was positively related to knowledge sharing.

These results indicate that when virtual teams communicate via rich channels of communication (in terms of both quality and frequency), the team members become more connected to and identified with their virtual team, and this connectedness feeling further leads to improved team outcomes. In addition, the connectedness relates to knowledge sharing, which also relates to the team outcome. This indicate that when employees of virtual teams feel connected to their team, they are more willing to share their knowledge with their remote team members, which is crucial for the team ability to perform well.
Regarding the moderators that were tested, we found that value diversity strengthens the positive relationships between channel richness and connectedness for two indices of connectedness (identification with the team and trust). This means that in the case of low value diversity, communicating via richer communication channels would not make any difference to the identification with the team or the trust level, but in cases of mid and high levels of value diversity, identification with the team and trust would be stronger when using richer communication channels.

**DISCUSSION**

This study contributes to the existing knowledge by shedding light on how the virtual space might be re-designed to take advantage of its competencies, to promote connectedness dynamics and knowledge sharing processes and to ensure that technology is most effectively used as a tool in service of the organization’s goals. By using the virtual working space wisely and reasonably, via sequential interventions, the negative consequences of working remotely may be reduced or possibly be prevented.

The effective management of social dynamics, team diversity and knowledge exchange as organizational resources, is one of the most important challenges facing organizations today (Rico et al., 2008). From a management perspective, it is vital to know which possible interventions have the potential to help an organization scale the social fence and move towards a scenario where everyone cooperates.

There are two main limitations: 1. Measuring the outcome variables reflected in productivity and quality was a self-reported, rather than objective measure. 2. The virtuality level would better analyzed by a team-level research and not by an individual-level as this study was. However, to accurately assess the level of virtuality of the team of each respondents, we have used detailed scales, which measured for each respondent - the number of his/her team members and their location, which allow us to compute the geographical disparity of the respondent’s team, and through this to assess its virtuality level.

DESTINATION MARKETING IN THE UNITED KINGDOM AND ORGANIZATIONAL AMBIDEXTERTY: EXPLOITATIVE DILEMMAS AND EXPLORATIVE PROSPECTS?

Scott, Peter¹; Stokes, Peter²; Rowland, Caroline³; Gordon, David²

¹School of Education, Leisure and Sport Studies, Liverpool John Moores University, Liverpool, U.K.
²Castle Business School, De Montfort University, Leicester, U.K.
³Chester Business School, University of Chester, Chester, U.K.

ABSTRACT

Significant change is currently taking place in the governance of place and destination marketing organizations in England. A destination marketing organization (DMO) is defined by Pike (2008, p. 31) as ‘The organization responsible for the marketing of an identifiable destination’. The term ‘destination marketing’ generally refers to marketing related to tourism development whilst the term ‘place marketing’ has a similar meaning save that it tends to refer to marketing activity designed to attract inward investment and skilled and talented residents as well as tourists (Quinn, 2013). As such, the practice of place marketing tends to have a wider brief than that of destination marketing.

The changes underway in place marketing organizations in the United Kingdom reflect international trends but they are primarily the result of continuing austerity measures and government policy. The central proposition underpinning the government policy is the desire to reduce public sector funding of destination marketing dramatically (Government Tourism Policy, 2011). The expectation is that the private sector will fill the resulting funding gap. However, the extent to which the private sector is willing or is able to fill this gap is open to conjecture. If the destination marketing organizations are unable to adapt sufficiently to these changed circumstances they may face an existential threat if, and when, their core funding disappears. A 2011 survey of a network of European DMOs known as European Cities Marketing found that the majority were public private partnerships with an average reliance on public sector funding of 48% (Heeley, 2015). If they are to continue as ‘going concerns’ such organizations have to adapt their working practices and attract new funding streams or they may cease to exist.

Organizational ambidexterity is a term that can readily be used to characterise and analyse the situation confronting DMOs. Organizational ambidexterity is the ability of an organization to be both exploitative and explorative in the way that it operates. The exploitative element involves a focus on, inter alia: existing customers and markets whereas the explorative element requires a focus on new markets and new methods (O’Reilly and Tushman, 2013, Smith, 2016). Exploitative resources are largely extant whilst exploratory resources are generally evolving and are representative of new
opportunities (Stokes et al., 2015). Junni et al. (2013) observe that the management of innovation may have particular resonance in organizations that largely draw upon intangible assets and knowledge to make themselves marketable and this is particularly the case with DMOs. The need to be organizationally ambidextrous and strategically agile in order to ensure survival exemplifies the challenge currently confronting DMOs in England. Chief executives with organizational ambidexterous skills of a high order are required to lead DMOs through the current financial maelstrom. This will necessitate the well-developed leadership skills that are required to effect transformative change as well as a willingness to embrace change throughout the organization. As exploitative and exploratory operations compete for the same resources (Junni et al., 2013), DMO leadership that is wedded to previous operating regimes may lack the flexibility to adapt to the new order. On the other hand, too much of a focus on exploratory operations may alienate existing partnership organizations such as local authorities. Achieving optimum organizational performance will require a balanced approach that involves the capacity to look both backwards and forwards or, in other words, to have a something of Janus perspective (O’Reilly and Tushman, 2004). The theoretical concept of organizational ambidexterity has been applied to a number of different industries and contexts but it has yet to be applied to DMOs. It is therefore hoped that the current research will make a valuable contribution to this growing field of academic enquiry.

Methodologically, the study employs an overall interpretive framework (Denzin & Lincoln, 2011). Fifteen semi-structured interviews have been conducted to date with senior figures in England’s destination context including nine DMO senior executives and two DMO board members. The sample has involved a combination of purposive and snowball approaches. The reliability, validity and generalizability of the findings will be assured through thematic analysis (King, 2004). A range of issues and themes have so far been identified in relation to the challenges and manners in which DMOs and the senior figures leading them have variously engaged (or not) in organizational ambidexterous behaviours and postures. The research has already identified a number of managerial implications that need to be taken forward if DMOs are to evolve and be sustained.

It is hoped that this research will contribute a deeper knowledge and understanding of the challenges currently faced by DMOs in England and elsewhere and will provide a theoretical basis for improving the effectiveness and efficiency of the change management processes that are required to confidently face the future.

EXPLORATORY TEST OF A NEW FOOTBALL CLUB AGGRESSION SCALE

Shuv-Ami, Avichai; Alon, Anat Toder
The School of Business Administration, Peres Academic Center, Israel

ABSTRACT

INTRODUCTION

Sports research have examined many different aspects of sport fandom (Wann, Melnick, Russell, & Pease, 2001), however, one of the predominant topics of interest continues to be fan aggression and violence during sporting events. Fan aggression is a societal problem that affects many football clubs worldwide, causing deaths, injuries and extensive property destruction (Dunning 2000; Russell, 2004), and leading to potential economical and reputational damage to sports clubs. The need to understand and leverage sports fans behavior has become especially critical for sports marketers dealing with marketplaces characterize by increasing commercialization (Crawford, 2004). Consequently, it is not surprising that the nature and expression of sports fans aggression are of special interest for both marketers and researchers.

Aggression in sport is defined as any intentional behavior, which is not recognized as legal within the official rules of conduct, directed towards an opponent, official, teammate, or spectator who is motivated to avoid that behavior (Maxwell, 2004). Various studies attempt to measure levels of fan aggression from different perspectives. For example, Buss-Perry Aggression Questionnaire (Buss & Perry, 1992) assesses participants’ trait aggression. This scale consisted of four factors with three items measuring each factor: physical aggression, verbal aggression, anger and hostility. In addition, Rocca and Vogl-Bauer (1999) Fan Behavior Measure assesses participants’ perceptions of the appropriateness of verbal and physical aggression among sport spectators. This scale consists of twelve Likert-scale items comprising two subscales: appropriateness of verbal aggression (nine items) and appropriateness of physical aggression (three items). Lately, the Dysfunctional Fandom Scale developed by Wakefield and Wann (2006) was designed to assess fan dysfunction. Fan dysfunction concerns the extent to which fans complain about various components of the fan experience (e.g., stadium amenities) and the degree to which they are confrontational (e.g., enjoy arguing with rival fans).

Even though the sports literature has used several types of fan aggression scales, which furthered our understanding of fan aggression, none of those measures examined club aggression. Importantly, the current study proposes that levels of club aggression can serve as a trigger mechanism for fans’ violent behavior. Thus, the purpose of this study is to develop a scale that examines levels of club’s
aggressiveness. Specifically, the current study attempts to develop a scale which assesses club aggression through two different measures: fan's aggression, which measure participants' perceptions of their favorite team's fan behavior; and team aggression, which measure participants' perceptions of their favorite team aggression (i.e., coach, players and management). Indeed, players' violence, coaches' aggressive behavior, and management's reaction toward fans' violence are important as fan aggression. For example, previous research have showed that player violence and aggressive play on the pitch were related to higher levels of spectator violence (Braun & Vliegenthart, 2008; Semyonov & Farbstein, 1989).

**METHODOLOGY**

The two set of data used in the current study were collected from an online panel that comprised more than fifty thousand people over the age of 18. The first set of data used to test the construct validity for the Club Aggression Scale employing Exploratory Factor Analysis using Principal Component with oblique rotation. The second set of data used to test the nomological validity of the scale. Participants in the first set of data were 244 Israeli football fans. Participants ages ranged from 19 to 81 with a mean age of 43.73 (sd = 15.5), 52.9% were males, 50.6% had academic education and 71.1% were married. The participants in the second set of data were 250 Israeli football fans with ages ranged between 19 to 81 with a mean age of 42.1 (sd = 15.4), 52% were males, 50.6% had academic education and 67.1% were married.

The current study develops a Club Aggression Scale that has two sub-scales; Fan Aggression and Team Aggression. All items were measured on a 10-point agree-disagree scale. Each of sub-scales had three items (see Table1).

The nomological validity is testing the correlations between the sports club aggression scale and hatred, self-reported aggressiveness and fan’s depression. Fan hatred is defined as an extremely strong feeling of dislike toward opponents of the fan’s football team. Self-reported aggressiveness represents the way fans feel or think they may offensively behave while watching their team’s games. Fan’s depression is defined as a state of feeling sad as a result of the performance of his or hers’ team. All correlations are expected to be significant and positive.

**RESULTS**

Items of the Club Aggression Scale were subjected to exploratory factor analysis with an oblique rotation. According to the criterions of eigenvalue > 1 and Scree test (Hair, Black, Babin, Anderson, & Tatham, 2006) two factors were extracted. On the basis of hypothesized structure and items content,
the two factors labeled “Fan Aggression”, and “Team Aggression”. These factors accounted for 82.1% of the common variance of the scale. This two factors solution is presented in tables 1. All items loaded highest on the appropriate factor and had substantive loadings that exceeded .60.

Alpha coefficients for the three-item Fan Aggression and the three-item Team Aggression sub-scales were .93 and .83. Correlations among the unit-weighted scale scores were similar to those between the factors. The correlation between the two factors was .58 suggesting discrimination between the factors. The substantial correlations found between the factors justified the use of the oblique rotation and suggested higher order constructs.

</tbody>
</table>

Rotated eigenvalue 3.9 1.00
% of explained variance 65.3% 16.7%

The nomological validity of the club aggression scale was assessed by testing its relations with three relevant scales in its hypothesized nomological network. As expected, results indicate significant ($p$ <
.01) and moderate correlations between the sports club aggression scale and hatred (r=.32), self-reported aggressiveness (r=.36) and fan’s depression (r=.35). Thus, these correlations provide evidence for the nomological validity for the football club’s aggression scales.

CONCLUSION

The current study explores a new scale for sports club aggression. Exploratory factor analysis showed that all the items loaded highest on the appropriate factor had substantive loadings. Thus, supporting the hypothesized scale structure that is comprised from two sub-scale; Fan Aggression and Team Aggression. The overall scale and the two sub-scales were found to be reliable. The nomological validity indicates significant relationship between sports club aggression scales and hatred toward opposing teams, self-reported aggressiveness and fan’s depression as a result of their team performance.

EXPLORATORY TEST OF A NEW SCALE FOR SPORT FANS SOCIAL AND PERSONAL IDENTITIES

Shuv-Ami, Avichai; Alon, Anat Toder

The School of Business Administration, Peres Academic Center, Israel

ABSTRACT

INTRODUCTION

In line with social identity theory (Tajfel & Turner, 1986) and self-categorization theory (Turner, 1987), the current study proposes that sports fans may perceive themselves as unique individuals or as members of the sports club and these two are equally valid expressions of self. Sports fans’ social identities (deriving from the sports club in which they perceive themselves to be members) are significant to the self as their personal identity (derived from views of oneself as a unique individual). Social identity theory and self-categorization advocate that the self is in not a fixed entity, but is socially defined in the context. Hence, there are different possible identities that participants can assume within the same interactive context. Accordingly, the choice about what possible self to show is driven by individuals’ perception of how the social situation is characterized and what features are more relevant and more effective in that specific situation. Further, social identity and self-categorization theories assume that there are two types of self-regulation: as a group member (social identity salience) and as an individual (personal identity salience) (Reicher, 1987). Importantly, salience relates not just to the general relevance of a group membership, but also to a selective change in self-perception whereby people actually define themselves as unique individuals or as members of groups. Further, these theories acknowledge that the nature of behavior is carefully regulated by the different self-images (Hogg, 2001).

The context of sport fandom represents a kind of middle landscape that allows individuals to exercise their impulses for both separation and connectedness. As such, sports clubs operate as sites where centrifugal and centripetal forces meet. In other words, sports clubs are co-determined by the simultaneous and dynamic forces of fans’ desires for independence and uniqueness (i.e., differentiating the individual as distinct from other fans) and for collective identity (i.e., emphasizing the similarities shared with other fans). It is important to note that de-personalization caused by immersion and anonymity in the group does not result in loss of identity or reduced self-awareness. Rather, this de-personalization results in heightened group-level self-regulation (Spears & Postmes, 2015).
THE SUGGESTED SCALE

Researchers in the self-categorization tradition emphasize that the relative salience of different identity levels depends on the context of interaction of the person (Turner, Oakes, Haslam, & McGarty, 1994). However, following Nario-Redmond et al. (2004), the current study maintains that there is a dispositional tendency toward self-definition at either the personal or social level of identification. Also, it is assumed that such differences are measurable and remain relatively stable over time, moderating self-perceptions and group behaviors across a variety of situations. Consistent with Nario-Redmond et al. (2004), the current study operationalized the social and personal identity constructs of sport fans, as conceptually separable levels of the self.

METHODOLOGY

The purpose of the current study is to explore a new scale of sports fans' social and personal identities. Participants were recruited using an online panel-based survey that comprised more than fifty thousand people over the age of 18. The participants in this study were 265 Israeli football fans. Participants ages ranged between 19 to 81 with a mean age of 42.0 (sd = 15.3), 58.1% were males, 57.7% had academic education and 64.6% were married. The participants for the nomological validity study were 273 Israeli football and basketball fans. Participants ages ranged between 19 to 83 with a mean age of 42.1 (sd = 15.6), 59.3% were males, 49.8% had academic education and 67.7% were married.

The Sports Fans Social-Personal Identities scale that was developed in the current study follows Nario-Redmond et al. (2004) sixteen items social and personal identities scale. The current scale used eight items that were relevant and thus were modified to fit sports fans context. The question was “Please rate from 1 to 9 how important or unimportant to whom you are, the behavior described in the following sentences. When score 1 means that you think the behavior "is not important to who I am" and "the behavior is very important to who I am." Where items 1, 3, 5 and 8 represent social identity salience and items 2, 4, 6 and 7 represent personal identity salience. In order to create a continuous scale where low is personal identity behavior and high is social identity behavior; the personal identity items were reversed.

1. it's important for me to behave like other fans of my team.
2. I have my own way to be a fan of my team (R)
3. I identify with the nationalist / ideological fans of my team
4. I have the need to be completely distinct and unique from other fans of my team (R)
5. It is important for me to be part of the fan base of my team
6. I have my own creative ways to be a fan of my team (R)
7. I feel that I am different from other fans of my team (R)
RESULTS

The items of the sports fans’ social and personal identities scale were subject to exploratory factor analysis with oblique rotation. According to the criterions of eigenvalue > 1 and Scree test (Hair, Black, Babin, Anderson, & Tatham, 2006) two factors were extracted. Items loaded onto the hypothesized factors (see Table 1). On the basis of hypothesized structure and items content, the two factors were labeled social and personal salience. These factors accounted for 62.9% of the common variance, above the recommended minimum threshold of 60%. All items loaded highest on the appropriate factor and had substantive loadings that exceeded .65. No item was found to have cross loading the exceeded .3 loading on the non-primary factor. The reliability for the overall scale was good (.82), and each subscale had good reliability (greater than .78). In addition, the two factors were correlated at .43 suggesting discrimination between the two factors. The substantial correlations found between the factors justified the use of the oblique rotation.

a. Rough estimates based on eigenvalues from the orthogonal, varimax rotation (cannot be estimated for the oblimin rotation due to confounded factors contribution).

The nomological validity of the sports fans’ social and personal identities scale was assessed by testing its relations with three relevant scales in its hypothesized nomological network. Testing nomological validity with respect to football fans, the results indicate, as expected, significant (\( p < .01 \)) and moderate correlations between the sports fans social and personal identities scale and Wann’s (Wann et al. 2001) sports spectator identity (\( r = .55 \)), Shuv-Ami’s and others’ (Shuv-Ami et al. 2015) fan commitment (\( r = .45 \)) and Shuv-Ami’s and others’ (Shuv-Ami et al. 2017) love for the team (\( r = .51 \)).

**CONCLUSIONS**

The current research explores a new scale of Sport Fans Social and Personal Identities. Exploratory factor analysis showed that all the items loaded highest on the appropriate factor had substantive loadings. Thus, establishing the two factors; one for sports fans’ personal identity salience and the other for sports fans’ social identity salience. The overall scale and the two sub-scales were found to be reliable. The nomological validity indicates significant relationship between sports fans’ social and personal identities and their identity as sports spectators, their commitment and their love for their team.

DISCLOSURE VIA SOCIAL MEDIA AND MARKET REACTION WITHIN THE
STAKEHOLDER THEORY

Solimene, Silvia; Coluccia, Daniela; Fontana, Stefano
Dept. Business and Law, Sapienza University of Rome, Italy

ABSTRACT
The main aim of this project is to analyze corporate disclosure through social media among a sample made of the biggest 100 firms listed on the Eurostoxx 100 and its effect on financial market.

The first part of the research is focused on the identification of the social channel used by the companies (Twitter, Facebook, Linkedin, Youtube, etc); then, on the selection of the information released during the 2014 and on the attribution to the many stakeholders of the company, in order to find if there is a prevailing stakeholder when companies disseminate their voluntary disclosure.

The latter section of the project is devoted to deepen the significance and the relevance of the disclosure via social media, at a financial market level. In order to do that, we use an Event Study Methology, carried out by the Event Styudy Metrics Software.

THEORETICAL BACKGROUND

The increasing importance of Social Media for Firms

Corporate use of social media for external communication – using social media to communicate with external stakeholders such as customers, investors, and the general public (Welch and Jackson 2007) – has grown in the past few years. External communication professionals are attracted to social media for its capacity to reach a broad audience, generate spread of information, and engage audiences (Macnamara 2010).

Using social media, corporate communicators hope to fulfill external stakeholders’ demands for transparency, particularly in the wake of the loss of public trust incurred by the Enron accounting scandal and the collapse of major financial institutions during the subprime mortgage-induced crisis.

While social media is now expected to be part of the external corporate communications toolbox, such use of social media remains overlooked by academics. This is contrasted starkly by the extensive attention that social media use for internal communication has received, also in knowledge Management, in Knowledge creation and in Knowledge collaboration and sharing field (Zammuto et al. 2007; Wagner and Bolloju 2005; Yates, Wagner, and Majchrzak 2010; Turban, Bolloju, and Liang 2011; Treem and Leonard 2012; Arazy and Gellatly 2013). Furthermore, the existing studies on social media use in external communications focus on customer (Majchrzak, Wagner, and Yates 2006). Some
Authors have examined the use of social networking sites for product endorsement and customer relationship management (Meadows-Klue 2008; Harris and Dennis 2011; Laroche, Habibi, and Richard 2013). Very little, however, is known about social media use for external audiences other than customers, despite the vital importance of good communication with investors and the general public to firms’ financial future (Petersen and Martin 1996; Hutton 1999). As a result, communications specialists “understand they should be doing more with social media but are unsure where to begin” (Schlinke and Crain 2013).

Here, we investigate which stakeholders firms do select to devote their voluntary communication and which channels they use to enhance their communication activities to a wide variety of external stakeholders—not only customers, but also investors, suppliers, environment and the general public. In so doing, we focus on different types of social media tools—Facebook, Linkedin, Twitter, social networking sites—because these are the types most commonly used for external communications.

Social Media allow different chances consisting on different capabilities users reach through them, such as encouraging active participation, providing audience interconnectivity, and fostering ongoing engagement with the firm, among others. Many of these affordances are unique to social media (Hazleton, Harrison-Rexode, and Kennan 2007; Jung et al., 2014). Social media are different from Mass media tools that are designed to disseminate and gather information in a monological manner (Kent and Taylor 2002). Therefore, mass media are dissimilar to social media, which foster dialogical communications between firm and audience (Kaplan and Haenlein 2010).

This unique characteristic may help users and practitioners to find appropriate social media tools for specific external communication activities and for specific stakeholders.

Voluntary Disclosure

The mandatory information has proven to be insufficient to meet the information demand by the various company’s stakeholders.

Voluntary disclosure, as it is known, refers to information that is not subject to reporting requirements or certification, whether quantitative or qualitative, regardless of the channel through which it occurs (press releases, annual reports, websites etc.) (Bozzolan, 2005).

There are several reasons that lead companies to supplement the compulsory information with voluntary disclosure. First, voluntary disclosure contributes to low information asymmetries and agency conflicts that arise between managers and investors (Brammer and Pavelin, 2008). Information asymmetries arise because of the presence of different information and conflicting incentives between companies and investors that can potentially lead to a rupture of the proper functioning of the capital market (Akerlof, 1970). The agency conflicts arise as a result of conflicts of interest between managers.
and investors. Since the interests of managers very often do not coincide with those of shareholders and creditors, it is possible that managers do act in their own interests (Jensen and Meckling, 1976).

Through voluntary disclosure, on the other side, managers are free to illustrate aspects of management that are not imposed by rules and regulations, which potentially can better capture the relevant features of company management and allow the company to be different compared to competitors (Quagli, 2004). Voluntary disclosure allows greater understanding of the Company and the opportunity to reach a broader range of investors. In addition, through the use of additional information to the mandatory disclosure, the company is able to build credibility towards its investors by communicating information which can help them to create valid expectations about the future performance of the company.

As a toolbox of voluntary disclosure managed by companies, the information via social media is a new topic on the research ground, within the mainflow of Voluntary Disclosure.

Our project is on the price-sensitivity of voluntary disclosure released via social media, in a multistakeholder perspective. To our knowledge this is the first study that combine these three aspects of disclosure of firms. All the previous researches were conducted on single stakeholder. Infact, the only empirical research existing on voluntary disclosure in a multi-stakeholder perspective is that of Boesso and Kumar (2007) who gave an initial step in the direction of examining voluntary disclosure from a multi-stakeholder perspective with 5 stakeholder groups (Investor; Employee; Customer; Supplier; Social and Environmental). They identified new drivers of voluntary disclosure other than what previous literature did. Differently from previous literature on the topic, our willing is to relate, for the first time to our knowledge, the voluntary disclosure to all categories of stakeholders identified by the literature (abroad theory), however, in a different way from what previously was done. In fact, we qualify the disclosure according to the content of such disclosure. In this perspective, the stakeholders become the object, ie the content of information, not the recipients of it. In this sense, the disclosure is qualified in various ways (disclosure on customers, suppliers, institutions, human capital and corporate governance, and so on). We also add to the literature the component of the relevance of multistakeholder disclosure via social media to the financial market.

**METHODOLOGY**

*Premise*

Our research has took inspiration form the Netflix case.

Netflix, in 2012, was involved in a case of fair disclosure. July 3, 2012 the founder of Netflix, Reed Hastings, announced through his Facebook profile that Netflix had reached a content of a billion hours of streaming. Hasting in the past had never used Facebook to make similar corporate announcements.
In addition post on Facebook Netflix founder was not accompanied either by a press release or a Form 8-K (The Form 8-K is a form used to alert investors of listed companies in the United States of specific events that may be important to the member or to the SEC).

The SEC began to investigate the following aspects of the case:

a) The application of Regulation Fair Disclosure (FD) to the post of Hastings;

b) The applicability of the 2008 Guide.

At the end of the investigation the Commission decided not to initiate any action against Netflix. However, it was the occasion to issue a survey report containing guidelines to be followed by issuers while disseminating the public disclosure of sensitive and confidential information. Corporate disclosure must be made in accordance with the provisions of Regulation FD (Fair Disclosure) whenever such information is disclosed to any interest group. In this regard, the issuer has to determine whether disclosure includes material and/or confidential information. Whenever the issuer decides not to issue a Form 8-K, the company should ensure that information is disseminated in a “reasonable” manner so that a greater part of the public have access to such information. The issuer also must declare to its investors the communication channels to be used for the dissemination of material and confidential information. The SEC report is not intended to inhibit corporate communication through social media because the commission has confirmed his appreciation to it as a means of communication.

In literature, the effects of information disclosed to the market is closely linked to the line of research on a single event introduced by Fama, Fisher, Jensen and Roll in 1969. Such studies offer valuable insights into how stock prices do react to information. Over time several studies have took place in this field, such as, for instance, those on the effect on the market of good and bad news (Skinner, 1994, 1997).

Over time, the voluntary disclosure has also been conveyed through social media. They became extraordinarily popular and are transforming the communication strategy of companies. It is estimated that over 70% of Fortune 500 companies has an official page or an account on Facebook, Twitter or LinkedIn.

Given the increase on the use of social networks by companies, the literature dealing with this topic is still poor (Jung et al. 2014), most of all about how many firms use social media to communicate financial information to investors and how investors process information provided through social media channels. Among the empirical research existing on social media disclosure, it has been demonstrated that among the social media channels Twitter is the most occurring to disclose financial voluntary information, while few companies do act the Facebook channel (Blankespoor et al. 2014). But, to some companies, social media channels are not a way to disseminate all relevant and significant information (bad or good), but only to communicate good news to the market in order to manage
stakeholder perception of the firm. As about “good” and “bad” news, previous literature (Healy e Palepu 2001; Skinner 1994; Aboody and Kasznik 2000; Trueman,1986) has demonstrated that, normally, only good news go through social media channels. In particular, quarterly earnings are useful for market participants who need to take their investment decisions. Diamond and Verrecchia (1991) has shown that information that has the power to reduce information asymmetry makes the share price more highly liquid. On the other side, Kim e Verrecchia (1994) demonstrated that the quarterly earnings financial announcement may enable some operators to formulate upper judgments: this leads to greater information asymmetry and a lower liquidity within the market.

RESEARCH DESIGN

As for the first part of the methodology, we will select all the voluntary information released through social media channel over the year 2014 among the sample, despite the characteristic of the information (quantitative or qualitative). This phase will be carried on empirically by the group of the researchers. Then, we will gather the information in order to assess which stakeholder is interested by the information. In this research, we identify the following stakeholder from major Stakeholder Theory:

- customers;
- supplier;
- competitors;
- financial lenders;
- community;
- human capital and corporate governance;
- environment;
- institutions;

At a descriptive level, we will be able to identify the prevailing stakeholder as for the dissemination of the information from a company, for every social media channel.

As for the second part of the methodology, our efforts will be addressed to understand if there is an effect of the information on the market, using the Event Study Methodology. The first step of Event Study methodology is to determine an equation (market model) able to correctly predict the returns of the i-th title. You can estimate the expected return of a stock i \( (R_i) \) by assuming that it depends linearly on the market return \( (R_m) \) according to the following relationship:

\[
R_i,t = \alpha_i + \beta_i \cdot R_m,t + \varepsilon_i,t
\]

Where:

- \( \alpha_i \) and \( \beta_i \) are the coefficients that need to be estimated by regression in a period (estimation window) prior to the period of investigation; and
• $\varepsilon$ is the error term.

In particular, the coefficients are estimated by regressing the logarithmic returns of the title compared to logarithmic returns recorded by the chosen market parameter along the estimation window. Each coefficient estimated by the model is associated with a t-statistic that measures the level of significance. The logarithmic return on a security or an index is obtained from the observation of market prices in a given period using the following formula:

$$R_t = \ln\left(\frac{P_t}{P_{t-1}}\right)$$

Where:

$P_{t-1}$ are the market share price (or index value) at time $t$.

The predictive validity of a model is defined by its RSquared, namely the portion of variance explained by the performance of the stock market return. After the estimation of $\alpha_i$ and $\beta_i$, the next step of the methodology consists of calculating the expected returns of the title by the following equation:

$$E(R_i,t) = \alpha_i + \beta_i \cdot R_m,t$$

Then, the Abnormal return ($AR_i,t$) in the event window is estimated by the following:

$$A(R_i,t) = R_i,t - E(R_i,t)$$

Where $R_i,t$ and $E(R_t)$ are respectively the effective and the expected stock return of $i$ for $t$ time.

To test whether the deviation is considered abnormal or is due to the case, it is necessary to estimate the statistical significance. The null Hypothesis is that $AR_i,t=0$ ($H_0: AR_i,t=0$), and it is verified by the absolute value of the T-statistic.

In the case the null hypothesis is verified, it can be concluded that abnormal returns are not statistically different and that therefore the difference between the effective return and expected yield has not been caused by specific events having an impact on the stock price, but due to chance.

If it appears that the AR estimates are statistically different from zero it can be said that the abnormal changes were caused by a specific event.

Starting from a single abnormal return is also possible to obtain the cumulative abnormal return (Cumulative Abnormal Return, CAR) until the $n$ period, in order to capture any price changes before and/or after the date of the event and related to the event itself:

$$CAR_n = \sum AR_t$$

As for AR, we will verify the statistical significance of the CAR.

The methodology involves the following steps:

a) Identification of the event to be analyzed (“Event”), for us the event is the disclosure selected during the 2014 coming from different social media channels;
b) Choosing the time window to study the effects (“Event window”). Usually the event window is chosen in a time interval that begins before the event and ends after it, according to the possibility that the market anticipates the information and that the price effects will last for few days;

c) Definition of a time period (“Estimation window”), prior to the event window, in which to estimate the relationship between the stock and the market return and to estimate the equations. This relationship is to be estimated through regression of the market model which will lead us to the stock expected returns;

d) Calculation of Abnormal Returns (AR) in event window, as the difference between actual and expected stock returns, so as to remove by the performance under the effects of market trends;

e) Validation of the statistical significance of AR to determine if the deviation between abnormal and expected returns is due to chance or has an economic belonging.

The dates on which material information is disclosed to the market, the AR measures the impact it had on the stock price, that is because the stock return has deviated from its expected return.

If the deviation is not statistically significant, it can be concluded that the AR is not relevant from an economic point of view; but if the AR is statistically significant, it can be asserted that the difference between the actual and the expected stock return has an economic sense and therefore that the information to the market is “material”; the higher is the AR, the more “material” is the information disclosed.

In the end, the case study will allow us to better understand if voluntary disclosure via social media has a real effect on the market at a financial level. In particular, we will try to identify, by an Event Study, the content of the information relevant to the market, namely the price-sensitive information. Further, to capture which stakeholder is mostly accounted for in voluntary terms, in order to suggest for the future if the voluntary disclosure is a way to address transparency to stakeholders or to manipulate them (Arena et al., 2015).

ABSTRACT

INTRODUCTION

Sustainable innovation management can give the chance to face new global challenges and can move ahead the transition from a waste economy to an economy based on renewable resources and sustainable consumption (Bresciani et al., 2015). Air pollution is a grave issue in green challenges, mainly caused by anthropogenic factors. Agriculture sector is a great contributor to global GHGs emissions due to lacking efficient management of the resources involved and research policies (Alemu et al., 2017; Cerri et al., 2016). In particular, livestock sector contributes to emissions of GHGs, deforestation, and nutrient imbalances. More effective agricultural research systems and technologies are necessary in order to improve farm productivity but also to reduce the GHGs emissions. The aim of this research is to evaluate the impact of ASTI (Agricultural Science and Technology Indicators) R&D on GHGs emissions for some international countries in 2013.

METHODS

The work collects data from FAOSTAT statistics concerning 28 OECD countries in 2012. We study the effects of ASTI on the emissions that result from the variation in the intensity of the treatment by means of generalized propensity score (GPS) procedures, estimating a dose-response function, also considering a set of covariates. The focus is on understanding how the effect of ASTI for 28 countries (variables) on the enteric emission (outcome) varies at different levels, using stock with covariates, based on a generalization of the Rosenbaum and Ruby propensity score. Propensity-based techniques have long been used for causal inference in observational studies to reduce the injury caused by non-randomized treatment. In recent years, Imbens and Hirano (2004) have suggested extending the propensity score for ordinal and categorical treatments respectively. In this study, the adjustment of GPS is obtained by inserting, as covariates, population and inventories in the result of regression. We also compared the GPS approach with the usual regression in order to estimate a function. Then, we use the corresponding Hirano and Imbens (2004) GPS to estimate ASTI's impact on emissions. In the
context of this study, two important advantages of the GPS estimator are the ability to capture potential non-linearity in the relationship between emissions and countries heterogeneity. Because GPS is a non-parametric estimator, no specific functional form for the R & D productivity ratio must be imposed a priori.

RESULTS

Results show the existence of influence of ASTI R&D on GHGs across 28 countries with a decreasing dose-response function for treatments, with no local minimum that is, as ASTI grows, emissions continue to decline (Fig. 1). Implications are crucial: reducing GHGs emissions by means of R&D based policies and correlative reaching efficient resources management through green available practices could have a crucial role for intra-generational fairness. To our knowledge, this work is the first application GPS of in the context of the impact assessment of Agricultural Research Expenditure on the control of Enteric Emissions.

Fig. 1 : Results from dose response function

![Dose Response Function](image)

Source: our processing on FAOSTAT database

Efforts should target single practices (e.g. vaccination against rumen methanogens), but also take into account the interactions between practices, to develop suites of effective mitigation practices for specific production systems (FAO, http://www.fao.org/home/en/).

ABSTRACT

OBJECTIVE(S)
This paper arises due to the emergence of the growing phenomenon of "dual embeddedness" of MNC's subsidiaries (Figuereido, 2011; Achcaoucaou et al., 2014; Ciabuschi et al., 2014; Ferraris, 2014) in IB studies and to the relevance of networks of knowledge (Del Giudice et al., 2010; Nicotra et al., 2014; Ferraris et al., 2016). The main objectives of this paper are: a) to conceive relational embeddedness as one of the main source and tool for knowledge sharing and transfer within MNCs in a globalized scenario; b) to highlight how external and internal relational embeddedness impact and interact in the process of knowledge transfer; c) to explain how subsidiary's dual relational embeddedness is useful in order to leverage and exploit a geographically dispersed body of knowledge in an effective manner.

RELEVANT THEORIES
In order to reach the objectives of this paper, we mainly based our analysis on the stream of literature that refers to relational embeddedness. Several IB scholars have studied embeddedness phenomena in particular from two different dimensions: structural and relational. Moran (2005) refers to structural embeddedness as the configuration of network relationships, i.e. the presence or absence of network ties between actors along with structural characteristics such as connectivity and centrality, whereas relational embeddedness concerns the quality of the network relationships. Relational embeddedness, which is the focus of our paper, is based on principles such as mutual adaptation, interdependence, and trust between counterparts (Uzzi, 1997).

Moreover, relational embeddedness varies in its degree from arm’s length linkages to knowledge-intensive linkages (Figuereido, 2011; Ferraris, 2016). Arm’s length linkages are relationships that are based on a lack of social closeness between the actors and have some key features: a) they are based on a profit-
seeking and opportunistic logic, b) they tend to be more infrequent, and c) they may difficultly enable the discovery of opportunities of potential partners and knowledge (Granovetter, 1985). Embedded or knowledge-intensive linkages, instead, are based on strong social attachments involving trust and reciprocity (Uzzi, 1997) and a long-term perspective. Through such linkages the firm can acquire different types of distinctive knowledge and skills (Maggioni and Del Giudice, 2011). The manner and the frequency of the firm’s engagement in such linkages may generate benefits for the firm in terms of knowledge accumulation and dissemination and innovative performance (Figuereido, 2011; Ciabuschi, 2014). Specifically, the relational embeddedness approach emphasizes that firms can acquire strategic assets through interfirm linkages embedded in social relations and networks in order to achieve competitive advantage (Uzzi, 1997). In a MNC context, there are two kind of relational embeddedness: external embeddedness, that is characterized by each subsidiary being embedded in a specific business network (Andersson et al., 2002; Ciabuschi, 2014) and internal embeddedness that is characterized by each subsidiary being embedded in the corporate network, i.e. headquarters and sister subsidiaries (Yamin and Andersson, 2011; Achcaoucaou et al., 2014; Bresciani and Ferraris, 2016).

METHODS

It has been taken the list of the largest 500 corporations in the world published annually by Fortune magazine that is one of the most important annual ranking of the firm worldwide as measured by revenue. In this list, 152 European MNCs has been individuated through Amadeus database. Thus, using a standardised questionnaire, specific data were collected through a postal survey between 2013 and 2014. This study focuses on European subsidiaries of MNCs with HQs located in Europe that are active in knowledge generation and transfer (“Integrated Player” in the sense of Gupta and Govindarajan, 1991). Due to incorrect answers or missing values the final sample includes answers from 165 subsidiaries. An OLS regression analysis has been performed in order to test the effect of both internal and external relational embeddedness on the degree of knowledge transfer.

Degree of Knowledge transfer:

The operationalization was adopted from Gupta and Govindarajan (2000) and Mimbaeva (2007). Data was collected on the following items: marketing know-how, distribution know-how, packaging design/technology, product designs, process designs, purchasing know-how, and management systems and practices. Subsidiary respondents were asked to evaluate the degree of knowledge transferred from its unit to other units (HQ or sister subsidiaries) for each aspect using a five-point Likert-type scale, where 1 indicated very low use of knowledge by the subsidiary and 5 indicated...
Substantial use of knowledge. Responses were averaged to yield a composite index reflecting the degree of knowledge transferred to the focal subsidiary.

**Subsidiary’s internal and external embeddedness**

The variable *external and internal embeddedness* capture the characteristics of the focal subsidiary’s network, by examining the relationships with and among various external and internal network actors, such as customers, suppliers, research centers, universities and competitors for external one and MNC’s HQ and sister subsidiaries for internal one. The variable comprises four indicators reflecting the extent to which the relationships in the subsidiary’s external and internal business network are characterized by aspects of embeddedness. They are: a) degree of specific adaptations in technology among network counterparts, b) long-term orientation and stability of the relationships, and the level of c) interdependence and of d) mutual trust (Hallin et al., 2011). The indicators were measured on a five-point Likert-type scale ranging from 1 (very low), to 5 (very high). The average value was used when constructing the two variables.

**MAIN FINDINGS AND CONTRIBUTIONS**

The main findings are: a) an high level of subsidiary’s internal embeddedness positively affected the degree of knowledge transfer through an increase in building relationships with other internal counterparts based on reciprocity, trust and frequency; b) an high level of subsidiary’s external embeddedness did not directly affect the degree of knowledge transfer leveraging to a increase in the ability and in the willingness of senders to transfer knowledge; c) an high level of both internal and external embeddedness reinforce the positive effect of the internal one on the degree of knowledge transfer due to interdependencies between the external and internal embeddedness.

In line with these findings, the main theoretical contributions are: a) to propose a dual relational way in managing knowledge flows in MNCs through subsidiary’s embedded ties; b) to suggest MNCs managers how to manage their networks of knowledge, leveraging and exploiting knowledge in the home country and in all the host countries where they operate through their subsidiaries; c) to individuate positive effects that arise from the combination and interaction of internal and external embeddedness that is, in practice, rarely sought by subsidiaries and that could be a source of dynamic capabilities (these are shaped by enabling variables within and outside the firm).

THE CUSTOMER EXPERIENCE WITH SELF-SERVICE TECHNOLOGIES IN SERVICE ENCOUNTERS

Teixeira, Antonio Samuel; Nobre, Helena; Simões, Cláudia

ABSTRACT

Customer experience (CE) is a holistic notion embracing different situations in service delivery and consumption. The focus on CE has increased among service researchers and practitioners over the last decades (Heinonen et al., 2010; Lipkin, 2016). Building a meaningful CE is the key to achieving competitive advantage and satisfied customers (Bolton et al., 2014). Prahalad and Ramaswamy (2004) argue that CE is co-created by the customer and the service provider in an interactive process in which customers co-create unique experiences during their contact with the service at different touch points (Vargo and Lusch, 2004). Such view assumes that customers create their personal experience with a service (Helkkula et al., 2012; Verhoef et al., 2009) and can develop their own setting for the service process and experience. Customers choose specific service aspects that will shape things according to their own experiences (Heinonen et al., 2010). Under this perspective, value-in-use has been regarded as a process in which value is achieved during the interactive process itself (Heinonen et al., 2010). Creating strong, positive experiences within the customer journey will result in improvements to create unique experiences (Lemon and Verhoef, 2016). Yet, the area is challenging because of the increasing number and complexity of customer touch points. This study addresses the CE in settings where self-service technologies (SSTs) are used. SSTs are “technological interfaces that enable customers to produce a service independently of direct service employee involvement” (Meuter et al., 2000 p. 50). SSTs transformed the way service companies relate to customers (Wang et al., 2012) given that the usual “high-touch and low-tech” in service encounters has been complemented with the “high-tech and low-touch” technological interfaces (Bitner et al., 2000). The introduction of SSTs changes the interaction between service providers and customers because traditional encounters become supported or transformed by technological interfaces (Bitner et al., 2000). The increasing number of interactions with SSTs affects the way consumers experience the service encounters creating challenges and opportunities for companies (Åkesson et al., 2014). Consequently, traditional processes of service delivery can be enhanced by the use of technological platforms.

Researchers have been addressing CE from an SST perspective (Lemon and Verhoef, 2016). In particular, previous studies on SSTs have focused on variables with positive and negative impact on
the adoption and continued use of SSTs (e.g., Meuter et al., 2000). CE in this new arrangement has also been carried out to understand the perception of customers in several distinct circumstances: for example airlines, retailing, and hotels (Wang et al., 2012). Yet, Lemke et al., (2011) observe that the outcome of CE has not been the center of most of the theoretical models because the literature on CE is relatively recent (Lemon and Verhoef, 2016). There is a call to create a model in which CE is the outcome in the moment of purchase (Lemon and Verhoef, 2016). The objective of this research is to develop and empirically test a research model where CE is the outcome variable. The quantitative methods, like scales, will be used to measure this model. We propose a preliminary conceptual framework including independent variables affecting CE. The framework is developed in the context of the SSTs. It is our view that perceived usefulness (PU), perceived ease of use (PEOU), hedonic value (HV), utilitarian value (UV) and convenience (CO) will affect CE. The literature provided some scales to measure the independent and dependent variables presented in this model by a questionnaire. PU and PEOU affect directly consumer's attitude in the adoption of any new technology, which is based on the easy understanding and operating with SSTs because customers want a comfortable experience during the use of technology. See figure 1.

**Figure 1 - Preliminary conceptual framework**

The purpose of the study is to access the consumer’s perceptions in a CE context and analyze the factors that can help to improve their experience with SSTs. It then becomes possible to understand consumer’s reactions to the self-service technology efforts. Aforementioned building a meaningful CE is a key to achieve competitive advantage and satisfied customers. In terms of contribution to the literature, it is improve the understanding about the CE because as mentioned before some authors (Lemke et al., 2011; Lemon and Verhoef, 2016) asked for CE as outcome in the models because CE literature is relatively new. Clearly, this model it is in development, so during the process can be added some control variables.

EXPLORING INTERVAL-VALUED SCALES: A COMPARISON OF SCALE ATTRIBUTES BETWEEN INTERVAL VALUED AND SEMANTIC DIFFERENTIAL SCALES

Themistocleous, Christos; Pagiaslis, Anastasios; Smith, Andrew; Cristian Wagner

1Nottingham University Business School, The University of Nottingham, Nottingham, UK
2Lab for Uncertainty in Data and Decision Making (LUCID), School of Computer Science, The University of Nottingham, Nottingham, U.K. and Institute for Cybersystems, Michigan Technological University, USA

ABSTRACT

BACKGROUND

Even though crisp single-point capturing scales such as Likert and Semantic Differential offer valuable information regarding a respondent’s perceptions on a specific topic, more recently-developed scales allow respondents to record their answers by choosing an interval rather than a single point. Wagner et al., (2015) introduce interval-valued scales (IVS) allowing respondents to record their responses and capture the uncertainty contained in the response. Figure 1 provides a visual representation of an IVS. The wider the interval the more uncertain the response is. IVS survey data may for example be analysed based on summary statistics or modelled via the Interval Agreement Approach. (see Wagner et al., 2015).

Q1. How many times do you go to a restaurant in an average week?

How invasive do you feel this question is?

Figure 1. Interval valued scale (IVS)

This paper explores Interval-Valued Scales (IVS) in a marketing research context and provides comparative results of an exploratory study between IVS and Semantic Differential Scales (SDS) comparing the scales using Preston and Colman’s (2000) scale attributes: i) Ease of use, ii) Speed of use, iii) Ability to precisely record desired answers, iv) Adequate expression of exact thoughts and feelings, v) Certainty/Uncertainty with personal answers and vi) Overall satisfaction with each scale.

DATA, METHODS AND RESULTS
The study is based on a convenience sample of 122 UK adults (equally split between IVS and SDS samples). The data collection was completed through personal survey interviews using a quasi-experimental questionnaire-based approach. A questionnaire was formulated which focused on eighteen questions designed to measure the sensitivity of respondents in respect to the capture of private information by rating the questions’ degree of invasiveness (see Fig. 1). Two versions of the questionnaire were constructed for this set of eighteen questions, one utilizing IVS and one SDS. The rest of the questionnaire was common and measured: familiarity with survey scales, respondent perceptions of scale attributes and demographics.

The study contrasts IVS and SDS scale attributes (N=61 per sample) utilizing a series of independent sample t-tests including effect size and power calculations. Demographic consistency and respondent survey familiarity between samples were tested and found to hold. Independent sample t-tests show that overall perceptions of satisfaction ease of use, certainty, precision and expression with IVS equals that of SDS. ‘Speed of Use’ results marginally in favor of IVS. This result may be explained either due to SDS respondents preferring single-point scales with fewer response categories (i.e. respondents preferring an SDS with less than 10 categories used presently) (Preston & Colman, 2000) or due to curiosity using a new scale leading to excitement and positive subjective perceptions thus overrating IVS (Kashdan et al., 2004).

DISCUSSION

The contribution of this paper is the exploration of IVS for capturing respondent data in a marketing context. The initial results presented suggest that IVS is not considered more difficult than SDS and is actually considered quicker to complete. IVS has the advantage of explicitly modelling response uncertainty through the utilization of an interval. The consistency of respondent perceptions between IVS and SDS indicates new pathways for measuring consumer responses (IVS) which entail a wider range of analytical capabilities especially so for modeling uncertainty. Future studies should expand sample size and compare the statistical capabilities of IVS vs other traditional scales used in marketing research.

MONTREAL’S MULTIMEDIA AND VIDEOGAME INDUSTRY: THE SOURCES OF ITS COMPETITIVENESS AND INNOVATION CAPACITY

Tremblay, Diane-Gabrielle

Téléc, University of Québec, Montreal, Québec, Canada

ABSTRACT

INTRODUCTION AND CONTEXT

The video games cluster in Montreal emerged in the early 1990s, within the context of an affirmation culture of the Quebec Society in politics, the arts and economics. At the regional level, Montreal, can be seen as a cultural bridge between Europe and North America. In the context of a digital animation culture, related to the National Film Board, this has apparently been an important advantage, although other elements also contribute to explain the competitiveness of the Montreal Multimedia and Videogame Industry. Our paper will develop on these elements which appear to be the source of competitiveness and innovation, including an important subsidy program offered by the State, but also training institutions, as well as the relational proximity to the Hollywood entertainment culture. These all appear to be important characteristics which explain the emergence and the development of the Montreal Multimedia and Videogame cluster and its innovative capacity, which largely explains its development over recent years.

METHODOLOGY

Our research is based on many years of research in the sector, as well as on the cluster policy of the City of Montreal in general. We have conducted over 50 open-ended interviews with various actors in the multimedia cluster and sector, including governmental organizations, intermediary organizations, as well as firms and training organizations. The research is thus based on qualitative methods, mainly documentary analysis and semi-directed qualitative interviews on issues related to the process of innovation, competitiveness, as well as collaboration between various industry actors.

SOME RESULTS

The video games cluster of Montreal has considerably grown, from 400 employees in 1996, to 1000 in 2003, 5 500 in 2009, and approximately 8000 employees today (2016). Montreal accounts for 80 percent of the industry in the province of Quebec (Canada) and has become known as an important

international hub in the videogame and multimedia industry. One can now ask: what is the source of this growth?

In our view, the explanation rests partly in the fact that Montreal is a cultural bridge between Europe and North America, and has a strong digital animation culture. Indeed, firms such as Softimage and the Multimedia City have contributed to brand the city as a “low cost high creativity” culture in film as in the multimedia sector. Also the fact that the government supported the industry with financial incentives is amongst the main explanations. Also, within an increasingly American and Hollywood-based entertainment culture Montreal was apparently at the right place, with the right talents to go forward with the video games cluster, and the Multimedia City program, which financed firms to establish themselves in Montreal (by contributing to labour costs), did the rest in terms of branding the city in the Gaming and Multimedia sectors. This led to the establishment of several foreign video games firms, from France, the UK and the U.S, in the late 1990s, and in the growing popularity of video games based on Hollywood movies and other foreign licenses. The local firms who took this “Hollywood road”, such as Hexacto, Kutoka, A2M now Behavior Interactive, Airborne, Beenox faced the fastest and the highest growth among local firms.

Behavior Entertainment is a typical case of the positive influence of the Hollywood entertainment culture on the development of the cluster. Through global partnerships of video games based on movie licenses, Behavior has become the biggest independent developer in North America (later bought off by a US company however). Also, as the first and major anchor firm, Ubisoft has generated creative talent through successful video game titles and through the creation of the Ubisoft campus. Finally, given the quality of training, due to the concentration of universities and technical colleges (IT, Image and sound, and video-film programs, etc.), video game firms were thus able to be nourished by creative talent and to operate and innovate at very competitive costs in comparison with the US and Europe. Montreal is more and more recognized as a “low cost high creativity” culture in the gaming and film sector and this has been mentioned in many of our research interviews. Over the years, other firms have joined the first anchor firm; for example Electronic Arts (from California), Warner Bros Interactive and THQ, from LA, Eidos, from UK, and Square Enix from Japan have created many jobs over recent years.

A deeper investigation into the Montreal’s cluster seems to indicate that tolerance and the openness of society as well as the quality of urban life and the low cost of rent in have had a positive impact in attracting and retaining local and foreign creative talent. This is important for various sectors of the so-called “creative economy” and appears to partially support the thesis of Florida and

---

1 Such as, Gameloft, Microïds, Bug Tracker, Electronic Arts, Eidos, DC Studios, Babel Media, Javaground, Cyanide.
al. (2005), who consider that tolerance and openness are important features encountered in the Quebec society and contribute to innovation and competitiveness.

Our research underlines the importance of knowledge and cooperation in the development of a creative cluster. It stresses the sources of the dynamism of the sector which rest in knowledge transfers and exchanges within the cluster. It shows that proximity of actors and the creative dynamism of the human resources have been essential factors in the development of the multimedia cluster. The value of our research is based on the identification of these factors favouring the development of clusters in general (training, proximity, local embeddedness, etc.) and their contribution to the Creative Ecosystem which the Multimedia City and Gaming industry represent in Montreal.

As concerns practical implications, the research contributes in developing more efficient policies for clusters and ecosystems in the multimedia, IT or other sectors. The research can also help creative firms understand how they can use the cluster theory and policies to support their creative activities and be more innovative. The local entrepreneurs as well as the Quebec government, with an important financial program, also are important actors, and this model of public intervention appears to have been replicated in other North-American regions as a way to attract firms and develop a competitive advantage.

FARM BUSINESS RESOURCES, GOALS AND STRATEGIES: IMPLICATIONS FOR ACCELERATING THE CERTIFICATION

Tselempis, Dimitrios; Karipidis, Philippos; Pavloudi Alexandra

Department of Agricultural Technology – Agricultural Economics, Alexander Technological Educational Institute of Thessaloniki, Thessaloniki, Greece.

ABSTRACT

Research findings indicate that the public authorities, the marketers, and the certifiers face serious impediments in their attempts to implement the Quality Management Systems (QMS) in primary food production to be dispersed. These impediments are mainly connected with the ineffectiveness of the supply side to sufficiently respond to the demand for certified products, especially in the case of small farm businesses, and with the weaknesses of the public policy to effectively mitigate the problems leading the supply system to meet the expectations of consumers and society for higher quality products. Thus, some opportunities for the farm businesses and the food marketers can be lost due to the inefficient exploitation of the farm businesses resources and due to the low growth rate of the certified products market. As a result, some welfare and quality of life losses can arise.

Many researchers explore the implementation of QMS by farm businesses worldwide. They analyze the farmers’ certification and his related decisions, and they compare certified with non-certified farm businesses, by incorporating some factors of the external and internal business environment in the exploration. As far as we are concerned, there are no studies examining the role of the resources of the farm businesses and their strategies on farmers’ certification decisions. This leads to incomplete interpretations and to the loss of some information which can be useful to farmers, marketers, certifiers, and public authorities.

The present study examines how certain farm businesses resources and strategies impact on their decision to implement QMS and to become certified. Particularly, this paper focuses on two choices that affect the farmers’ decision: 1) the time they decide to be certified in relation to the others farmers’ decisions and 2) the type of the QMS standard (Organic, AGRO 2 - a national Greek standard- and GlobalGAP) they choose between a public and private standard.

A survey was conducted among farm businesses producing fruits and vegetables in Central Macedonia–North Greece. Based on the collected data, two discrete choice models are estimated: an ordered logit model for the time the farm businesses implement a QMS, and a binary probit model for the selection of the type of QMS standard, between public and private. The results indicate that two out of the seven factors connected with the resources accelerate the certification. Specifically, the farmers’ knowledge about the institutional environment, for example the mandatory regulations,
impacts positively on the acceleration, while farmers’ insufficient technical knowledge impacts negatively on it. Regarding the farm business strategies, has been found that the differentiation, imitation, selling in local markets, and buyer dependency strategies, impact positively on the acceleration of certification. It has been also found that the choice of a private standard relates to the differentiation, buyer dependence and vertical integration strategies and to the technical insufficiency of farmers, while the choice of a public standard is connected to their special education, implying a higher dependence of farmers’ decisions on public policy measures.

These findings suggest for public authorities the need to take into account the level of available internal resources when they design the certification-related public policy mix, in order to avoid a divergence between the level of the existing farm business capacities and the requirements for the implementation of QMS. Also, the public policy should review its role when the farmers’ decisions are not taken in alignment within the policy goals and strategies, but they are strongly pushed by the market forces in a way that do not meet the needs of the society. Furthermore, the results regarding the factors affecting the choice of QMS standard, between public and private, imply the effectiveness of the public policy in motivating farm businesses to be certified and at the same time, the arising of the private governance of food certifications.

THE EFFECTS OF CEO NARCISSISM AND CORPORATE BRAND REPUTATION ON FIRM PERFORMANCE

Turner, Karynne
Department of Business and Management, LUISS Guido Carli University, Rome, Italy,

ABSTRACT

The attributes of the Chief Executive Officer (CEO) have a significant influence on the actions of the organization and, ultimately, firm performance (Chatterjee and Hambrick, 2007). Recently, there has been growing interest in one particular CEO attribute, i.e., narcissism and how this individual characteristic affects actions taken by the firm and the outcomes achieved. Narcissistic CEOs have been described as “having an inflated self-concept that is enacted through a desire for recognition and a high degree of self-reference when interacting with others (Resick, 2009: pg. 1367).” Prior research has found that CEOs with a more narcissistic personality make riskier decisions by changing the company’s strategy more often (Chatterjee and Hambrick, 2007), making acquisitions more frequently and of larger targets (Chatterjee and Hambrick, 2007), adopting discontinuous technologies (Gerstner, et al., 2013), and expanding international business activities (Oesterle, et al., 2016). The results of previous studies show that by pursuing decisions with greater risk and involving the firm in wide-ranging efforts, the actions of narcissistic CEOs lead to fluctuating firm performance (Chatterjee and Hambrick, 2007) and diminishes the positive affect of various firm activities, e.g., Corporate Social Responsibility (CSR) (Petenko, et al., 2016) and Entrepreneurial orientation (Engelen, et al., 2016), on performance.

While these prior studies have provided valuable insight, the strong emphasis on the organizational actions taken as a consequence of the narcissistic CEO has not added to our understanding of the relationship between CEOs who seek personal affirmation, admiration, and attention and the corporate brand reputation. Corporate brand reputation signals the status of an organization and influences the actions of capital markets, investors, consumers, and applicants in the job market (Fombrun and Shanley, 1990). Due to stakeholders’ use of corporate brand reputation as a means to compare and contrast competitors, favorable reputations have a significant effect on competitive advantage and organizational performance (Roberts and Dowling, 2002). Managers actively work to construct favorable corporate brand reputations through the actions the firm takes and the information selectively released to the media and public. Yet, the literature suggests that narcissistic CEOs spend time focusing on how to enhance their own image rather than on achieving organizational goals (Resick, 2009). In this regard, the attention-seeking CEO likely becomes a focal point for the corporate brand. However, no research to date has examined the relationship between...
the narcissistic CEO’s personality and corporate brand reputation. This study fills the gap in the literature by investigating how CEO narcissism influences the effectiveness of corporate brand reputation on firm performance.

We conducted our study using data from U.S. services firms. Firms in the service sector rely on relationships as a key inimitable resource and the corporate brand reputation is fundamental for distinguishing competitors. Our dependent variable was return on assets (ROA) (total assets/total revenue) based upon data from the COMPUSTAT database. COMPUSTAT was also the source for our measure of CEO narcissism, the rank of CEO total compensation (salary + bonus)/rank of next highest executive’s total compensation (Chatterjee and Hambrick, 2007). Corporate brand reputation was measured using the Harris Interactive Assessment on a scale of 1 to 100. The Harris Interactive Assessment conducts over 23,000 online interviews with adults over the age of 18 regarding their opinions of the best and worst companies along six dimensions: 1) social responsibility, 2) emotional appeal, 3) product and services, 4) vision and leadership, 5) financial performance and 6) workplace environment. Our initial findings show that in the services sector CEOs with a higher narcissistic personality trait have a more negative effect on ROA. We attribute this result to the likelihood that narcissistic CEOs do indeed spend more time and resources than less narcissistic CEOs to promote themselves and not the firm. In addition, these CEOs likely distract from the corporate reputation by diluting stakeholders’ attention. However, we also found that the interaction of brand reputation and CEO narcissism has a positive effect on ROA. Thus, firms with stronger corporate brand reputations are able to compensate for the behaviors of the narcissistic CEO.

ABSTRACT

The crisis is not an uncommon phenomenon in world economies last decades. Thus, some researchers examine its impact on certain issues of consumer behaviour. For example, research findings indicate that consumer behaviour during the economic crisis differs than that in good times (Griffith et al., 2015; Hampson & McGoldrick, 2013; Kaswengi and Diallo, 2015; Kaytaz and Gul, 2014). Engel et al., (1995) report that consumers adjust their lifestyle to new economic situation, while Schiffman and Kanuk (1994) conclude that the consumption decisions are influenced by perceived risk, consumers become more careful in their choices, devote more time to search products and look forward to the greatest benefits for their limited available income.

It is apparent that the impact of economic crisis is not sufficiently understood if the investigation is limited to consumer behaviour issues without a deeper understanding of consumer motivations. The marketing choice models adopted in a lot of consumer behaviour studies tend to overstate the importance of product attributes and ignore the personal connections consumers make with products at higher levels of abstraction (Phillips and Reynolds, 2009; Walker and Olson, 1991). The Means-End Chain (MEC) approach is adopted in the analysis of consumer behaviour at different levels when evaluating their purchase options choosing actions that produce desired consequences and minimize undesired consequences (Pieters et al., 1995; Khalifa, 2004). It posits that attributes derive their relative importance from satisfying (functional) consequences, which in turn, derive their importance from satisfying higher-order personal values. This theory compared to other consumer behaviour analysis methods, provides a better understanding of consumer incentives, performing a hierarchical model of cognitive consumer structure (Gutman, 1982; Xiao et al., 2014).

This work is the outcome of a preliminary study focusing on food consumer behaviour during the economic crisis in Greece, which explores the consumers’ preferences related to food and retailing service attributes, the consequences and personal consumer values by adopting the Means-End Chain theory. The laddering technique is used as a means of understanding consumers’ motivations for food product and retailer choice. In a first step a literature review is conducted to identify food product and retailer characteristics, connected with the consequences and the consumer personal values. In a...
second step, the laddering procedure is developed into three steps. 1) Elicitation of differences among products/brands: four respondents are asked to make comparisons between selected basic food items and retailers, 2) in-depth interviewing with the same persons are conducted and 3) analysis of the data and construction of a Hierarchical Value Map is conducted which can help to segment food consumers in groups having similar personal values.

Keywords: consumer behaviour; personal values; economic crisis; retailing; means-end chain; laddering

RECENT DEVELOPMENTS IN THE HYDROCARBON ENERGY MARKETS IN THE EASTERN MEDITERRANEAN

Vasilopoulou, Panagiota

Department of Political Science and International Relations, University of Peloponnese, Corinth, Greece

ABSTRACT

The political-economic situation in the Eastern Mediterranean in the energy sector is changing rapidly. The political change in Egypt after the Arab Spring, the war in Syria, the emergence of Turkey as a new force in the region, the ever-existing tensions between Israel and Palestine, the turbulent relations between Turkey and Israel, the Cyprus issue, which remains unresolved between Cyprus and Turkey, are factors that lead to the redistribution of forces and the disturbance of the balance in the region. The purpose of this article is to record the current situation, to explore new balances between states and to highlight potential bracings and new opportunities through reviewing the literature of recent years.

The region’s energy map is possibly going to be re-adjusted in the prism of the possibility of the presence of natural gas in the Eastern Mediterranean region (the area close to Egypt, Israel and Cyprus). As a consequence, a change in the position of these countries in the global energy community, from peripheral to prominent stakeholders is eminent. Consequently, geopolitical and energy pressures create new opportunities and challenges for all those involved in the region. The energy sector is directly linked to the social, economic and political situation of the states concerned (Tagliapietra, 2013: 4)

The discovery of new oil and gas reserves, in effect, forces all parties involved to consider both the relationship between them and the new balances they are developing.

• Recent developments in the Mediterranean: Cyprus, Israel and, to a lesser extent, Greece, are (or can be) the new protagonists in the field of energy. The relatively recent discoveries of two new gas fields (Leviathan and Tamar) off the coast of Israel in 2009 and the possible existence of oil, create a new dynamic for the region's energy security.

The republic of Cyprus, with the discovery of the Aphrodite plot in the EEZ in December 2011, some 34 kilometers west of the Israeli field, provides a new perspective in its growth prospects. This discovery came at a difficult time for the Cypriot economy, while its membership as an EU member provides the necessary support for the exploration of the field.

Greece started extracting oil in 1981, in small amounts, from the Thassos deposits in the northern Aegean sea. New research, shows what there might be significant reserves in the Ionian sea, South Crete and Kastelorizo. The latter area, may be problematic as it is very close to the Turkish coast. (Source: Natali, 2012). In addition, Greece could act as a transit hub for gas to Europe (Tagliapietra,
2013:19-20). In November 2012, Israel, Cyprus and Greece signed an agreement to set up working groups to discuss the development of an Energy Corridor in the Eastern Mediterranean with a view to allowing exports of gas from Israel and Cyprus to Greece and from there to Europe. (Stavris, 2012).

• Energy concerns in the EU- Europe "sees" a possible way out of its energy dependence on Russia. With the ever-increasing economic growth and declining energy production, the energy needs of the EU Member States are expected to increase significantly over the coming years. According to the European Commission, 57% of gas and 82% of oil were imported for 2008, and these needs are expected to increase significantly by 2030. Demand for gas has been increasing as opposed to oil. Algeria and Egypt are the most likely to export Liquefied Natural Gas (LNG) in the EU. Italy possesses small deposits, it only 80% of its energy needs is covered. Spain and Portugal show increased demand for gas and, due to their geographical location, countries such as Greece, Slovenia and Turkey are more dependent on Russia for gas. Greece’s natural gas needs were covered by Russia in a rate touching 80% of its gas energy needs and the agreement with Gazprom was extended until 2040. (Winrow, 2009).

• The United States, albeit geographically remote, is seeing such a positive development as its strategic allies gain a more prominent position in the field of global energy.

• The suspension of Ukraine’s gas supply in January 2006 over a price dispute, combined with new long-term agreements for gas supply to European countries such as France and Italy were consider by some as evidence that Russia was going to use gas and oil production but also its pipeline accessibility to gain more political influence. Others, mainly in Western Europe, argue that the fact that Europe remains Russia’s largest energy market, and hence the largest source of foreign revenue, has led Russia to pay more attention to dealing with EU countries.

Russia-Turkey relations are at a marginal point and at the moment there are insufficient data on the outcome of the case. (Ratner et al 2013: 15)

CHALLENGES

Access to resources: High costs and advanced technology are needed to make them accessible. Gas extraction: It is necessary to build pipelines, liquefaction facilities, facilities and hinterland that are exposed to terrorist activities, the definition of territorial waters, the attraction of technologically advanced mining companies, the provision of political support within each Member State. Terrorist and civil or non-conflicting actions, ISIS and turmoil caused by the Arab Spring are important factors for exploiting or not (if applicable) the available oil or gas reserves. (Stavris, 2012)

TYPES OF ENERGY

Global and national business theories and practice: bridging the past with the future
The term “energy resource” refers to any natural resource that provides energy. Energy resources are distinguished into: **Renewable Energy Sources** (RES) that include solar, wind, geothermal, hydropower and biomass energy. Renewable energy sources are non-exhaustible and there are unlimited in the environment, and their production does not burden the environment. **Non-renewable or Conventional forms of energy** that mainly include oil, natural gas and coal. Practically, Non-renewable or Conventional forms of energy refer to the planet’s mineral wealth, which is currently used to produce energy and results in quite damaging consequences for the environment and the climate of the planet. The energy which is produced by **nuclear fission** (**nuclear energy**) is otherwise referred to as an alternative form of energy, and is, in reality, the energy, which is released when the atomic nuclei are transformed. (Source: Koroneos Ch., 2012: 11-46)

JOBS SATISFACTION IN THE HOSPITALITY INDUSTRY. A CASE STUDY FROM GREECE

Vasilopoulou, Panagiota

Department of Political Science and International Relations, University of Peloponnese

ABSTRACT

In a globalized, highly competitive environment, service-providing enterprises such as the ones within the hospitality industry, have come to realize that enhancing service quality and increasing customer satisfaction are crucial to their survival. Given the fact that service quality depends on employee performance, they are compelled to create customer-centric strategies. Concepts such as job performance, job satisfaction and job burnout, are directly linked to the degree of commitment to work and the quality of work. Given that the quality of services depends on the performance of first-line employees (Zeithaml, Berry and Parasuraman, 1988; Schneider, 1980 in Karatepe et al.) and that they handle approximately sixty five percent of customer complaints, the industry should focus on the critical role of front-line workers and the creation of customer-centered strategies. Factors that affect job performance are apart from the wages, (long) hours of work, the working environment, the sense of security, employees’ involvement, the sense of purpose of the work, any benefits included in the pay system, the culture of the enterprise. (Boshoff and Allen, 2000; Kotler, Bowen and Makens, 1999; Rust et al., 1996 in Karatepe, O., et al.).

JOBS SATISFACTION

"The pleasant emotional state that results from the evaluation of the work of the individual, as well as the attainment or the facilitation of achievement of the individual’s work goals” is described to be job satisfaction (Locke 1969, p. 316 in Karatepe et Al). The subject has been extensively studied in connection with other issues such as empowerment, role conflict, role ambiguity, rewards, organizational commitment, and the rate of staff renewal (Brown and Peterson, 1993 : Liden, Wayne and Sparrow, 2000: Hartline and Ferrell, 1996 in Karatepe et al). A limited number of studies show a correlation between job satisfaction and service quality. For example, Hartline and Ferell (1996 in Karatepe et al) found a significant positive correlation between job satisfaction of frontline workers and customer perceptions of hotel quality.

ESTIMATION (OR SELF-ESTEEM) FROM WORK
Work self-esteem has been described as the process of judging the work of an individual as it results from a self-assessment and feelings about work by the employ (Washington, Feinstein, & Busser, 2003 in Byung-Gook Kim (2014). There are strong indications that employment is the key determinant of job satisfaction (Jung & Lee, 2010: Byung-Gook Kim (2014)).

WORK/ JOB BURNOUT

The concept of burnout has been growing more and more so in recent years, and has been extensively studied by psychologists, sociologists and management specialists as they have recognized its significant impact on the individual, the organization and more generally in the economy and production. "Burn out" means "progressively extending from the interior to the point of charring" (Maslach & Jackson, 1984 in Theophilus, 2009).

EFFECTS OF THE HOTEL ENVIRONMENT ON EMPLOYEES

A key element of the hotel work environment for the continuous and unhindered employee job performance is the fact that certain conditions should be met that could be summarized as follows:

- Work environment that provides a sense of security for both the physical integrity of the employees and for safeguarding and maintaining their job.
- Existence of premises in order for the employees to meet basic individual needs
- Technical specifications and the provision of equipment and materials designed to facilitate work and increase employees’ efficiency
- Provision for the correct and employee-friendly appearance of employees

The employees’ dissatisfaction with their work environment may lead to behaviors that are either detrimental to the person himself or, more often than not, damaging to the business. (Lytras, 2004: 140) According to Laloumis (2002:168) the working climate or atmosphere is a significant job satisfaction factor. This refers to a certain space or area but it includes the aesthetic and emotional environment as well. The emotional environment is mainly about the emotional disposition of the people in the area.

CASE STUDY

The seaside, 4 * resort hotel complex, holds a capacity of 225 rooms, operates 12 months of the year and employs 50 employees on a year round basis in all departments. During high season, there are approximately another 50 employees, occupied on a temporary or extra basis.
The purpose of the survey is to investigate the levels of job satisfaction that the employees derive from their occupation. In order to achieve the above, a primary quantitative survey was designed using a questionnaire consisting mainly of closed questions (a total of 25 questions, 4 open and 21 closed questions).

The survey involved a total of 25 employees, accounting for 50% of all year-round employees. The results were processed with KNIME software.

An overall assessment of the responses shows that although the firm is in a decline phase, staff shows high rates of job satisfaction, a high degree of loyalty to the firm, and no interest in seeking employment with another employer. The is strong correlation between the years of employment and the satisfaction rate, the level of education and the years of employment, a ratio of 52% female and 48% male employees, 75% of the personnel is 35 years old or older, 40% hold a University or Technological Educational Institute degree, 72% have been employed by the firm for more than 10 years, 70% find their job quite meaningful/fulfilling, and 50% feel that they are being moderately paid whereas 12.5% feel that they are being underpaid.

FEAR OF TERRORISM AND THE COSMOPOLITAN VALUE SYSTEM REFLECTED IN THE TOURISTS’ PERCEPTION OF COUNTRY IMAGE AND TRAVEL DECISION

Vereb, Vanda1; Nobre, First, Helena2; Farhangmehr, Minoo1

1University of Minho, UMINHO, Braga, Portugal
2University of Aveiro, Aveiro, Portugal

ABSTRACT

While tourism is one of the most effective ways to build up (Thompson and Tambyah, 1999) and express one’s cosmopolitan orientation (Alden et al., 2006), it is also a prime target for terrorism (Butler, 2014; Goldma and Neubauer-Shani, 2016). This makes tourism a perfect test field to investigate how the cosmopolitans’ desire for openness and freedom (Cannon and Yaprak, 2002) clashes with the recent restraining fear of terrorism (Araña and León, 2008), and understand how these competing drives impact the worldview, destination perception, consumption preferences, and final consumer choices of the global travellers.

Most previous studies conceptualized and studied cosmopolitanism as a stable orientation rather than a context specific state (e.g., Riefler et al., 2012), while others argue for a gradual transition in cosmopolitan orientation (e.g., Thompson and Tambyah, 1999) but without solid empirical validation. This study is an attempt to address the research gap, suggested by Riefler et al. (2012, p. 300), to test empirically if “major shock” (like a terrorist attack or the fear of it) “can dampen a cosmopolitan orientation, while fuelling ethnocentric tendencies”. Contemporary societies are moving in the direction of so-called new racism, associating the fear of terrorism to race (Koskela, 2010) and living in constant panic (Europol, 2016). As a direct result of the fear of terrorism travellers are drastically changing their travel preferences by avoiding destinations that are culturally too different (Araña and León, 2008), or traveling in total isolation (Clancy, 2012; Yoon & Shafer, 1997). Will this tendency, make also cosmopolitans rethink their value of cultural tolerance, change their perception of a destination, and amend their travel habits?

Cosmopolitan values, like risk taking, do affect tourism behaviour (Lepp and Gibson, 2008). Some studies argue that risk aversion (fear, in this case) directly affect personal values that influence destination perception and final travel decision (Alvarez and Campo, 2014; Sarman et al., 2015). While others place fear as a moderator between perception and final decision (Woodside and Lysonski, 1989). The aim of this study is first to explore how fear exactly changes individual values, perception and final decision in the case of global travellers; and then validate the findings through national tourism and global terrorism statistics.
The findings will contribute by not only mapping a more informed profile of cosmopolitan consumers, but also providing a valuable insight for tourism professionals on just how diverse the expectations of their cosmopolitan clients are. Furthermore this research sets to develop strategies on how marketers and policy makers can build a destination/country image that keeps up with the current realities of global tourism.

CORPORATE GOVERNANCE, CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE SOCIAL PERFORMANCE

Vinarski -Peretz Hedva

Department of Political Science and Department of Health System Management, The Max Stern Yezreel Valley College, Israel

ABSTRACT

This paper is aimed to add a glance at the development of corporate governance in Israel and the legal amendment acted to facilitate the adoption of corporate social performance (CSP) among firms and corporation. Scholars have challenged to understand what constitutes corporate social performance (CSP) and establishing the numerous internal and external factors affecting firm behavior (Karassin and Bar-Haim, 2016). In this regard, the link between corporate governance and corporate social performance is well known it the literature. However, a fundamental gap exists in our knowledge of what specifically drives CSP and the role of institutional structures in influencing CSP at the level of the firm. The interrelationship between corporate governance and social corporate performance in Israel discussed with regard to the legislative amendments.

INTRODUCTION

Recently, as the interest in corporate social responsibility (CSR) adopted by various institutional actors and firms, its shift 'the way we think about and understand the relationship between firms, their institutional environment, and important stakeholders, such as communities, employees, suppliers, national governments and global society' (Ioannou and Serafeim, 2010). As the social awareness increased, CSR become more and more vital and stakeholders have recognized that firms expected to benefit rather than strengthen their financial assets and obey the law. Clapp and Rowlands, (2014, 42) have noted that the idea of CSR is to "promote social and environmental goals and to minimize any potential social and environmental costs associated with their business activities. The rationale behind CSR is that firms themselves are best placed to ensure compliance and implementation and to monitor progress toward their own environmental and social performance targets and will do so because it makes good business sense" (2014, 42).

As part of CSR, the corporate social performance (CSP) is away to making CSR applicable and putting it into practice (Maron, 2006; Huang, 2010). CSP explained as the operationalization of socially responsible activities (Blanco, et al., 2013).Researchers have studied corporate social performance in CSR as parameter to measurable organizational achievement (Hafsi and Turgut, 2013). A successful CSP create a condition or circumstance that puts the firm in a favorable or superior position and is
argued to be an effective means enhancing overall reputation, and, that may add advantage and benefit the financial performance of a firm in the long run (Orlitzky, et al., 2003). Regard to the management responsibility in the firms, Lin-Hi and Muller, (2013) have noted that the accountability of corporate managers to multiple stakeholders harmonizes with ongoing analysis of the impact of CSR strategies on economic, social, and environmental concerns and strategies aimed at doing better.

In order to understand what drives CSP among firms, studies focus on what motivate or impede economically, socially, and environmentally responsible behavior in firms (Matten and Moon 2008; Aguinis and Glavas 2012). Ioannou and Serafeim, (2010) have classified four distinct segment of institutional structure in a country that foster firms to engage in socially responsible behaviors: 1) legal institutions, 2) political institutions, 3) labor market institutions and 4) capital market institutions and discuss the mechanism through which the specific institutions may influence CSP among other drivers. They have suggested that 'legal institutions play an important role in facilitating the corporation’s engagement with its key stakeholders as well as regulating to an extent the relationships among corporate actors within the same industry' (p. 11). Based on their work, this paper is aimed to add a glance at the development of corporate governance in Israel and the legal amendment acted to facilitate the adoption of corporate social performance (CSP) among firms and corporation. The link between corporate governance and corporate social performance is well known it the literature (Huang, 2010). However, a fundamental gap exists in our knowledge of what specifically drives CSP and the role of institutional structures in influencing CSP at the level of the firm (Ioannou and Serafeim, 2010).

The findings indicate that, in the Israeli case the current policy does not have binding legislation or systematic doctrine on the subject of mandatory reporting regarding CSR activities, duties and principals. The corporate governance in Israel is currently experiencing significant and rapid change in respect to corporate governance regulation and practice (Shaham and Schapiro, 2011), however, "...the ambiguity of the concept of CSR combined with public ignorance about the effects of processes, products and services for society and the environment have left each corporation the freedom to choose the proper amount of transparency and action needed” (Nathanson and Gazala 2014; 4) Practically speaking, for successful implementation of CSR and CSP, more policies and regulation, is inevitable.

DETERMINANTS OF YOUTH’S TRUST IN THE RETAIL BANKING SECTOR IN TURBULENT TIMES

Viterbo, Marilia Ribeiro; Azevedo, António J. A.

School of Economics and Management, University of Minho, Braga, Portugal

ABSTRACT

Trust is a determinant for the success of relationships building particularly among young adult customers in a period of financial crisis. The proposed model is a simplified version of the European Customer Satisfaction Index (ECSI) applied to the banking sector, since it includes as predictors of satisfaction (image, perceived quality, expectations and perceived value (price), trust (satisfaction as predictor), loyalty (trust as predictor) and word-of-mouth. The data was collected by a questionnaire realized to 491 individuals. The results suggest that only price is not a predictor of satisfaction. This study also concluded that to build trust among young people, is crucial that bank meet their expectations. The bank must be transparent and their products and services must be reliable. The determinants of loyalty are trust, satisfaction, easiness of access (convenient location), stability in the market and good agencies facilities (tangibility).

Keywords: Banking sector; crisis; trust; youth; European Customer Satisfaction Index (ECSI)

INTRODUCTION

Nowadays the economic realities are increasingly uncertain due to multiple financial collapses, thus producing a feeling of mistrust regarding the banking institutions especially after the period of 2008-2009 (Shim, Serido and Tang, 2013; Chaudhry and Jayasekera, 2014). This paper aims to study the antecedents and consequences of trust and loyalty in retail banking sector among the youth target segment.

The retail banking is traditionally characterized by long-term relationships which increase the propensity for loyalty (Beerli, Martin and Quintana, 2004; Yognathan, Jebarajakirthy and Thaichon, 2015). Berry (1995) stressed that the idea of making gains through the loyalty and satisfaction of customer needs was common by the early traders, being this as old phenomenon as the history of trade (Grönroos, 2006). Although Relationship Marketing is a truly studied theme, there is no consensus regarding their concept definition: “It’s all about to attract, maintain and improve the relationship with customers in multi-service organizations” (Berry, 1983, p.25).
The proposed model is a simplified version of the European Customer Satisfaction Index (ECSI) comprising the predictors of satisfaction (perceived quality, expectations, image and the perceived value) and its consequences (trust, loyalty and WOM-word-of-mouth). The ECSI model was developed and applied to the bank sector (Ball, Coelho and Machás, 2004). This paper explores a gap in literature regarding the decision-making behavior of the youth target segment in retail banking after the financial crisis period. The decision of opening a bank account occurs at 16-18 years old and it is fostered by the emergence of new needs such as pocket-money, the purchase of the first car, or the use of credits to studies. Therefore customer’s satisfaction and trust emerge as key concepts in building long-term relationships.

METHODOLOGY
An online survey was answered by 491 respondents (average age= 23.93; SD=4,25). 65% of the respondents were women. 48.5% of sample stated to have a monthly income lower than 300€, while only 39.5% earn more than 500€/month, probably because 60.3% unemployed or students.

DISCUSSION OF RESULTS
The majority of the respondents (55.4%, N=272) stated that the preferred bank is Caixa Geral de Depósitos (CGD), followed by Santander Totta or Millennium BCP (9.4%). The average time of the customer-bank relationship was 7.78 years (SD=6,00). 86% have a debit card, use the internet banking channel (38%) or mobile apps (18%).

The majority of banks have a negative image score (below 5 points). The CGD has the best image score (M=7,34; SD=2,08). As a possible explanation for the negative image 54% respondents answered “I do not trust in this bank” and 40% said “this bank is not stable and solid in the market”.

A multiple linear regression (F<0,001) (stepwise method) was performed in order to assess the following significant predictors which explain 76% of the trust variance amongst the respondents who mentioned that CGD is their bank: product and services reliability (beta=0,474); efficient and high quality services (beta=0,173); solid/well established in market (beta=0,141); transparency (beta=0,125).

On other hand, satisfaction is a predictor of trust ($R^2=0,601$). The average total score of trust ($M=4,79$; $SD=0,872$; in 1 to 6 Likert scale) is very low. Authors also verified that trust is positively correlated with loyalty ($R^2=0,554$) and WOM ($R^2=0,764$). These findings confirm the conclusions of and Ball, Coelho and Machás (2006).

CONCLUSIONS AND PRACTICAL IMPLICATIONS
By analyzing the ECSI applied to the banking sector (ECSI Portugal, 2016) the objectives of this study were accomplished through the assessment of the determinants of satisfaction, trust and loyalty. The results only rejected the hypothesis that perceived value would be one of the predictors of satisfaction which the not consistent with contributions from Fornell, et al. (1996) and the ECSI Portugal (2016).

This paper provides some recommendations to bank managers. It is crucial for young people that the bank will meet their expectations; the quality and the convenience of agencies’ location are also key success factors. Young customers value innovative strategies and customized communication channels for building trust and still showing a preference for reliability, transparency and clarity of information.

Recent studies also confirmed that banking customers aged between 18-35 years old are the most active when it comes to underwrite new financial services. The conclusions drawn on the “actions” of young people tend to dictate the needs for change in the banking channels, thus eventually also affecting the older individuals preferences.

THE IMPORTANCE OF SOUND IN THE GAMING AREA OF A CASINO

Wannenburg, Elizma; Drotsky, Tonie; De Jager, Johan

Faculty of Management Sciences, Department of Marketing, Logistics and Sport Management, Tshwane University of Technology, Pretoria, South Africa

ABSTRACT

INTRODUCTION
When entering a supermarket, consumers are faced with various consumer products that varies in size, colour, weight, volume, smell, taste, touch, quantity and style to name a few. These elements are known as product attributes. Casinos are in a sense similar to supermarkets seeing that visitors to the casino are faced with hundreds of slot machines that differ in colour, theme and sound. A reporter at the Baltimore Sun also indicated that time and technologies are catching up with traditional slot machines, which don't hold anywhere near the same appeal for younger players as they do for their parents. In an interview with the former gaming director of the Sun International casino group in South Africa, Mr Whitcher (2016) he agrees with Barker (2015) and pointed out that casinos need to stay abreast of the new technological developments in the gaming market in order to satisfy the needs of new slot machine gamers.

RESEARCH METHODOLOGY
The research question can be asked: “Does sound have any influence on gamers’ slot machine selection? To answer this question, the study intends to explore the importance of music in the gaming area as well as sound as slot machine attribute. For the purpose of this paper a hypothesis was formulated:

Hypothesis 1
H_0: No significant differences exist between male and female slot machine gamers regarding the way they perceive sound as a slot machine attribute.

H_1: Significant differences exist between male and female gamers regarding the way they perceive sound as a slot machine attribute.

The primary objective of this paper is to determine whether sound, as slot machine attribute, play any role in the gamers’ slot machine selection process. The secondary objectives of this paper are to determine whether slot machine gamers are influenced by the sound effects found in the gaming area of the casino and to determine if slot machine gamers would enjoy playing on slot machines with new
pay-out sound effects. Cluster sampling method was used to select six Sun International casinos in South Africa. Personal interviews and self-administrated questionnaires were used in this study. Field workers conducted structured interviews with 630 gamers in the gaming areas and 10 regular slot-machine gamers at each of the six selected casinos were asked to complete a self-administered questionnaire in an enclosed environment. The purpose of the self-administered questionnaire was to determine whether colour, theme and sound, as slot-machine attributes, could be seen as important slot-machine attributes or not. The researcher used a conjoint analysis, whereby music along with different slot machine themes and colours were combined to determine if sound effects are amplified when visual stimuli are added.

RESULTS AND RECOMMENDATIONS

The data were captured on an Excel spread sheet and then statistically analysed with the SPPS version 20 software program. Chi-square test in Frequency distribution tables were used to establish the levels of agreement and disagreement between male and female gamers. The results indicated that Ho: \( p > 0.05 \) was accepted for nine variables and one variable was rejected. The rejected variable indicated that male and female gamers perceive sound as a slot machine attribute differently. The self-administered questionnaire used in this paper was statistically analysed by means of a conjoint analysis. Sound as a slot machine attribute was rated the most important slot machine attribute and the Las Vegas melody followed by the fantasy melody were most enjoyed by slot machine gamers. It is recommended that slot machine manufacturers and casino management should take sound effects into consideration when designing or acquiring new slot machine games. The sound effects of the slot machines could influence the gamers and that can lead to approach or avoidance behaviour by the gamers. It is further recommended that slot machine manufacturers should: create pay-out sound effects that sound realistic, musical melodies can also be added to the pay-out sound effects; the option to control the sound levels of the pay-out sound effects can also be considered. In conclusion, sound is a piece of art that enters in the ears of the gamers, straight to the heart of the gamers.

THE IMPACT OF THE SUBSIDIARY’S INTRAPRENEURIAL CAPACITY ON THE EVOLUTION OF MNC’S STRATEGIC ORIENTATION IN THE EURO-MEDITERRANEAN REGION

Yahiaoui, Dorra¹; Chebbi, Hela²

¹Kedge Business School, France
²EDC Paris Business School, France

ABSTRACT

THEORY

The last two decades, a growing number of European multinational corporations (MNCs) have established subsidiaries in the south-Mediterranean countries, especially in North Africa. Few researches were made on how such European MNCs are controlling and managing their operations in these countries (D’Iribarne, 1987; Franck, 1997). However, less is known about the evolution of the strategic orientation of the MNC operating in this region.

This dominance of French FDI in Tunisia is partly an outcome of history and culture. According to Zghal (2000), France’s colonisation of Tunisia has left behind cultural and institutional influences which contribute to enabling French FDI today. There are, for instance, similarities in several aspects of Tunisian and French employment law (Zghal, 2000; Yahiaoui, 2015). Similarly, certain characteristics of French management which were developed in the colonial period can be observed in contemporary Tunisian organisations. These include bureaucratic forms of control, a relatively high power distance between managers and workers, the importance of qualifications from the grandes écoles in recruitment and promotion, and the presence of strong trade unions (Yahiaoui, 2015). We add the influence of the French education system on the Tunisian one (Yagoubi, 2003) and the presence of many French schools (around twenty) in Tunisia. All of these historical and cultural factors give French FDI a unique advantage in Tunisia.

This paper aims at exploring the evolution of the MMNC’s strategy in Tunisia. Particularly, it focuses on the impact of the subsidiary and its intrapreneurial strategy on this evolution. According to Perlmutter (1969) and Heenan and Perlmutter (1974), MNCs, depending on their stage of internationalisation, follow one of these four different strategic orientations: ethnocentrism (the dependence of subsidiaries on the parent company), polycentrism (decision-making autonomy of subsidiaries), geocentrism (subsidiaries as complementary to the parent company) and regiocentrism (decision-making, control and appraisals are carried out at regional level). According to previous research (D’Iribarne, 1987; Franck, 1997), French MNCs have tendency to prefer the ethnocentric
orientation. According to a survey carried out by Poirey (1997) on 35 French MNCs, ethnocentrism is "moderate in Europe and developed countries, whereas it is high in developing countries".

The choice of MNCs' strategic orientation depends on a variety of different organizational, economic and cultural factors. The explanation most often advanced is linked to the quality of the labour force available in the host country (Dowling and Welch, 2004). Institutional context and pressure are also considered as other factors impacting the choice of strategic orientation. According to Kostova and Zaheer (1999), for example, subsidiaries are exposed to isomorphic pressures deriving from both home- and host-country institutional contexts. Perlmutter (1969) stresses the degree of economic development of the host country in determining the strategic orientation to adopt. Thus, MNCs often adopt a 'polycentric' orientation in relation to subsidiaries located in developed economies while opting for 'ethnocentrism' in developing nations. Based on these factors, Mucchielli (1998) confirms that strategic orientations have a tendency to change, with subsidiaries being given greater autonomy when they become more mature. The position and role of the subsidiary in the multinational network becomes very important in the evolution of the strategic orientation. Some subsidiaries operate as receptive while other act as more or less independent entities. According to Bartlett and Ghoshal (1986), this variety depends on the skills of the subsidiaries and the importance of their local environment. Since the 1990s, some authors have considered the subsidiary as an important source of knowledge because of the local relationships it develops (Birkinshaw, 1998; Bikinshaw and Hood, 1998). Considering the subsidiary as a real contributor to the whole MNC leads the headquarter to take advantage from the local initiatives. In this context, the intrapreneurial literature can be mobilized to understand the innovative capabilities of some subsidiaries.

Historically, intrapreneurship was perceived as the grip of innovative initiatives by an isolated, rather refractory employee on the organizational system of the company. This gave rise to a stream of literature based on a positive, individualistic, and not programmable abnormality of corporate entrepreneurship (Le Masson and Weil, 2009). On the organizational level, intrapreneurship is a part of an innovative strategy based on initiatives and autonomy (Ireland et al. 2009; carrier 2000). Many researchers underlined the importance of the favorable conditions under which they evolve within the organization. The employees can innovate within their organizations on different levels (Thornberry, 2001): organizational transformation, new activities’ creation, new products/services’ creation, etc. The challenge of the top managers thus is to exploit the workspace to promote new and disruptive ideas in the whole organization.

The intrapreneurial strategy first needs the creation of a convenient working environment to develop innovation, where every collaborator can show his/her ability. To assess the intrapreneurial behavior, we chose the CEAI method (corporate entrepreneurship assessment instrument). This instrument was
initially created in 1990 by Kuratko et al. It aims at measuring the efficiency of internal organizational factors or the climate susceptible to influence activities and innovative behavior. This model was tested and validated by Hornsby and al. (2002, 2013). The more recent validation showed five main factors that can favor any intrapreneurial approach: top management support, work discretion, reward system, time availability, and organizational boundaries.

In the MNCs context, the parent company and the subsidiary can have different life cycles, which may lead to an evolution of the subsidiary’s behaviour (Chebbi and Yahiaoui, 2012). In some cases, a headquarter can afford a favourable environment for some mature subsidiaries to be innovative. This intrapreneurial strategy can enrich the MNC’s and lead the headquarter to change its strategic orientation towards it.

**METHODOLOGY**

To pursue our research question about this subject, we conducted a qualitative study within two medium sized Tunisian subsidiaries of one French MNCs (Chemical) operating in Tunisia for more than 20 years. We adopted an exploratory case study methodology (Yin, 2014) in order to explore the evolution of its strategic orientation. We conducted our qualitative research in two phases (2005-06 and 2016) in France and in Tunisia in order to examine whether the intrapreneurial capability of Tunisian subsidiaries influenced the strategy of Chemical Company. We conducted 26 semi-direct interviews in two distinct phases. In the first phase (2005-2006), we conducted interviews with 2 Tunisian HR managers, 10 Tunisian general managers and 3 HR managers from the parent companies in charge of the North Africa region and involved in international strategic decision making. The 5 general managers of each company were belonging to different departments (sales, manufacturing, marketing, finance, and logistics). The main themes and questions discussed during these interviews are related to international strategy, the environment established by parent company to foster innovation (top management support, work discretion, reward system, time availability, and organizational boundaries) and the intrapreneurial behavior of local subsidiaries. In phase two (2016), we returned a decade later in order to investigate whether and how the firms’ strategic orientation had changed over time. We interviewed 2 new Tunisian HR managers, 1 previous Tunisian HR manager that had moved to another position as legal compliance manager and 8 Tunisian general managers belonging to manufacturing, marketing, finance and logistics. The interviews lasted between 1 and 2 hours. All interviews were recorded and then transcribed. The data was then coded using NVivo software and analyzed following Miles and Huberman (1994) guidelines.

**FINDINGS AND CONTRIBUTIONS**
The analysis of the first interviews in 2006 reveals a clear desire for “standardisation”. A high ethnocentrism orientation is noticed in Chemical, expressed through its unilateral transfer of home-country practices and the use of French expatriates to manage the subsidiaries and make important decisions. These statements therefore lead us to believe that there is no willingness to take local practices into account and that the parent company’s practices are superior. This quest for the subsidiaries’ conformity to the practices of their parent company seems to contribute to establishing a common corporate culture to all the group in order to maintain competitiveness, facilitate the national and international identification of the practices in all the subsidiaries and help audit and control the subsidiaries. This could be explained by the priority given by the headquarter to institutional characteristics that resemble their own in the host country. Among these characteristics, we have identified the similarity between the Tunisian and French education systems. Local staff acculturation through the adoption of certain standards of the parent company country, linked to the history between the two countries, is also an important factor in bringing them together.

Deeply concerned about the development of their subsidiaries in Tunisia, the parent company HRDs view the subsidiary country’s HRM practices as old and inefficient. These managers try to change the subsidiary’s local environment by transferring their own practices, which are considered more modern and efficient, hence the evolutionist stance.

Ten years later, we returned to the same companies for further research and interviewed the local managers. Our analysis shows a gradual move to less ethnocentric forms and also a great change in the position of Tunisian subsidiaries. After the revolution occurred in 2011, local entities becomes more mature and asked for more autonomy. This “rebel behavior” leads the headquarter to review its policy on different levels.

The top management support becomes more important since 2011 and become a facilitator by mobilizing the necessary human and financial resources for innovative and audacious local employees. Some expatriates are replaced by local managers to promote the ideation, culture of sharing and error acceptance (McGinnis and Verney, 1987). The corporate culture also evolved to pay more attention to the collaboration and less formalization. Some global rewards system are established for the Tunisian subsidiaries while giving employees time to create and think out the box. Considering the organizational boundaries, internal and external collaborations becomes open and local subsidiaries can work with local startups to provide some innovative projects.

Consequently to these changes, Chemical, in 2016, moved away from an ethnocentric orientation toward, a geocentric strategy. Most of the Tunisian managers went on training programmes in France once a year or every two years to update their knowledge in their respective field of expertise and present their ideas. There was a clear interest in having Tunisian managers operate more
autonomously, thereby reflecting a shift to geocentrism. Success in Tunisia thus depended on a degree of decentralisation but this was very much on the condition that the Tunisian environment and market – and by implication Tunisian managers – remained French-like.

The orientation of Chemical evolved from ethnocentric to a geocentric strategy according to the configuration of Heenan and Perlmutter (1974). This is due to the change of the behaviour of Tunisian subsidiaries and their maturity. After the revolution, the managers of the Tunisian subsidiary considered that they don’t have to behave passively. Their intrapreneurial capability leads the parent company to trust the local employees. The interviews made in 2016, showed that the Tunisian subsidiary is no more considered as a receptive unit but as a real contributor to the whole MNC network. Each subsidiary can add its contribution thanks to its local competencies, but the main decisions remain still to the parent company. The local suppliers of the subsidiary become real partners of the whole group. This result confirms the conclusion of Kynighou (2014) among others (Perlmutter, 1969). In this sense, our results contradict the literature (Mucchielli, 1998; Jaussaud et al., 2000) which states that practices are often transferred in subsidiaries at the time of their set-up and that as the subsidiary matures it becomes more independent.

AN EXAMINATION OF THE INFLUENCE OF ISLAMIC BRAND LOVE ON BRAND LOYALTY, WORD OF MOUTH AND PURCHASE INTENTION: AN EMPIRICAL STUDY IN SAUDI ARABIA

Yousef, Waleed; Melewar, T.C.; Dennis, Charles; Foroudi, Pantea

The Business School, Middlesex University London, United Kingdom, UK

ABSTRACT

This research aims to examine religious beliefs as a new antecedent to brand love, and proposes a new construct which is Islamic brand love. Brand love as a construct has been linked with different constructs such as brand loyalty, brand trust, brand likeability, brand commitment and word of mouth (Albert and Merunka, 2013; Batra et al., 2012; Cengiz and Yayla, 2007; Nguyen et al., 2013). In addition, brand love can be influenced by other psychological factors such as cultural identity, religiosity or strongly held values (Batra et al., 2012). Therefore, it is suggested that religious beliefs as one of the cultural components can be one of the brands love antecedents. (See the conceptual model in figure 1).

To address the research objective, a mixed method research design will be adopted following a positivist research philosophy (Malhotra and Birks, 2003). From the positivist perspective, qualitative methods can be applied in the initial stages of research in order to gain a deeper understanding of the nature of the research problem and also to improve the primary research model and hypotheses (Malhotra and Birks, 2003). Since this study aims to investigate the influence of religious beliefs on brand love within the Islamic context, qualitative research methods will be used in the first stage. Therefore, Churchill’s (1979) paradigm will be adapted in this study, in order to develop a scale for the new construct proposed (Islamic brand love). Moreover, the relevant literature will be reviewed to validate the scale, and to generate measurement items. In order to collect sufficient information of the Islamic brand love as focal construct, three focus group interviews will be conducted with Muslim consumers and seven in-depth interviews will be conducted scholars of Islamic studies. Therefore, by employing a mixed method approach, with a quantitative basis, but using some qualitative techniques in the early stages of the research, it is possible to generate law-like regularities which can later be generalized to broader situations.

This study contributes to the academic body of knowledge on the brand love construct by providing religious beliefs as a new antecedent. Since love is considered to be the highest level of satisfaction (Albert et al., 2008), it is vital for brand managers to focus on consumers’ religious beliefs to create love for their brands.

STYLES OF GOVERNANCE AND COMPANY PERFORMANCE. NEW INTERDISCIPLINARY MODEL APPLIED TO BEST PERFORMING AUTOMOTIVE INDUSTRY GIANTS

Zanda, Stefania

Department of Management, Sapienza University, Rome, Italy

ABSTRACT

The choice of the automotive industry derives from the major role that this sector plays in the economies of the main industrialized countries, particularly in Western Europe, especially in terms of employment and the percentage share of GDP, despite the significant downsizing in the last twenty years in terms of production and turnover.

In 1990, car production in Western Europe was 38% of the world market; in 2015, it was just over 17.4%. However, some car manufacturers, have returned to register significant increases in terms of production and sales with different dynamics (2014-2016).

We wondered whether in a general climate of the Knowledge economy, in which the technological, economic and financial efforts required to counter competition, regain market share and increase sales, have required specific adaptation in terms of management styles.

Our research involves the construction of a systematic model to assess the management style of executives in the last five years.

The model chosen is interdisciplinary and is combined with our own questionnaire to be submitted to the top management of the best-performing car companies, to investigate different organizational variables.

Analysis of the questionnaire involves determining an overall score for each executive interviewed, to which are associated the values of the following outcome variables for the individual companies: ROI, ROE, increase/decrease of turnover, increase in number of employees.

The research objective is to identify which variables of management models adopted by managers of the analyzed companies were more efficient in terms of efficiency, effectiveness and development of the companies.

ECONOMIC AND SOCIAL COMMUNICATION NETWORKS: STRUCTURAL COMPARISON

Zvereva, Olga M.; Kondratyev, Andrey; Zverev, Fedor
Ural Federal University, UrFU, Russia, Ekaterinburg

ABSTRACT

ECONOMIC AND SOCIAL SYSTEMS AS COMMUNICATION NETWORKS

Communication process is a process which runs in systems from various scientific domains. There is a scientific branch known as communication theory which studies communications, and it determines a single communication as a process with the following obligatory characteristics: there are, at least, two entities taking part in the process (they are both called communicants, or a communicant and a recipient); there is something to be transferred and is of a real value for both communicants (presented in a material or non-material form); there is a communication channel for transferring; and a communication process must have a goal (Kashkin, 2013). There is no doubt that communications are the basis for every social group existence, but the fact that economic system, in its essence, is a communication network can be debated. To prove that relations in an economic system may be considered as communications, it is necessary to look for the earlier discussed characteristics. In an economic relation two communicants are involved: one of them initiates communication in order to sell manufactured product, and the other consumes this product to produce its own output. Something to be transferred is a product manufactured by one of the communicants (a seller), and it is of a value for another communicant (a customer). As a kind of a channel, one can consider a logistic chain. Through a channel the product is moving in one direction, and money is moving in the opposite direction. The goal of this process is to exchange a product for money.

Moreover, social and economic systems can be considered as networks and visualized as graphs where communicants become nodes (vertices) and communications are links (in most cases arcs). Social systems as networks are considered by most of nowadays professionals in sociology, main concepts of the network approach were formulated by B. Wellman in (Wellman, 1988). There is a special methodology, SNA-methodology (SNA- Social Network Analysis), proposing techniques, methods, and parameters for a social system investigation from the network standpoint. This methodology is based on graph theory, linear algebra and sociometric theory.

In economics many scholars also consider a network to be the most prospective system structure. Fukuyama in (Fukuyama, 2000) argued that, being an intermediate form between hierarchy and
market, a network proposed the best opportunities for technology development and organization success in the modern world.

The main goal of this submission is to compare structural characteristics of economic and social local networks and to understand whether both type networks are similar or have certain peculiarities. Thorough understanding of communication process structure could result in recommendations for economic and social communication process improvements. This research focus was made on the issue of system sustainability, it was decided to find social and economic system structural peculiarities from the standpoint of sustainability support.

**EXPERIMENTAL NETWORKS**

To compare network structures, one must engineer these networks on the basis of some data. It is a common knowledge that it is very difficult to receive real economic data. That is why, economic communication networks were developed with the experimental economics approach usage. On the basis of three different entrepreneurial communities three economic communication networks were generated as results of business games. For more relevance, these business games were organized in three different regions of Russian Federation: Ufa city (Bashkortostan Republic), Ekaterinburg (one of the industrial centres), and Moscow (the capital of Russia). Participating in these games, individuals exchanged goods and services in the way similar to they are doing in the real life.

As to social network engineering, data was collected with “KOMPAS TQM” information system usage. “KOMPAS TQM” system is a quality management system which was implemented into the educational process of one of the departments in Ural Federal University. This system supports the process of regular communication result evaluation. System users enter positive or negative marks from the certain range. Thus, the marks entered into the system reflect the real communications between system users. The mark sign (“+” or “−”) characterizes the recipient attitude to the communication result in a whole (positive or negative) while numerical value (from 1 to 5 points) reflects the strength (weight) of this communication (i.e. the usefulness degree for the recipient). This research process and results are discussed in details in (Berg and Zvereva, 2015). Two networks under discussion are visualized in Fig.1: Fig.1a is a network of social communications, and Fig. 1b is a network of economic communications – the result of the business game in Ufa city.

**STRUCTURAL TEMPLATES OF SYSTEM SUSTAINABILITY**

In economic systems cyclic (closed) contours are considered to be structural patterns for system sustainability. To prove this fact special SNA techniques were used: for every investigated network the
set of corresponding (of the same size and density) Erdos-Renyi random graphs was built, than the number of cycles was calculated in the investigated economic network and in the random graphs (mean value), and these numbers were compared. To reveal cyclic structures in a graph program framework was engineered (both graphs in Fig.1 are depicted by this framework). It was revealed that in all inspected cases the number of revealed cycles in an economic network is greater than in the corresponding random graph set. The result for social networks was quite opposite: cyclic structures were more seldom for social networks than for corresponding random graphs. We can postulate that a cyclic pattern is a very seldom structure in a social network and cannot be considered as a basis for its sustainability.

![Social and Economic Communication Networks](image)

*Figure 1. Social communication network (a) and economic communication network (b)*

There are several theories (models) of structural balance developed for social system analysis. Most of them are based on and extend the cognitive theory of Heider (Faust, 2007). They can be realized using triad census, a special network characteristic, which can be received by Pajek framework (Pajek, 2017). As in the discussed case with cyclic structures, network censuses were received for every social and economic network and for the aim of comparison with corresponding random networks. It was revealed that the social network triad censuses correspond to the structural balance models (some of them) while corresponding random graphs do not. For the economic networks both network and random graph censuses were not in accordance with these structural balance models.

As a result, we can conclude that although social and economic issues are tightly interconnected and intertwined in our life, both type communication networks have their own structural peculiarities. Keeping this fact in mind, managers can try to improve a network structure in accordance with its type and goals: if the goal is to increase efficiency of production, it means that a network is of an economic type, and it is necessary to provide cyclic structures for its sustainable functioning. If an analyzed
system (network) is formed of social communications than for its sustainable existence, its structure has to be modified to be in accordance with structural balance models.
