a. It is wrong to reduce the quality of a whole life to the conditions in which one is born,

b. Only the individual can decide about the quality of his own life, and he can only do so as a living being (Magnone, 2015).

We consider that this approach is not well founded given that the embryo does have some rights, in spite of the fact that it is not endowed with the legal status of a person, yet. It is not logical to deny the right to compensation to the damage suffered by the victim itself, even if the damage was caused when the victim was still an embryo. In the legal orders, entities having no human beings as members
do have rights, such as the foundations. These nonprofit organizations under the private law are endowed inter alia with the rights to honor and property and deserve compensation in case of damage. So, it is not normal to deny any right, like compensation, to the embryo, as long as it became a person. Besides, in the current framework of Environmental Law there is the rather ambivalent trend to recognize Nature itself as a subject of rights! It is about Nature or the goddess “Pacha Mama” (meaning Mother Earth) or essentially the goddess of the ancient Greek religion Demeter (meaning equally Mother Earth), namely the entire ecosystem as a whole, as a separate subject of rights relevant to its circle of life, as it is the case of the Constitution of Ecuador. Finally, it is also to take account of the fact that legal orders have the tendency to a wider protection in favor of the embryo, as it the case of the Greek State which has recently completed this protection by previewing the physical injury against the embryo, committed from negligence, as a crime.

**RIGHTS RELATED TO MEDICALLY ASSISTED PROCREATION AND ECONOMIC IMPACTS**

Not only Nature (alternatively called “Mother Earth”) has begun to be institutionalized as a subject of rights but the notion of mother has been significantly enriched through the scientific intervention to nature of the human being. The advent of new technologies has led to the existence of up to three types of mother. Due to the techniques of assisted fertility, three types of mother can be defined:

a. Genetic, whose contribution to the child was the ovum, and hence genes,

b. Gestational and

c. Social, who rears the baby already born.

A woman can enact one, two or all three roles of mother to a child. As for the technique of gestational mother, the above-mentioned School of Thought “Ethics of conviction” raises severe criticism. For instance, in the course of public auditions of the French National Assembly, a woman jurist, as a guardian of human dignity, did not hesitate to denounce to the deputies the gestational mothers’ practices, regarded as ‘‘*a slavery of technically assisted procreation*’’ (Borillo, 2011).

On the other side, Bioethics tends to become a biological power or biopower, in case that the access to the techniques of medically assisted procreation is prohibited to all women with menopause, in the name of the biological incapacity of these women to conceive a child (Borillo, 2011). It is to underline that this neologism is mainly accepted in French, in form of “*biopouvoir*”. This notion, which has been the object of a discussion explosion the last years, can be understood in two different ways.
(Paltrinieri, 2013). According to the first interpretation, this term is synonym of a theory on the power and has to do with the political philosophy. The second approach is associated to the social sciences and has to do with the ("objective") description of the present. As far as the prohibition of procreation is concerned, this exclusion is very important and has led to Greece to the emergence of a social movement of protest against the age limit of 50 years, although the right to pursuit of happiness, to which the right to procreation could be correlated, has received no recognition in this legal order, yet. Indeed, this right seems to be rather completely “unknown”.

The medically assisted procreation has been regulated by Law 3089/2002 and Law n. 3305/2005 in Greece whilst the Greek Church, in spite of its opposition to this technique, formulated its arguments that were taken into consideration by the State in the law-making procedure for the adoption of the first legal act. In this country, there is an entire “industry” facilitating with a profit couples that cannot get a child and want to find a solution to their serious problem. Women are offered to enact the role of a gestational mother, just to acquire an income in the black market (Nikolaou, 2015). To this particular illegal profession are devoted mainly young women, just as the role of genetic mother is above all connected with youth. Of course, there is also the legitimate alternative, for instance with the use of the grandmother of the embryo as a gestational mother. This practice is not merely an acceptable solution by law but also a very strong example of modern fundamental rights; it exemplifies the above-mentioned principle of solidarity within society, let alone within family, which is typical for both 3G rights and 4G ones. New dynamic roles and networks have emerged, with the central figure of grandmother, which has the right not only to enact the role of social mother or at least to back up her daughter as far as raising children is concerned, but also to become the gestational mother of her grandchild!

CONCLUSION: A CONSTELLATION OF 2G AND 3G ETHICAL RIGHTS AND 4G BIOETHICAL RIGHTS

The current research has highlighted some 3G and mainly 4G fundamental rights, related not only to genetic engineering and bioethics but also to the wider notion of ethics. Indeed, it is not realistic to take an approach to the field of bioethics without analyzing some nearby questions, which have caused ethical debates, traditional or not.

On the one hand, as far as the field of ethics is concerned, the freedom to abortion on some strict conditions does not seem illogical. For instance, the issue of prenatal diagnosis for multi-factorial diseases is guided in the Greek legal order by article 5 par. 5 of the Constitution, according to which: « Everyone has right to protection of health and his genetic identity. A law defines the issues relevant to the protection of every person against the biomedical interventions”. This kind of diagnosis of serious illnesses
from which the unborn embryo suffers, such as the aforementioned case of Down syndrome and Mediterranean anemia, is perhaps among the few cases where it could not be argued that free growth of personality and reproductive freedom (with its negative aspect of not acquiring descendants) predominate the protection of the embryo (Charisi et al., 2014). The law could not require from someone to raise a child who will certainly suffer in his life. The fact that abortion has been partly decriminalized in the late 2G period, through the adoption of the Abortion Act in 1967 in the UK, and mainly in the 3G period, in 70s and 80s, implicates the institutionalization of a nowadays consolidated right of women.

In a similar way, the 3G right to respect and mainly to restitution of human remains belonging to museums is an ethical one, strictly related to the bioethical legislation. The revindication on the matter is quite logical and should not be limited to the rights of autochthonous people. This topic has also another serious particularity in legal terms, consisting in the public law principle of inalienability of public collections, let alone the fact that the administrative procedure of declassification may be proved to be very difficult to activate, if not excluded, as it the case of donations and legacies in the French legal order (Maori head case). France has also another particularity, given that the declassification results from pressures of foreign countries and is sometimes linked with trade agreements, as it is the case of the “loan” of the Uiwge manuscripts to South Korea.

On the other hand, as for bioethics, it has to do with too important questions to be exempted from rules whilst formal Constitutions should be modernized on the matter, as it has been the already mentioned case of the Greek one. We think that no absolute approaches are suitable for the delicate problems that this modern discipline has to cope with. In legal terms, it would be recommended to explicitly recognize the status of the conceived in the Constitutions, which anyway must be thoroughly protected at least against harmful medical errors.

Last but not least, the age limit for medically assisted procreation constitutes an unconstitutional restriction against women of over 50 years given that they do have the right to acquire a child, as long as biotechnology is available. For these developments, the constitutional recognition of the “forgotten” human right to pursuit of happiness is a highly recommended development, having to do not only with bioethical matters but also with other activities with an important business impact, such as inter alia religion and the group of recreational rights (namely recreation, culture, education, sport, tourism and hospitality).

THE RIGHT TO RECREATION (Ψ, Χ) WITH EMPHASIS ON TOURISM

Maniatis, Antonios

University of Applied Sciences, Athens, Greece

ABSTRACT

This paper focuses on recreation, as a fundamental right of each “anonymous” citizen, like the mathematics symbols of the unknown factors, usually called Ψ and Χ. It has to do mainly with heritage and tourism as specific rights exemplifying the general right to recreation, which could be called as the right “Ψ, Χ”, inspired by the Greek homonymous word “αναψυχή”, which means “recreation”. Besides, as far as heritage is concerned, the coverage of monuments with earth serves various purposes of the State whilst private individuals also make use of it illegally, to continue their building works. It is recommended to consecrate the right to unearthing monuments and to correlate them with business activities of recreation, the cultural tourism included. The general right to recreation, strictly related with the “forgotten” right to pursuit of happiness, should be consecrated in Constitutions along with the right to free time and could include the specific right to recreation, exemplified by nightlife and carnival, and the separate set of rights to culture (culture, education) and to physical movement (sport, tourism and hospitality).

Keywords: Acropolis Museum of Athens, Constitutionalism, Cultural rights to recreation (Culture and Education), Cultural tourism, Fundamental rights, Heritage, Movement rights to recreation (Sport, Tourism and Hospitality), Right to pursue of happiness, Right to recreation (Right / Ψ, Χ), Right to unearthing monuments

INTRODUCTION: RECREATION, THE GENERAL RIGHT FOR “UNKNOWN” INDIVIDUALS

The current research focuses on the fundamental right to recreation, exemplified by the specific right to heritage, particularly the cultural one, and the right to tourism. Heritage is a particularly sensitive part of culture and mainly of the environment. It has to do usually with the cultural environment but also, in some cases, with the natural environment, like petrified forests. Tourism may be strictly related to the goods, particularly the material ones, of cultural heritage.

Recreational activities will be analyzed, with emphasis on tourism in correlation with heritage. We suppose that the right to recreation needs further recognition and promotion.
The paper examines the following topics:

- all generations of fundamental rights,
- the right to pursuit of happiness,
- the right to vacations,
- the right to heritage and tourism as versions of the right to recreation,
- the Acropolis Museum of Athens, as a case study,
- the antiquities in the city of Kalamata, as a second case study, and
- the protection and promotion of heritage.

An Overview of the Generations of Fundamental Rights

Fundamental rights are defined as the legal rights of persons, either natural or legal, that have to do with the role of the State. These public law rights are usually consecrated in formal Constitutions but a fundamental right may be an unrecognized possibility, at least explicitly in this supreme level of norms.

As far as the world history of the emergence of fundamental rights is concerned, there are four generations. The first one has to do with two groups, consisting in civil rights, such as the right to life, to liberty, to property etc., and political rights, exemplified by the rights to elect and to be elected particularly in the parliamentary elections and to participate in a political party.

The second generation appeared after the end of World War I but was developed mainly after the end of World War II. If it is known particularly as the generation of social rights, it is not connected uniquely with the model of Welfare State delivering free services to people, like education. It has to do with the set of economic rights, such as employment, the syndicalism and the strike. In this era, new rights have been recognized, to human rest, free time and recreation. The French State was pioneer to recognize explicitly the universal right to recreation, in the Preamble of its Constitution of 1946. According to par. 11 of this text, the French nation “shall guarantee to all, notably to children, mothers and elderly workers, protection of their health, material security, rest and leisure”. This rule is so important that scholars make use of it even to back up the right to sports, which has no constitutional consecration (Marcilloux – Giummarra, 2011). Anyway, it goes without saying that there is also another set of rights in the framework of this generation, related to various forms of culture.

The third generation has to do with modern activities, coming from the international law doctrine and rules. The public law doctrine was very reluctant to recognize it, at least till the end of 20th century. There is still vagueness on the matter, in various aspects, such as the content of the rights, their subjects (having to do with people as entities in the framework of the international communities or with private individuals), their legal nature in combination with the question of sanctions…

The rights of this generation emerged from about 1975 and on, although the term is a little bit more
recent, introduced and used by the doctrine and not by the norms themselves. As already signalized, they were institutionalized mainly due to the initiative and the mobility of UN and have a crucial content for the destiny of people, particularly of those of the underdeveloped world. However, even national constitutional orders have been endowed with norms on them, as it is the case of the right to the environment which is regarded as the mainstreaming right of this generation. They are frequently called “solidarity rights” because they have to do with the expression of solidarity (fraternity) for people or private individuals, usually directly or even indirectly, by supporting the State helping the weak or endangered social groups. They are similar mainly to social rights (second generation), because they focus on the socioeconomic support of various groups. They are also related to civil rights, as they are not merely a possibility to help members of the society but also to enjoy some goods by the subjects of 3G rights, themselves. For instance, the right to the environment has a double content, to the enjoyment and to the protection of goods of the natural or the cultural environment. So, as far as the protection is concerned, the private individual may protect the environment for his own interest or by merely expressing his solidarity to other members of the society. In a similar way, another emblematic right of the 3G era consisted in the right (being also a very important general principle) to the sustainable development of regions, countries or the entire planet.

The fourth generation is still a marginal matter in the level of the doctrine and has not been recognized, at least explicitly, by the jurisprudence as a separate generation. Anyway, it began to emerge about in 1995 and has as its emblematic right the participation to the Information Society. The so-called “Knowledge Age” is strictly related to the advent of new technologies, mainly in the field of communications and information. On the one hand, there is the set of rights promoting the communications, as already signalized, and, on the other hand, rights to protection against information have also been institutionalized, exemplified by the right to protection of personal data. There are also other rights, already recognized or still in process of recognition. For instance, some of them are related to genetic engineering and are close to the relatively new science of Bioethics. There is also a trend having to do with the recognition of rights related to the world of animals.

THE RIGHT TO PURSUIT OF HAPPINESS

In the current era of 4G rights, another fundamental right could be recognized. It is about the “forgotten” possibility to pursue of happiness, essentially the right to hope, which seems to be an all-time classic issue (Maniatis, 2017a). It emerged within the American Declaration of Independence, of 4th July 1776. According to this revolutionary text of the 13 independent United States of America: “We hold these
truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life; Liberty and the pursuit of Happiness”. Furthermore, the right to pursuit of happiness is also implicitly included in the French Declaration of the Rights of Man and the Citizen, of 26th August 1789, which makes a reference to the objective of the “happiness of all”. This Declaration constitutes the point of reference of the French institutions, mainly in the Constitutions of 1852, 1946 and 1958. The Preamble of the current Constitution makes an explicit reference to it whilst even the Constitutional Council tends to invoke it.

The right to pursuit of happiness, being present in the above-mentioned declarations, was omitted in the Constitutions of the era that was inaugurated by them.

Umberto Eco made an all-time classic comment, on the right to happiness, in 2014 (Eco, 2014). He formulated the opinion that the literature on happiness is enormous, from Epicurus and perhaps before him and on, but he believed that nobody knows in what happiness consists. He could not admit that it is about a permanent status for common people. The question is that happiness, conceived as an absolute fulness, is a very transitory situation, episodic and brief, like a moment in the course of an excursion in the countryside. So, happiness is obviously related to recreational activities, such as excursion and tourism journeys. Furthermore, the idea of happiness evokes always the personal happiness and hardly ever the one of the human species.

As far as the juridical science is concerned, it seems rather divided on this “forgotten” human right whilst still a few experts have treated this quite unelaborated topic. On the one hand, in 2008 the opinion was formulated that this right exists, resulting from various factors, like the historical antecedent (Gemma, 2008). Although the right was recognized in Declarations and not in ulterior formal Constitutions, it is not regarded as strange in both the vocabulary and the principles of Constitutional Law.

It is logical to look for a legal back in article 2a of the Italian Constitution (and the similar article 25 par. 1a of the Greek Constitution), according to which: ‘The Republic recognizes and guarantees the inviolable rights of the person, both as an individual and in the social groups where human personality is expressed’. This disposition is endowed with a content quite similar to the question of recognition of new human rights. Various rights have been deduced from sectors of doctrine and jurisprudence in Italian legal order, beyond the explicitly consecrated in various constitutional dispositions.
However, the right to pursuit of happiness does not have the same nature to the consecrated in the Constitutions and to those deduced from these. It is possible to be deduced from the Constitution, via the recourse to either the teleological interpretation or the systematic one. It constitutes the *ratio* of all the other constitutional rights, being considered as a system, and from this ratio would be possible to deduce this right, being transversal to the other ones. It is connected with the phenomenon of multiplication of constitutional rights of various nature, in the process of interpretation of the fundamental charter. From the explicit provision of one or more constitutional rights it is possible to deduce rights that are implicitly formulated, because either these rights are the prerequisites of the explicitly consecrated rights (for instance, the right to life is not mentioned in the Italian Constitution whilst it is previewed in other Constitutions) or simply result from the mentioned rights (like the right to the environment in correlation with the right to heath, being mentioned in article 32 of the same Constitution). On account of these data, it is obvious that the right to pursuit of happiness is not just another right, beyond the classical ones. It is in a logical relation not with some single rights but with the entire constellation of the constitutional rights.

Nevertheless, there is also another article to wonder about its utility as a constitutional back of the right on the matter (Rotondo, 2013). It is about article 3, according to which:

“All citizens have equal social dignity and are equal before the law, without distinction of sex, race, language, religion, political opinion, personal and social conditions.

It is the duty of the Republic to remove those obstacles of an economic or social nature which constrain the freedom and equality of citizens, thereby impeding the full development of the human person and the effective participation of all workers in the political, economic and social organization of the country”.

Whilst a lot of stakes have been introduced to article 3 by the Constitutional Court’s interpretations, it is to wonder whether man should instead do the opposite route and interpret it extensively, as a right to research of happiness, or not. According to this approach, the right to happiness seems to be the mother of all rights. In case that a person is a victim of discrimination, is treated as a B Class citizen, is submitted to violence for what he is, for his own status, is deprived of an assured income, he cannot feel happy.

Besides, there is the opinion that the right to pursuit of happiness is the fundament for constitutional pretensions that cannot be based on other rights, being explicitly consecrated in the Constitution (Gemma, 2008). These pretensions are related to the acts or omissions of other persons, mainly in public domain of life. For instance, they are disconnected from the disappointment of a fan, provoked by the defeat of the team that he supports. So recreational activities of minor importance are not linked with the serious question of the right on the matter.
The human needs, mainly of psychological order, may be translated as versions of the constitutional interest in happiness. An example has to do with the area of family relationships and to events related to these. As for the behavior of parents towards the children, exist behaviors, being absolutely unrecognized by norms and judicial decisions, of persons that tend to place their children in conflict to the other spouse or that cause suffering of children without justifying reason. In this concept, we add the example of the revindication of women beyond the age limit of 50 years to medically assisted procreation.

Moreover, the existence of a right to pursuit of happiness should not be regarded as the legal victory of the individualism but can be correlated to the symmetrical phenomenon of the so-called “fundamental duties” of citizens. Indeed, it is in full harmony with the concept of solidarity of private individuals (Gemma, 2008).

However, this right is not fully admitted within the juridical science. For instance, a part of the Italian doctrine signalizes on the hypothetical new rights that there is the danger of an absolute approach to the type of the constitutional right to vacations, without defining its material limits (Ferro, 2014). In the framework of this controversy, the doctrine makes reference to a “privilege” ruling the “new rights”. As these rights have not managed to be a part of positive law so far, they cannot be placed in the more severe field of norms that rule the traditional rights, being explicitly consecrated in the Constitution.

THE RIGHT TO VACATIONS

The right to vacations, let alone to peaceful ones, may be regarded as one of the various specific versions of the eventual “right to happiness” or “to serenity” (Maniatis, 2017a). Nevertheless, the civil jurisprudence of the Italian Supreme Court is not friendly to such a development. The tribunal, in its decision n. 26972 of 11th November 2008, denied the existence of a right to happiness, in the framework of a case having to do with claims on recovery of material damage. This right was eloquently considered as “wholly imaginary”. If a part of the doctrine, invoking the judicial negativism, considers that positive law is quite satisfactory to back any civil law pretensions in case of damage, the tourism law cases included, it does not stop in this point but also adds that the right of pursuit to happiness is merely a fiction.
It is also to signalize that Italy became just the second State, after France in 2006, to put a Tourism Code into force, in 2011, but this text has not recognized the existence of a “right to vacations”, at all (Ferro, 2014). In a similar way, within Italian Constitutional Law there is no autonomous fundamental right to vacations.

THE RIGHTS TO HERITAGE AND TOURISM AS VERSIONS OF THE RIGHT TO RECREATION

The general right to recreation includes some other separate rights, besides the right to recreation itself. This specific right is exemplified by the rights to nightlife and to carnival, which are excluded from an explicit constitutional consecration, let alone the fact that Europe, with the exception of a few countries like Greece, has not developed particularly the nightlife recreation, even in the peak of tourism season!

We suggest the mainstreaming content of the general right to recreation be classified in the following groups (specific recreational rights):

A. Rights to culture

The cultural rights consist in:

a. Right to culture (particularly to art, first of all consecrated in the German Constitution of 1919) and to cultural heritage,

b. Right to education (the physical education included).

B. Rights to movement

The rights to physical movement of human beings, particularly from one place to another, include the following rights:

a. To sports.

It is about a genuine and separate right, although strictly related to physical education in schools, as a specific version of the above-mention right to education. It was Mexico that initially intended to consecrate it in its Constitution but the Soviet Union became the first State to adopt a constitutional disposition on sport associations, in its 1936, whilst France has not done a similar step to date, as already signalized.

b. To tourism, which constitutes a logical couple with the symmetrical human right to hospitality. It is to point out that “tourism and hotel industry” were included as public policy
scopes in the first version of the 1946 Constitution of Italy, but this mention disappeared through the 2001 revision! So, the constitutional right to tourism may be regarded as a second generation right, which remains unrecognized, at least explicitly, in the vast majority of countries, Italy included nowadays!

As far as tourism is concerned, it is not merely a taboo in constitutional terms but also a source of various prejudices and misperceptions. For instance, nobody wants to be identified as a tourist whilst there are decent alternatives like “traveler” or “visitor”. Furthermore, criticism exists against the phenomenon of “anonymization” of individuals participating in the movement of mass tourism, for instance discernable with the badge, the small hat etc. (Mylonopoulos, 2016). However, massive tourism constitutes an important democratization of tourism and more widely of leisure activities, in full correspondence not only to the human right of pursuit of happiness but also to the 3G right to development of tourism destinations. Of course, it is also associated to the movement of 4G right to protection of personal data of tourists.

CASE STUDY I: THE ACROPOLIS MUSEUM OF ATHENS

The new Acropolis Museum in Athens, a modern architecture sample being constructed in front of the rock of Parthenon, has constituted an important tourism destination since June 2009. Nevertheless, it is not widely known on international scale that the Greek Ministry of Culture wanted to demolish two buildings of the same street, already listed as modern monuments, in favor of the Museum that would be inaugurated soon. The Council of State blocked the suppression of the listed buildings status, let alone was led to interpret the Constitution in a pioneer way. It judged that private individuals have not only the right but also the “responsibility” to protect the environment. This formulation was original, given that the Constitution explicitly refers to this fundamental right and not also to a kind of responsibility (quasi “debt” or “obligation”). So, visitors of the Museum and tourists can enjoy a walk in this pedestrians’ street, including the sight of the above-mentioned modern monuments that are still in operation.

So, the new juridical principle of equality between antiquities and modern monuments has been confirmed, whilst also the principle of sustainability could be alleged in favor of these buildings. It is to point out also another paradox, which consists in the tendency of this supreme administrative Court to avoid any explicit use of the constitutional tool of sustainability, after its introduction in the Constitution through the 2001 revision, not to mention that this Court had already consecrated it through its pioneer jurisprudence, some years earlier! Perhaps the judges, who on international scale are inspired by a wider tendency of judicial “self-restraint” in their duties, not only in the
environmental disputes, consider the block of dispositions on the right to sustainable development as a too drastic legal “weapon” to make an explicit use, even in the famous trials. This case of self-restraint ties in with the material primacy of the Museum of Acropolis against the rest cultural goods of the same region, which does not implicate an absolute, negative approach against them but coexistence. In other words, we believe that the Council of State has proceeded to a tacit (operational) classification of the general constitutional principles relevant to the Environmental Law and has reserved the use of the sustainable development principle for particularly delicate disputes, in a subsidiary way.

Besides, the case of this Museum has been used to prove that the official definition of tourism, adopted by the World Tourism Organization, is not absolutely accurate, as long as it previews a journey of at least 24 hours. For instance, a Frenchman can leave Paris for Athens in the morning, visit the Acropolis Museum (as well as the rock of Parthenon) and return to his country in the evening, having completed a tourism journey (Mylonopoulos, 2016)!

The doctrine has logically supported that tourism should be exempted by clichés like that, which anyway do not facilitate even the world of business.

**CASE STUDY II: ANTIQUITIES IN THE CITY OF KALAMATA**

The problem of the coverage with earth of an ancient immobile monument in the “Ypapanti” square of Kalamata, a city in Greece, emerged after excavation works in the Southern edge of the square, in the beginnings of 2008. Nevertheless, the antiquities on the matter have been earthed up since 1961 (Garoufou and Kallioupi, 2011).

Coverage with earth constitutes a controversial issue, particularly widespread in the archeological practice (Asimakopoulos, 2012). During the excavation for the metro of Thessalonica, an Early Christian Basilica was discovered, in the station “Syntrivani” (Marinos, 2012). The monument was to be transferred in a distance of about 200 meters, in the park of the Faculty of Theology. This decision was attacked and finally the coverage with earth was decided. “The future cannot and should not be built against the past”, according to some archeologists like Mr. Paul Chrysostomou, reminding of the final paragraph of the Amsterdam declaration, adopted in 1978. It is about the director of the excavation which was held in the cemetery of Archontikon, in Pella, with hundreds of impressive findings, such as the famous gold masks of Macedonian warriors. Samples of these masks were transferred to the Louvre Museum, in the periodical exhibition on Macedonia of Alexander the Great, which was completed in January 2012. However, identical samples, of the 6th century BC, were found in the hands of antiquities looters in October 2011, in a district out of Thessalonica. In summer 2011, during which no excavations were held, in the totally unguarded – due to the lack of resources – site of
Archontikon over 10 pits of mound diggers were localized. The recent double case of discoveries in the Central region of Macedonia, in Greece, reveals a permanent error, according to which the coverage with earth protects the monuments not only from the harm of their material substance but also from crimes. The “Syntrivani” square is added to the casuistic of the coverage of the White Tower with earth and the prevention of the unearthing of the nicest temple in the “Antigonidon” square, which was transferred there in virtue of the ancient custom of the “wandering temples”...(Maniatis, 2010a).

As the State makes use of the coverage with earth as a “mortgage” for an on-the-field research, to be accomplished by the future generations of archaeologists, some private individuals take benefit from it as a “mortgage” for illicit excavations of the current era. As a result, a finding emerges, consisting in the counterbalancing dynamic of criminality against the controversial practice of Public Administration. So, administrative and private practices result in a homogeneous total, particularly in the countryside.

The recent developments in Kalamata shed light to other aspects of the problem of coverage with earth. The Municipality of Kalamata had planned the unearthing of the earthed-up monument in the “Ypapanti” square, within the scope “Regeneration of the Historical Center of Kalamata”, but in the controversial way consisting in maintenance underground. This technique, thoroughly omitted by Law 3028/2002 on culture, has to do with the maintenance of the monument unearthed, below a glass cover (Maniatis, 2011). At last, the State decided, in spring 2011, to keep the monument earthed-up due to its own protection.

This somehow vague reason is not convincing provided that the monument does not seem to be in danger of antiquities looting or of natural damage, as it is located in the center of the city, on account of the unearthing experience during a semester, in 1960-1961.

The State sets the bad example to citizens as in the urban fabric denies them their own right to heritage, according to the principle of sustainable development, in virtue of par. 1 and 6 of article 24 in combination of par. 1 of article 106 of the Constitution. What has not been realized is that the dynamic of private individuals' criminality against the State, as the owner of the ancient monuments, more generally against the public interest, corresponds to controversial practices of the Public Administration like this. Owners of immobile things, particularly in the urban fabric, have the tendency to decide to earth up the findings of cultural interest. This is confirmed mainly when they desire to proceed to building works, a case in which complicity of the businessmen (building contractors) may occur.

Besides, the case of the earthed-up hypothetical gymnasium of the ancient City – State of “Pharai”, in the South of the Venetian castle (former Citadel with a probable worship of the goddess Minerva) is...
comparable with another archeological site of the same city. It is about the ancient temple dedicated to Neptune, god of the sea and sailors’ protector. Neptune’s site constitutes a dipole along with the actual Southern town, the Old Town. In virtue of the General Plan of Country Planning and Sustainable Development, a State program being in vigor since July 2008, which recommends the combined protection of monuments per space unity, a question emerges, consisting in not only the continuation of the excavation and the promotion of the archeological site in “Akovitika” of Kalamata (including antiquities besides Neptune’s site) but also its correlation to the antiquities of the “Ypapanti” square. These antiquities should be unearthed and in principle maintained on the field, in the surface of the ground as Neptune’s site is proposed to constitute a nautical archeological “open museum”. This proposal is actual, given that the economic crisis of Greece has led to the abolition of Nautical Week, since summer 2010, against the nautical collective memory! Another thing that may be proved to be important is the correlation to the old, in vigor till the beginnings of the year 1960, official name of Kalamata, “Kalamai”. That place name, meaning reeds, resulted from the fact that reeds fit in with wetlands. Consequently, if, according to an assumption, the current place name “Kalamata” corresponds to the goddess of the town having good eyes, namely Minerva and afterwards Madonna, the legally abolished place name “Kalamai” reminds of Neptune’s site (although it may be connected even with the goddess, given that near the Castle the river “Nedon” exists).

**DISCUSSION ON THE PROTECTION AND PROMOTION OF HERITAGE**

The above-mentioned case studies, mainly of the ancient monuments of Kalamata, are conducive to the following conclusions of a wider significance:

1) **Coverage with earth and illicit excavations in the open air, coverage with earth for self-interested reasons by the State and for building by private individuals in the town**

In the open air and in the urban fabric, State and society are involved in controversial practices, against the monuments, with the coverage with earth as a point of reference. This thing should be realized by the competent public authorities that anyway are supposed to have taken in time measures of guardianship of the archeological sites and of unearthing the monuments through programmed excavations, by observing the fundamental principle of proportionality.

2) **The climax of depreciation: “burying” (“marginal placement”), “coverage with earth”, “rubbishing”**

The case of the maintenance underground usually constitutes a peculiar depreciation of the monument, consequently “burying” in the sense of marginal placement. However, it is to signalize that this term is adequate to cover even other cases of monuments, which are maintained in the surface of the ground but without the relevant protection.
The opinion that the “burying” of the unearthed monuments is presumed to constitute a more important problem for the Greek cultural heritage than the one of coverage with earth (in spite of the fact that by nature this coverage implicates more negative consequences for each monument in a separate way) favors the perpetuation of the coverage with earth. Well, it favors the obscurantism in the domain of history and archeology as well as the socioeconomic underdevelopment (Maniatis and Kapralou, 2012). In fact, the coverage with earth cannot be assessed as long as nobody is sure about what exactly exists under the surface of the ground. Anyway, there is also the eventuality of “rubbishing” a monument, even in case it has not already been earthed-up. This happens, for instance, when an earthed-up monument is offended, either materially either morally, like through the non-convincing refusal of the State to allow its requested unearthing. This is confirmed as long as arguments reducing the archeological importance of the monument are used, without activating any democratic mechanisms of public exchange of views. It is to signalize that even the European Landscape Convention, promulgated by Greece through Law 3827/2010, consecrates no fundamental right to unearthing of monuments, or at least to public exchange of views and decision-making on the matter (Maniatis, 2010b). The irony of the fate is that the Municipality of Kalamata some years ago created a system of underground bins of rubbish to replace the grey bins in the surface of the ground...

3) Depreciation of the nautical culture available for tourism business

The case of Neptune’s temple highlights an important lack of protection and promotion of the culture of the Greek nautical nation. The landscape should be protected thoroughly and the recommended revival of the Nautical Week is proposed to resume through the highlighting of areas like this. As for the proposed “open museum”, man could benefit from international conventions, like the European Landscape Convention, which includes earth, internal waters and sea areas. Anyway, the Nautical Week constitutes a great challenge for leisure activities and tourism business, so a potential framework for the promotion of commercial products and services and for sponsorship.

4) Need of a combined protection of landmarks and place names

The need of protection of place names, particularly of the traditional ones, has emerged. The protection on the matter constitutes an important vacuum of the European Landscape Convention. It is recommended to protect in a combined way the landmarks of a certain area and the correspondent place names.

CONCLUSION: RECREATION, A CHALLENGE FOR CONSTITUTIONALISM

The paper hypothesis has been fully confirmed as the right to recreation has not been explicitly
consecrated in many Constitutions like the Italian and the Greek ones, yet. The right on the matter deserves to be called as the right "/Ψ, Χ", inspired by the Greek homonymous word “αναψυχή”, which means “recreation” and be treated in the democratic context implied by this name. Leisure activities must be seen as a universal human right, endowed with the back of companies accomplishing their mission or promoting themselves through sponsorship. The right to recreation should be incorporated in the Constitutions along with:

- the general, similar right to pursuit of happiness
- the right to free time (right to vacations) and
- the specific recreational rights to culture (culture, the heritage included, and education) and to physical movement (sport, tourism – hospitality) (Maniatis, 2017b).

The current century is the time of pursuit of happiness through the recreational rights!

Last but not least, this challenge for current constitutionalism worldwide, should be completed by a special care for the specific right of recreation itself. This recreation is not a topic of minor importance in socioeconomic terms and has been marked sometimes by significant legal prohibitions, as it is the case of the carnival in mainstreaming tourism destinations, such as Venice and Tenerife. Indeed, it is worth consecrating explicitly the nightlife and the carnival and developing a systematic public policy for both these tourist attractions…

***

Prohibitions are a policy of the past, recreation, let alone its artistic forms like carnival, a challenge for the future…

ABSTRACT

This paper presents approaches to detecting turning points in economic evolution on the basis of probit analysis. Most methods describing the business cycle are based on evaluating information obtained from the evolution of certain short-term indices, with the idea of estimating a value (or rate) of an aggregate index so that a turn of the economic evolution is indicated. Probit analysis estimates probability of occurrence of such turning points. We apply our approach to data collected in the Czech Republic from 2007 to 2015.

Keywords: GDP, turning point prediction, probit analysis

INTRODUCTION

The business cycle, i.e., alternating stages of growth and recession, is an integral part of economic evolution in all countries. Causes of such phenomena may be internal, based on the specific conditions governing the economic evolution in the given country (such as economic crises accompanying the transition from centrally planned economies to the market environment in the early 1990s); however, worldwide and multinational factors have been becoming more and more pronounced due to globalisation and cohesion of economies. The beginning of the new millennium witnessed several small-scale shakeouts, which coalesced into a mortgage crisis, followed by banking and fiscal crises. The economic recession in developed countries was so significant in the period of 2007-2009 that it has since been referred to as an economic crisis. The developed countries’ economies are now growing, but the question of why that crisis occurred and, more importantly, whether its occurrence might have been predicted or estimated, is still highly relevant.

The fundamental starting point for our consideration is the nature of the business cycle – the expansion stage is characterised by growth and terminates when decline comes. But is each and every decline, in the sense of a slowdown in the GDP an indication that the recession and crisis are really coming? How can we recognise whether the economic changes are or are not so significant that the recession and subsequent crisis are to be expected?
The national economy is a complex live organism that cannot be pre-programmed and controlled with the aid of rigid charts and models. Neither can we expect to be able to "read" the symptoms from evolution of a single phenomenon expressed by a single index. In order to obtain the information related to the condition of the national economy, we need to continuously follow and evaluate the evolution of a number of indices that are relevant for diagnostics and predictions. On the other hand, how can we say which indices are relevant in this sense? Is their scope fixed, or does it undergo dynamic changes? In what way can we synthesise information implied by the evolution of these indices? These are questions asked by those who try to identify turning points, i.e., changes in the character of economic evolution in either direction.

Most methods that try to describe the business cycle and identify the turning points are based on evaluating information derived from evolution of a certain group of short-term (monthly and quarterly) indices. In the present text we describe a technique developed on the basis of probit analysis; this method will enable us to indicate, with high rates of probability, that a turn in the economic evolution is coming.

**THEORETICAL AND METHODOLOGICAL BASIS**

All considerations of whether we can predict turning points in economic evolution and how to do it are based on the definition of the business cycle. A generally accepted definition was formulated by Burns and Mitchell (1946) during their work for the National Bureau of Economic Research (NBER): "Business cycles are a type of fluctuation found in the aggregate economic activity of nations that organize their work mainly in business enterprises: a cycle consists of expansions occurring at about the same time in many economic activities, followed by similarly general recessions, contractions, and revivals which merge into the expansion phase of the next cycle; this sequence of changes is recurrent but not periodic; in duration business cycles vary from more than one year to ten or twelve years; they are not divisible into shorter cycles of similar character with amplitudes approximating their own". Subsequently to this generally valid and respected definition, the economic and statistical practice has created a pragmatic definition, based on the GDP growth rates in two consecutive calendar quarters: the recession is beginning (or the growth is ending) when GDP has gone down in two consecutive quarters; and vice versa, the growth is beginning (the recession is ending) when GDP has been growing in two consecutive quarters. It has turned out that this "two-quarter rule" and the NBER definition are not too distant from each other (cf. Negro, 2001).

The two-quarter rule is an indicator of changes in the economy that have already taken place, bringing information ex-post, on the basis of the past described by statistical data. On the contrary, we seek the turning points and therefore need to predict such changes. Hence we have to use tools based on the
past but having potential for predictions. This approach, of course, leads us to monitoring the evolution of a certain group of indices that (directly or indirectly) affect the GDP evolution. Methods of leading indicators, econometric models, and probit models are most frequently used to generalise the information stemming from the inference on the evolution of values in a certain group of indices.

The notion of leading indicators was, as related to predicting the turning points in the business cycle, first introduced in the late 1930s thanks to the work at the NBER (cf. Mitchell and Burns, 1961). The then defined group of leading indicators has gradually been modified according to the underlying economic conditions. But the universal basis always consists of monthly (quarterly) values of the selected indices covering the industries, construction industry, consumption, capital markets and finances. In the 1990s, indicators obtained by business cycle surveys (expectations in industries, construction industry, services, and the Index of Consumer Expectations) got to the limelight. An advantage of these indicators is that they are easy to obtain and have a great potential for predictions.

The necessity of synthesis the information coming from the evolution of the leading indicators brought about the composite (leading) indicators. A general problem when setting up a composite indicator is the choice of a suitable group of leading indicators and determination of the weights with which the individual leading indicators are reflected in the resulting composite indicator. With regard to the subjective nature of the choice of the leading indicators and the weights, the ability of composite indicators to predict the turning points is rather problematic.

Another type of synthesis of the information concerning the evolution of a selected group of indices is represented by econometric models. There are two categories of these methods for predicting the turning points: the first sets up a model for estimating the growth rate of the GDP and other aggregates. The other one directly predicts the turning points. In this area, in addition to the traditional models based on simultaneous equations (cf., e.g., Fair, 1994 or Klein, 1991), there are VAR models (cf., e.g., Hamilton, 1989; Zellner et al., 1991; and Li and Dorfman, 1996) or dynamic factor models using leading indicators (cf., e.g., Kim and Nelson, 1998; Stock and Watson, 1993; and Jun and Joo, 1993). All these approaches assume that the basic conditions of the economy remain preserved during the stages of growth and recession. What is changing is the positive or negative sign of the growth rate. In other words, the economy goes from growth to recession via turning points and the latter reflect the changes in economic behaviour of economic subjects, not only the negative phenomena (shocks) in the economy.

Probit models predict the turning points with the aid of a probabilistic model in which a probability value of a turning point occurrence is estimated. An advantage of probit analysis is, in comparison with traditional econometric models, not determining the actual values of the index in question (most often the GDP) but only estimating the probability of occurrence of a situation in which a turning point might be present. It is not a direct calculation of, say, the GDP value, quarterly indices or annual
growth rates. We could say that it is a statistically recognised "potential for a change", or identification of "turning trends".

Probit models, similar to other models for estimating the turning points in the business cycle, prevailed in the 1990s. The probit model based on financial indices (cf. Estrella and Mishkin, 1998) may be viewed as one of the important inputs in this area. Nyberg (2010) proposed the dynamic extensions of probit model of Estrella and Mishkin (1998) to predict monthly recession periods in the USA and Germany.

Another approach, based on estimating probability of turning point in the unemployment rate evolution, was applied in the economic practice (cf. Chin D., Geweke J. and Miller P., 2000). This model makes use of both financial and non-financial indices on the input. Hao, L. and Ng, E. C. Y. (2011) examined the ability of various financial and macroeconomic variables to forecast Canadian recessions; they used the advanced dynamic, autoregressive, dynamic autoregressive probit models and the conventional static probit model. Proano, C. R. and Theobald, T. (2014) have proposed a composite indicator for real-time recession forecasting based on alternative dynamic probit models and have used a lot of monthly macroeconomic and financial leading indicators from the Germany and USA.

The probit model introduced in the present paper is to be used for detecting the turning points in the trend of an index in question (or its long-term evolution trends). One of its advantages is the fact that it need not utilise smooth trend functions, some of which even do not admit inflexion points in the evolution curve, such as the line; others may have inflexion points (such as higher-degree polynomials) but these points rather reflect the mathematical character of the selected function. i.e., are of a formal nature. Another advantage is that neither adaptive nor stochastic models are used for the description of the turning points and therefore the assumptions for the use of such models need not be verified, which would often be a complicated procedure.

**BASIC CONCEPT OF THE MODEL**

The suggested probit model assumes that we have at our disposal one dependent variable and several independent ones. The dependent variable is, in this instance, the basic index expressing the economic performance, namely, the GDP, or rather its quarterly growth rates, in the period from 2007 to 2015. We feel that this period of time provides us with a sufficiently long time series; moreover, the Czech economy underwent several critical moments during that time.

For independent variables we take indices that are decisive for the evolution of the economy, and therefore the GDP growth rate. We identified the most important ones from among those by gradual reduction and factual analysis (cf. the Tables and calculations below). While identifying the suitable independent variables (and eliminating the less suitable ones), we were guided by the principle that we need indices whose values sensitively respond to the conjunctural cycle stages, are available timely and
with a high degree of reliability, and represent the key industries or economic sectors. In particular, we focused our attention on the indices representing the following areas:

- The general industry as the dominant sector in the Czech economy;
- The construction industry, whose results very sensitively respond to the stages of the conjunctural cycle in the Czech economy; and
- The area of salaries and wages, which markedly reflects the stages of the economy growth and recession.

From among a number of indices offered by the official statistics (the Czech Statistical Office) with quarterly frequency, we have chosen the following characteristics for our independent variables, respecting the above-mentioned principles and restrictions.

The industrial production index (a year-to-year quarterly index, denoted by $x_1$). It expresses the dynamics of industrial production. Another index is that of the sales from industrial activities (a year-to-year quarterly index, denoted by $x_6$). It expresses the dynamics of industrial revenues.

We have chosen two indices from the construction industry: one for the "recorded past" – the construction production index (a year-to-year quarterly index of the physical volume, denoted by $x_2$); and another one for the "contracted future", i.e., the new construction orders (denoted by $x_4$). The construction production expresses the dynamics of the volume of construction works carried out by businesses in which construction is the prevailing type of activity. The "new orders" index follows the value of the building construction and civil engineering works in the Czech Republic. These indices also indicate future demand for construction materials and labour force in the months to come.

In the area of wages and salaries we have also chosen two indices: the unemployment rate (percentage values, denoted by $x_3$), and wages and salaries (a year-to-year quarterly index in current prices, denoted by $x_5$). The Czech Statistical Office calculates and publishes the so-called general unemployment rate, which is the ratio of the unemployed to the total labour force (15 to 64 years of age); both the numerator and the denominator in this fraction correspond to the definitions and recommendations of the International Labour Organisation (ILO). The data are adjusted of seasonal influences. The wages and salaries index is based on the methodology of national accounting and expresses the volume of regular and irregular monetary and in-kind income received as fee for work carried out according to the employment and other laws. It includes the income tax and social insurance paid by employees.

THEORETICAL PROBIT CONCEPT FOR DETECTING TURNING POINTS

The concept of the turning point indication with the aid of the probit analysis can be formulated as follows: we monitor the evolution of a certain index, $y_t$, and look for a moment of time at which a turn in the evolution occurs (both qualitative and quantitative). This moment is then viewed as a turning
point brought about by economic phenomena on such a scope that the actual evolution is turned to the opposite direction and an overall change in the economic climate is observed.

Our first task is to choose an index whose character is sufficiently aggregate so that its change indicates an overall change in the economic climate. Logically, an aggregate from the system of the national accounts will be most suitable. Most frequently, the GDP is our choice; but another aggregate might be chosen provided that it expresses the overall performance of the economy. The \( y_t \) variable will be the dependent variable in the regression sense, and \( t = 1, 2, \ldots, n \) will be the time variable.

The evolution of the index \( y_t \) is affected by \( p \) exogenous factors \( x_{1t}, x_{2t}, \ldots, x_{pt} \), that is, it is connected with the evolution of these factors. In other words, they are \( p \) independent variables. Their evolution may, as explained above, have an intervention character and may bring about a change in the evolution of the aggregate index \( y_t \). Our next task is to find those exogenous (factor) variables that are significant and may influence the evolution of \( y_t \). Probability \( P_z \) that the behaviour of index \( y_t \) will undergo a qualitative change (in either direction) thus depends on exogenous variables \( x_1, x_2, \ldots, x_p \). Let us define the probability of a turning point occurrence as

\[
P_z = F(x_1, x_2, \ldots, x_p),
\]

(1)

Now we re-define the variable \( y_t \). Namely, we create a new random variable \( Z \) as follows: the time series \( y_t \) will not be represented by its original numerical values (e.g., the GDP or its growth rate values), but will, with the aid of this artificial variable \( Z \), be transformed to a "zero-one" form. Here \( Z_t = 0 \) means that there is no turning point in the dependent variable's evolution at time \( t \). On the contrary, \( Z_t = 1 \) indicates presence of a turning point.

We have denoted by \( P_z \) the probability that there is a turning point. Now we have to define the theoretical value of \( y_t \) at point \( Z_t \) as a function of the exogenous variables \( x_1, x_2, \ldots, x_p \). We can take into consideration the fact that, the dependence of \( Z_t \) at time \( t \) on the exogenous variables \( x_1, x_2, \ldots, x_p \) is expressed by a theoretical linear regression hyperplane

\[
\pi_{zt} = \alpha_0 + \alpha_1 x_{1t} + \alpha_2 x_{2t} + \ldots + \alpha_p x_{pt}, \ t = 1, 2, \ldots, n
\]

(2)

where \( \alpha_j, j = 1, 2, \ldots, p \) are the theoretical partial regression parameters of this linear regression hyperplane.

As already mentioned above, the empirical value of \( Z_t \) indicates whether there is or is not a turning point at time \( t \). The vector \( Z \) of such values is thus an empirical estimate of the vector of the theoretical values of the linear regression hyperplane \( \pi \), and vector \( \hat{Y} \) is a point estimator for the vector of the theoretical values of the linear regression hyperplane \( \pi \). That is
Let us first assume that the parameters \( \pi_j \), \( j = 1, 2, \ldots, p \) are known. We transform \( y_t \) to the above-mentioned artificial "zero-one" variable at time \( t \); now we are getting to the basic idea of the turning point indication. If the run of the evolution is to actually occur at time \( t \), the theoretical random variable \( \pi_t \) must exceed a certain threshold value (let us denote it by \( H_t \)). It means that

\[
\pi_t > H_t .
\]

must hold at time \( t \). The threshold value \( H_t \) is a random variable and we can assume that it is governed by the normal distribution with known parameters \( \mu \) and \( \sigma \). The probability that the monitored index achieves a status in which we indicate a turning point according to Formula (4) can be derived from

\[
P(\pi > H) = P(H < \pi) = P\left( \frac{H - \mu}{\sigma} < \frac{\pi - \mu}{\sigma} \right) = F\left( \frac{\pi - \mu}{\sigma} \right) = F(\psi),
\]

where

\[
\psi = \frac{\pi - \mu}{\sigma} = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_p x_p
\]

is the normed form already mentioned in Formula (2). For the parameters of the theoretical regression hyperplane, we have

\[
\beta_0 = \frac{\alpha_0 - \mu}{\sigma}, \quad \beta_1 = \frac{\alpha_1}{\sigma}, \quad \beta_2 = \frac{\alpha_2}{\sigma}, \ldots, \quad \beta_p = \frac{\alpha_p}{\sigma} .
\]

According to (5), the probability value \( F(\psi) \) corresponds to the distribution function of the normed normal distribution and is called probit. From the practical point of view, we will not deal with a vector of the theoretical values of the linear regression hyperplane \( \pi \), for the estimator given by Formula (3), but with its regression estimate \( Y \).

**ILLUSTRATION ON TIME SERIES OF NATIONAL ECONOMY IN THE CZECH REPUBLIC**

Our search for the turning points stems from Formula (2). The choice of the exogenous variables will therefore play an important role. This choice is not easy to make, it will never be unambiguous, there should be an adequate number of such variables, and their choice should always respect statistical criteria (such as eliminating multicollinearity), as well as factual criteria (where the latter are of primary importance).

The exogenous variables must be factually related to the index expressing the overall performance of the economy – the aggregate dynamics of the GDP in this instance. The model setup includes identification of the dependent variable, the set of the independent variables, and the subsequent estimate of the linear regression hyperplane \( \pi = \pi_0 + \pi_1 x_1 + \pi_2 x_2 + \ldots + \pi_p x_p \) according to (2); that is,
\[ Y_{(q)} = \text{est} \pi = \text{est} \alpha_0 + \text{est} \alpha_1 x_1 + \text{est} \alpha_2 x_2 + \text{est} \alpha_3 x_3 + \text{est} \alpha_4 x_4 + \text{est} \alpha_5 x_5 + \text{est} \alpha_6 x_6 \]

The GDP, or rather its quarter-to-quarter indices, play the role of the dependent variable, as Table 1 shows. The corresponding probits are then determined.

Table 7. Quarterly GDP values in the Czech Republic (million CZK, current prices, seasonally adjusted), and quarter-to-quarter indices of the GDP (source: www.czso.cz)

The evolution of the quarter-to-quarter GDP indices is shown in Fig. 1. On the basis of factual economic considerations and visual counts we identified the turning points in Fig. 1. They are marked by dark triangles in Fig. 1, by bold black print with grey highlighting of the relevant fields in Table 1 for evolution peaks, and by white bold print with black highlighting for evolution saddles. Namely, there are the 3rd quarter in 2007 (peak), 4th quarter in 2009 (peak), 4th quarter in 2013 (peak), and 4th quarter in 2008 (saddle).
Figure 3. **Quarter-to-quarter GDP indices**

The first turning point (Q3-2007, with seasonally adjusted data) was a peak of the positive development in the Czech economy before the coming mortgage crisis, which then also prevailed in our economy. It is followed by a saddle representing the deep recession (2008 and 2009, the Q4-2008 saddle). A temporary recovery of the Czech economy (Q4-2009), which was not very distinct, was followed by more troubles (fiscal difficulties in European countries including the Czech Republic); however, these troubles did not bring about an evolution saddle. And finally there is the recovery of the Czech economy after overcoming the crises (Q4-2013).

Let us have a closer look at certain aspects of the economic evolution in the Czech Republic in the important nodes, so that we realise the causes for the turning points visible in the chart. The development in the Czech economy after 2000 can be divided into several stages: the recovery from 2001 to 2004, conjuncture from 2005 to 2007, followed by the recession and crisis (2008 and 2009). Nonetheless, the first two stages had different features. The year 2004 started a period of high growth rates, forewarned by a slowdown in the growth rate of the final consumption expenditure by households (year to year 3.4%, compared to the preceding value of 5%), growing gross fixed capital formation (year to year 4.0%, compared to the stagnation in the preceding year), and – above all – the positive foreign trade balance for the first time since 1993. On the other hand, the year 2007, when our analysis begins, indicated an overheated economy with a high rate of investment growth (by 13.5% in 2007), high growth in the final consumption expenditure by households (by 4.0% in both 2006 and 2007), record net borrowing of non-financial corporations (amounting to 211 bln. CZK – a sum never seen before), and the subsequent debtor position abroad, with the total net borrowing of the national economy amounting to (again the record figure of) 155 bln. CZK.

Years 2008 and 2009 brought a deep drop in the GDP growth, not only in the Czech Republic. Moreover, there was a drop in investments (year to year by 10,1%), drop in the final consumption expenditure by households, and a recession (GDP growth by -2.3% in 2008 and -1.6% in 2009).
expenditure by households (by 0.7%), and the government deficit amounted to a record value of 216 bln. CZK (5.5% of the GDP). Afterwards came another – fiscal – crisis, followed by growing indebtedness (a growing government debt of EU countries and growing deficits in budgets). The evolution of the GDP in the Czech Republic somehow stabilised as late as in 2013, accompanied by a slowdown in the recession in investments, a decrease of the government deficit, and a positive balance of the results of non-financial corporations.

However, such factual considerations of the turning points in the evolution of the national economy are insufficient for the use of formalised mathematical-statistical tools. Let us therefore analyse the turning points from the formal point of view, with the aid of the probit method. This method has a certain potential for predictions; we will also verify the “prediction ability”. The latter is mainly characterised by the fact that probit is nothing else but probability of occurrence of a certain situation. Once we set up a model containing one endogenous and several exogenous variables of the type described in Formula (2), the probit values will enable us to make statements about probability values of occurrence of turning points.

A key issue to be resolved at the very beginning is the time shift in exogenous variables \( x_p \) with respect to the endogenous variable \( y \) (the GDP). The stochastic character of probits grants them with prognostic potential. If the exogenous variables have been properly chosen, their evolution may suggest in advance the evolution of \( y \) (the GDP), thus containing information on predictions. That is why we step one period back in the series of the exogenous variables: their evolution will thus be one step ahead of that of the endogenous variable. In other words, the \( x_p \) variables now enter the probit model from the periods Q1-2007 through Q3-2015, while the \( y \) variable from the periods Q2-2007 through Q4-2015. Let us now deal with formalisation of the probit method. For the moments of time which correspond to the turning points, we introduce the artificial “zero-one” variables, where a turning point (whether a peak or a saddle) has the value one, and the other points (with no turn in the GDP evolution) have the value zero. The output of this probit indication of the turning points is illustrated in Table 2 and Fig. 2. The \( Y_{(i)} \) values stand for the regression estimates (obtained by the least-squared method) for the vector of the theoretical values of the linear regression hyperplane \( Y = \alpha_0 + \alpha_1 x_1 + \cdots + \alpha_6 x_6 \), or for the particular estimates on the basis of the input data according to Formula (7):

$$Y_{(i)} = \text{est} \pi = \text{est} \alpha_0 + \text{est} \alpha_1 x_1 + \cdots + \text{est} \alpha_6 x_6 = 0.94289 + 0.00140 x_1 + 0.00009 x_2 - 0.00030 x_3 - 0.00024 x_4 - 0.00061 x_6 \quad (7a)$$

The probits corresponding to the \( Y \) values were subsequently determined according to Formula (5). The turning points are marked with the “zero-one” variables as described above. We also state the estimates of the average and the standard deviation, \( s \), which were necessary for the calculation of the probits according to Formula (5).
The average value for the "zero-one" variables (the "Turning point" column) amounts to 0.171, with a standard deviation value of 0.372. The average of \(Y(Q)\) calculated according to Formula (7a) amounts to 1.006. Their standard deviation is 0.006. We will need these estimated characteristics for norming when calculating the probits.

</table>

Table 8. Probit indication of turning points (authors’ own calculations)

Table 2 and Fig. 2 indicate that low values of the probits do not imply turning points in the evolution of the Czech economy. On the contrary, the Q3-2007 turning point (a grey field in Table 2 and a triangle mark ▲ in Fig. 2) the probit probability of a turning point occurrence as estimated in the preceding time step \(t-1\), i.e., in Q2-2007, amounts to 0.844 (the probit value is marked with a large square mark ■ in Fig. 2). In other words, since the exogenous variables have been put one step (one quarter) backwards, a high value of probit at time Q2-2007 indicates a turning point in the GDP evolution at time Q3-2007, or rather, it indicates a high value of probability that the turn may occur in the next period.

A similar interpretation (cf. Table 2 and Fig. 2) is valid for Q4-2008 (one period ahead, i.e., at Q3-2008, the probit distinctly grows to 0.678; hence a coming turning point – saddle – is signaled). Similarly for Q4-2009 and Q4-2013 (always with the probit flag one step ahead) – in the last two instances the turning points are evolution peaks.

The coefficient of determination for the case of using the linear regression hyperplane with a time shift of the exogenous variables by one step backwards equals \(r^2 = 0.74477 = 74.477\%\).
In any case the most important task in the probit indication of the turning points is the requirement for a timely signal that the potential for the occurrence of an evolution turning point is growing. This would bring substantial information to be used in decision making in the economic policy.

The most important task in the probit indication of the turning points is the requirement for a timely signal that the potential for the occurrence of an evolution turning point is growing. This would bring substantial information to be used in decision making in the economic policy. However some open questions remain: What price level should be chosen for certain volume indices? It has not been satisfactorily shown which of the options – fixed prices, current prices, previous year's prices, etc. – is the best? Should original or seasonally cleaned data be used? A reply to this question will probably have to be found experimentally. A certain complication in this respect is implied from the fact that for data obtained from the public-domain sources it is usually unknown what procedures were used for the seasonal cleaning and/or whether all indices we would like to include in the model were seasonally cleaned by the same procedure? What length of the time series should be used?

CONCLUSIONS

Detecting a turning point in economic evolution and, in particular, a possible beginning of recession is an all-encompassing problem. Its solution cannot be restricted to the use of one formalised (statistical or econometric) method. Neither can it be narrowed down to an indefinite factual analysis not based on data and evaluation of the evolution of key indices. Successfully coping with a risk of a turning point (of course, especially for recession, but also conjuncture as a way out of economic problems prevailing in a country or group of countries) is only possible by applying a carefully balanced combination of factual analysis and detailed analysis of key economic data.
Our method is an attempt at finding this very combination. It primarily preselects the decisive factors (exogenous variables) whose evolution may include potential for influencing the overall economic development. This, however, is not enough. We also have to analyse the genetic background of such influence on the aggregate index (usually the GDP, but another aggregate index is also possible). Now it is the right time for a factual analysis of the accompanying variables (as illustrated in the Basic Concept of the Model chapter of the present paper), and also for quantifying the possible risk, implied by the measure of this genetic background. It may be viewed as a kind of "risk seismograph".

The factual concept must defend the role and influence of the exogenous variables on the aggregate evolution, including a proper choice and reasoning of the selected indices – answering the question "how" and "why" the transfer occurs. The subsequent quantification (here with the aid of the probit method) must calculate the risk of transfer – answering the question "how much" or "to what extent". The main contribution of our method is the combination of both approaches, when both are simultaneously evaluated and intertwined. At the same time, we explicitly express the probability that a turning point (in either direction) occurs. Moreover, our model is interactive because we can add or remove the exogenous variables. Last but not least, there is a prediction potential – thanks to the one-step time delay of the endogenous variable (here the GDP) behind the lead exogenous variables we can try to predict changes to come.

ABSTRACT

This study sought to contribute to research on entrepreneurial intention (EI) by identifying which constructs of the entrepreneurial profile and internal conditions of healthcare organizations support entrepreneurship and contribute to the EI of nurses.

In addition to psychological attributes, cognitive processes, motivations, sociodemographic and professional characteristics, and entrepreneurial abilities, the literature indicates that internal conditions of organizations also contribute to explaining EI.

To evaluate this model empirically, the primary data were collected with questionnaires distributed to nurses. In two public hospitals—the Trás-os-Montes and Alto Douro Hospital Center (CHTMAD) and the Local Health Unit of the Northeast (ULSNE)—638 nurses filled out the questionnaire. The data were analyzed using inferential and regression analyses.

The results suggest that the dimensions related to personal attributes, namely, motivation and entrepreneurial skills, are the constructs that best explain the EI of these professionals within their organizations. A broad discussion is needed about how to implement internal conditions that promote an intrapreneurial and innovative culture in healthcare organizations.

The results confirm that healthcare organization administrators need to develop conditions that enhance the EI of their healthcare professionals and differentiate their practices from other organizations.

Keywords: Entrepreneurial profile, entrepreneurial intention, intrapreneurship, health organizations, nurses.

AIMS

Society is currently experiencing an era of extensive entrepreneurship, dominated not only by increased entrepreneurial activity but also a fundamental change in the way of thinking about life,
organizations, and the environment. The concept of intrapreneurship has emerged, which can be defined as the way an organization can be transformed from inside to become more profitable when more visionary employees are allowed to implement their entrepreneurial ideas. Any organization can benefit from sustaining and encouraging entrepreneurship because, through entrepreneurship, organizations can develop, reinvent themselves, improve their performance, and ensure survival in the marketplace (Cadar & Badulescu 2015). To this end, organizations must take into account their employees’ entrepreneurial profile, as well as the internal organizational conditions that foment an entrepreneurial culture.

The entrepreneur is considered an agent of change: an innovator who produces new products, identifies new markets, combines resources to lead to new and unique modes of competitive advantage, and creates changes in the rules of market competitiveness. In contrast, the intrapreneur seeks to change the current state of his or her organization and to innovate within this context, which requires an organizational culture and environment that encourages successful intrapreneurship (Smith et al. 2016). An internal work environment that rewards and recognizes employee discretion—combined with the appropriate level of organizational boundaries, such as formalization, centralization, technological routines, and connectivity—is crucial to fostering organizational culture and job satisfaction. This, in turn, can lead to development of entrepreneurial orientation and intention within organizations (Karyotakis & Moustakis 2016).

Entrepreneurial intention (EI) is considered a significant construct in the most recent research on entrepreneurship, based on the evidence that EI predicts future entrepreneurial activity even in the very long term (Liñán & Fayolle 2015). Some studies have already related EI to entrepreneurial skills (e.g., Adeyemo 2009, Ibrahim & Lucky 2014), taking into account personal characteristics and context factors (e.g., Karimi et al. 2015, Singh et al. 2016). However, only a few studies have been conducted in health organizations (e.g., Lages 2015) and have specifically involved the growing number of nurses who are part of change processes in different areas of healthcare activities. Erdmann et al. (2009: 642) suggest that: “The visibility of ... nurse[s] is ... [increased] by ... [a] search of the interactive and associative possibilities of [their] social contribution[s] in ... different spaces and fields of action, in order to broaden and make known ... [nurses’] field of intervention”. According to DeSantis and Scales (2015), nurses have an extremely important role in the healthcare system. However, to engage in innovative behavior, nurses need management support, resources, a favorable work environment, and knowledge about innovation and the role of nurses. Nursing leadership is, thus, vital to the development of nursing practices, fostering and supporting the level of intensity required for innovation processes.
Taking into account the aforementioned research, the present study had as its main objective to identify which constructs of the entrepreneurial profile and internal conditions of organizations promote the EI of a specific group of health professionals, namely, nurses. This research was justified by the lack of studies in this area, including the need for a fuller understanding of the relationship between the entrepreneurial profile, organizations’ internal conditions, and healthcare professionals’ EI in this case, nurses. The study sought to provide top administrators of health organizations with the information needed to develop conditions that foster their employees’ intrapreneurial intentions, thereby differentiating how they exercise their profession in workplace activities from other organizations’ employees.

After this introduction, a brief theoretical discussion of EI and related factors is provided. Section three describes the methodology used. In the fourth section, the results are presented, followed by the final sections’ discussion of findings and this study’s limitations and implications.

BACKGROUND

Entreprenenurial Intention

Intention can be interpreted as an indication of how willing an individual is to try something and how much effort he or she is willing to expend in order to engage in certain behaviors for a particular length of time (Kusmintarti et al. 2016). The decision to become an entrepreneur needs to be considered voluntarily and consciously (Krueger et al. 2000), so, logically, how this decision is made needs to be analyzed (Liñán & Chen 2009). Within the field of entrepreneurship, EI is already a consolidated area of research (e.g., Fayolle & Liñán 2014), with a growing number of entrepreneurship studies using this construct as a powerful theoretical reference (e.g., Liñán & Fayolle 2015). According to Fayolle and Liñán (2014), the work done by Shapero and Sokol (1982) and Shapero (1984) marks the period in which the literature on EI started its rapid growth (e.g., Fayolle & Liñán 2014, Fayolle et al. 2014).

EI can be defined as an individual’s self-recognized conviction that he or she intends to start a new business and consciously plans to do so at some point in the future (Thompson 2009). Ibrahim and Lucky (2014) defined EI as a set of ideas that guide, coordinate, and control the action of creating and developing a new business, including its implementation and the evaluation of the external or internal environments of relevant organizations. In general, EIs depend on perceptions of the personal attractiveness and social norms of the viability of entrepreneurship, but some authors also mention that EIs depend on perceptions of personal convenience and viability, as well as individuals’ propensity to act (Krueger et al. 2000). For a variety of authors (Krueger et al. 2000, Ismail et al. 2015),
studying EI helps to understand its antecedents and to anticipate this intention (Ibrahim & Lucky 2014). Therefore, one of the dimensions chosen for the present study was to examine the EI of a specific group of healthcare professionals – nurses - in order to identify the antecedents of their EIs.

Internal conditions of organizations

A set of conditions can be identified that make the internal environment of an organization more welcoming to entrepreneurial attitudes. Most of these conditions are associated with the openness with which organizations deal with their employees, as well as the incentives administrators provide for employees to develop an entrepreneurial culture within the organization (e.g., Antoncic & Hisrich 2003). Bhardwaj and Sushil (2012) argue that, by giving appropriate rewards to employees, intrapreneurial activity can be improved. An effective reward system needs to consider goals, feedback, result-based incentives, and an emphasis on individual responsibility. Currently, dynamic and soft conditions advocate work environments that encourage new ideas, innovation, proactive behavior, risk-taking, and rational management, rewarding experiments, maturity, willingness to change, and open-mindedness (Karyotakis & Moustakis 2015). Several researchers have recognized the importance of internal organization conditions to promoting and supporting the development of an entrepreneurial environment (Kuratko et al. 2001, Hornsby et al. 2009). Notably, the size and type of organization (i.e., public, private, or non-profit) influence the internal conditions that the organization provides its employees (Zapkau et al. 2015). Kuratko et al. (2014) identify five specific dimensions that contribute to an environment that encourages entrepreneurial behavior: manager and/or coordinator support, autonomy, rewards, availability of time, and organizational procedures. Therefore following research hypothesis was proposed:

\[ H_1: \text{The internal conditions of a healthcare organization foster the EI of nurses.} \]

Sociodemographic and socio-professional factors
Previous research on EI has identified some factors related to individuals’ intention to start a business, including social aspects, socio-professional contexts (e.g., Nabi & Liñan 2011, Karimi et al. 2015), and sociodemographic aspects, such as gender and training (e.g., Phipps et al. 2015). Regarding gender, several studies highlight the impact of gender on EI and gender differences among entrepreneurs (e.g., Pejić Bach et al. 2016). Liñán et al. (2011) refer to several determinants of EI, including demographic factors such as age, gender, education, and work experience. In regard to the target organizations of this study (i.e., healthcare institutions), a multitude of factors can stimulate intrapreneurship in these organizations, among which are social, administrative, demographic, professional, and educational aspects. Individual and sociocultural factors have a significant explanatory power for entrepreneurial intent and the decision to start a business (Singh et al. 2016, Darbyshire 2014). Based on these findings, the following hypothesis was formulated:

H₂: Sociodemographic and professional characteristics influence the EI of nurses.

Psychological and cognitive factors

Despite some skepticism in the past, personality traits continue to attract considerable attention in entrepreneurship research. Studies of psychological and/or personality factors have revealed the complexities inherent in personality and cognition, with different types of variables influencing the way people see, interpret, and react to reality (Liñán & Fayolle 2015). Individuals’ personality influence their behaviors and attitudes. Since the decision to start a business is a human behavior, it is influenced by psychological factors (Chedli 2016). In their studies in the healthcare sector, Marques et al. (2013) and Lages et al. (2016) identified the psychological factors of creativity and/or innovation, self-esteem and/or self-confidence, and self-autonomy. In the present study, based on the review of the literature discussed above, the following research hypothesis was proposed:

H₃: Psychological factors influence the EI of nurses.

The cognitive approach emphasizes the fact that everything humans do or say is influenced by mental processes, motivations, perceptions, or attitudes. Through these processes, people acquire information and then store, transform, and use it to achieve different goals, make decisions, or solve problems (Fernández et al. 2009). Entrepreneurial cognition focuses on entrepreneurs’ mental models and on the ways they link their psychological traits to entrepreneurial processes and outcomes (Chen et al. 2015, Virick et al. 2015). Tang et al. (2007), Marques et al. (2013) and Lages et al. (2016) refer factors such as perseverance, an optimistic perception of success, and the influence of affective states.
as cognitions that influence entrepreneurial behavior. Muehlfeld et al. (2015) confirm that one characteristic typically attributed to entrepreneurs is perseverance, namely, their commitment to a chosen path and fearless pursuit despite adversity (e.g., Baron 2004, Holland & Shepherd 2013, Verheul et al. 2012, Patel & Thatcher 2014). In the present study, the cognitive attributes associated with the profile of the healthcare professionals under study were: (1) an optimistic perception of success, (2) perseverance, and (3) the influence of affective states. Based on this line of thought, the following hypothesis was formulated:

**H**₄: Cognitive factors influence the EI of nurses.

**Motivational factors**

Chedli (2016) lists a number of motivational factors that influence entrepreneurial behavior. These fall into two categories: (1) psychological motivations, such as personality traits and satisfaction of personal needs and (2) contextual motivations, such as sociological interactions between individuals and their environment, situations, economic settings, and government aid. Debariev et al.’s (2015) study identified three motivational factors—personal attitude, perceived behavioral control, and subjective norms—that have a positive impact on EI. Romero-Martínez and Milone (2016), in turn, report that autonomy at work, self-actualization, and the need to find an alternative to unemployment are the main motivations for entrepreneurship. Research by Indarti and Rostiani (2008) identified a desire for self-realization as a determinant of EI. Taking into account the healthcare organizations and professionals involved in the present study, autonomy and self-actualization were considered determining variables for intrapreneurial intention. Thus, the following hypothesis was proposed:

**H**₅: Motivations for intrapreneurship influence the EI of nurses.

**Entrepreneurial skills**

Entrepreneurial skills are necessary basic skills that enable individuals to start and successfully develop a financially viable business (Adeyemo 2009). Ibrahim and Lucky (2014) also observed that entrepreneurial skills are an important factor for the development of successful entrepreneurship and that these are related to entrepreneurs’ EI. According to Ibrahim and Lucky (2014), in the context of entrepreneurship, capacity has been identified as one of the most important and necessary factors in becoming entrepreneurs and being successful in entrepreneurial activities, including as a characteristic of those who intend to become entrepreneurs. Phipps et al. (2015)
emphasize that individuals need relevant knowledge and skills in order for their intrapreneurial intentions to succeed. Therefore, the following research hypothesis was formulated:

**H6:** The entrepreneurial capacities of nurses positively influence their IE.

**Conceptual Model**

Based on the objective and research hypotheses presented in the previous subsections, the conceptual research model in Figure 1 was proposed. This model included the conceptualization and incorporation of relevant dimensions from the following studies: Tang et al. (2007), Marques et al. (2013), Lages et al. (2016) Liñan (2008) and Liñan and Chen (2009).

![Figure 1 - The conceptual model.](image)

**METHODS**

In the two public hospitals involved in this study, 1,384 questionnaires were distributed—823 in the Trás-os-Montes and Alto Douro Hospital Center (CHTMAD) and 561 in the Local Health Unit of the Northeast (ULSNE) in the first half of 2016, and 638 questionnaires were collected. The five-part questionnaire contained closed-ended, multiple-choice questions with answers using a five-point Likert-type scale. The anonymity of the study participants was safeguarded to ensure ethical principles, and the data were treated using methods that guaranteed confidentiality. The scales used were validated by previous studies. More specifically, the scale of psychological and cognitive factors was taken from Marques et al.’s (2013) work. The entrepreneurship scale was originally developed by
Liñan (2008) and translated and retranslated for the present study. For the EI scale, the scale was based on the one used by Liñan and Chen (2009), and the scale of organizations’ internal conditions came from Lages et al. (2016) study. The hypotheses developed for this study were tested via analyses of multiple linear regression coefficients and their respective statistical significance using a stepwise algorithm. In addition to these calculations, the explanatory capacity of the models (i.e., adjusted r-squared), the validity and suitability of the models for the data (i.e., analysis of variance), and possible multicollinearity problems (i.e., the condition index value) were analyzed.

RESULTS

Characterization of Sample

This research dealt with a sample of participants in a feminized healthcare profession (i.e., 79.9% of respondents are female), who were mostly married or in a civil union. In terms of age, 70.9% of the respondents were over 36 years old. Regarding qualifications, 85.3% of the sample have a higher education degree, and 12.6% have a master’s degree. The data also revealed that only 18.2% of the participants were trained in management. A majority (62.4%) of the nurses worked in CHMTAD and 37.6% in ULSNE, dispersed across several hospital units. Almost 40% of the sample was concentrated in the Vila Real Hospital. In terms of employment status, 88.6% of the respondents had a permanent contract, while 10.9% have a fixed-term contract.

Validation of Research Instrument

The factorial analysis for motivations for entrepreneurship led to the retention of two factors: self-realization (5 items; Cronbach’s alpha = 0.898) and need/family influence (3 items; Cronbach’s alpha = 0.789) that account for 71.58% of the explained variance, with good internal reliability results (KMO = 0.828).

The factorial solution for the items related to entrepreneurial skills led to the retention of a single factor (6 items; Cronbach’s alpha = 0.911). This is associated with 69.48% of the explained variance and an extremely good result from the internal reliability analysis (KMO = 0.888). The matrix of the components was also subjected to a varimax rotation.

The factor analysis of the items related to EI resulted in the retention of a single factor (6 items; Cronbach’s alpha = 0.971), which accounts for 87.66% of the explained variance. This factor also produced extremely good result in the internal reliability analysis (KMO = 0.928).

The factor analysis of the main components for the cognitive profile items led to the retention of three factors: optimistic perception of success (5 items; Cronbach’s alpha = 0.733), perseverance (2
items; Cronbach’s alpha = 0.645) and influence of affective states (1 item) with acceptable results for internal reliability (KMO = 0.754).

In relation to psychological factors the factor analysis of the main components of the psychological profile resulted in the retention of three factors: propensity to risk and innovation (8 items; Cronbach’s alpha = 0.845), self-control (3 items; Cronbach’s alpha = 0.703) and autonomy (2 items; Cronbach’s alpha = 0.723). These factors account for 52.88% of the explained variance. All internal reliability results are above the acceptable level for index creation (reliability (KMO = 0.918).

**Linear Regression Model**

In order to respond to the objective defined for this study, the research hypotheses were verified using multiple linear regression models. These included EI as the dependent variable and the independent variables of the entrepreneurial profile (i.e., motivations and cognitive, psychological, sociodemographic, and professional factors, as well as entrepreneurial capacities) and organizations’ internal conditions. The results are presented in Table 1 and Figure 2.

</table>
The results in Table 1 and Figure 2 can be divided into two large groups that can influence the nurses’ EI: (1) the factors that constitute the entrepreneurial profile and (2) factors arising from organizations’ internal conditions. Regarding nurses entrepreneurs, the results indicate that:

- The intrapreneurship motivations of self-realization and family need and/or influence contribute positively to EI.
- With regard to entrepreneurial skills, professionals with a higher level of entrepreneurial skills have a higher EI.
- Regarding cognitive profile factors, an optimistic perception of success and the influence of affective states contribute positively to EI.
- In the psychological profile, only the propensity to risk and innovation makes a statistically significant contribution to EI, and, the greater the respondents’ propensity to risk and innovation manifested, the greater is their EI.
- With regard to the sociodemographic and professional profile, being female means a lower EI and being older also contributes negatively to EI, but having management training implies an increase in nurses’ EI.
- Regarding organizations’ internal conditions, the results verified that only the dimension of operational autonomy has statistical significance: the greater the autonomy granted by the health organization to the professional, the higher the level of EI within the organization.
CONCLUSIONS

Ferreira et al. (2013) identified the permanent need to proactively design, create, and carry out activities and the skills to deal with and motivate people as entrepreneurial characteristics. The present study sought to fill the gap in the literature arising from the inexistence of valid instruments capable of measuring these characteristics quantitatively in a specific professional area such as healthcare. To this end, this section starts by presenting the results for the verification of the research hypotheses.

A positive relationship exists between operational autonomy and respondents' EI, thus reinforcing the conclusions of some authors who argue that individuals with greater autonomy at work have a higher level of EI (Hornsby et al. 1993, Kuratko et al. 2014) – confirm H1. The data offer support for H2 since the analysis verified that being female means lower EI levels and that a more advanced age also contributes negatively to EI. In contrast, having training in management means a higher level of EI, which is in agreement with previous studies (Antoncic & Hisrich 2003, Rodrigues et al. 2008, Martiarena 2013, Urbano et al. 2013). The results of the present study provide support for H3 so that, the higher the risk and innovation propensity manifested by respondents, the higher their EI, as suggested by the studies reviewed (Rodrigues et al. 2008, Martiarena 2013, Urbano et al. 2013). Since the factors of optimistic perception of success and influence of affective states contribute positively to EI, as argued by Marques et al. (2013) and Lages et al. (2016), H4 was also confirmed. Based on the present results, H5 is confirmed given that self-actualization and family need and/or influence contribute positively to EI. This has been corroborated by previous studies (Antoncic & Hisrich 2003, Baron 2004, Rodrigues et al. 2008). The final hypothesis was also confirmed since the data verified that, the higher the level of entrepreneurial skills of nurses, the higher their EI is. This confirms the findings of prior research (Phipps et al. 2015).

Given the limited research in this area, the present study could stimulate other scholars' interest in conducting future studies in this field because the present results confirm the great potential for research on this subject. Thus, due to the pioneering nature and singularity of the present study—in addition to its other merits—these findings are a significant contribution to the literature on EI. This study could also have future implications for both the scientific community and healthcare organizations. A study of this nature always entails some limitations; one limitation observed was that the questionnaires were only distributed to nurses in two public hospitals in a northern region of Portugal, so future research could extend this study's approach to include other regions of this country and carry out comparative studies with other type of institutions, especially in the private sector.
IMPLICATIONS FOR NURSING MANAGEMENT

Organizational research is clearly important to the healthcare system, in particular when assessing the impacts of nursing, because most nurses perform functions in complex organizational contexts (Aiken & Patrician 2000). The importance of this study lies in how it recognizes nurses as potential entrepreneurs, as well as the influence of healthcare organizations’ internal conditions that support entrepreneurship. The results could help top administrators and intermediate managers of healthcare organizations to develop activities that enhance the EI of nurses, thereby differentiating how they exercise their professions through workplace activities from other organizations’ employees.

ABSTRACT

This paper aims to identify the main characteristics of the women entrepreneur’s profile in healthcare sector. It’s an exploratory study that emerged from the qualitative study supported by semi-structured interviews to women in a northern Portuguese town. Using the interview technique, we collected data about women entrepreneurs in healthcare sector, which were analysed quantitatively (descriptive statistics) and qualitatively (content analysis) giving rise to an exploratory and descriptive study. As results we may summarize that women entrepreneurs in the healthcare sector in a Portugal town are successful; their motivations were a combination of factors (e.g. training in the area, personal recognition and economic needs); obstacles have been identified; the work-family balance is not a limiting factor for their business; institutional support did not affect the start-up of the business and these women entrepreneurs do not feel discriminated. In the expressions of the entrepreneurs they showed self-confidence and self-realization, energy and perseverance. The elaboration of this study will contribute to enriching knowledge about the profile of women entrepreneurs in the healthcare sector, their motivations and obstacles.

Keywords: women entrepreneurs; profile; motivations; work-family balance; healthcare sector, Portugal.

INTRODUCTION

Entrepreneurship is a silent revolution in markets, distinguishing business creation and value added, dedicating time, and effort, assuming financial, psychological, and social risks that are inherent to it, but concomitantly welcome the gratifications of personal and economic satisfaction (Mari et al. 2016). However, for entrepreneurship developed and subsisted, there are a number of structuring factors, namely: financial support; policies and programs; education and training; transfer of R&D results; commercial and professional infrastructure; opening up of the internal market; access to physical infrastructure and social and cultural norms.
When analyzing the concept of entrepreneurship from a gender perspective, female entrepreneurship is characterized by the result of a different experience, which in turn shapes the entrepreneurial intention, and stereotypes are also perceived in the social relations of gender (McClelland, 1961; Brush & Gatewood, 2008). The focus of the Global Entrepreneurship Monitor Portugal 2013 (Caetano 2014) in the individual participation allows the socio-economic analysis of among other characteristics on the entrepreneurs. With this information, it is possible to assess the level of inclusion in the labor market, since several groups (e.g., those classified by age, gender or education) engage in business activity (Kelley et al. 2015).

Studies on women entrepreneurship are emergent given the nature of the increasing evolution of the role of women in contemporary society, as well as the appearance of new issues within this group (e.g. Carter & Shaw 2006, Brush et al. 2014, De Vita et al 2014, Marlow 2014, Henry et al. 2015).

In the research on the theoretical referential in relation to the healthcare sector together with women’s entrepreneurship in the healthcare area, we have a bibliographical gap regarding the specificity of the theme. However, many studies have been done on entrepreneurship in the healthcare sector (e.g. Marques et al. 2013, Lages et al. 2016), but none of them takes into account the gender variable women, in our study. Thus, we may say that the investigation of entrepreneurship based on the healthcare sector is growing, but for now neither focuses women.

Considering the importance to foster women entrepreneurship and the healthcare sector, our study is an exploratory one in qualitative perspective, with the main of identify the key characteristics of the women entrepreneur’s profile in healthcare sector.

The elaboration of this study will contribute to enriching knowledge about the profile of women entrepreneurs in the healthcare sector, motivations and obstacles, as the studies on the subject of entrepreneurship in the healthcare sector, focusing on the female gender are rare.

After this introduction, a brief theoretical discussion about some attributes and motivations of women entrepreneurs. Section three describes the methodology used. In the fourth section, the results are presented, followed by the final sections’ discussion of findings and this study’s limitations and implications.

BACKGROUND

Sex and Gender in an Entrepreneurship Perspective

Entrepreneurship is considered as one of the primordial mechanisms, promoters of economic development, innovation, and well-being. Considered as a dynamic process of change, vision and design, it is based on the identification of opportunities and creation of new solutions by the entrepreneur, with the objective of meeting the needs of individuals (IFDEP, 2014).
In the literature, concepts such as gender and entrepreneurship have expanded over the last few years, but these still remain limited theoretically and methodologically (Calas et al. 2009). As a way of understanding the roots of entrepreneurship, history presents us with four important milestones for the emancipation of women in the labor market. Until the Industrial Revolution in the XIX century, the women were incapable to work outside the household (Hamilton, 2013). Through this revolution, and with the increasing demand for labor, female inclusion has intensified. However, the wage disparities, and the poor working conditions, in this period began to give rise to demands for labor rights. The ideological shift associated with domestic activity has become a dominant gender discourse, linked in large part to industrialization, the separation of production and consumption, household and labor activity, played an important role in the definition of gender roles. In the emerging middle class in Europe (Gatrell 2008). Another important momentous in history was the first and second World Wars, because with less men because of their deaths in combat, it became essential to hire women in the labor market, as a way to fill the activities that were performed until then by men (United Nations 2010). In Portugal, the various political, social, and economic transformations that took place since the 1970s provoked deep changes at various levels, in health in education, in social structure, and in citizenship. Parallel to these changes, the position of women in the labor market, as well as the legal procedure, and the recognition of equal rights between men and women; have undergone fundamental changes, namely of the political regime through the implementation of democracy in Portugal (IFDEP, 2014).

Silveira (2012) presents different associations around the gender issue: associated with the male rationality, calculism and logical thinking; And to female the emotions, intuition and affections, the same emphasizes the existence of a significant asymmetry between the two genders based on the difference of the sex and the culture in which they are inserted. This author refers that gender relations are the result of continuous learning, of social interaction, and not solely of the biological factor. So gender is a social construction and sex is something biological, which is pre-determined at birth.

Women’s Entrepreneurship

When we talk about the first studies on women’s entrepreneurship we refer to the 70’s of the 20th century and was one of the first works by Schwartz (1976). Schwartz (1976) sought to address aspects related to the characteristics of the personality of the entrepreneurial woman, their motivations, and also the difficulties they face. Through her research she concluded that the reasons why lead men and women to open their own business are similar, as well as their qualities as entrepreneurs (Gomes et al. 2014). However, it was notorious that women faced more barriers to the business, impeding the success of their organizations (Gomes et al. 2014).
According to Jennings and Brush (2013) the subdomain of women’s entrepreneurship has passed many of the key development milestones associated with the maturation of a field of research. Brush et al. (2009) refer that business activity is increasing among women, proving to be the most entrepreneurial population in emergency worldwide. However, in spite of this considerable increase on the part of women entrepreneurs, men have still been at the forefront of the entrepreneurial field in recent years, with disparities persisted across all countries (Shinnar et al. 2012).

According to GEM Portugal 2013 (Caetano 2014), the Entrepreneurial Activity Rate Early-Stage Total (TEA) in Portugal in 2013, the number of early-stage male entrepreneurs was 10.8% of the male population in adulthood, while the number of female early-stage was 5.8% of the adult population. There was an intensification of the imbalance of the involvement of men and women included in entrepreneurial activities. Thus, in 2012, “the number of early-stage male entrepreneurs corresponded to 9.3% of the adult male population and the number of early-stage female entrepreneurs to 6.2% of the adult female population. The increase in the overall TEA rate in Portugal is mainly due to the increase in the number of entrepreneurial men” (Caetano, 2014, p. 29)

**Entrepreneurship profile**

There are psychological approaches to entrepreneurship, which seek to identify unique behaviors and traits in the personality of the entrepreneurial individual, allowing him to achieve success. Among them, we highlight the ones that are presented in Table 1.

<table>
<thead>
<tr>

</tbody>
</table>
| Assumption | The business passport (...) will be the entrepreneurial capacity, that is, the capacity
calculated risks | to innovate, to take risks intelligently, to act quickly and efficiently to adapt to the continuous changes of the economic environment (Kaufman, 1991, p. 3).
Use of influence strategies | Once entrepreneurs recognize the importance of their face-to-face contact with others, they quickly and vigorously seek to do so (Markman & Baron, 2003, p. 114).
Entrepreneurial Spirit | Developing the entrepreneurial profile is to enable the student to create, lead and implement the process of developing new life plans. (...) Entrepreneurial training is based on the development of self-knowledge, with emphasis on perseverance, imagination and creativity, associated with innovation (Souza et al. 2004, p. 4).

Motivations

McClelland (1972) advocates that values, human motivations and the need for self-actualization move individuals in search of entrepreneurial activities. It is also evident that the need for achievement and achievement is one of the main reasons that motivate the individual to have a proactive and dynamic attitude. Marques et al. (2011) adds that entrepreneurship in general is persuaded by the following motivating factors: self-actualization; independence; unemployment or need for security; education and previous experience; social status. Now speaking specifically about the motivations that lead the women’s entrepreneurship group to open the business itself, we have authors who defend the:

- Spirit of survival; Dissatisfaction with male leadership; Designing a niche market; Own will at the time of deciding; and finally, the main incentive is the combination of factors such as challenge, pleasure and contentment to face obstacles (Anderson & Woodcock 1996)
- Independence; desire for personal fulfillment; need for survival or a way to reconcile work with family; stagnation of professional career and perception of opportunities in the market (Machado, 2003).
- Difficulties in advancing their professional career, the organizational policies in force in the business context, and the difficulty in the duality of roles, that is, the reconciliation between work and family (IFDEP, 2014).

METHODOLOGY

To answer the research question “What is the profile of women entrepreneurs in healthcare sector?”, a qualitative investigation was carried out, with specific quantitative analyzes in an exploratory and descriptive study. Thus, in the data collection we applied a focused and structured interview, with 24 questions, divided by two segments: socioeconomic characterization and the profile of the entrepreneurial woman in the healthcare sector. The questions of the interview were adapted based on Marques et al. (2017) study.
At the time of the interviews, there was always a concern to safeguard the identity of the interviewees. The sampling was intentional, since we applied the interview to the entrepreneurs who made it available, having as only concern that the women were the owners of their own business related to the health area. This is because there is no Portuguese database to identify companies that are owned by women, nor by sector of activity. The questions were also based on the “GEM Portugal 2013” (Caetano 2014) and “GEM special report: Women’s entrepreneurship” (Kelley et al. 2015), and the interviews were applied to 16 entrepreneurial women, aged between 25 and 53 years, holding business related to the healthcare sector. The use of this method allowed an analysis of the characterization of the entrepreneurial woman in the healthcare sector.

In this work we intend to characterize the entrepreneurs of Vila Real, Portugal, having as reference our research question: What is the profile of women entrepreneurs in the healthcare area? To do this, we defined six propositions:

- **P1**: Women entrepreneurs in the health sector want to be successful.
- **P2**: The motivation of women entrepreneurs in healthcare sector is common.
- **P3**: Barriers to business creation are the bureaucracy and funding.
- **P4**: Work-family balance is not a conditioning factor for business.
- **P5**: Institutional support does not affect the start-up of the business.
- **P6**: Women entrepreneurs in the healthcare sector feel discriminated against.

Despite the efforts made and the limitations to the intended characterization, we were only able to collect 16 interviews in the city of Vila Real, Portugal. Because the size of the sample is small and local – only for business in the city of Vila Real, Portugal – it was decided to establish this first characterization for the entrepreneurial woman in the healthcare sector of this city. Qualitative analysis was done using counts and percentages (tables and graphs) using the IBM SPSS Statistics program 22. The content of the women entrepreneur’s comments was standardized based on the literature using word clouds. The descriptive statistics and graphs built based on the program, and we still used clouds of words.

**RESULTS: ANALYSIS AND DISCUSSION**

**Socio-economic characterization**

The women’s entrepreneurs age varies between 25 and 53 years, with the average age of 39.2. Most of these women are married (68.8%) and the others are single. Half of the women entrepreneurs

---

9 A word cloud is a graphic representation that gives greater prominence to words that appear more frequently in given texts (e.g., responses to open-ended survey questions or interview transcriptions), displaying them differently by size, color and brightness. Thus, for example, the words in the largest font-size are those most commonly encountered in the texts.
in the health area of Vila Real lives with their children and 12.5% lives with their parents. The majority (62.5%) have a degree, 31.3% have a master’s or post-graduate degree and 6.3% (one of 16 women) had a PhD. These entrepreneurs in healthcare sector in Vila Real present an academic profile similar to the early-stage described in GEM (2013).

Regarding the importance of education and training in the creation of the business, all 16 interviewees (100%) reported being a relevant factor. The words associated of the role of training in the management of entrepreneurial business (content analysis) were: training in management, knowledge, contribute, creation, fundamental, management, important and role.

Regarding the type of business of the 16 interviewees, the highest percentage of entrepreneurship in the healthcare sector are dental medical clinics (31.3%), and there are other diversified businesses (Figure 1). Concerning the functions that entrepreneurs carry out in their own business, 23.5% of these women are technicians and managers (Figure 2).

Figure 1. Business in the healthcare sector of the women entrepreneurs in Vila Real town

Figure 2. Functions in their own business of women’s entrepreneurs

Motivations
The graphic representation cloud of words was used and following Portuguese words stand out: area, mine, have, work, clinic, dental, create, formation, taste, medicine, motivated, academic. The cross-analysis of these motivations with the function groups in your business, as it highlighted the technical “my training area”. In this cross-sectional analysis, we highlight that 57.1% of the women (4 out of 7) who reported a combination of factors had told us to perform technical functions and managers and/or managing partners (Figure 3).

Figure 3. Motivations of the women entrepreneurs to create their business in the area of healthcare and functions in this business

The clouds of the words related to the personal characteristics that these women entrepreneurs in the healthcare area of Vila Real, refer as being those that help in their entrepreneurial activity - perseverance, organization (in green on the left) -, those that help and prejudice - sympathy, emotivity (in the gray, center) - and which ones hurt your business (in red on the right, Figure 4).

Figure 4. Characteristics of women entrepreneurs in their healthcare business
Among the personal characteristics that help, those women in their own business stand out in the foreground of the cloud of Portuguese word are organization and perseverance; and in the background: attention, responsibility, and sympathy. Finally in the third plane: ambition, actualization, boldness, and confidence. The personal characteristics that help and hinder them in your business the only referred were sympathy, emotion, and youth. The personal characteristics that harm the entrepreneurs of this area in your business, in the cloud of Portuguese words the emphasis is for not being and being, followed by perfectionism and kindness.

**Obstacles**

The main obstacles to the creation of their business to these women entrepreneurs in the healthcare area: four women (25%) reported bureaucracy, three mentioned space (18.8%) and two (12.5%) indicated the weight of taxes. The result of all responses is displayed in the word cloud (Figure 5).

![Word Cloud for obstacles to the creation of women entrepreneurs' business](image)

**Roles of women**

About people who supported and motivated these women entrepreneurs in the area of health in Vila Real, they mentioned in the first place parents, family and husband. Then friends, brothers, and fathers. Finally, other relatives as children, sister, brother, boyfriend and cousins. Concerning the priority of family versus work, these women entrepreneurs prove to be “the two”, adding that one without the other would be inconceivable to those women.

Crossing these results with those of the marital status of those women entrepreneurs, it is clear that within them, the priority is family and work and in the married ones family and work or family alone, overall of 72.8% (figure 6). Thus, in spite of a small sample of the municipality of Vila Real, the balance of the family versus work seems to be evident, as mentioned in Brush et al. (2014) and Berger and Kuckertz (2016).
Discrimination and self-perception

Of the 16 women entrepreneurs only one (6.3%) reported that she experienced discrimination as an entrepreneurial woman; which is a satisfactory result compared to the “GEM Portugal 2013” (Caetano 2014), “GEM special report: Women’s entrepreneurship” (Kelley et al. 2015) and the IFDEP (2014) reports.

Finally, inquiring about how she thinks society sees her, in the following cloud of words, the following words stand out: entrepreneur, professional, courageous, woman, among others.

In summary five of the propositions were confirmed (P1, P2, P3, P4 and P5) and only one was rejected – P6.
FINAL REMARKS

In spite of the limitation of a small sample, from the 16 interviewees we may have a first approach to the profile of the women health entrepreneurs in Vila Real have the same age range as the early-stage entrepreneurs (Caetano 2014, Kelley et al. 2015) most are married, and the household is slightly higher than Portuguese one.

The motivation of those entrepreneurs was in agreement with their area of training and resulted from a match of factors (Anderson & Woodcock 1996): personal achievement, independence and opportunity arose (Vale et al. 2014). As for the personal characteristics, those that help, help and hinder, and harm their own business are distinguished, being in line with those mentioned for the entrepreneurs in general (Schmidt & Bohnenberger 2008). Finally, the motivation of women entrepreneurs in healthcare in this town can be considered common. The obstacles to the creation of the business refered by these women entrepreneurs are mainly related to complaints of institutional context: bureaucracy, bureaucracies, financial, taxes and licenses (Baughn et al. 2006). To conclude, the obstacles were identified with a slightly different connotation from that exposed in the literature.

It was evidenced the reconciliation of work with the family (Greene et al. 2007, Welter et al. 2014). However, the women roles – family versus work – is not a conditioning factor for their business.

In the expressions of the entrepreneurs they showed self-confidence and self-realization (Vale et al. 2014, Anderson & Woodcock 2009), energy and perseverance (IFDEP 2014, Schmidt & Bohnenberger 2008). In addition, we have also seen that these entrepreneurs do not experience discrimination, contrary to what many authors refer to as Gupta et al. (2013).

The results suggested by the results that may be useful to women entrepreneurs and political decision-makers showing that this is a very feminine sector, without discrimination, and incentive policies should be developed to create start-ups in this sector, starting with the development of entrepreneurial skills and opportunity recognition in education and training related to healthcare.

While encouraging, the results of our preliminary study need to be viewed with caution. Their generalisability is limited given the strong dependence on the narrowly defined context of analysis and decision groups involved (i.e. only 16 womens entrepreneurs), as well as the subjective component of the interview methodology adopted.

Regarding future research, we recommend 1) quantitative studies; 2) studies with different stakeholders in this sector to confirm the robustness of the results; 3) studies across the same sector in different countries to increase the generalisability of the results; 4) comparisons of different methodological approaches and 5) the development of a number of case studies that could complete the framework of research. In this way, methodological improvements and the availability of larger samples will help to strengthen the preliminary conclusions drawn here...

ABSTRACT

This paper examines the relationship between environmental knowledge, organisational learning and business performance through an empirical study of 87 companies in the Spanish hospitality sector. This study includes “time” as variable in the analysis and by focusing on the need to update environmental knowledge six years after the learning process took place. The results of the study indicate that environmental knowledge has a positive impact on business performance. Therefore, our findings show that in order to achieve a sustained effect on performance, it is necessary for the organisation to keep its environmental knowledge stocks up to date. That is, there is a need to review the organisation’s environmental awareness at a regular intervals (in our particular research, six years after the initial analysis). This can be achieved by defining environmental knowledge as one of the priorities of the organisational learning processes. The paper discusses both conceptual and practical implications for the development of successful hotel operations and management.

Keywords: environmental knowledge, organisational learning, market, hospitality industry, business performance

1. INTRODUCTION

The environment and its protection are a common global concern. An increasing number of organisations are embracing environmental and sustainability challenges into their strategies and activities (Dangelico and Pontrandolfo, 2015). The extant literature contains evidence that by integrating the environment-friendly tasks into organisation strategies a number of benefits can be achieved. These include improved performance not only on organisational but also on environment-relevant aspects. In particular, organisations can implement several actions to reduce their negative impact on the environment and -directly or indirectly, they can improve their business performance.
Environment protection and the improvement of organisational performance are two of the key business priorities worldwide and the basis for attaining sustainable development (Cegarra-Navarro and Martinez-Martinez, 2010). In other words, sustainable development is one of the most widespread ideals of the self-dubbed “knowledge society” (Waldimir et al., 2011). In this context, environmental knowledge and learning have taken on a central role on how the duality organisation–environment is managed (Sinclair, Diduck and Fitzpatrick, 2008).

The dynamics of tourism as an activity and as an industry, combined with the growing concerns about the environment call for a continuous effort in seeking new approaches, tools and perspectives for the acquisition of environmental knowledge by organisations in the hospitality sector (Song et al., 2012). Uncertainty inherent to many resource and environmental decisions underscores the importance of environmental learning through the need to explore and exploit new environmental knowledge (Grant and Spender, 1996; Zahra and George, 2002). Further, the need for institutional innovation and generative change in response to the sustainability imperative emphasises the necessity of organisational learning in the hospitality industry (Kates et al., 2001).

Concern for the environment is an important, sustaining characteristic in several sectors. In the case of the hospitality industry, this commitment is especially important since stakeholders demand special environmental protection and natural resources are clearly not unlimited. However, the hospitality industry has been marginally affected by environmental regulation, becoming a widely neglected research setting. The sector is thus able to shed some light on why some organisations, e.g. hotels, produce different responses to the environmental concerns of their customers compared to others (Darnall, Henriques and Sadorsky, 2010; Fraj, Matute and Melero, 2015; Boiral, Raineri and Talbot, 2016; Rahman and Reynolds, 2016). It may be postulated that the reason why hotels adopt environmental knowledge in the long term could be related to process and to environmental learning, which enable the exploration and exploitation of environmental knowledge (Kim and Rhee, 2009) and its subsequent updating over time. The purpose of this study therefore is to analyse the role played by organisational learning over time as key aspect for updating the environmental knowledge of an organisation, along with the impact these processes may have on business performance. This paper contributes to the relevant literature in several dimensions.

Firstly, it analyses the relationship between environmental knowledge and performance in the context of the hospitality industry unlike the majority of previous studies, which have examined industrial firms (Molina-Azorín et al., 2009; Dangelico and Pontrandolfo, 2015). This established focus in the research literature probably arose because the activities of businesses potentially have a more negative...
impact on the environment (Bowen, 2000; Darnall, Henrique and Sadorsky, 2010), whereas service firms have received much less attention (Mina, Bascavusoglu-Moreau and Hughes, 2014). Secondly, while most of the previous research uses measures of proactivity on environmental performance (e.g. the negative effects of emissions and waste), this paper measures environmental impact as a result of implementing environmental organisational learning. Thirdly, this paper incorporates a longitudinal perspective, focusing on the changes of environmental knowledge along a period of time -mediated by organisational learning processes, with the impact it has on business performance. The longitudinal study described in this paper involved two observations of the same variables over a period of six years (2008 and 2014).

The proposed theoretical framework is presented in the following section. The methodology section provides details of the empirical tool used to collect appropriate data to test the conceptual model presented in the theoretical framework. Finally, the theoretical contribution and managerial implications of this research are discussed in section 4.

2. THE PROPOSED RESEARCH MODEL

2.1. Environmental knowledge and the Spanish hospitality industry

In order to answer the questions proposed by this research, a model was developed using quantitative data from the Spanish hospitality sector, particularly the section of the industry that deals with hotel operation and management. As a service industry, the hospitality sector is particularly relevant as the focus of research on environmental knowledge and organisational learning for two main reasons. First, this sector has an increasing importance on the global economy. Secondly, tourism and the tourist industry show an increasingly growing environmental concern. In contrast, the service sector, which makes a great contribution to development, is being held responsible for many of the issues leading to the planet’s environmental degradation.

The United States, China, Spain and France remain the world’s top tourism destinations (WTO, 2016). These countries not only attract the highest numbers of tourists but also have a combined income of approximately US$ 400 billion. Previous studies have shown that in the both developed and developing economies the service sector has been found to be contributing to more than 70% of the gross domestic product (GDP) (Mittal and Dhar, 2016).

Hotels carry out activities with a substantial dependence on the environment, an element that has modified the global competitive context. Therefore, hotel managers are required to reconsider their position in the conservation of natural resources. In addition, “green” tourism has led to increasingly demanding tourists who remain concerned about the products and services offered by hoteliers. In this context, the implementation of an environmentally-friendly strategy could become a key success factor...
for the competitiveness of hotels (Stegerean, Petre and Chis, 2014). As a consequence, organisations within the hospitality sector face an increasingly complex and competitive environment, forcing them to continuously learn and adapt to the new business environment and embrace innovation as being critical to the survival and success (Cruz et al., 2016). Preservation of the environment therefore becomes a key factor to consider in developing and managing hotel operations (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015).

Environmental knowledge is defined as a system to connect data, analysis and people which presents an opportunity to formalise industrial ecology in a business setting (Wernick, 2003). According to Fryxell and Lo (2015), environmental knowledge is defined as a general knowledge of facts, concepts, and relationships concerning the natural environment and its major ecosystems. Thus, environmental knowledge involves what societies know about the environment, key relationships leading to environmental aspects or impacts, and an appreciation of systems, and collective responsibilities necessary for sustainable development (Frick, Kaiser and Wilson, 2004; Po-Shin and Li-Hsing, 2009; Whyte, 2013). Based on this understanding, we focus on gaining an understanding of how the updating of environmental knowledge, mediated by learning processes, may contribute to the development of new environmental-informed responses or to adapting existing environmental approaches (Cegarra-Navarro and Martinez-Martínez, 2010).

2.2. Connecting environmental knowledge to organisational learning over time

Environmental knowledge has been invoked to characterize the way in which hospitality companies are able to create a path for the implementation of environmental practices that promote sustainable development (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015). In this paper, the authors adopt this view and therefore take an approach that considers environmental knowledge as the knowledge that can help hotel managers develop better environmental solutions (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015). Employees and management hold environmental knowledge at an individual and organisational levels. At every level they become stakeholders of such knowledge, take responsibility, experiment, make mistakes and acquire new environmental knowledge as they socialise and in the process of seeking continuous improvement in every aspect of the firm’s transformation process (Spender, 1998). This use of environmental knowledge helps employees find solutions to problems and improve their performance (Klassen and McLaughlin, 1996; Céspedes-Lorente, Burgos-Jiménez and Álvarez-Gil, 2003; Easterby-Smith and Prieto, 2008; Boiral, Raineri and Talbot, 2016). In this context it is worth noting that other research has shown how tacit and individual environmental knowledge of stakeholders by sharing and use of tacit environmental knowledge also can imply the development of it (Boiral, 2002). Likewise, the implementation of environmental programs requires learning, collaboration and helping relationships between employees, which are...
facilitated by environmental knowledge (Paillé and Raineri, 2015). These considerations led us to frame the first hypothesis of our study as follows:

**H1. Environmental knowledge (t) positively influences organisational learning (t)**

Organisational adaptation to a volatile environment has long been a major topic of research. It has been documented that an organisation’s adaptation requires a balance between exploration and exploitation to attain long-time viability in the face of a changing environment (Kim and Rhee, 2009). We add to such argument by proposing that for such adaptation to be successful the organisational learning processes should also be updated. What one may see as drivers of the exploitation and exploration processes of environmental knowledge over time within firms is their updated organisational learning strategies (Sinclair, Diduck and Fitzpatrick, 2008; Kim and Rhee, 2009; Liao, Chang and Wu, 2010; Kalmuk and Acar, 2015). As Martínez-Martínez, Cegarra-Navarro and García-Pérez (2015) noted, “time” provides hospitality companies with the temporal space they need to adjust and adapt to the new environmental challenges such as planning aims to enable recycling. For example, time implements a shared calendar for adjustment and revision of environmental practices and, delivers space for both synchronization and adjustment of knowledge structures. As a result, new environmental knowledge through learning orientation requires systematic update and represents a firm’s internal cognitive map in answering the needs of customers and markets through the updating of environmental knowledge (Sheng and Chien, 2016). This led us to hypothesise that:

**H2. Organisational learning(t) positively influences environmental knowledge (t+6)**

Once the staff has updated knowledge concerning its environment (e.g. new regulations to improve integrity of tourism industry), this knowledge can be viewed as a source of better solutions that meet new market needs or requirements (Sinclair, Diduck and Fitzpatrick, 2008; Kim and Rhee, 2009; Liao, Chang and Wu, 2010; Kalmuk and Acar, 2015). In other words, since environmental knowledge such as that of legislative changes has a dynamic nature, it requires solutions to be updated for managers to create (exploration), retain, transfer and use (exploitation) an organisation’s explicit and tacit environmental knowledge over time (Easterby-Smith and Prieto, 2008). In the same way organisations need develop dynamic capabilities, understood as routinised knowledge directed to the development and adaptation of operating routines (Zollo and Winter, 2002; Kabongo and Boiral, 2017). This allows them to incorporate into their routines the measures dictated by changes in the environment (Boiral, Raineri and Talbot, 2016; Font, Garay and Jones, 2016). Hotels operate in a context of intensive innovation and need to review their learning processes, which are implemented to create and update environmental knowledge (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015). For example, according to Psomas, Fotopoulos and Kafetzopoulos (2010) and Tari et al., (2010) a way to increase and update environmental knowledge is implementing a quality standard’s such as ISO 9001, which
suggests that hotels need to update their environmental knowledge through organisational learning over time (Fraj, Matute and Melero, 2015). Thus, longitudinal studies might potentially elucidate the long-term effects of organisational learning on environmental knowledge. We therefore propose the following hypothesis:

H3. Environmental learning (t+6) has positively effects on organisational learning (t+6)

One of the most important reasons for implementing “green organisational learning” strategies is the customer and their views, often touted as the central stakeholder in driving hotels to be environmentally friendly. Indeed, a growing consumer base exists who are attracted by the ecological appeal of lodging facilities (Han et al., 2011; Han and Chan, 2013). In the case of these hotels, environmental protection activities are embedded in business operations and may bring some benefits, such as the reduction of operating costs by exploiting ecological efficiencies, an increased demand by attracting ‘green’ consumers, gaining a competitive advantage, achieving marketing benefits and improved relationships with stakeholders, improving corporate reputation, obtaining additional social benefits, reducing long-term risks, innovation or a higher ability to influence or to operate ahead of the formalisation of new regulations (Álvarez Gil, Búrgos Jimenez and Céspedes Lorente, 2001; González-Benito and González-Benito, 2005; Callan and Thomas, 2009; Molina-Azorín et al., 2009; Cegarra-Navarro and Martinez-Martínez, 2010; Mina, Bascavusoglu-Moreau and Hughes, 2014; Dangelico and Pontrandolfo, 2015).

The above considerations have allowed us to propose that hotel performance is likely to be associated with environmental knowledge. As noted above, through organisational learning it can be possible to increase environmental knowledge, help hotels improve their business performance and obtain also a sources of competitive advantage (Easterby-Smith and Prieto, 2008; Civre and Omerzel, 2015). Thus, the following hypothesis is proposed:

H4. The existence of an up-to-date organisational learning strategy (t+6) could help hotels achieve better levels of business performance.

Taking all of the above into consideration, this study proposes the structural model shown in Figure 1, which can be briefly described as follows: Hotels must exploit and explore new environmental knowledge to internalise such knowledge through updated learning processes and thereby improve their business performance.
3. METHOD

3.1 Data collection

The population samplings used in this study comprised hotel managers. Spain is the third most visited country in the world. Not only its geography as a western European country with a Mediterranean weather, but also the fact that Spain is seen as a safe destination with a strong economic recovery are factors that make Spain appealing both to visitors and investors alike. Tourism contributes 13% of the Spanish GDP and provides 11% of all jobs. By the end of 2016, 70 million tourists had visited the country in the year. According to the World Travel and Tourism Council (WTTC), in 2017, these numbers will increase in a 2.9%. The WTTC also forecasts an average 2.7% annual increase in visitors until 2020. It should also be noted that the Spanish tourism sector is very complex and requires intensive use of knowledge resources to competitively operate in the market and satisfy its customer needs (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015).

A list of 560 Hotel Operators was provided by the SABI database (from the SABI Database based on the statistics for the year 2006), which was used as an initial sampling frame. All companies were included in the CNAE-552 (the Spanish National Classification of Economic Activities 552) and had ten or more employees. Before conducting the survey, the businesses were contacted by telephone and invited to participate in the study. Data sets were gathered in two phases, the first of which lasted two months, from early September to the end of October 2008. From a sample of 245 companies, 127 companies responded to the survey. The second stage in the data collection process within this research was conducted six years after the completion of the first phase. For approximately two months, between January and February 2014, the same companies that had completed the survey six years earlier were contacted. A survey was conducted and a total of 87 responses were collected, for a response rate of 15.53% of the total.
3.2 Measures
Churchill’s (1979) approach to questionnaire development was used, combining scales from several other relevant empirical studies with new items to make an initial list of 16 items. Several items were modified through interviews with colleagues and a first draft of the questionnaire was tested with three hotels. The questionnaire constructs were operationalised and measured as follow:

With regard to the items making up knowledge exploration, the technique of Mom, Van Den Bosch and Volberda (2007) was followed in adopting a broader notion on knowledge exploration. This means that the exploration scale determines the extent to which the HHU supports activities that allow its employees to learn new skills or knowledge (Mom, Van Den Bosch and Volberda, 2007). The existence of conditions necessary to support knowledge exploitation (ET) were measured using an adapted version of a scale designed by Bontis, Crossan and Hulland (2002) to measure the construct ‘feed-back learning flows’. They were focused on the utilisation of knowledge, which is embedded in the HHU to develop plans and the response implementation of such plans.

Environmental knowledge was computed using the scale of (Martínez-Martínez, Cegarra-Navarro and García-Pérez, 2015), who highlight the importance of supporting policies, rules, reporting structures and decision-making protocols that encourage the introduction of clean technologies and approaches to reduce pollution that often leads to substantial savings of materials and energy.

As the use of objective measures may pose some challenges to researchers while making causal inference from the historical data (March and Sutton, 1997), this study adopts subjective measures to achieve a more comprehensive evaluation of performance of the firm. In this regard, several measures of business performance have appeared in literature and we adopt the growth-based measures proposed by Kaplan and Norton (1992) and Klassen and McLaughlin, (1996) for sales, profits and profitability on total assets.

3.3 Data analysis and results
The data collected was analysed using the PLS-Graph software version 03.00 Build 1058. PLS was selected due to the characteristics of the model and population sample, which met Chin’s (2003) criteria. The proposed model is complex and uses reflective indicators, and the data collected is non-normal. Using PLS involves a two-stage approach (Barclay, Higgins and Thompson, 1995). The first step required an assessment of the measurement model. This allows for the relationships between the observable or manifest variables and the theoretical concepts or latent variables to be specified. This analysis is performed in relation to individual item reliability, construct reliability, average variance extracted (AVE), and discriminant validity of the indicators of latent variables. In the second stage, the structural model is evaluated. The aim of this is testing the extent to which the causal relationships specified by the proposed model are consistent with the data available. For hypothesis testing, the
bootstrapping procedure recommended by Chin (1998) was used. In order to analyse the relationship between the different constructs and their indicators, a latent model perspective was adopted in which the latent variable is understood to be the cause of the indicators.

First-order constructs or dimensions are therefore referred to as reflective indicators. Knowledge exploration (KEr), knowledge exploitation (KEt), environmental knowledge, and business performance (BP) were operationalised as first-order reflective constructs.

The results in Table 1 show that all of the constructs considered are reliable. The values for composite reliability are greater than the stricter value of 0.8 for basic research (Nunnally, 1978). The AVE should be greater than 0.5, meaning that at least 50% variance of the indicators should be accounted for (Fornell and Larcker, 1981). All the constructs in this model exceeded this condition. To assess the discriminant validity, the square root of the AVE (the diagonal in Table 1) was compared with the correlations between the constructs (the off-diagonal elements). On average, each construct relates more strongly to its own measures than to others.

Notes:
Mean = the average score for all of the items included in this measure; S.D. = Standard Deviation; CR = Composite Reliability; AVE = Average Variance Extracted. The bold numbers on the diagonal are the square root of the Average Variance Extracted. Off-diagonal elements are correlations among constructs.

As noted above, a second-order confirmatory factor analysis was conducted of a model depicting the constructs of knowledge exploration and knowledge exploitation. From an examination of the results
shown in Table 2 and Table 3, all first-order and second-order factor loadings were significant. In addition to this, all the knowledge creation constructs involving two dimensions [i.e. organisational learning (t) and organisational learning (t+n)] explain a high amount of variance in their respective knowledge processes (i.e. knowledge exploration and knowledge exploitation), thereby providing evidence that organisational learning (t) and organisational learning (t+n) are multifaceted constructs, construed from two dimensions (i.e. knowledge exploration and knowledge exploitation).

3. Results

This study uses PLS-Graph software version 3.00 to conduct an analysis of the data collected. The structural model resulting from the PLS analysis is summarised in Figure 2, where the variance of endogenous variables (R2) and the standardised path coefficients are shown. Figure 2 shows that all relationships are significant in all the scenarios analysed. Hence, the findings provided full support for H1, H2, H3 and H4.

Figure 2. Structural equation model
4. THEORETICAL CONTRIBUTION AND MANAGERIAL IMPLICATIONS.

By examining the relationship between environmental knowledge, organisational learning and business performance, this research has made a number of significant contributions to the body of knowledge in areas such as knowledge management and sustainable hospitality management practices.

Our key theoretical contributions fall into three main areas. First of all, the research has shown that there is a direct relationship between environmental knowledge and business performance, mediated by organisational learning. Whilst this relationship had been studied in other, mainly industry settings, the research fills a gap in this domain for the context of service-related organisations. In particular, its focus on the hospitality sector makes this research relevant for a significant number of hotels and their supply chain around the world.

Secondly, the research has addressed the challenges of sustainability and environmental performance from a new perspective. Instead of focusing on the problem (e.g. current environmental issues such as pollution, climate change, environment degradation, etc.) to propose a solution, we have sought to understand how addressing the roots of the problem may lead not only to its reduction but also to direct benefits for the organisation.

Finally, the paper has incorporated a longitudinal perspective, focusing on the relationship between the three key concepts being studied (i.e. environmental knowledge, organisational learning processes, business performance) over a period of time. This provides an improved perspective when compared to most previous studies.

The research also has a number of implications for management. From the fact that environmental knowledge has a positive impact on business performance, decision makers within the hospitality sector and in particular hotels’ management will better understand the importance of demonstrating the industry’s concern for the environment and putting in place mechanisms to raise awareness of
relevant environmental issues in their specific organisations. The implementation of environmentally responsible activities and of new and revised policies influencing both operational and management strategies could lead to the long-term sustainability of their businesses.

Additionally, this research shows that environmentally responsible activities, policies and strategies must be sustainable for such improvements in performance to remain. That is, that the organisation needs to put in place mechanisms for a continuous acquisition and use of environmental knowledge in order to achieve a sustained effect on performance and the environment.

The main limitation of this study relates to its focus on the Spanish hospitality industry and specifically in hotels. In order to corroborate the validity of our findings in other service-related industries and thus improve the empirical understanding of this topic, similar analyses would need to include other organisations within the hospitality industry, other sectors which have an impact on the environment, and even organisations and sectors in different geographic and socio-economic contexts.

THE SUCCESS OF CROSS BORDER ACQUISITIONS: DOES CULTURAL DISTANCE MATTER FOR CONSUMERS?

Marconi University, Rome, Italy
University of Sannio, Benevento, Italy

ABSTRACT

The aim of this research is to investigate the effect of cultural distance on the reputation transferability from a local target firm to a foreign acquirer by analyzing local country consumers. The work compares two foreign acquiring companies: a Chinese firm (large cultural distance to Italy) and a Spanish firm (small cultural distance to Italy). The findings show that Italian consumers have more negative attitudes and lower repurchase intentions toward the post-acquisition target if the acquirer has large cultural distance rather than it has small cultural distance. Furthermore, the study aims at verifying that the case of small cultural distance fosters the reputation transferability more than the opposite case of large cultural distance. The research could be of value and interest because little has been written dealing with the acquisition process in relation to market-based performance, particularly analyzing the consumer behavior toward a post-acquisition target.

Keywords: Cross-border acquisitions, cultural distance, reputation transferability.

1. INTRODUCTION

Cross-border mergers and acquisitions (M&As) have become increasingly popular over the last decade and represent an important alternative for strategic expansion. A large part of scholars has focused on cross-border M&As performances in order to define and suggest good practices and reduce the failure number of such operations (Perry and Herd, 2004; Teerikangas and Very, 2006). However, few studies have focused on consumers’ perspective after an acquisition operation (Thorbjørnsen and Dahlén, 2011; Fong et al., 2013). This variable could shed more light on the prospects of acquisition (Heinberg et al., 2016).

Another theoretically and empirically under-investigated phenomenon is the impact of cultural distance on the reputation transferability in the acquisition process. Cultural distance plays a considerable and complex role in acquisitions because of its impact on the reputation transferability. The aim of this research is to fill this gap by investigating, in cross-border acquisitions, how cultural
distance between the country of the acquirer and that of the acquired company influences the reputation transferability from a local target firm to a foreign acquirer.

The study contributes to the cross-border acquisition literature in several manners. First, it investigates the impact of cross-border acquisitions on consumer behaviour. Previous studies put more emphasis on objective data stressing managerial, organizational and financial aspects (Bandick, 2011) and ignoring the influence that cross-border acquisitions could have on consumers’ responses. Second, this study analyzes the impact of cultural distance between the acquirer and acquired firm on consumers’ choices. Existing literature is mainly based on the impact of cultural distance on organizational aspects in the cross-border acquisition rather than a consumers’ behavior (Kirkman and Shapiro, 2001). Third, for the first time, reputation transferability and cultural distance among firms involved in a cross-border acquisition are linked in the same interpretative model.

In the following section, a review of the literature on the relation between the three topics analyzed is presented. Then the article describes the methodology adopted and the results. The last section summarizes the authors’ findings and discusses future research areas.

2.THEORETICAL BACKGROUND AND HYPOTHESES

A commonly accepted definition of corporate reputation is “a perceptual representation of a firm’s past actions and future prospects that describe the firm’s overall appeal to all its key constituents when compared to other leading rivals” (Fombrun, 1996 p.72). Fombrun et al. (2000) developed the RQ (Reputation Quotient) model based on six dimensions: emotional appeal, products and services, financial performance, vision and leadership, workplace environment and social responsibility. Additionally, according to Lafferty and Goldsmith (1999) corporate reputation have a significant influence on consumers’ attitudes and purchase intentions. In fact, corporate reputation is in part a measure of future prospects, which may be clouded by an acquisition (Saxton, 2004). Acquisitions can create uncertainty for consumers, therefore the high reputation of the company could reduce it (Saxton and Dollinger, 2004).

Little of the research on corporate reputation has paid adequate attention to link reputational transferability and cultural distance among firms involved in the acquisition process. Hofstede defined the concept of culture as the “collective programming of the human mind” which he operationalized by means of six dimensions (Hofstede, 2001): power distance; individualism/collectivism; masculinity/femininity; uncertainty avoidance; long/short term orientation and indulgence/restraint. Hofstede developed his original model proposing only the first four dimensions along which cultural values could be analyzed. Further research led him to add a fifth (long-term orientation), and then a sixth dimension (indulgence versus self-restraint).
Doney et al. (1998) suggested that norms and values linked to Hofstede’s dimensions influence the extent and manner in which the transfer of reputation to the corporate level can take place. They highlighted how significantly cultural differences on the side of the corporate audience could shape perception and create conditions, which either support or inhibit transference of reputation. Therefore, it is reasonable to expect that intangible assets are even less likely to accrue to an acquirer when cultural differences are large (Saxton, 2004 p.185). The creation of positive attitudes toward new organizations, the emergence of a sense of shared identity and trust among organizational members is facilitated if the other part shares the same values and norms (Stahl and Voigt, 2008).

Thus, we suppose that in presence of large cultural distance between the acquired and the acquirer firm, consumers will have a more negative attitude and lower repurchase intention toward the post-acquisition target. Consumers react that way because they perceive the acquiring firm as operating under different norms and values, therefore trust can be erode.

The research considered China and Spain to investigate this phenomenon. The choice of countries was based following the Kogut and Singh’s index (1988), a composite measure of Hofstede’s dimensions of national cultures.

The above discussion leads to the following hypotheses:

H1a: Consumers have more negative attitude toward a post-acquisition target with high reputation when the foreign acquirer has large cultural distance from the home market (Chinese firm) than they do when the foreign acquirer has small cultural distance (Spanish firm).

H1b: Consumers have lower repurchase intentions toward the post-acquisition target with high reputation when the foreign acquirer has large cultural distance from the home market (Chinese firm) than they do when the foreign acquirer has small cultural distance (Spanish firm).

3. METHODOLOGY

In order to test the hypotheses above-mentioned, the following assumptions were made (Fong et al., 2013): the foreign firm acquires all shares of a local firm; the corporate name of the acquired target remains unchanged; the foreign acquirer assigned a new CEO and key positions in the firm; the foreign acquirer firm has high reputation; the respondents are habitual customers of the acquired firm.

The current study takes into account a cross-border acquisition of an Italian firm, which operates in the food sector. It is a real firm, but with disguised brand name. It is the market leader in Italy for processed meat products (ham, mortadella, salami, sausages etc.), which are completely manufactured and packaged in the home country. Moreover, the study considers two acquirers: the first with large cultural distance (Chinese firm) and the second with small cultural distance to Italy (Spanish firm). We compared consumers’ attitude and repurchase intentions in two business scenario: the first one with large cultural distance and the second one with small cultural distance between the acquirer and the acquired firm. In both scenario, acquirer and acquired firm are supposed to have high reputation. The valence was manipulated using a number of stars (*) on six corporate attributes considered. The greater the number of stars, the higher the reputation status.

The survey was conducted on 424 Italian students through online questionnaire built on validated scales in the literature. The use of students as respondents is a common practice in consumer behavior studies (Chaudhuri and Holbrook, 2001; Fong et al. 2013) considering that they are a more homogeneous group than ordinary individuals are. Of the 424 students who participated in this study, 216 replied to the first type of questionnaire (local target acquisition from a Chinese firm, Scenario 1) and 208 replied to the second type of questionnaire (local target acquisition from a Spanish firm, Scenario 2).

In order to allow participants to better understand the relevant points of our research, both the acquired and the acquirer firm profile was described in the first section of the questionnaire, and participants were informed about the high corporate reputation of the firms involved. This study considers six dimensions of Fombrun et al. (2000) as criteria to evaluate corporate reputation. In the second section, respondents were asked to express their attitudes toward the post-acquisition target on nine, seven-point scale, anchored as “disagree very much” and “agree very much” (Javalgi et al., 1994; Mathwick et al., 2004; Pope et al., 2004). Later, participants were asked if they would consider repurchasing products of the post-acquisition target on four, nine-point scale, anchored at “disagree very much” and “agree very much” (Heitmann et al., 2007). Each measure demonstrated a relatively high internal consistency (Cronbach’s $\alpha=0.99$ and $\alpha=0.98$). The last page contained questions related to personal information.
4. RESULTS

The manipulation check for the valence of the reputation of the local firm acquired was successful. In both scenario, the perceived reputation of the target firm was the same ($M_1 = 6.38$ versus $M_2 = 6.47$; $t = -1.48; p > 0.05$).

Hypotheses were assessed using t-test. Italian respondents evaluated the post-acquisition target more negatively if the acquiring firm has large cultural distance rather than the acquiring firm has small cultural distance ($M_{Lcd} = 2.62$ versus $M_{Scd} = 5.81$ p < .001. See Table 1). The results, therefore, are in line with the hypothesis H1.

In a similar manner, H2 predicts that Italian consumers have lower intentions to repurchase products of the post-acquisition target if the acquiring firm has large cultural distance rather than small cultural distance. As expected, the main effect was significant ($M_{Lcd} = 2.75$ versus $M_{Scd} = 7.1$ p < .001. See table 1).

The findings support the hypothesis above-mentioned.

5. DISCUSSION

Findings indicate that cultural distance could hinder the transfer of reputation from the local target to the acquirer. In fact, the transfer of reputation assets of the local target only occurs in case of small cultural distance between the acquired and the acquirer.

A reason why Italian consumers had more negative attitudes and lower purchase intentions in case of large cultural distance could be relative to their own culture. Italian culture is characterized by both high masculinity and individualism (geert-hofstede.com/italy.html). Schweizer and Wijnberg (1999) argue that the more are masculinity and individualism, the less corporate reputation transferability...
will be. Anyway, this study provides evidence of reputation transferability if the acquiring firm shows small cultural distance. The reason would be that Italy has high level of uncertainty avoidance, therefore Italians are more frightened by distant cultures.

These results provide important evidences that the cultural distance directly affects consumers’ attitudes and purchase intentions toward the post-acquisition target.

6. MANAGERIAL IMPLICATION

The managerial implications of the study refer to companies engaging cross-border acquisitions. In order to get the intangible benefits of a faithful behavior, a well-established brand and a good reputation, firms should carefully analyze the reactions of consumers. When the cultural distance between the acquiring and the acquired firm is large, the host acquiring firm can’t reap the benefits of the reputational capital and of the customer target. Therefore, when the cultural distance seems to hamper the reputational transferability and the acquisition benefits, managers could consider other entry modes.

Prior research suggests that to enhance consumers’ attitude to an acquired firm post-acquisition, the multinational has to increase its legitimacy in order to be perceived as a national firm (Zaheer, 1995; Luo and Mezias, 2002) and to factor in customers’ opinions (Thorbjörnsen and Dahlén, 2011).

This research also finds that in case of small cultural distance, local target reputation could be transferred to the post-acquisition target. Thus, an acquiring firm with similar characteristic can acquire an Italian firm of made in Italy and benefit from the advantages of its high reputation, customer base and market resources. Taking into account all factors, foreign companies with small cultural distance to Italy may benefit from the local target reputation transferability. Italian will continue to consider that product as made in Italy, and they will have a positive attitude toward the post-acquisition target and its products.

7. LIMITATION AND FUTURE RESEARCH

The present study has some limitations, and the recognition of these should represent opportunities for future research. The findings are limited to the product tested. Future research with other products or services not belonging to sector of made in Italy, could shed light on limits of these findings. Second, the study only considers acquirers with high reputation; however, considering a foreign acquirer with low reputation may lead to different results despite the presence of small cultural distance. Thus, future research could consider a low reputation foreign acquirer in order to extend this line of research.
Third, as our sample solely consists of Italian consumers, we recommend future studies to replicate our test in other settings, analyzing the reaction of consumers from other countries in order to contribute to the generalizability of our findings.

ABSTRACT
This paper studies the market reaction to an inconvenient event, i.e. the accounting restatement of earnings, occurring when the firms acknowledge that they released financial statements that were not in accordance with GAAP. Through an empirical test on 133 bonds issued by restating firms from 26 IFRS-adopting countries, we find that due to restatements the cost of financing increases among bonds, similar to those increases previously observed among stocks and private debt. Hence, restatements signal lower firm value, as the results indicate that they impair corporate bond ratings and increase bond yield spreads. Furthermore, the increase in bond yield spreads is significantly larger when the error is more severe. Our findings suggest that rating agencies and bondholders perceive restatements as a critical determinant of the risk of debt financing. Overall, our research fills an important void in the extant restatements literature and completes the framework for measuring the feasible impact of restatements on the corporate cost of capital.

Keywords: restatement; bond market; agency ratings; bond yield spread; severity

1. INTRODUCTION
Firms meet an accounting restatement when they acknowledge that they released financial statements that were not in accordance with GAAP, usually because their statements were affected by a material omission or misstatement (Palmrose & Scholz, 2004).

Previous studies document a massive recourse to accounting restatements. For example, in 2002 in the USA, restatements involved approximately 10\% of listed firms, representing a market value of roughly 2 billion US dollars. Empirical evidence shows that restatements cause a reduction in shareholder value, decreasing stock returns and increasing the cost of equity (Palmrose et al., 2004; Hribar & Jenkins, 2004; Albring et al., 2013). In a two-day window after the announcement of restatements, firms have been found to suffer an approximate 9\% abnormal decrease in stock returns; in a one-month period after restatements, the cost of the equity capital increases by over 10\%.
Similarly, looking at the effects of restatements on private loan contracting, an 11% increase in the total loan rate has been found during the one-year period following a restatement (Graham et al., 2008).

Conclusively, restatements risk the credibility of firm disclosure, likely reducing the value of the firm and increasing company risk (Graham et al., 2008).

Existing literature has examined the adverse consequences of accounting restatement from the perspectives of equity holders (Palmrose et al., 2004; Hribar & Jenkins, 2004) and private debt contractors (Graham et al., 2008; Park & Wu, 2009). Given that both stock and bond markets are dependent on the same underlying firm value, it could be of interest to study the effects of accounting restatements on corporate bond financing, an area that has been overlooked by the literature. This paper aims to fill this gap by providing empirical evidence of the impact of accounting restatements on bond issues.

We focus on the bond market for two primary reasons. First, corporate bond issues increased in volume and frequency in the last decade (Creditreform Rating AG, 2015) due to the decline in both bank lending and interest rates driven by the advent of the global financial crises (Tendulkar & Hancock, 2014). Second, corporate bonds complement equity and private debt in building firms' capital structure. Studying the effect of restatements on bond markets can help to provide a comprehensive framework to measure the impact of restatements on the cost of capital. Our study investigates the unexplored question of whether restatements affect bond issues and how they are perceived by credit rating agencies and bondholders, which drive the cost of bonds.

To test our predictions, we selected all restatements occurring in the period 2006-2014 from listed firms that are mandatory IFRS adopters (26 countries), ultimately collecting 133 bonds issued by restating firms.

In line with our expectations, we documented that compared with bonds issued before restatement, bonds issued after restatement have lower corporate ratings. Moreover, after restatement, bondholders require a higher risk premium. We also investigated whether bond markets punish more severe restatement through a sharper decrease in bond ratings and a larger increase in yield spreads in the post-restatement period. Using principal component analysis to proxy the severity of errors, we found that firms with more severe restatements have a larger increase in yield spreads after the error announcement. Finally, studying a pair-matched sample of restating and non-restating firms, we found that the bonds of the restating firms underperform those of the non-restating firms only in the aftermath of the restatement.

This paper makes several contributions.
In primis, our study stands beside the literature investigating the effects of restatement on the cost of equity (Hribar & Jenkins, 2004) and on private debt financing (Graham et al., 2008). We provide new insights from the alternative perspective of public debtholders, which are supposed to be more cash-than earnings-focused in their estimate of firm value because “payment has to be made by cash” (Standard & Poor’s Rating Services, 2014).

Second, since restatements increase information uncertainty (Dechow et al., 1996; Palmrose et al., 2004; Hribar & Jenkins, 2004), this work reinforces Lu et al.’s (2010) study, which shows that information uncertainty has a significant impact on increasing bond yield spreads.

Third, to date, empirical research on restatements has examined US (Palmrose et al., 2004; Palmrose & Scholz, 2004; Srinivasan, 2005), Chinese (Firth et al. 2011; Jiang et al., 2015; Ma et al., 2015) and German (Hitz et al., 2012; Böcking et al., 2015; Strohmenger, 2014) firms, whereas research from other countries is still lacking. To our knowledge, this work is the first cross-national empirical analysis of restatements.

The rest of the paper follows the outline given below. Section 2 reviews the related literature. Section 3 develops the hypotheses that this research will test. Section 4 explains the empirical methods. Section 5 describes the sample. Section 6 presents the results, and Section 7 concludes the paper with a brief discussion.

2. LITERATURE REVIEW

An accounting restatement consists of adjustments to a previously published accounting statement due to the occurrence of a material error(s)\(^{10}\). A restatement can be forced either by external auditors or by market authorities; moreover, firms themselves can voluntarily report error(s), which are typically discovered by performing an internal review process (Chung & McCracken, 2014). In accounting literature, a financial restatement that corrects previous accounting errors is viewed as a clear measure of poor accounting (Palmrose and Scholz, 2004) and audit (DeFond and Zhang, 2014) quality. Moreover, restatement is a proxy used to measure earnings quality, and it is more direct than discretionary accruals and other earnings quality measures (Francis, 2011; Dechow et al., 2010; DeFond & Zhang, 2014).

Restatements lead investors to reassess the quality of a firm’s financial information, as they perceive a greater risk of encountering misleading information in the aftermath of restatements (Kravet and Shevlin, 2010). Extensive research has variously studied the adverse impacts of restatements on firm

\(^{10}\) According to International Accounting Standard no. 8. par. 41, material accounting errors are revealed by adjusting the comparative figures of companies’ financial statements for the prior period(s) in which the error occurred. The correction is made in the first set of financial statements authorized for issue after their discovery (IASB, 2005).
value, such as downward revisions in market value (Palmrose et al., 2004; Karpoff et al., 2008; Dechow et al., 1996), lower firm growth (Albring et al., 2013), higher auditor and board turnover (Hennes et al., 2014; Srinivasan, 2005), and an increase in audit fees (Feldmann et al., 2009).

One major stream of research demonstrated that restating firms suffer a significant increase in the cost of capital, although mainly focusing on the cost of equity.

2.1 Restatements and the cost of equity

Research has extensively documented that restatements cause a substantial loss of market value, with abnormal returns estimates ranging from -4% to -19% in the aftermath of restatement announcements (Dechow et al., 1996; Anderson & Yohn, 2002; Palmrose et al., 2004; Hribar & Jenkins, 2004). Studying a sample of firms that allegedly overstated reported earnings and that were under enforcement action by the Security and Exchange Commission, Dechow et al. (1996) initiated the literature on the causes and consequences of restatements. They found that firms overstating earnings initially enjoy a lower cost of capital, but once the earnings manipulation is revealed and the restatement occurs, the firms experience significant increases in their cost of capital, proxied by the increase in short-term interest and the dispersion of analyst forecasts. Palmrose et al. (2004) first systematically studied equity market reactions to the announcement of restatements. They found that market-adjusted abnormal returns systematically decrease by 9.2% over a 2-day event window and also noticed a significant increase in the analysts’ forecast dispersion at the time of the restatement announcement; this dispersion is negatively correlated with the market reaction to earnings restatement. Anderson and Yohn (2002) similarly studied how markets and dealers react to the announcement of restatements. They examined the market returns and bid-ask spread effects at the time when the accounting problem that lead to restatement is announced and found that both the markets and the dealers perceive an increase in information asymmetry for problems related to revenue recognition, consequently leading to a depreciation in firm value. Finally, Hribar and Jenkins (2004) split the estimation of the loss in market value measured by previous research into two main proxies, on the one hand measuring the decrease in expected future earnings and cash flow – the so-called “numerator effect” – representing firm value, and on the other hand measuring the reduction in the cost of equity capital – the so-called “denominator effect” (Kasznik, 2004: 358) – representing the discount rate. Directly measuring the implied cost of capital through various valuation models, they estimated an average increase in the cost of equity that ranges from 7% to 19% in the month immediately following the restatement.

Restatements impact firms differently, as companies suffer greater financial problems when restatement is more severe. For example, Palmrose et al. (2004) found that restatements involving more negative adjustments of previously reported income are linked to more negative returns.
Albring et al. (2013) similarly showed that firms with the largest corrections of prior earnings experience a larger decrease in externally financed growth after restatement. Consistently, Hennes et al. (2014) documented that error severity is an important determinant of auditor turnover after restatements. Finally, Bardos and Mishra (2014) examined the effect of litigation-triggering restatements on the cost of equity and expected future cash flows compared to restatements that are not followed by litigation. They found that the cost of equity increases after restatement for all firms, but the increase in the cost of equity is substantially greater for firms that are sued for restatement. Conclusively, previous research shows that accounting restatement is a detrimental event that negatively affects the market value of the firm, reducing both its expected earnings and cash flows and augmenting its information uncertainty, thus increasing the cost of equity capital (Palmrose et al., 2004; Hribar & Jenkins, 2004; Dechow et al., 1996). Moreover, when the errors corrected by restatement are more severe, the impact on the financial performance of the firm is stronger (Palmrose et al., 2004; Albring et al., 2013).

2.2 Restatements and the debt market

Debt has a central role in firm financing, as it complements equity in building the firm’s capital structure and, together with equity, is an efficient means to reduce the agency costs of the firm (Jensen, 1986).

Graham et al. (2008) and Park and Wu (2009) studied the impact of restatements on debt capital. Because restatements raise concerns about the credibility of financial statements, they increase the perceived informational asymmetry from the bank’s perspective. Consequently, Graham et al. (2008) empirically showed how banks use both price and non-price terms to reduce informational asymmetry with borrowers in the aftermath of restatements. They found that banks try to monitor borrowers by using tighter contract terms and a more efficient lending structure, as private bank loans initiated after restatements have higher spreads, shorter maturity, higher fees and more stringent contract terms compared with bank loans initiated before restatements. They further found that firms continue to pay high loan spreads up to five years post-restatement.

Park and Wu (2009) analyzed the secondary loan market. They found that cumulative average abnormal loan returns were significantly negative during the restatement announcement window. Unlike the stock and bond markets, the secondary loan market includes both public and private lending contracts. In a private lending agreement, lenders have the possibility to access information about restatements earlier than the public markets. Park and Wu (2009) surprisingly found that the secondary loan market anticipates impending restatements, with downward revisions of returns starting at least 30 days before the event. Finally, they compared debt and equity secondary markets and documented that information on restatement is incorporated earlier into the cost of debt than it is
into the cost of equity. These findings show that in a context where banks and institutional investors operate with the advantage of private contract agreements, including special access to information, they anticipate restatement announcements. In contrast, previous findings in the main equity market documented that sellers do not anticipate restatement announcement dates (Drake et al., 2015) and similarly that analysts are more likely to revise their forecasts in the aftermath of a restatement disclosure but not before (Griffin, 2004). Hence, due to significant differences in the behavior of market participants in a private compared to a public context, it could be of interest to study the impact of restatement on the public debt market.

3. HYPOTHESIS DEVELOPMENT

This paper examines the effect of restatements on the bond markets. Similar to Hribar and Jenkins (2004), we disentangle the bond price effect of restatements into changes in the expected cash flows and changes in the cost of debt. The assumption behind this approach is that the intrinsic value of the firm should be estimated considering both the “numerator effect” of the expected earnings and cash flows and the “denominator effect” of the discount rate.

We adopt credit ratings as a proxy for expected future earnings and cash flows (the “numerator effect”). Credit ratings assigned to bond issues may play a crucial role in enabling companies to raise additional capital, directly providing a measure that can be utilized by investors when making investment decisions. In formulating a rating for an individual corporate bond, rating agencies often take into account both issuer creditworthiness and the credit quality of the bond issue (Standard & Poor’s Ratings Services, 2014) and further evaluate the current and historical financial information of the issuer. Moreover, an agency may adjust the credit rating of an issue when identifying factors that could impact the level of credit risk (Standard & Poor’s Ratings Services, 2014). Restatements inform credit rating agencies that they were using erroneous accounting numbers when they originally assessed the firm’s credit risk, increasing suspicions regarding the future financial reliability of the restating company. Hence, restatements may impact investors’ beliefs about a firm’s future ability to generate cash flow (Graham et al., 2008; Hribar & Jenkins, 2004) because previously disclosed financial statement information was affected by material error(s). In this context, a negative reaction from rating agencies is expected, with a revised and downgraded credit rating of the firm in the aftermath of the error announcement. The following hypothesis is therefore formulated and tested:

Hypothesis 1: Bonds issued after restatements have lower ratings than bonds issued before restatements.

As a second hypothesis, we suppose that restatements may affect projections, also impacting the cost of debt. Restatements undermine firms’ perceived ability to meet bond principal payments and interest, as bondholders consider the restatement to be a sign of poor accounting and audit quality.
The best way to compensate for additional credit risk is to require higher risk premiums; therefore, we expect the following:

Hypothesis 2: Bonds issued after restatements have higher yield spreads than bonds issued before restatements.

Finally, we extend the literature by exploring how error severity affects bond ratings and risk premiums. We investigate whether rating agencies and bondholders simply view an error announcement as an adverse event, or whether they instead consider information about the severity of the error in detail and consequently adjust the risk premium. Previous research shows that accounting errors with more serious effects on financial statements bring the competence of management into question (Huang & Scholz, 2012), as severe restatements often contain opportunistic managerial manipulation (Palmrose et al., 2004; Hennes et al., 2008). The more severe the materiality of restatement, the greater the adverse consequences faced by firms (Graham et al., 2008; Albring et al., 2013; Huang and Scholz, 2012; Hennes et al., 2014; Hitz et al., 2012; Palmrose & Scholz, 2004; Bardos et al., 2014). Hence, in line with previous work, we offer the following hypothesis:

Hypothesis 3: A greater severity in the restatement causes lower bond ratings and a greater increase in bond yield spreads.

4. RESEARCH DESIGN

This paper empirically investigates the impact of restatements on the bond market. We use two alternate measures of the cost of bond financing, consistent with prior research (Jiang, 2008; Liu & Jiraporn, 2010). We test Hypotheses 1 and 3 using corporate bond ratings as proxies for expected earnings and cash flows from the bond investment; we test Hypothesis 2 and 3 using bond yield spreads as a proxy for the discount rate of the investment.

4.1 Empirical model

Similar to prior literature (Crabtree et al., 2014; Crabtree & Maher, 2009), we test whether rating agencies incorporate restatements into the assigned bond ratings (i.e., Hypothesis 1) using the ordered logistic regression analysis described in Equation (1).

\[ RATING = \alpha_0 + \beta_1 \text{RESTATE} + \gamma_1 \text{SUB} + \gamma_2 \text{SIZE} + \gamma_3 \text{MATURITY} + \gamma_4 \text{COUNTRY} + \gamma_5 \text{INCOME} + \gamma_6 \text{CFO} + \gamma_7 \text{LEV} + \gamma_8 \text{ASSETS} + \gamma_9 \text{PPE} + \gamma_{10} \text{ROA}D + \gamma_{11} \text{RET}D + \gamma_{12} \text{BIG4} + \varepsilon \]  

(1)

We subsequently examine the relation between accounting restatement and yield spreads. A potential problem with \( RATING \) is that it may contain information regarding restatement and control variables. To mitigate collinearity and endogeneity concerns when testing Hypothesis 2 and examining the effect of restatements on bond pricing, we implement a two-stage regression procedure, similar to Anderson et al. (2004) and Mansi et al. (2011). Consequently, we rename the vector of the residuals (\( \varepsilon \)) from
Equation (1) as ORTH and regress Equation (2) as a second stage of the regression contained in Equation (1), adopting the ordinary least squares procedure.\textsuperscript{11} ORTH in Equation (2) incorporates credit rating information without the influence of restatement and other control variables.

\[
YLDSPREAD = \alpha_0 + \beta_1 \text{RESTATE} + \beta_2 \text{ORTH} + \gamma_1 \text{SUB} + \gamma_2 \text{SIZE} + \gamma_3 \text{MATURITY} + \gamma_4 \text{INCOME} + \gamma_5 \text{CFO} + \\
+ \gamma_6 \text{LEV} + \gamma_7 \text{ASSETS} + \gamma_8 \text{PPE} + \gamma_9 \text{ROA}_D + \gamma_{10} \text{RET}_D + \gamma_{11} \text{BIG4} + \eta_\text{Industry} + \nu
\]

Finally, to test how bond ratings and bond pricing change for various levels of restatement severity (Hypothesis 3), we adopt an interaction model, and Equations (1) and (2) are respectively changed into the following Equations (3) and (4):

\[
\text{RATING} = \alpha_0 + \beta_1 \text{RESTATE} + \beta_2 \text{ORTH} + \beta_3 \text{SEVERITY} + \beta_4 \text{RESTATE} \times \text{SEVERITY} + \gamma_1 \text{SUB} + \\
+ \gamma_2 \text{SIZE} + \gamma_3 \text{MATURITY} + \gamma_4 \text{COUNTRY} + \gamma_5 \text{INCOME} + \gamma_6 \text{CFO} + \gamma_7 \text{LEV} + \\
+ \gamma_8 \text{ASSETS} + \gamma_9 \text{PPE} + \gamma_{10} \text{ROA}_D + \gamma_{11} \text{RET}_D + \gamma_{12} \text{BIG4} + \eta_\text{Industry} + \varepsilon
\]

\[
YLDSPREAD = \alpha_0 + \beta_1 \text{RESTATE} + \beta_2 \text{ORTH} + \beta_3 \text{SEVERITY} + \beta_4 \text{RESTATE} \times \text{SEVERITY} + \\
+ \gamma_1 \text{SUB} + \gamma_2 \text{SIZE} + \gamma_3 \text{MATURITY} + \gamma_4 \text{INCOME} + \gamma_5 \text{CFO} + \gamma_7 \text{LEV} + \\
+ \gamma_8 \text{ASSETS} + \gamma_9 \text{PPE} + \gamma_{10} \text{ROA}_D + \gamma_{11} \text{RET}_D + \gamma_{12} \text{BIG4} + \eta_\text{Industry} + \nu
\]

For all regressions, we utilized robust standard errors to correct for heteroscedasticity (White, 1980) and firm clustering, in line with the previous literature (Ge & Liu, 2015; Ge & Kim, 2014).

\textbf{4.2 Description of the variables}

In Equations (1) and (3), the dependent variable \textsc{RATING} is the ordinal representation of each issue's initial rating provided by Standard and Poor's. When Standard and Poor's ratings are missing, we use Moody's ratings (Liu & Jiraporn, 2010). Rating agencies provide an independent assessment of firm credit quality based on inside information. The issue is assigned to a rating category that ranges from AAA, indicating the highest credit quality, to D, the poorest quality, according to the scale provided by Standard and Poor's. We follow bond rating conversion adopted by Liu and Jiraporn (2010), in which \textsc{RATING} takes on a value of 22 for AAA-rated bonds and a score of 1 for D-rated bonds.

In Equations (2) and (4), the dependent variable is \textsc{YLDSPREAD}, which is the difference between the corporate bond yield at issuance and a Treasury bond yield with comparable maturity (Jiang, 2008; Ge & Liu, 2015).

To test whether restatement in our sample influences bond credit ratings and yield spreads, we adopt the explanatory variable \textsc{RESTATE}, which is a dummy variable that equals 1 if a bond is issued after a restatement announcement, and 0 otherwise. In line with Hypothesis 1, we expect a negative

\textsuperscript{11} To apply the ordinary least square procedure, in the first step, we changed the ordinal variable \textsc{RATING} into its natural
relationship between RESTATE and RATING in Equation (1), whereas Hypothesis 2 predicts that RESTATE will be positively associated with YLDSPREAD in Equation (2).

To test Hypothesis 3, in Equations (3) and (4) we include SEVERITY and the interaction between SEVERITY and RESTATE in the model, examining whether RATING and YLDSPREAD are sensitive to SEVERITY after the restatement. A number of factors can measure the severity of restatement, such as the magnitude of market reaction to the error announcement (Hennes et al., 2014; Wilson, 2008), the absolute value of the error amount scaled by total assets (Huang & Scholz, 2012; Srinivasan, 2005), the number of years restated (Huang & Scholz, 2012; Palmrose et al., 2004), the number of accounts misstated (Palmrose et al., 2004; Palmrose & Scholz, 2004), the reasons for restatement (Wilson, 2008; Palmrose et al., 2004; Palmrose & Scholz, 2004), whether restatements involved earnings (Wiedman & Hendricks, 2013), and whether restatements were due to irregularities (intentional misapplication of GAAP) or to errors (unintentional misreporting) (Chen et al., 2014; Albring et al., 2013; Hennes et al., 2008). In line with previous empirical analysis (Hennes et al., 2014; Burks, 2010; Hitz et al., 2012), in this study, SEVERITY is based on a principal component analysis of multiple restatement measures. It is a linear combination of three measures: (1) the natural logarithm of the number of years the firm restated; (2) the direction of the restatement, which is a categorical variable that equals 1 for downwards restatements and 0 for upwards restatements; and (3) the magnitude of the restatement, which is the absolute value of the error amount divided by total assets at the first fiscal year-end before the restatement announcement. Higher values for this factor represent a more severe restatement. Prior research suggests that restatements with greater negative income effects are of greater concern to market participants (Palmrose et al., 2004). We similarly expect that a greater SEVERITY*RESTATE negatively affects the bond market.

Based on prior research on the determinants of the cost of debt (Crabtree et al., 2014; Liu et al., 2010; Ge & Kim, 2014; Crabtree & Maher, 2009; Jiang, 2008), we included in the model several bond- and firm-control variables. The bond-control variables are SUB, SIZE, MATURITY and COUNTRY. SUB is a binary variable that equals 1 if the issue is of subordinated bonds, 0 otherwise. Subordinated bonds are expected to be associated with higher risk, thus exhibiting a negative relationship with bond rating and a positive relationship with bond yield spreads (Crabtree & Maher, 2009). SIZE is the natural logarithm of the bonds’ issue amount. MATURITY is the natural logarithm of the bonds’ maturity (in years) and should be negatively related to RATING and positively related to YLDSPREAD (Ge and Kim, 2014). Last, country risk is an important determinant of corporate bond ratings (Standard & Poor’s Ratings Services, 2014). As a result, in Equation (1) we also controlled for country risk (Bae & Goyal, 2009) by converting the sovereign risk rating obtained by Moody’s sequentially to numbers, logarithm (Ge & Kim, 2014).
with 20 for AAA-rated countries to zero for C-rated countries (Kräussl, 2005). In the regression analysis, we use a logarithmic transformation of this sovereign credit rating measurement to compute the variable COUNTRY. A higher sovereign credit rating indicates lower country risk, so we expect COUNTRY to be positively related to RATING.12

The firm control variables in our model are INCOME, CFO, PPE, LEV, ASSETS, ROA_D, RET_D, and BIG4. INCOME is measured as operating income for the year divided by total assets. It controls for firm productivity, and we expect that it is positively related to RATING but negatively related to YLDSPREAD, as higher INCOME indicates a lower default risk for bonds. We included CFO (Crabtree & Maher, 2009; Jiang, 2008), which is cash flow from operations scaled by total assets, controlling for firm liquidity. CFO is expected to have a positive relationship with RATING and a negative relationship with YLDSPREAD because firms with greater cash flow are more likely to repay debt. We also controlled for firm leverage (LEV) measured as total debt divided by total assets. The greater the leverage, the higher the probability of default, so we predict LEV to be positively associated with YLDSPREAD and negatively associated with RATING. ASSETS controls for firms’ size and is the natural logarithm of total assets. Since issuers with greater assets are perceived to be less risky, we predict that ASSETS will be positively linked to RATING and negatively related to YLDSPREAD. In addition, we included PPE, which is gross property, plant, and equipment scaled by total assets, to account for differences in firms’ capital intensity (Liu et al., 2010; Liu & Jiraporn, 2010; Crabtree & Maher, 2009). ROA_D is the standard deviation of return on assets (net income/total assets) for the past five years (Crabtree et al., 2014). It controls for firms’ normal profitability and the impact of extraordinary items on the growth of the firm, thereby measuring the volatility of earnings. We further control for firm risk by measuring the annualized standard deviation of daily stock returns for the past year (RET_D) (Anderson et al., 2004; Jiang, 2008). Finally, we adopted a control for firms’ corporate governance, measuring the quality of external auditing by adopting the binary variable BIG4, which equals 1 if the auditor is a Big 4 audit company, and 0 otherwise (Becker et al., 1998; Teoh & Wong, 1993). We measured all firm-control variables at the fiscal year-end prior to the bond issue to ensure that the information is publicly available to bondholders at the time of the issue.

5. SAMPLE SELECTION AND DESCRIPTION

We examined a sample of listed companies that restated their financial statements over the period between 2006 and 2014. We begin the sample collection procedure by including all listed firms from

---

12 To avoid redundancy, we do not include COUNTRY in Equations (2) and (4), since YLDSPREAD already controls for macroeconomic factors (Ge & Liu, 2015; Ge & Kim, 2014) and is a direct measure of a firm’s incremental cost of public debt (Sengupta, 1998; Jiang, 2008).
countries that mandatorily adopted IFRS as of 31/12/2005, excluding banks (Standard Industrial Classification codes 6000-6199), in line with previous work (Stanley & Sharma, 2011; Perols & Lougee, 2011). Similar to Daske et al. (2008), the countries involved in our study are Australia, Austria, Belgium, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hong Kong, Hungary, Ireland, Italy, Luxemburg, the Netherlands, Norway, the Philippines, Poland, Portugal, Singapore, South Africa, Spain, Sweden, Switzerland, the United Kingdom and Venezuela. We used the Datastream database from Thompson Reuters to identify firms that restated annual financial statements prepared in accordance with the IFRS. We manually collected information about the direction of restatement, the number of errors and the number of years restated using the annual reports available both on corporate websites and in the Osiris database provided by Bureau van Dijk. We also complemented these data by collecting from other sources, e.g., we gathered information about auditors from the Eikon database from Thomson Reuters, bond data from the Deal Analytics app, also provided by Eikon, and the remaining data came from Datastream. We found 362 restating firms and restricted the final sample to restating firms with at least one bond issue between 2006 and 2015. After merging data sources and dropping observations with missing values, our final sample contains 133 restatements from 28 firms. The 28 issuing firm sample does not differ in error severity or general firm characteristics from the 334 non-issuing firms sample, as documented by a test of equality in means. This test is omitted here for brevity, but it is available from the authors on demand. Table 1 presents the descriptive statistics for our observations.

Our sample size is comparable with those used in previous studies addressing restatements. For example, Hitz et al. (2012) analyzed a sample of 45 observations, Nahar Abdullah et al. (2010) included 31 firm-years of companies that restated their annual reports, DeFond & Jiambalvo (1991) examined 41 firm-years of companies that overstated prior year earnings, and Bardos & Zaiats (2012) found that 28 out of 436 US restating firms issued bonds in the restatement period, and their number of debt issuances (128) is similar to our sample (133).
On average, 44% of the bonds in our sample were issued in the aftermath of restatements \((mean(RESTATE)=0.44)\). The average credit rating \((RATING)\) for the observations is 14.9, ranging from 8 to 18. As expected, the comparable sovereign credit rating \((COUNTRY)\) is slightly higher, being on average 18.7 and ranging from 11 to 20. The average bond yield spread \((YLDSPREAD)\) is approximately 206. This value is very similar to values found in previous research, e.g., 224 found by Liu et al. (2010), 226 by Ge and Kim (2014), and 247 by Mansi et al. (2004). Almost 20% of bond issues are subordinated \((mean(SUB)=0.20)\). The average offering amount \((SIZE)\) is € 693 million, with an average maturity of 21 years. On average, the firms in our sample have low productivity \((mean(INCOME)=0.04)\), low liquidity \((mean(CFO)=0.06)\), and are highly indebted \((mean(LEV)=0.26)\). There is considerable variation in firm size, as average total assets is approximately € 127 million, whereas the median total assets is less than 48 € million, and more than 40% of assets is invested in property, plants and equipment \((mean(PPE)=0.42)\). The activity of these firms slightly deviates from the normal flows \((mean(ROA_D)=0.01)\), and the stock market is fairly volatile, as the standard deviation of the daily stock returns over the year is approximately 30% \((mean(RET_D)=0.30)\). Finally, more than 93% of the restated annual statements were controlled by a Big 4 audit company \((mean(BIG4)=0.93)\).

Table 2 provides the Pearson correlations of the variables used in the models.

\(\$\) Data before logarithmic transformation

\(\$\$\) Data in million €
As expected, \textit{RESTATE} is negatively and significantly related to \textit{RATING} and positively and significantly correlated with \textit{YLDSPREAD} (\(\rho=0.22\)). This provides initial evidence that rating agencies and bondholders perceive accounting restatements negatively. Moreover, \textit{RESTATE} is significantly and negatively correlated with \textit{CFO}, which proxies firms’ liquidity (\(\rho=-0.17\)). As expected, \textit{RATING} is correlated with \textit{ASSETS}, \textit{LEV}, \textit{ROA_D}, \textit{RET_D}, \textit{PPE} and \textit{COUNTRY}, higher bond ratings being associated respectively with larger firm size (\(\rho=0.46\)), higher indebtedness (\(\rho=-0.38\)), lower volatility in net income (\(\rho=-0.51\)), lower volatility in daily stock returns (\(\rho=-0.23\)), higher flexibility in asset structure (\(\rho=-0.27\)), and lower sovereign risk premiums (\(\rho=-0.21\)). Last, consistent with our predictions, \textit{RATING} correlates highly and negatively with \textit{YLDSPREAD} (\(\rho=-0.67\)). Finally, also as expected, \textit{YLDSPREAD} is positively and significantly correlated to the volatility in stock returns, measured by \textit{RET_D} (\(\rho=0.26\)); to \textit{COUNTRY} (\(\rho=0.30\)), evidencing sovereign risk premiums; to the dummy \textit{SUB} (\(\rho=0.25\)), indicating a subordinated issue; to \textit{LEV} (\(\rho=0.15\)), controlling for debt-dependence; and to

Column (1) shows the effect of restatements on corporate bond ratings, as described in Equation (1).\textsuperscript{14} We find a significant negative impact of RESTATE on RATING ($\beta<0$; $p<0.10$). This relationship validates Hypothesis 1, supporting the expectation that credit rating agencies perceive restatement announcements as a factor that reduces expected earnings and future cash flows, thereby increasing credit risk. All control variables have the expected signs for their coefficients. We find that $\text{SUB}(\gamma<0$; $p<0.05)$, $\text{LEV}(\gamma<0$; $p<0.01)$, and $\text{ROA}_D(\gamma<0$, $p<0.05)$ affect RATING negatively, whereas $\text{INCOME}(\gamma>0$; $p<0.01)$ has a positive impact. Consequently, consistent with our expectations, we find that more profitable firms receive better credit ratings, whereas highly leveraged firms and more risky and volatile investments receive lower ratings. Also $\text{COUNTRY}$ is positively and significantly linked with RATING ($\gamma>0$; $p<0.01$), documenting that firms operating in low risk countries enjoy higher corporate bond ratings. Finally, corporate governance control positively impacts RATING ($\gamma>0$; $p<0.05$), supporting that firms supervised by a Big 4 audit company receive higher ratings compared to counterparts. Overall, the results for our control variables support the findings of prior studies (Crabtree et al., 2014; Liu & Jiraporn, 2010).

Column (3) of Table 3 lists the results of Equation (2), studying the impact of the restatement on the bond yield spreads.

\textsuperscript{14}The database in this study is composed of bonds issued by a single firm in the same fiscal year; this violates the assumption of independence in the residuals, so the standard errors from the ordinary least squares procedures may be biased. To circumvent this problem and avoid spurious correlation, we used Hierarchical Linear Models (HLM) for robustness. HLM use the maximum likelihood method to estimate coefficients and are widely used in social science research to address potential multilevel observation problems (Seibert et al., 2004). The results are consistent with those displayed in Table 3 and are unreported here for brevity; they are available from the authors on request.
The coefficient of \textit{RESTATE} is positive and significant ($\beta > 0; p < 0.05$), suggesting that bondholders perceive restatements as a credit risk-increasing factor and thus require higher risk premiums. We document that after the restatement announcement, the yield spreads increase on average by nearly 57 basis points. As expected, \textit{SUB} ($\gamma > 0; p < 0.01$) and \textit{MATURITY} ($\gamma > 0; p < 0.10$) are positively associated with \textit{YLDSPREAD}. In regard to firm-level controls, the coefficients of \textit{LEV} ($\gamma > 0; p < 0.05$) and \textit{RET\_D} ($\gamma > 0.01; p < 0.01$) are positive and significant, showing that more highly leveraged and more volatile firms pay higher bond yield spreads. Finally, \textit{ASSETS} is negative and significantly associated with \textit{YLDSPREAD} ($\gamma < 0; p < 0.05$), suggesting that smaller firms issue bonds at a higher cost. Overall, the results for these control variables are consistent with those from prior studies (Ge and Liu, 2015; Liu et al., 2010).

Columns (2) and (4) in Table 3 show the results of the analysis from Equations (3) and (4), respectively, studying the effect of the severity of restatements on bond ratings and bond yield spreads. While the interaction term \textit{SEVERITY\*RESTATE} is not significant when \textit{RATING} is the dependent variable, it positively and significantly influences yield spreads, indicating that firms with more severe errors suffer an approximately 40% higher increase in risk premiums after the restatement. These findings partly validate our prediction under Hypothesis 3, showing that the market is more efficient than financial analysts when they measure the severity of a restatement and downgrade their opinions about investment in restating firms.

The \textit{Pseudo-R^2} of Equations (1) and (3) is approximately 30%; the \textit{Adjusted-R^2} of Equations (2) and (4) is greater than 60%; these results support the overall satisfactory empirical explanatory power of the adopted models.

### 6.1 Corroborating analysis

In line with previous works (Albring et al., 2013; Chen et al., 2013), we corroborated the empirical findings by checking whether the results hold when comparing restating firms to a matched sample of non-restating firms. We used a pair-matched sample design, where each restating firm is matched by country, stock exchange, industry and size to a control firm that made no restatement. We regressed the sample, which included both the restatement and the pair-matched firms, and included the variable \textit{PAIR\_MATCHED}, an indicator that equals 1 for the bonds issued by the pair-matched sample and 0 for bonds issued by the restating firms. The results are displayed in Table 4.

Note: This table presents the impact of restatement on the bond ratings and bond yield spreads in restating firms compared with a non-restating pair-matched sample. Respectively the estimates of Equations (1) and (2) are displayed in Columns (1) and (3), and Equations (3) and (4) in Columns (2) and (4). Adj-R² is McFadden’s Pseudo-R² in columns (1) and (2).

Estimates are corrected for firm clustering and for heteroscedasticity and serial correlation (Huber White robust standard errors). The constant is omitted.

*, **, and *** denote statistical significance respectively at the 0.10, 0.05 and 0.01 levels.

The main results (βi) remain consistent and in some cases become more significant, although the PAIR-MATCHED indicator has no statistical relevance. This unexpected result shows that the pair-matched sample is considered to be similar to the restating firms unless the restatement event occurs, providing additional evidence that the ratings agencies do not anticipate the restatements. Apparently, there is no impact from restatements on the evaluation of bond issues until the restatement occurs. Restating and non-restating firms similarly affect both the bond rating and the bond yield spread; nevertheless, in the aftermath of a restatement event, the agencies’ ratings drop, and the costs of the bonds rise with a coefficient equal to 56.77.

7. DISCUSSION AND CONCLUSIONS

Several studies have documented that restatements have serious consequences on the equity and private loans markets, but no study to date has analyzed the economic consequences of restatements on the bond market. This paper adds to the accounting literature by empirically demonstrating how restatements affect the decisions of the rating agencies and bond market participants. After firms announce restatements, Graham et al. (2008) found that private loan spreads increase by approximately one half (49%); we found that public loan spreads increase by approximately 57 basis points. Conclusively, restatement leads to a downgrading of bond ratings and a rise in the bond yield spreads, suggesting that firms committing an accounting error(s) suffer a reduction in firm value and an increase in the cost of public debt capital. We further find that firms with greater restatement severity are also associated with a greater increase in bond yield spread, demonstrating that the materiality of restatement aggravates the rise of risk premiums. Surprisingly, we also documented that the rating agencies price the restatement per se and do not appear to care about the severity of the restatement. Hence, we can state that the market is more efficient than the rating agencies in evaluating the severity of the error that caused the restatement event.

From a practical perspective, our study has implications for the accounting choices of CEOs and CFOs and for their decisions about the capital structure of the firm. Given our findings that restatements are
expensively priced by both rating agencies and investors, they should consider the risk of issuing bonds at an extra cost in the aftermath of a restatement.

APPLYING SECI MODEL TO TRANSFER ORGANIZATIONAL MEMORY THROUGH CORPORATE MUSEUMS

Matricano, Diego

Department of Management, Università degli Studi della Campania “Luigi Vanvitelli”, Italy

ABSTRACT

The present paper starts from the idea that companies implementing corporate museums need to share and transfer organizational memory in a proper way in order to strengthen their brand identity. From the review of dedicated literature, in fact, it results that the above companies have to face some difficulties dealing with the selection of the memory to be transmitted and with the way customers assimilate it.

By reflecting on the topic, it arises the need for searching for a theoretical model able to frame this process. The SECI model, proposed in reference to knowledge management, seems very useful in this vein. The phases of socialization, externalization, combination and internalization seem to describe the process through which companies can define the organizational memory they want to share and transfer through corporate museums and visitors/customers can internalize it.

Despite some criticalities that necessarily emerge – and that cannot be ignored – when referring an existing theoretical model to a new topic, this paper tries to get corporate museums halfway between museology and management literature.

Keywords: corporate museums; brand identity; memory; SECI model; knowledge management

INTRODUCTION

The fact that companies are more and more involved in the implementation of corporate museums in order to strengthen their corporate identity is rather evident (Poullson and Kale, 2004; Prahalad and Ramaswamy, 2004; Vargo and Lusch, 2004a, 2004b; Lusch and Vargo, 2006; Payne et al., 2009; Tynan and McKechnie, 2009).

However, despite the growth of this phenomenon, the way companies should manage these museums still needs to be unfolded. Corporate museums, in fact, still lie in the field of museology even if – as a matter of fact – they should move closer to the field of management since they are meant as a marketing instrument (Danilov, 1992; Amari, 1997; Griffiths, 1999; Gilodi, 2002; Nissley and Casey, 2002; Stigliani and Ravasi, 2007; Montella, 2010, 2014; Bonti, 2014; Piatkowska, 2014). This passage,
however, is not effortless. Corporate managers, exhibitions directors and curators, in fact, need to manage the organizational memory (Nissley and Casey, 2002) to be shared with visitors/customers in a proper way in order to avoid possible mistakes and strengthen corporate identity.

The present paper starts from this emerging need. Corporate managers (who hold the organizational memory to be transferred) and exhibitions directors and curators (who need to find the best way to transfer it from the company to visitors/customers) aim to remind the visitors/customers of the information to which they are exposed (selective attention), to reconcile information with what they already believe (selective distortion), and to remind them of the good characteristics of the brand they like and to forget good characteristics of other brands (selective retention), as suggested by Kotler and Scott (1993). This aim is very challenging for corporate managers and exhibitions directors and curators since the memory to be transmitted needs to fit with the brand identity (Nissley and Casey, 2002). It is important, then, that corporate managers select the memory to be transmitted, share it with exhibition directors and curators who, in turn, transfer it to visitors/customers during the exhibition. If visitors/customers assimilate it by paying selective attention and by putting into practice selective retention, then companies can feel satisfied; if visitors assimilate it by paying selective distortion, then companies are not going to be fulfilled. According to the above, corporate managers, exhibitions directors and curators need to refer to a theoretical model able to transfer organizational memory in a proper way.

In reference to the search of theoretical models that can be used by corporate managers and exhibitions directors and curators, the above passages seem to recall a well-known theoretical model proposed in the field of knowledge management: the SECI model (Nonaka and Takeuchi, 1995). This model assumes that knowledge creation takes place through four phases: socialization (tacit knowledge is created from tacit knowledge); externalization (explicit knowledge is created from tacit knowledge); combination (explicit knowledge is created from explicit knowledge); and internalization (tacit knowledge is created from explicit knowledge). By assuming that the memory that companies aim to transfer to visitors/customers can be treated and managed like knowledge – they both are intangible resources – it seems that corporate managers and exhibitions directors and curators can leverage on the SECI model as well.

According to the above, the structure of the paper is the following. In the section “Literature review”, both the literatures focused on corporate museums and organizational memory and on the SECI model are reviewed. After this, in the section “Applying SECI model when implementing corporate museums”, the four phases of the SECI model are recalled and referred to the organizational memory that companies want to transfer through the implementation of corporate museums. In the section “Limitations, conclusions and further developments”, after highlighting the main limitations of this
study, some conclusions are drawn and some further developments, which need to be enlarged and enriched by comments and suggestions of other management scholars, are hypothesized.

LITERATURE REVIEW

Corporate museums and organizational memory

According to Bonti (2014), corporate museums are not passive collections of artifacts belonging to the organizations. On the contrary, they are valuable marketing tools that are usually situated close to the company’s headquarters or factories and run by the company itself. As such, they can offer relevant, novel, surprising, informative and engaging interactions and experiences to customers (Poulsson and Kale, 2004) and they are expected to be marketing tools able to transfer organizational memory (Danilov, 1992; Katriel, 1994; Nissley and Casey, 2002). Broadly speaking, organizational memory can be defined as the set of company’s values that corporate managers want to recall and transfer to customers.

The final aim that corporate managers and exhibition directors and curators try to pursue through the implementation of corporate museums is to transfer organizational memory to visitors/customers. This happens through a process that – from the visitors/customers’ perspective – is articulated in three steps (Lambin, 2000) that consist in providing: 1) a cognitive response, referred to learning something; 2) an affective response, referred to feeling something; and 3) a behavioural response, referred to doing something.

If corporate managers and exhibitions directors and curators properly manage the three steps of the above process, then corporate museums can really improve the politics of remembering and/or of forgetting, in reference to the past or to the present, and to the politics of imagining, in reference to the future (Nissley and Casey, 2002).

In this vein, it results that management scholars have not paid yet so much attention on the theoretical frameworks that can be used to manage the transfers of organizational memory. The transfers involve at first corporate managers and exhibition directors and curators; later on they involve exhibition directors and curators and visitors/customers.

This seems to be a relevant gap to be filled in.

Knowledge management: the SECI model

The origins of SECI model can be dated back to 1991 when Nonaka published his seminal work entitled “The knowledge-creating company”. This contribution has been enriched over the years (Nonaka, 1994; Nonaka and Takeuchi, 1995; Nonaka et al., 1996; Nonaka and Konno, 1998; Nonaka et al., 2000, 2014;
Nonaka and Nishiguchi, 2001; Nonaka and Toyama, 2003) and up to now it represents one of the most known and used model in the field of knowledge management.

Even if the model is well known, it seems appropriate to recall each of the four phases in order to underline their main characteristics and their possible reference to organizational memory.

The SECI model starts with the socialization phase. Over this phase, which takes place inside the company and depends on the context, individuals exchange their tacit knowledge (Argote and Ingram, 2000). The affiliation to the company, the relationship and the proximity between employees – who are willing to favour this exchange – make the socialization happen. In particular, employees exchange tacit knowledge through observations and imitation. Because of the context and through observations and imitation, new tacit knowledge is created.

The second phase of the SECI model deals with externalization. Over this phase, employees transform the tacit knowledge created through the act of socialization into explicit knowledge. As underlined by Nonaka and Takeuchi (1995), the phase of externalization is the most critical one since tacit knowledge needs to be formalized through metaphors, analogies, concepts, figures, and models that are expected to symbolize the tacit knowledge in a proper way.

The third phase of the SECI model deals with combination. During this phase, explicit knowledge is turned into explicit knowledge. The explicit knowledge – which has already been formalized through metaphors, analogies, concepts, figures, and models – needs to be systemized (Nonaka and Takeuchi, 1995). Generally speaking, this happens through language and, in fact, as a result explicit knowledge is formalized into reports, documents and notes. This favours the following sharing of explicit knowledge.

The last phase of the SECI model deals with internalization. In this case, the explicit knowledge is turned into tacit one. Employees embody the explicit knowledge shared through reports, documents and notes and internalize it. As underlined by Nonaka (1991), internalization implies the dissemination of explicit knowledge. Generally speaking, in the organizations this phase takes place through the act of learning by doing.

Relevance of the SECI model seems to be due to the fact that: it considers both tacit and explicit knowledge; it assumes that knowledge creation is a social and an individual process; and it aims to create and disseminate new knowledge.

Because of what was said above, it seems that the SECI model could be referred to companies implementing corporate museums. In this case, companies aim to create and disseminate organizational memory and, in order to do this, they need to consider both tacit and explicit knowledge and to manage both a social and an individual process.
APPLYING SECI MODEL TO TRANSFER ORGANIZATIONAL MEMORY

As underlined before, corporate museums and organizational memory on the one hand and knowledge management on the other hand have always been considered as standing alone topics of research. The aim of the present paper, instead, is to try to combine them and, in particular, to try to apply the SECI model in order to transfer organizational memory. In the following lines, the four phases included in the SECI model (socialization, externalization, combination and internalization) are recalled and referred to the process through which corporate managers and exhibition directors and curators try to transfer organizational memory to visitors/customers.

To the knowledge of the author, this is one of the first trials of referring the SECI model to organizational memory. This implies that some criticalities necessarily arise. Hopefully, they are properly managed and reduced at an acceptable level.

Socialization

As already said, the SECI model begins with the phase of socialization. During this phase, tacit knowledge is shared in order to create new tacit knowledge. In reference to the implementation of corporate museums, it is obvious that corporate managers are aware of the brand identity but it might happen that exhibition directors and curators are not. In this vein, corporate managers need to communicate the brand identity to exhibition directors and curators. Over dedicated meeting and through observations – which are events and facts that favour the act of socialization – exhibition directors and curators can apprehend from corporate managers the organizational memory linked to the brand. In this phase of SECI model, it is important the context in which socialization takes place. Generally speaking, the context in which this phase takes place is the company headquarters where its organizational memory lies. By referring the SECI model to corporate museums, it seems reasonable to suggest that:

P1: When implementing corporate museums, corporate managers need to socialize with exhibition directors and curators so that these last ones can apprehend the organizational memory that corporate managers want to transfer to visitors/customers.

Externalization

The second phase of SECI model deals with externalization. Over this phase, tacit knowledge is transformed into explicit. As for the implementation of corporate museums, exhibition directors and curators (who have already apprehended the organizational memory that corporate managers want to transfer to visitors/customers) need to externalize the apprehended organizational memory in a new way that lies outside the company and falls in a corporate museum. In this vein, metaphors, analogies, concepts, figures, and models (Nonaka et al., 2000) need to be properly selected and used since they
represent the *incipit* of the exhibition. In this phase, in fact, exhibition directors and curators start thinking about the best means to communicate the company’s organizational memory with the outside. By referring the SECI model to corporate museums, it seems reasonable to suggest that:

**P2:** When implementing corporate museums, exhibition directors and curators need to externalize the apprehended organizational memory to be transferred to visitors/customers so that corporate managers can validate or reject it.

*Combination*

The third phase of the SECI model deals with combination. Over this phase, explicit knowledge is created from explicit knowledge. In reference to the implementation of corporate museums, exhibition directors and curators need to systemize the organizational memory (previously apprehended by corporate managers, externalized through metaphors, analogies, concepts, figures, and models and validated by corporate managers) through language. Similarly to the explicit knowledge that results from combination and that can be easily formalized into reports, documents, and notes, the organizational memory that results from combination can be easily shaped into an exhibition that can be easily communicated to visitors/customers. By referring the SECI model to corporate museums, it seems reasonable to suggest that:

**P3:** When implementing corporate museums, exhibition directors and curators need to combine the apprehended organizational memory that corporate managers aim to transfer so that it can be easily communicated to visitors/customers.

*Internalization*

The last phase of SECI model deals with internalization. Over this phase, explicit knowledge is turned into tacit one. In the original SECI model (Nonaka and Takeuchi, 1995), it is clearly underlined that this phase – differently from the previous ones referred to organizational learning – refers to individual learning. Something similar can be assumed by referring the SECI model to corporate museums. In the previous phases, in fact, attention was paid over corporate managers and exhibition directors and curators that have to socialize, externalize and combine organizational memory. In this phase, instead, attention is paid over visitors/customers who internalize the organizational memory embodied in the corporate museum. Exhibition directors and curators need to manage the politics of memory with due diligence since they can stimulate the politics of remembering and of forgetting – in reference to the past and to the present – and the politics of imagining – in reference to the future – of visitors/customers joining the exhibition (Nissley and Casey, 2002). According to the above reasoning, it seems reasonable to suggest that:
P4: When implementing corporate museums, exhibition directors and curators need to manage the politics of memory in proper way (by leveraging on selective attention and selective retention) so that visitors/customers can internalize the organizational memory that corporate managers aim to transfer.

LIMITATIONS, CONCLUSIONS AND FURTHER DEVELOPMENTS

The present paper has tried to apply the SECI model to the transfer of organizational memory through corporate museums. The trial is not easy since it is based on the mix of two different fields of research: corporate museums and organizational memory on the one hand and knowledge management on the other. These two fields of research have always been considered as standing alone even if an overlapping seems to exist.

In reference to the limitations of the paper, it is obvious that the main one is linked to the fact that this is a theoretical paper trying to combine different fields of research without testing them. Both qualitative and quantitative analyses could be useful in this vein.

Despite the above limitation, it seems that the mix of different topics (corporate museums and organizational memory on the one hand and knowledge management on the other) can disclose a new and intriguing field of research that other scholar might enrich by proposing alternative perspectives and by providing qualitative and quantitative analyses in order to assess its validity.

IDENTIFICATION OF LEADERSHIP COMPETENCIES IN THE INTERNATIONAL ENVIRONMENT

Mazáněk, Lukáš; Pekárek, Jan; Vraniak, Lukáš; Konečná, Zdenka
Dept. of Management, BUT, Faculty of Business and Management, Brno, Czech rep

ABSTRACT

The aim of this study is to describe the significance of leadership competencies in the companies „operating“ in the international environment. We surveyed 96 manufacturing companies to obtain questionnaire responses from 54 South Moravian international manufacturing companies’ CEOs. The total of 25 questions, mapped 5 groups of interest in the field of technical (professionally expert), strategic, personality, social and intercultural competencies level perception of company CEO. Every question was rated from 1 – 5, when as higher value than higher frequency and perception of importance of the competence was assumed. This research approach is based on five-factor leadership model, nevertheless the attention is focused only at factor defined as individual competence. Therefore, as well other factors can affected the overall leadership effectiveness. There had been identified competencies, which are the most frequently used and those, which are perceived as the most important to adopt for managers who wish to be perceived as a leader. Among the three most important competencies there were identified the ability to make decisions, ability to negotiate, and ability to organize the work of subordinates. Thanks to the understanding which competencies are key to leadership, we are able to use these results in HR management. The clear practice implication is to create a competency model that can be used as a beneficial tool for recruiting and leadership development.

Keywords: Leadership, competencies, international environment, manufacturing company

INTRODUCTION

Human resource management in international environment is defined as “the process of employing and developing people in international or global organizations” (Armstrong and Stephens, 2015). According Briscoe et al. (2009) the human resources management represents examining and implementing all human resource management activities that affect the process of human resource management in organizations in a global environment. “The purpose of human resources management is to emphasize the organization’s overall interests - the interests of organization’s members are...
recognized, but are subordinate to enterprise’s interests. This also implies the importance attached to strategic integration and strong culture based on the vision of top management and its lead. This requires people who will be committed to this strategy, who will be adaptable to change and who will behave in accordance with the corporate culture” (Armstrong and Stephens, 2015)

In connection with developments and challenges in human resource management, Stone & Daedrick (2015) mention several factors that can influence the future of human resource management in organizations, including economic change, globalization, the use of new technologies, and the diversity of contemporary society. The way, how successful can companies handle these challenges can also affect the application of a suitable leadership concept. According to Armstrong and Stephens (2015), leaders focus their attention on the most important source – people. They motivate workers and gain their commitment and engagement. Applying a suitable leadership concept enables companies to get a competitive advantage through a balanced relationship between the leader and the subordinates. Ideally, it is not the traditional relationship of two groups with different interests - the interest of the leader in fulfilling the tasks on the one side and the interest of the workers in obtaining wages on the other side (Pavlica et al., 2013). The concept of leadership includes the ability of the leader to create a real vision of the enterprise direction and to explain its followers their role according to vision achieving (Kotter, 1991).

THEORETICAL BACKGROUND

Competencies

Prusak (2016) emphasizes the value of human capital and that human capital is a combination of knowledge, innovation, abilities, experience, creativity, social and personal skills, and physical, mental, intellectual and moral characteristics of predispositions and intrinsic motivations with a company with which they are able to cooperate. At the same time, the authors emphasize the complex structure of human capital by pointing to the following components: competence (knowledge and skills), motivation and utilization of potential and intellectual properties.

According to Kubeš et al (2004), competency models can significantly unify the view of what will be needed in the future, what behavior the organization should promote, develop and reward. According to Plamínek (2015), it can have a practical use of a competence approach, giving people more benefits: a clear definition of the direction of society. A clear definition of performance requirements. Setting the terms of cooperation; identification of the necessary human resources; creating an evaluation system; limiting conflicts of jurisdiction; reducing the need for operational management; increasing efficiency of
performance in the company; higher success rate of changes and many more. Mikušová (2015) also confirms that competency models are an inevitable part of integrated human resources management.

**Leadership**

Leaders inspire and motivate their followers, it is important for them to feel that their work is meaningful and important to the business. Obviously, even the best leaders cannot have the perfect knowledge and skills in all areas. This is the reason why they create the team of experts, which are specialists in their field and with the right lead is highly synergic effect in fulfilling the assigned task achieved (Veber, 2009). It is advisable for the leaders to continue develop themselves and develop their knowledge, while an important part is openness to learning from others and the ability to receive advice from more experienced people. In addition is important to listen to their followers and take their remarks and suggestions to improve business processes. The neglecting of employees’ remarks, together with the traditional reluctance to make changes, dampens the potential for growth in business efficiency and has a negative impact on employee motivation (Kotter, 1991). An important is leader’s role in building an organizational culture, where he has an irreplaceable place to build a confidential environment because, in the absence of confidence, all decisions and implementation of the chosen strategy are doomed to failure (James and Woten, 2010). Talented people are currently considered the most valuable capital, the role of the leader is to recognize the talent of their followers and to assign appropriate work to develop their talent and exploit their full potential within the enterprise (Ulrich et al., 2012). A separate chapter is the role of the leader and in the context of managing change, and crisis management, where their proactive approach and ability to make quick decisions is welcomed (James and Woten, 2010).

One of the actual typology of leadership effectiveness represents the dynamic five-factor model of leadership, created by Seiler and Pfister (2009). This model originated from the Complex adaptive system theory (CAS) and Complex theory of leadership (CLT), which understand leadership as dynamic process contains more independent, nevertheless cooperating variables (agents). Authors are focused especially on the person of leader, as important, active part of this dynamic five-factor model illustrated below in the figure number 1. In our research, we are focused at the first peremptory factor of leader effectiveness represented by these five facets of individual leader competences.
Individual competence includes all the individual capabilities, knowledge, and experiences of a leader. Undoubtedly, individual competence is the foundation for successful leadership. An individual has the most direct control over his or her own behavior. Many studies that examine leadership competencies provide typologies or lists of relevant skills and attributes. Abraham et al. (2001), for example, found that skills such as communication, team building, problem solving and decision-making are important for effective leadership. Kirkpatrick and Locke (1991) stated initiative, intelligence, and business knowledge are key determinants of successful leadership behavior. Ireland and Hitt (1999) added flexibility, strategic thinking, and teamwork. Propp, Glickman, and Uehara (2003) included other leadership core competences such as experience, technical skills, the ability to manage relationships, and acknowledgment of informal organizational structure. Brownell (2008) examined a range of leadership competencies and found team leadership, effective listening, coaching, feedback, and conflict management as well as trustworthiness, integrity, positive attitude perseverance, and flexibility among the most important skills and abilities. To identify the main components of this factor, Bolten’s
model of international leadership competencies (2005) was adopted. He defined five key competencies for international leaders: professional, strategic, personal, social, and intercultural. Professional competence refers to all knowledge and abilities related to performing in the current function, such as market knowledge, work knowledge, technical knowledge, and so on. Strategic competence includes all knowledge concerning strategic decisions and their implementation within the organization. Risk, cost and profit awareness, knowledge management, problem solving, and decision-making skills are examples. Personal competence refers to the ability to perform as an individual and to have the ability for self-development. Self-motivation, stress resistance, ability to self-criticize, and hierarchy awareness are part of this competence. Social competence refers to abilities that are important in interactions with others. It includes teamwork, empathy, tolerance, taking the initiative, communicating, and leading. Intercultural competence includes the capability to master foreign languages, possess some knowledge of domestic and foreign cultures as well as intercultural processes, and being open minded to intercultural learning and tolerant toward cultural ambiguities (Seiler and Pfister, 2009).

RESEARCH

Sample

There was conducted the quantitative research among 96 manufacturing companies. The sample was randomly selected based on willingness of CEOs to cooperate voluntarily with researchers, and its layout copies the representation of international manufacturing company in the basic set of Czech international manufacturing companies. During the three-month phase in 2017 (1/2017 – 4/2017) we have obtained questionnaire responds from 54 South Moravian international manufacturing companies’ CEOs.

There were collected overall information about our respondents. The gender were in 74% male and 26% female (see fig. 2). The number of followers were in 44,4% more than 10 people in managed group and in 55,6% the CEOs had less than 10 followers (see fig. 3). We had been interested in the experience of the leaders and results are showing that the most of our respondents are working in this position from 4 to 7 years (see fig. 4).
Research questions

The total of 25 questions, mapped 5 groups of interest of company CEO competencies (see table 1).
The survey data shows differences how respondents perceive different competences. The respondents provided two perspectives – how the competence is important and how often the competence is used in their position. They rated both perspectives on the scale from 1 to 5, where 1 means that the competence is not important at all and 5 means the competence is of very high importance. The same for frequency of use – 1 means the competence is used very occasionally, 5 mean it is used very often.

In order to estimate overall significance of individual competences, we multiplied the frequency and importance. Table 2 shows the individual competences as well as their mean values.

Knowledge of other nations’ culture & 2.5 & 2.1 & 6.4 \\
Approach to working abroad & 2.8 & 2.3 & 7.7 \\

Table 2. Competences and their importance, frequency and significance (Source: authors’ own composition based on the survey)

Discussion

The most significant competencies were (in order) ability to make decisions (s=22,4), ability to negotiate (s=20,6), ability to organize the work of subordinate collaborators (s=19,9), teamwork (s=19,8) and ethical behaviour (s=19,5).

On the other hand among the least significant competences were identified non-English language skills (s= 4,6) and knowledge of other nations’ culture (s=6,4). An interesting finding is the low level of perceived significance of German language skills (s=6,7) and low level of be capable to work abroad (s=7,7). When discussing low level of German language skills, there is a fact that our republic is the neighbor to the Austria and Germany. Despite that, it could be explained due to the willingness of German nations to speak English. Next up the lower score of working abroad could be explained as the historical consequences of almost 40 years of closed borders.

Due to our focus at companies operating in the international environment there hadn’t been found any more significant competence of leaders in the intercultural field than ability to master the English language (s=13,2). Other identified competencies weren’t in any special relation to international environment. In the field of technical competencies were the most important the ability to make a decision (s=22,4) and on the other hand as almost useless shows the competence of labor law understanding (s=9,4). In the field of strategic competencies was identified as the most important the ability to organize work of subordinates (s=19,9) and the lowest score gain the ability to formulate an attractive vision of the future (s=11,3). This competency overall gain the average evaluation however due to the low frequency of use, the final score expressed by the significance was quite low. In the field of social competencies the most important competency is ability to negotiate (s=20,6) and what is remarkable, there had been identified relatively low score for empathy (s=14,1). This may pose some problems in the future, because leadership in based on the relationship with followers and the empathy plays its important role here. Finally in the field of leader personality the most important is ethical behavior (s=19,5) and the other personality competencies gain mostly average evaluation. (see figure 5.).
CONCLUSION

In the studies conducted so far, the values of the staff were examined in the context of the management of international teams (Hofstede, 1993, 1999, 2001, Trompenaars, 2000, Shalhoop, Sanger, 2012), behavior of managers in international environment (Thomas, 2002, Nový, Schroll-Machl et al., 1999) and styles of leadership in different cultures (House, Javidan, Dorfman, Gupta, 2004, Dědina, Odcházel, 2007). Realized studies have shown a significant influence of managers on the behavior and performance of other staff (e.g. Hagberg, Heifetz, 2000, Dolan, Garcia, 2002, Dolan et al., 2006 and others). Output of several comparative international studies (Thomas, 1996, Stumpf, 2005, House, et al., 2004) was the definition of the personality profile of a successful international manager, i.e. assumptions that managers in a multicultural environment would unconditionally be able to be well-oriented in the environment of multinational companies, and to perform the performances expected from them. In addition, there are defined procedures recommended for managers working in a multicultural environment to form and consolidate their position in international companies (Schein, 1996, Thomas, 2000, Bolten, 2005, DeSanctis, Silberzahn, Chen, 2012).
In the research projects carried out up to now in Czech Republic were examined the specificities of manager behavior (Nový, Schroll-Machl, 1999, Dědina, Odcházel, 2007) using the tool developed in western economics, which were not adjusted to Czech conditions (Dědina, Odcházel, 2007). Regarding this topic were carried out several – but sporadic case studies describing the environment one particular enterprise (e.g. Groenwald, 1998)

Our study continues with this extensive research of managerial competencies and presents materials allowing us to create competency model based on the results of the behavioral research of managers. This competence model will cover competencies that have been identified as the most important for managers in the role of leaders across companies operating in an international environment. Next up this competency model will serve HR specialist during the recruitment and as well professional development and training of the managers who would be perceived as a leaders in their profession.

MANDATORY ENTREPRENEURS’ CHARACTERISTICS TO NEW VENTURES’ INTERNATIONALIZATION

Meneses, Raquel¹; Moutinho, Nuno¹; Azevedo, José²

¹School of Economics and Management of the University of Porto (FEP)

ABSTRACT

As International New Ventures are defined as firms that internationalizes almost since inception, many researchers have linked their nature to entrepreneurs’ characteristics. This study will try to define what entrepreneurs’ individual features are really necessary to international new ventures, using semi-structured interviews to the owners of 21 Portuguese companies from the technological sector and performing a fuzzy-set qualitative comparative analysis (fsQCA). Previous work has failed to address this question, may be because this methodology capable of examining complex causal situations is rarely used. Our major finding is that for a firm to have an early process of internationalization it is absolutely necessary that the entrepreneur has a previous international network of contacts. All other individual characteristics of the entrepreneur were not considered mandatory although some combinations of them would lead to the same result.

Keywords: Entrepreneurship; Entrepreneurs; Networks; Social Capital; fsQCA; Global Orientation; International New Ventures

INTRODUCTION

Traditionally, internationalization is seen as a gradual time-consuming process, based on firms’ knowledge (Johanson and Vahlne, 1977), or on firms’ contact (Johanson and Matsson, 1987; Johanson and Vahlne, 2011). In those approaches, the entrepreneur is invisible. More recently, literature about international entrepreneurship (Oviatt and McDougall, 1994, 1997, 2005) makes entrepreneur a central piece in internationalization. International New Ventures are firms that internationalizes almost since inception (Oviatt and McDougall, 1997). Many researchers have studied different entrepreneurs’ characteristics and their consequences on firms’ internationalization. However, nobody knows what entrepreneurs’ characteristics are really necessary to international new ventures.

This paper is based on the fuzzy-set qualitative comparative analysis (fsQCA). The literature shows that this method is suitable for the examination of complex causal situations (Ragin, 2008). Therefore,
it can show how the characteristics of companies (causal conditions) can be combined in different ways to reach the same solution (their own brand production - outcome), and what configurations are necessary or sufficient (Fiss, 2011).

This paper proceeds in the following way: the next section discusses the process of internationalization in the new ventures cases, and the impact of objective and subjective characteristics of entrepreneurs on it. The third section describes the fzQCA and presents the results. The following sections are the analysis and the conclusion, which identifies the limitations of the study and formulates suggestions for future research.

INTERNATIONALIZATION OF NEW VENTURES

Traditionally, internationalization is seen as a gradual process, based on firm experiential knowledge (Johanson and Vahlne, 1977). Firms need time to develop a domestic base and then progressively enters in closer markets. Internationalization gives more experience and it makes possible to go further. Rennie (1993) claims that there is a new type of firms that consider the world as their market almost from inception, and Cavusgil (1994, p.18) states that “gradual internationalization is dead” and “small is beautiful”. The works of Oviatt and McDougall (1994, 1997) develop a new approach and the study of International New Ventures is very important since the nineties. This new trend is based on technological development, new market conditions and people characteristics (Nummela et al., 2004). Now, the entrepreneur is seen as playing a key role in all process.

This vision is not completely new. Bilkey and Tesar (1977) show the importance of entrepreneurs in all internationalization process. Miesenbock (1988) claims that decision-maker is the key variable in small business internationalization. Thus, people with different traits influence firms’ internationalization differently. Thus different entrepreneurs’ stories will give different firms’ stories, too. Ghannad and Andersson (2012, p. 148) claim that a “good understanding of the firm’s development could be reached by studying the entrepreneurs’ backgrounds”. So, it is important to know if there is any entrepreneur characteristic that is necessary or sufficient to the internationalization of the firm.

According to Westhead et al (2001), older entrepreneurs have more contacts, experience and management know-how, so their firms are more likely to be exporters. These international contacts and international experience play a key role in all internationalization process (McDougall et al., 1994; Madsen and Servais, 1997; Nummela et al., 2004). However, Andersson et al. (2004) found that younger entrepreneurs are more prone to internationalize firms than older ones. So, there is no consensus about the influence of age in internationalization.

According to Andersson (2000, p. 80), “the technical entrepreneur’s main interest is technology” and “internationalization is not the main interest of this entrepreneur”. Therefore, technical entrepreneurs
delay firms' entry in foreign markets, so it is expectable that firms with entrepreneurs with very technical formal education are not international new ventures.

On the other side, marketing entrepreneur “is proactive in the internationalization process and is creating new channels to reach the customer” (Andersson, 2000, p. 80). Marketing entrepreneur must be present in international new ventures.

Social capital is often defined as the sum of resources that a firm (individual, organization) can access or mobilize by virtue of possessing a durable network of relationships (Bordieu and Wacquant, 1992). More recently, literature has been enlightening not only organizational but also inter-personal relations. These relationships enable partners to get more contacts, more information, to get closer to resources, and to know opportunities (Hakansson and Snehota, 1995; Harris and Wheeler, 2005). As Harris and Wheeler (2005, p. 189) note: “The individuals with whom entrepreneurs hold personal relationships offer access to their own network of relationships in other countries, from simple contacts to deeply trusted relationships”, so these relations could play an important role in overcoming internationalization problems (Ghauri et al., 2003).

Global orientation is a managers’ positive attitude to international affairs and their capacity to adapt to foreign markets (Nummela et al., 2004). Firms with entrepreneurs with global orientation will internationalize easier and faster (Bloodgood et al. 1996; Ghanmand and Andersson, 2012). Dremann et al., (2005) and De Vries and Florent-Treacy (2003) demonstrate how important childhood is to understand entrepreneurs’ mindset. So, this global orientation could be a consequence of foreign or migrant parents. If a person grows up within an international environment, it has a borderless vision of the world. At the same time parents had established social connection in diverse countries and second-generation could exploit those networks. This global orientation could result from international experience from living abroad, in diverse countries, too. On the other side, Zou (2007) states that international knowledge of entrepreneur is not a determinant of firm internationalization, only the capacity to detect opportunities.

Kirzner (1973) argues that the opportunities exist in the market; they arise because markets are never in equilibrium. However, only some people recognize them. Nowadays, the principal role of entrepreneurs is seen as an opportunity of discovery and exploitation (Mainela et al., 2014). Opportunities exist, independently of people being aware about their existence. (Alvarez and Barney, 2007). So, it is important to be conscious of what is happening around the world to capture and leverage opportunities. According to that thought, general awareness facilitates internationalization of new ventures.

Based on the literature review and following fsQCA, this study proposes the following:
• Marketing Entrepreneur Mindset, International Social Capital, and General Awareness are necessary conditions for internationalization.

• Single causal conditions may be present or absent within configurations of internationalization, depending on how they combine with other causal conditions.

• No single best configuration of conditions leads to internationalization, but there exist multiple, equally effective configurations of causal conditions.

• The presence or absence of age, individually or combined, can either promote or inhibit internationalization.

• Technical entrepreneur mindset must be absent to get internationalization.

METHOD

Because the literature of international entrepreneurship never studied the existence of necessary conditions, a qualitative analysis is the most appropriate methodology (Eisenhardt and Graebner, 2007). According to Ragin (2000), the fsQCA method favors the dialogue between empirical evidence and theory and therefore it allows results to support the whole analysis. This explicit iteration provides a deeper understanding of case studies by reaching different solutions for different cases. So far, its application to the study of companies has been limited (Felício et al., 2015), and as best as our knowledge, it has never been applied in international entrepreneurship studies.

This method establishes a bridge between the case-oriented approach that treats cases as whole and the variable-oriented approach that uses a “half-verbal-conceptual and half-mathematical-analytical” language (Ragin, 2000, p. 4). For that reason, one of the great advantages of the fsQCA is that through Boolean algebra and algorithms, this method reduces a large number of causal conditions to a much smaller number of configurations that lead to the outcome (Felício et al., 2015), thus treating cases as a whole.

This study analyses 21 Portuguese companies from the technological sector to remove contextual differences. All of the companies are less than 6 years old (to be considered new), and some have already internationalized (they are international new ventures). Table 1 shows the companies considered in the present study.

B-Guest
A Guest Engagement Platform that has been designed to shorten the distance between hotels and guests, connecting them in the best possible way.

Biti
A media environment designed for children to enjoy full autonomy in their digital world, allowing parents to draw the limits.

Black Block
A hybrid solar drying system, designed to dehydrate food and agribusiness products – such as aromatic herbs.

Brain-e
An online platform where everyone can manage the energy consumption and be sure to save money every month.

Change Tomorrow
It provides a do-it-yourself like and easy to use Participatory Democracy platform capable of adapting to the best practices as well as local specificities.

City Guru
A web and mobile app providing direct access to local guides (professional and amateur) and allowing a personal contact through real time chat.

Clickly
An in-article content discovery technology that allows readers to discover relevant content in an interactive format.

Cuckuu
A social network that allows anyone to surprise and be surprised at the right time, turning trivial moments into something people will never forget.

Egg Electronics
Manufacturer of personal premium quality charging devices that blends user-centered product engineering with design.

Eguru
An app using a crowdsourced pool of drivers and a logistics algorithm used to transform the delivery of any item a quick and effortless activity.

Eventfuel
Mobile apps for events with the purpose of giving to attendees a rich experience featuring speaker profiles, session summaries, automatic check in, push notifications, live polls and per session feedback.

Fibersail
A shape sensing system based on FBG fiber optic research to monitor and analyze windmill blades in terms of shape, condition and behavior.

Graf.ly
Digital newsroom platform that puts journalists and editors in full control, and help media organizations to focus on content and monetization, not tools.

Learninghubz
Online platform and curation tools bringing together the best online business management training with internally produced and curated video training.

Probe.ly
It performs scans of web applications and lifecycle management of the vulnerabilities found in a sleek and intuitive web interface.

Sensefinity
It provides Internet of Things for the masses, since projects can immediately start using data gathered from their assets and delivered by their ubiquitous GSM data-pipe with multinational companies and worldwide coverage.

Spindots
It provides management, design and programming of web portals, information systems and decision support, customer relationship management, platform
management, training and advice on information systems

Trigger systems Platform to control irrigation systems using exclusive calculation models based on weather forecasts determining the exact amount to irrigate.

The analysis uses documents, interviews, and news in the press. The leading sources of information are the semi-structured interviews with the sample companies’ owners. The information requires interpretation and coding that results in 8 categories reflecting the causal conditions that lead to brand creation as an outcome (see Table 2).

As a multiple stage analytic procedure, we have several steps. The first step was the selection of the theoretical attributes. In our study, these attributes were entrepreneurs’ age (when the firm was created); global orientation (childhood international exposition, international experience, and international diversity - number of different countries); educational background (technical entrepreneur; marketing entrepreneur); previous entrepreneur experience; international network; and general concern.
The second step was, according to Ragin (2008), the establishment of a score with six fuzzy-set values (0 – fully out; 0.2 – mostly but not fully out; 0.4 – more or less out; 0.6 – more or less in; 0.8 – mostly but not fully in; and 1 – fully in) for each category in each case.

As explained above, the outcome is internationalization. Two different approaches were used: 1) Business Internationalization - a dichotomous outcome (1, if firm has any international experience and 0 otherwise); 2) International Commitment - a fuzzy set outcome (between 0, if it is not present in any foreign country and 1, if it is present in more than four countries). Please refer to table 3.

</table>

In what concerns entrepreneurs’ age, our sample was very diverse: four companies with young entrepreneurs (less than 30 years old), 8 cases with entrepreneurs between 30 e 40 years old, and the majority (9 cases) had entrepreneurs older than 40 years.

The international exposition of entrepreneurs presented a great diversity, varying between what we consider a completely international exposition (resulting from a childhood experienced abroad and /or more than one year living abroad – 8 cases), to a total absence of any kind of international experience (4 cases). In the middle ground, we found 9 entrepreneurs with some international exposition.

In the group of completely international experience, six have already lived in more than 4 different countries, one in three different countries, and one in only one country.

In terms of the educational background, 3 entrepreneurs were considered marketing entrepreneurs (as they completed formal education in Management) and 12 as technical entrepreneurs (formal education in technical or technological areas).
Considering the main type of network presented, we found 12 entrepreneurs with a completely international network, and only 3 with a completely domestic one.

In what concerns the outcome, 12 firms were already internationalized and only 9 were not.

RESULTS

Table 4 shows the results for the necessary conditions. In theory, the outcome is a subset of necessary conditions, so “it does not say anything for the cases disclosing the outcome” (Bol and Luppi, 2013, p. 205).

Ragin (2008) argues that we should not accept conditions with consistency values below 0.75 and states that “in the case of necessary conditions, the consistency value should be set much higher”, so we decide to use a cut point of 0.9.

Hence, the data from Table 4 shows that in order to internationalize (independently the way we evaluate internationalization), entrepreneurs must have an international network. It is very interesting to note that having an international network required a deep commitment. This result confirms the crucial role of social capital (international networks). On the other side, it contradicts the idea that Marketing entrepreneurs and Global Orientation are necessary conditions.

**Reassessing Cases**

The next step is to generate a truth table (in the appendix) with the fsQCA program (Ragin et al., 2006) to produce the distribution of the 21 cases by the possible combinations. According to Ragin et al. (2008, p. 75) “the truth table algorithm incorporates a two-stage analytic procedure.” The second step is to specify the possible causal conditions vis-a-vis the outcome.

The fsQCA 2.5 allows a complex solution, a parsimonious solution and an intermediate solution. Rihoux and Ragin (2009) find that an intermediate solution is superior, so we use that to take conclusions. According to literature review, we consider that Age could be absent or present, Technical Entrepreneur should be absent; Marketing Entrepreneur should be present; Social Capital should be present; Global Orientation could be present or absent; and General Awareness should be present.

</table>
International Business (yes/no)

From all possible combinations, seven of them reflect the case studies, and therefore all others are removed. From among the seven, three have a consistency above 0.75, and for that reason are assigned the value of one while the remaining is assigned the value of zero.

Table 5 shows that two combinations of solutions generate the same outcome (internationalization). The intermediate solution generates a very good value for consistency (0.8656), while coverage is good (0.483).

This result reflects two conditions present in all of the solutions (int, and intmob). It highlights the idea that entrepreneurs should be very active and aware about what is happening (Zou, 2007). Surprisingly, marketing entrepreneur must be absent in both recipes.

So, there are two possible recipes to get internationalization before firms are 6 years old:

- int*intmob*~mark*~globor*age

Thus, international new ventures can have older entrepreneurs if they are fully aware about what’s happening (to detect opportunities), and if they present an international mobility. Educational background and global orientation seem to be confounding variables.

- int*net*intmob*intwork*globo*~mark*~age

Thus, firms with young entrepreneurs, interested in what is happening, with international network, and international and diverse work experience, and with global orientation could be international new ventures too. Educational background seems to be a confounding variable.
International Commitment (number of countries)

From all possible combinations, seven of them reflect the case studies, and therefore all others are removed. From among the seven, two have a consistency above 0.75, and for that reason are assigned the value of one while the remaining is assigned the value of zero.

Table 5 shows that two combinations of solutions generate the same outcome (internationalization). The intermediate solution generates not so good values for consistency (0.6969) and coverage (0.319).

It is very interesting to note that there are two recipes but they are very similar:

- int*net*intmob*intwork*prevent*globor*-age
- int*net*intmob*intwork*tec*globor*-age

Considering that, to be an international new ventures firms must have young entrepreneurs with social capital (international networks), very active (with awareness about what is happening and with international mobility), with international work experience and a global orientation. And with technical mindset or previous experience as entrepreneur.

These results confirm the idea that younger entrepreneurs present more proactivity so their firms show an earlier internationalization, confirming also the common sense thought that general awareness is very important (to detect opportunities) and international knowledge (resulting from global orientation or from international work experience) is very important to accelerate internationalization process. On the other side, according to those results, technical entrepreneurs are important. The explanation could be that in order to expand so quickly, firms must have a very innovative product and technical entrepreneurs are very concerned about product development.

Considering the onset propositions, the analysis produces the following conclusions:

- Entrepreneurs’ International Network is a necessary condition for young internationalization.
- The recipes to go further (more than four countries) are more demanding than the recipes to start the process of internationalization.
- Marketing entrepreneurs could be an obstacle to begin the process of internationalization.
- No single best configuration of conditions leads to firms’ internationalization.
- No recipe generates the entry in a high number of countries.

CONCLUSION

This study investigates how some companies can internationalize in a very young age (less than six years old) using the fuzzy-set method for its investigation. The greatest advantage of this method is the admission of equifinality, that is, the recognition that “different equally effective configurations of conditions may lead or contribute to the same outcome” (Gonçalves et al., 2016, p. 3).
Hambrick and Mason (1984) argue that the company is a mirror of its managers. According to the network approach, liability of outsidership is the biggest obstacle to internationalize. Nevertheless, according to our study, new ventures could start internationalization if entrepreneurs have an international network. This is mandatory to go further in the internationalization process. Young, very active entrepreneurs (with general awareness, and international mobility), with global orientation and international work experience, with previous entrepreneur experience or technical mindset are two causal combinations that leads to more commitment to internationalization.

The importance of the technical mindset could be connected to the nature of the sample, as all 21 firms are technological. In this sector, innovation, namely technological development, is a distinctive factor. This point is a limitation of our work, so it is very important to repeat this methodology in others sectors. It is possible to include other entrepreneurs’ traits like gender, formal education, work experience, or to include not only individual characteristics but all top management team features. Nevertheless, this study fills a gap in the literature, identifying mandatory individual characteristics of entrepreneurs to internationalize their companies almost since the inception.

ABSTRACT

This work focuses on the situation of plastic manufacturers in Italy. It aims to analyse their financial structure and economic situation, in the period before, during and after the crisis (2008-2015), in relation to economic and financial ratios trend. The study focuses on three research questions: what is the actual situation and which trend there has been in the last decade in Italy? What was the effect of the international crisis on the financial structure of companies in the sector? What changes has the international crisis brought on the financial structure of plastic firms’ industry? How profitability evolved during the period in question?

To these aims and starting from AIDA data, the study carries out a trend analysis. The financial structure is assessed using ratios (Leverage, Current ratio, Quick ratio, Financing ratio for non-current assets) and Fixed asset to equity capital margin. By evaluating ROE, ROI and ROS, the profitability was investigated.

The study shows that the recent economic crisis has hit different industries in different ways; particularly, it has affected Italian plastic industry in a limited way because of the increasing product demand. Ratios values are highly satisfactory, despite the dominance of the debts on internal sources, which is unjustified given the cheap equity borrowing. Future studies should deepen the issue by comparing Italian and other countries’ situation in order to enrich international literature. In fact, the focus on production and technical aspects and the impact of plastic on environmental pollution have always been the main object of interest.

Keywords: Plastic manufacturers, Global Crisis; Financial ratios; Profitability ratios.

INTRODUCTION AND PURPOSE: STRUCTURE OF THE ESSAY

The recent international economic crisis has affected the nations and the industries with different intensities and consequences. It was also an opportunity for scholars to detailed analyses of the causes
and possible solutions to propose to the globalized economic system and every company. This study focuses on the plastics industry trend in Italy during the economic crisis. Plastic is one of the most important industrial product everywhere. It replaces gradually other expensive and strict raw materials. Plastic material sector has been affected by the recent global crisis, albeit in a slighter way than the other business sectors. Therefore, it represents a useful case study for its global dimension and for the verification of its relations with the economic crisis causes. However, it raises the issue in terms of its real use in order to avoid environmental pollution, given the problems of waste and recycling (Glerean, 2012). Sector analysis is useful for both typical purposes, related to the financial statements analysis, and for the ecological and social implications inferred from plastic environmental impact. This sector unites managerial and social issues and the indications obtainable from it may be useful to develop, at the same time, appropriate employment and environmental policies.

This research answers three questions focused on financial and economic dynamics:

RQ1: What is the current situation and what did the trend in the last decade?

RQ2: What was the effect of international crisis on firms’ financial structure?

RQ3: How the profitability changed during the period in question?

In the future, the research must be extended to the economic and environmental aspects, which are intimately tight, and to the dissemination of environmental reports among the firms.

In order to answer to these research questions, the study carries a quantitative analysis based on the financial statements of a sample of companies for eight consecutive years. By analysing the time trend of some capital and revenue ratios, a first view on industry trend and on consolidation efforts developed.

The study, after explaining the research approach and the methodology, gives some evidences about the studies on the environmental impact of plastics, which are relevant and frequent. In literature, fewer researches have dealt with the economic and capital balance of firms. The aim of this work is to fill this gap.

Subsequently, the essay shows some data on the plastics industry both in Italy and in the world. These data are the subject of the analysis.

Finally, the results show a growth industry. The economic and capital structure benefit from this situation, despite a substantial debt persists, which is unjustifiable regarded the lower costs of money in the European Union.

a quantitative analysis. The other sections are of Guido Migliaccio.
RESEARCH APPROACH

Our research approach is quantitative. It develops an analysis on ratios and indexes carried on a sample of 3,227 companies from AIDA database (https://aida.bvdinfo.com – 19/9/2016). The companies considered have two characteristics:

1) They belong to Ateco 22.20.00 2007 (www.istat.it - 27/03/2016): they produce plastic goods;
2) They do not belong to special Ateco classes: «Manufacture of plastic plates, sheets, tubes and profiles», «Manufacture of plastic packing goods», «Manufacture of builders’ ware of plastic».

Before the analysis, the study presents the statistical data and their elaborations on global, European and Italian production.

The empirical analysis develops a characterization of the financial structure by using the following ratios: leverage, quick ratio, current ratio, fixed asset to equity capital margin. By evaluating ROE, ROI and ROS, the profitability was investigated.

Finally, we presented conclusions and possible future in order to make clear open questions.

INTERNATIONAL AND ITALIAN LITERATURE REVIEW

The international studies concerning the production of plastic are wide and articulated. There is a prevalence of technical and engineering studies about the realization of quality goods. Economic studies are less numerous and classified in two groups: some of them analyse the environmental impact of plastic materials and the social consequences; others are more managerially oriented and analyse economic and financial balance of manufacturers.

A brief and necessary mention must be devoted to ecological economy, albeit it is not the specific aim of this research, but rather of a possible future continuation. There is the wide research of Zaman and Swapan (2016) which presents the environmental and economic benefits of global waste management systems in the context of zero waste practices. Other studies are synthetized as follows: Corbett (2000) analyses the environmental management systems in the New Zealand plastics industry; Steuer et al. (2017) show the analysis of the value chain and network structure of informal waste recycling in Beijing, China; Alcántara-Concepción et al. (2016) analyse the Environmental impacts of computers (at the end of their lives) and their management alternatives in México; Zhou et al. (2014) present the characteristics and the recovery potential of plastic wastes obtained from landfill mining, etc.
A wide international literature analyses economic and social effects of pollution, which derives from plastic packaging (Ravi, 2015; Valarmathy, 2015; Accorsi et al., 2014; Cai and Savio, 2013; and Cozzi, 2016).

A limited number of studies focuses on specific management issues in plastics industry, presented as follows:

- Lélis and Simon (2013) study the relationship management in the automotive chain. The object focuses on the relationship management in an industry of automobile plastic parts in São Paulo, Brazil. The results show the relationship management factors which contribute to the efficiency of supply chain management and highlight the aspects which can be improved concerning the chain collaboration in terms of informal communication and lack of joint business planning between the company partner;

- Damoah and Nyarko (2016) study the influence of leadership strategies on organisational commitment. The purpose of this research is to examine the effect of different dimensions of leadership strategies on employees’ commitment, in order to identify the best strategies required to improve the commitment of employees in a developing country’s context. Well 132 employees based on the two major plastic manufacturing companies in Ghana. Based on the findings, organisations are therefore encouraged to adopt the democratic leadership strategy to improve the commitment of the work force;

- Xu et al. (2016) present some evidences on a sustainable performance assessment framework for plastic film supply chain management from a Chinese perspective, because the application of biaxial-oriented polypropylene plastic film has had a significant influence on the economic, environmental and social performance of supply chain management;

- Resende et al. (2014) present the results of a lean production project implementation developed in a plastic injection company. The main aim of the project was the application of lean principles and tools involving the company’s stakeholders. Some tangible and financial results obtained, were an increase in productivity of the assembly lines and of the operating income, a reduction of the cycle time etc. Intangible results were the operators’ engagement and involvement with continuous improvement and with lean implementation;

- Van Eygen et al. (2017) analyse the national plastic flows in Austria from the production stage up to the waste management stage, reference for the year of 2010;
- Paksoy et al. (2006). In this study, the supply chain management strategies and applications of two plastic profile manufacturer firms, which are two of the six greatest in the Turkish market, are benchmarked based on a questionnaire;

- Low and Lee (2008). In the current mould-making industries, the challenge is to shorten the mould lead-time while maintaining the desired quality. In the current practice of local mould-making industries, almost all the data for the mould design, manufacture and testing stage are often either confused or duplicated unnecessarily. This paper presents a framework for how the data from the different stages of the mould project could be managed more efficiently through the use of templates;

- Hallam et al. (2009). This project focused on a small manufacturer of plastic bags to identify the critical and non-critical factors of production and develop a strategy for the firm to manage those critical factors in order to improve production rates and quality while decreasing waste. The results of the project demonstrated a strategy that could achieve all three objectives for the company, namely increased productivity, quality, and reduced waste, all of which drive bottom line financial improvements, a key performance outcome in any lean enterprise;

- Aydogan et al (2013). This chapter presents a mathematical model which is a fuzzy goal programming model for imprecise goals for reverse logistic network design with multiple objectives in plastic sector. The considered objectives are to reduce cost in reverse logistics, to improve product quality, and to provide environmental benefits by minimizing waste production.

Asasongtham (2012) studies the factors affecting cost management of SME factory entrepreneurs in the plastic industry in Pathumthani during the economic crisis. The findings reveal that the overall cost management was at a moderate level and was not different in terms of business size, but as classified by years in business. Villa (1997) underlines that an efficient financial structure ensures a permanent position on the market. Maybe, it is perhaps the only example of writing which relates financial structure of the plastics companies to durability.

From this literature review, it emerges a lack of studies about the composition of sources and application of funds that derive from the financial statements and on the average profitability of the industry. In fact, it seems useful in order to understand the industry in question. The next notes are a first attempt to fill this gap.

**PLASTIC MATERIAL PRODUCTION IN THE WORLD**

The industry sector of manufacture and transformation of plastic materials is one of the most important in Italy and in the world.
Plastic, from year to year, has reached a huge development, because of its properties and possible uses. Its success is due to a specific combination of materials: it can be flexible or stiff, heavy or light, opaque or transparent, with sealing and/or blocking properties. All these merits, together with the lower costs of production have lead the plastic to replace other materials, especially the metal (Kerns, 2016).

The recent global crisis affected the plastics industry, like all industries. However, the crisis hardly affected this sector, compared to the others; in fact, it began its recover in 2010-2011. Globally, plastic material production has grown by 10 million tons reaching 280 million tons with a growth rate of 9% per year (www.plasticseurope.org - 23/03/2016). The global and European trend (table 1) records a constant growth despite the crisis. In 2014, the production reaches the value of 311 million tons.

Source: data from PlasticsEurope Market Research Group (PEMRG)

The markets for plastics are shifting towards Asia characterized by growth rates higher than average: in Asia, there is a growing production capacity. Currently (table 2), China has the 26% followed by Europe with the 20%, NAFTA 19%, the remaining Asia 16%, Africa 7%, Latin America 5% and, lastly, Japan 4% (http://www.plasticseurope.org/plasticsindustry/plasticseurope.aspx - 24/03/2016). The Europe produces 47.8 million tons of plastic materials whose manufacture and transformation is highly concentrated in five countries: Germany with the 24, 9% followed by Italy (14, 3%), France (9, 6%), Great Britain (7, 7%) and Spain (7, 4). The remaining part belongs to the other 22 European countries.

Table 2: Global plastic material production
5. THE PRODUCTION OF PLASTICS MATERIALS IN ITALY

The plastic materials transformation and the realization of parts and products for the final user is one of the most important production activities in Italy, which has gained significant results even in the crisis.

In 2009, Italy was (The European House – Ambrosetti, 2013):

- the third in Europe for employment (146 thousand), turnover (€ 32 billion) and added value (about € 8 billion) in the production and transformation of plastic materials, under Germany and France. Italy, as well as the rest of the Europe (except Germany), employs around 90% of the workforce and the 87% of the added value in the transformation;

- the second in Europe for consumption market of plastic materials after Germany (7,1 compared to 11,9 million tons/year).

Currently, the industry in question is stable: it records about 180 thousand workers, 11 thousand companies, growing compared to 2009 (ISTAT, 2016).

Plastic materials are extremely versatile and usable in different sectors.

Its main use is for packaging that takes up in Italy more than 45% of production, considering versatility, lightness, robustness, chemical inertness, reliability and economy.

http://www.plasticseurope.org/plasticsindustry/plasticseurope.aspx (24/03/2016)
The building takes up in Italy more than 11%, particularly for hardware, industrial plant building, coatings, plumbing, thermal and acoustic insulation; the furniture takes up about 6%; the transport over 4% in various parts like air bag, safety-belt etc.; agriculture more than 3%.

6. THE EVOLUTION OF THE ECONOMIC AND FINANCIAL STRUCTURE: RESULTS FROM A QUANTITATIVE ANALYSIS

The paragraph carries an asset analysis on the sample identified before. We used the indexes and ratios calculated on reclassified financial statements of Aida database.

By rearranging the information, we reported every formulation from https://help.bvdinfo.com/mergedProjects/73_IT/Data/Financial/AidaRatioDef.htm (22/02/17).

6.1 Financial and patrimonial analysis

6.1.1. Indebtedness level

The Leverage (Total assets/Equity) expresses the coverage of uses with own funds. In Italy there is the trend shown in the table 3:

<table>
<thead>
<tr>
<th>Year</th>
<th>Leverage</th>
</tr>
</thead>
<tbody>
<tr>
<td>2008</td>
<td>9.09</td>
</tr>
<tr>
<td>2009</td>
<td>8,30</td>
</tr>
<tr>
<td>2010</td>
<td>10,39</td>
</tr>
<tr>
<td>2011</td>
<td>9,32</td>
</tr>
<tr>

<td>7,94</td>
</tr>
<tr>
<td>2013</td>
<td>11,01</td>
</tr>
<tr>
<td>2014</td>
<td>9,88</td>
</tr>
<tr>
<td>2015</td>
<td>10,15</td>
</tr>
</tbody>
</table>

Source: elaboration on AIDA database.

The industry is characterised by high leverage, sometimes fluctuating. In 2015 there is a 10, 15 of slight decrease compared to 11, 01 of 2013. There is also a move from 8, 30 of 2009 to 10, 39 of 2010 and a decrease in 2011-2012 followed by a peak in 2013. The industry is characterised by an imbalance between own funds and third party funds, which are dominant. This could cause increasing borrowing costs, which would reduce firms’ profitability. Therefore, this fact has to be linked to the following datum about Roe, Roi and Ros ratios. It must be noted that in some of the considered years, the cost of money was low because of the effects of monetary and European Central Bank too.

6.1.2. Short-term financial balance
It can be analysed by using the *quick ratio* and the *current ratio*.

a) The *quick ratio* \([\text{Current assets} - \text{Remainder}/\text{Current liabilities}]\) expresses the short-term financial situation, by considering current liquidity and liquidity on deadline such as security investments in liquidity (Fadda *et al.*, 2008) (table 4).

<table>
<thead>
<tr>
<th>Year</th>
<th>2008</th>
<th>2009</th>

<td>Ratio</td>
<td>1.17</td>
<td>1.22</td>
<td>1.20</td>
<td>1.20</td>
<td>1.21</td>
<td>1.22</td>
<td>1.25</td>
<td>1.29</td>
</tr>
</tbody>
</table>

Source: elaboration on AIDA database.

The index has a fluctuating trend in the years 2008-2012, and then it remains stable and increases. During the period examined, the quick ratio records average values underline a good financial situation in 2008-2011. In 2014-2015, it becomes increasingly positive.

b) The *current ratio* \((\text{Current assets}/\text{Short term debts})\) expresses the coverage of short-term debts with short-term investments, including stock (table 5).

The companies worked in a situation of financial balance improving from year to year despite the crisis. It is a particular important evidence because it is a sign of a good working capital management, which has not been affected by the detrimental effects of the crisis that, sometimes, has lead to quick choices with negative effects on short-term asset balance. It is useful to compare (table 6) in a graph,
the two last indexes: the dimension of the stock (which is close to liquidity) has not affected in a significant way the financial dynamic.

Table 6. Current ratio e quick ratio: a comparison.

<table>
<thead>

<td></td>
</tr>
<tr>
<td>2015</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Source: elaboration on AIDA database.

6.1.3. Medium and long-term financial balance

The analysis focuses on fixed asset to equity capital margin and financing ratio for non-current assets.

a) The fixed asset to equity capital margin (Equity – Net fixed assets) expresses, in absolute values, the coverage of non-current assets with equity capital (table 7).

Table 7: Fixed asset to equity capital margin

<table>
<thead>
<tr>
<th>Year</th>
<th>2008</th>
<th>2009</th>
<th>2010</th>
<th>2011</th>
<th>2012</th>
<th>2013</th>
<th>2014</th>
<th>2015</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>-642</td>
<td>-578</td>
<td>-579</td>
<td>-526</td>
<td>-524</td>
<td>-415</td>
<td>-393</td>
<td>-316</td>
</tr>
</tbody>
</table>

It has always-negative values: third party equity is necessary in order to cover long-term investments. However, the trend is increasingly improving and it has a reduction of about 50%. This datum states the debt ratio trend, which highlights a great intervention of the external sources compared to the equity capital.

b) The financing ratio for non-current assets [(Equity + Long-term debts)/Fixed assets] considers the use of both own funds and third party equity in order to cover long-term investments (table 8).

Table 8: financing ratio for non-current assets

<table>
<thead>
<tr>
<th>Year</th>
<th>2008</th>
<th>2009</th>
<th>2010</th>
<th>2011</th>
<th>2012</th>
<th>2013</th>
<th>2014</th>
<th>2015</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>2,66</td>
<td>3,07</td>
<td>2,50</td>
<td>2,77</td>
<td>3,01</td>
<td>3,25</td>
<td>3,26</td>
<td>3,28</td>
</tr>
</tbody>
</table>
The trend is almost constant, except for 2010, which represents a minimum peak. After 2010, the trend is increasing. The industry tends to take constant values despite the reduction of the fixed asset to equity capital margin. This is interpreted in various ways. It could be the effect of the decreasing value of the durable assets for the obsolescence and senescence, which take to new investments, or it could be due to an increasing long-term debt. In this analysis, it is not possible to determine precisely the reason, which will ask for more data.

### 6.2 Profitability analysis

The ratios used are ROE, ROI and ROS. ROE (Return on equity) (Net income/Equity) is a measure of the company profitability, which referred to different areas: operations, financial and extra-ordinary operations (Tieghi, 2004). In order to evaluate and organise the strategies to improve company profitability there is a need for a ratio, which measure the potential of company profitability, regardless of extra-ordinary operations, financial events and tax burden. This is the role of ROI (Return on Investment) [Operating income/ (Equity + Bonds + Long-term bonds + Bank debts + Long-term bank debts + Debt to members + Long-term debt to members], which expresses effectiveness and efficiency in the management of the firm business areas (purchase, production and sales) (Bubbio, 2007).

ROS (Return On Sales) [Operating income/ (Sales revenue + other revenues)] expresses the remaining margin after the coverage of the business costs with sales revenues (Campedelli, 1990).

Profitability ratios do not have thresholds parameters and change from one industry to another. The industry considered is characterised by the following values (table 9).

<table>
<thead>
<tr>
<th>Year</th>
<th>Roe</th>
<th>ROI</th>
<th>ROS</th>
</tr>
</thead>

</tbody>
</table>

Source: elaboration on AIDA database.
The sector has a good profitability profile, despite the crisis. The minimum values, even positive, are present in 2009. Then, they improve with discontinuity (table 10). They rank consistently among even greater levels than government securities considered as a valuable benchmark. Even in the worst years, the profitability is positive and acceptable.

7. CONCLUSIONS

The recent economic crisis affected the different productive sectors with different consequences. The plastic material production shows a low negative effect of the crisis on Italian companies, mainly resulting from the growing need of the product on all international markets. Italian industry has followed the international trend, by recording similar satisfactory values also in the crisis years.

This study investigated the effects of the crisis on capital, financial and income balances on a sample of Italian companies with a good market space in the global and European production.

The analysis derives from the study of a high number of firms' financial statements for eight consecutive years. It shows that the positive market conditions have obviously beneficial effects on relations between sources and financial investments and on corporate profitability. The worrying situation is about the relation between internal and external sources: the predominance of the second ones reduces the profitability, which has, however, a good and positive value. Positive profitability outcomes could also derive from a judicious monetary policy of the European Central Bank, which has kept the interests low for capital procurement.

The plastics industry therefore requires, however, a significant investment of equity capital in a national financial market still characterized by significant under-capitalization of companies, therefore, they have to address to third-party sources. The opposite signs of the structure and the index of fixed income coverage, which also considers the medium and long-term loans, confirm this
judgment. The first highlights the equity gap replaced by third-party capital for fixed asset coverage. Even if it seems evident that capital costs have not affected the profitability, the undercapitalisation represents a limit to freedom in firm management. The excessive use of third party equity leads to frequent financial emergencies due to the deadlines imposed by the return of the funds and to the need for new sources. Moreover, the administration could be dampened by fundraisers’ need to criticize the choices of new investments made by the internal bodies, and that may harm the refund of the third party equity. It is quite realistic to think that a better balance between financial sources would allow freer, more efficient and more effective choices, which are also more profitable, leading to self-financing and to investments free from thirds’ choices. The short-term situation is satisfactory and presents a positive relation between liquidity and stock, considering the trend and the linked ratios.

Such issues, however, must consider the necessary quality of the data obtained from Aida database. During the research, it seemed preferable to eliminate the margin cash, because it was in contradiction with the short-term financial ratios. The contradiction probably derives from the information system mode of calculation.

A deeper analysis must ask for other ratios, which had better explained the relation between sources/application of funds, in particular for the impact of the equity capital on total sources. It will be possible to devise an eradication policy for the industry in question and for a great number of its firms. The readjustment of sources does not seem so problematic, given the high profitability of the sector, which can also improve by reducing financial costs. Such investigation should be deepened and extended to comparisons, among different countries. Moreover, it represents a new proposal compared to the traditional international bibliography, which is highly focused on technical aspects and production of plastics and their relative impact on environmental pollution.

CITIZEN SATISFACTION IN ITALY: RESULTS FROM AN EMPIRICAL RESEARCH

Migliaccio, Guido1; Russo, Agostino2

1Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy;
2Salaries service, Province of Benevento, Benevento, Italy

ABSTRACT

The Italian public administration research consistently effective and efficient organizational models aimed at the full satisfaction of the user. A continuing problem is the use of a fair assessment mode of the services offered: from the results often depend economic interests related to incentive bonuses payable to executives and staff.

It is understandable, therefore, the delicacy and difficulty of identifying tools, methods and interpretative criteria of citizen satisfaction investigations.

This paper describes an empirical research carried out at the employment office of Province of Benevento in Italy. Online questionnaire they were evaluated some aspects of the service provided to users. They have participated for about 10% of the users. The results diverge significantly compared to similar surveys carried out in the same context with different methodologies. Even within the limits of the method used, the project can be easily exported to other offices of public administration, considering its low costs, provided that it registers an actual need for transparency.

Keywords: Citizen Satisfaction; Employment offices; Public Employment Services.

INTRODUCTION AND MOTIVATION: AIMS AND STRUCTURE OF THE PAPER

The organization and the high cost of the Italian Public Administration are the object of study by Italian researchers and part of the international Academy. The various attempts to make a public apparatus economically, effectively and efficiently are the subject of reflections of many experts (Migliaccio, 2011).

In recent years there has been a sharp change of the general approach, moving from bureaucratic logic to meritocratic criteria. The State must consist of simple offices that respond immediately to citizen’s
needs. This paper proposes some significant insights into the managerial skills of the Italian Public Administration: citizens should participate more in political choices that must be evaluated also in relation to social, economic and financial results achieved by various agencies in different levels of intervention.

The first significant problem that should be solved is in relation to the mode used to probe the actual citizens of the assessments with the services provided by public administration offices. Here is the first question:

RQ 1: how to assess the quality of services offered to the citizen?

Arises, then, the problem of the methodology to be proposed, so that, the instrument chosen is proposed to champion of citizens sensitive to the research. It is obvious that we must protect the confidentiality of information gathered, so that, they are really expressive of the user judgment. Here is the second question:

RQ 2: how to propose the survey instrument chosen for our citizens?

Finally, to be considered is the problem of the interpretation of the results that may be different to that which in similar surveys is conducted with different criteria and methodologies, even with support by law in force as it’s been happening in Italy. Here is the third question:

RQ 3: how to interpret the survey results?

In order to respond to the questions outlined we propose an experimental investigation, through online questionnaire, realized with collaboration of the employment office of the Benevento province, which is a municipality of modest size located in southern Italy.

In particular, the objectives of this paper are:

- to emphasize the importance of a correct and transparent relationship with citizens;
- to highlight how the assessment of users of a public service can improve its effectiveness and efficiency;
- stress that the information system can constantly monitor the user-public administration relationship;
- to propose an appropriate methodology using up-to-date IT systems to properly reflect the opinion of citizens to the quality of a public service.

After outlining the theoretical framework in which this study is grafted with connection, in particular, to previous investigations of similar content developed in Italy and abroad, the paper explains the purpose of the investigation, the instrument used, the mode of administration and, finally, the results obtained comparing other results from similar surveys.
In conclusion, we present some considerations and the possible scenarios export cases of this experience in other areas of Italian public administration and other nations that have similar demands, however pointing out the limits and possibilities of future research developments.

THEORETICAL BACKGROUND

The analysis of the satisfaction of the citizens of a state with respect to the provision of public services and therefore the function of offices is widely investigated in the Italian and international scientific doctrine.

It talks about of the purpose of this kind of analysis that should be mainly aimed at measuring the effectiveness and efficiency of services provided and thus achieve improvement programs that derive from citizens’ proposals. Politicians can also use the information to manage and steer the consent of voters favoring a more flexible relationship between represented and representatives.

The technical tools used to measure the satisfaction of the citizens are different. Morgeson (2014), for example, investigated the topic of satisfaction with government services from a variety of perspectives, using case studies and empirical results from satisfaction studies at the federal level.

The Italian scientific literature suggested contributions related to the overall theme of the satisfaction of Italian citizens (Lo Schiavo 1997, Polidori and Fiorillo, 2003) and European (Lo Schiavo, 2002), proposing specific statistical surveys related to limited contexts, for example the city of Rimini (Giacalone et al., 2014). Much more diffused, however, are the studies published relating to specific sectors of the national economy, interesting for both the method used to investigate the satisfaction of its citizens, that for the achievements that can be inspiring for effective public policies.

For example, Scanagatta and Segatta (2008) analyzed the information needs of the operators of social services particularly interested in the detection of opinions, information, or other data relating to the structure in which they operate. The study was conducted in the Veneto region and leads us to reflect on the essential elements and fundamental to understanding the centrality of citizen satisfaction and the best type of surveys needed for the operator to get a proper measurement.

Other studies relative to Italian context have focused attention on satisfaction of some stakeholders of health services (Scanagatta and Furlanetto, 2008; Vainieri, 2006), the courts (Finocchiaro et al., 2012), of the prefectures (Rizzo, 2006), services removal of garbage (Council et al., 2012), and state tax (D’Angelo and Orlando, 2003).

There are no significant relevant experience related to the satisfaction of users of renovated provinces and, in particular, of the provincial labor employment offices. That is why this research has tried to fill this gap.
International studies relating to the satisfaction of the citizens are very numerous. As in Italy, researchers are experimenting with measurement models of citizen satisfaction, especially for the efficiency evaluation of public administration services.

Interestingly, for example, the study from Daunoriene and Zekeviciene (2015) which, although it concern a small country in development such as Lithuania proposes a reference model of public institutions ‘quality practices, citizen satisfaction and performance quality. Using secondary data alongside with methodological measurement, this paper representation provides information about citizens perceptions about the influence of public institutions quality improvement actions on citizen satisfaction and public institution’s quality performance. Developing and exploring reference model integrating different relationships between public institutions’ quality practices and infrastructure quality, and application waiting time and quality information. Moreover, the relationship between public institutions performance quality and public institutions quality practices shows the importance of continuous improvement initiatives. Reference model tested on the secondary statistical data presents evidence and information provides results in order to take effective decisions.

There are also those who work “in reverse” by measuring the user dissatisfaction aiming to arrive at a similar knowledge. This is the case, for example, the study by Olsen (2015) who introduces the importance of equivalence framing on understanding how satisfaction measures affect citizens’ evaluation of public services. Two experiments were conducted on citizens evaluations of hospital services in a large, nationally representative sample of Danish citizens. Both experiments found that exposing citizens to a patient dissatisfaction measure led to more negative views of public service than exposing them to a logically equivalent satisfaction metric.

Recently further empirical analyzes have been conducted, for example, that of Tummers et al. (2016) which measured the impact of red tape on citizen satisfaction: red tape has a strong negative effect on citizen satisfaction, and that this effect is weaker when citizens have high knowledge of political processes.

Contrary to the Italian literature, many foreign authors have ventured into the test methods for the evaluation of effectiveness and efficiency of the labor employment offices in different states. Referencing the 1990’s eg. Althin and Behrenz (2015) aimed to measure the efficiency and productivity of Swedish labor employment offices. Using four inputs, five outputs, and two quality attributes the efficiency and productivity of 253 Swedish labor employment offices are evaluated using models of relative technical efficiency and Malmquist productivity indices. Even Vassiliev et al. (2006) have experienced a quantitative evaluation of the labor employment offices’ performance in Switzerland based on production efficiency measures. They use Data Envelopment Analysis (DEA) to estimate the performance of all employment offices and then account for factors in the local operating environment.
that are outside managerial control. This approach, and the ranking of labor employment offices, may easily be interpreted by policymakers and provides guidelines for raising the efficiency of the public employment service.

Interestingly is the more recent study by Hainmueller et al. (2016) both it refers to an economically strong country such as Germany, and because it focuses on caseworker-to-clients ratio that is an important, but understudied, policy parameter that affects both the quality and cost of public employment services helping job seekers find employment. In the international bibliographic landscape, However, the study closely matches the intent of this paper is to Sivitanidou (1996). Although related to a search more than twenty years ago, the article tries to measure how office-commercial firms value access to service employment centers. Proposes to hedonic value analysis within polycentric Los Angeles. These tests involve the analysis of office property values per unit land across sites differing in center access.

Despite the laudable efforts of so many scholars from different cultural backgrounds, it has not yet been proven an adequate method of analysis of the degree of customer satisfaction to employment office on the side of potential labor demand. This study, therefore, has applied to employment agencies an empirical research in order to assess their degree of satisfaction enriching, even within the limits indicated below, the areas of research on the subject.

**RESEARCH METHODOLOGY**

In Italy, as in many other countries, it is accentuated the need of the community to give back “word” to the citizen/user investing they with a key role in the evaluation process with the help of tools and commonly used methods of ICT.

With this experimental study we tried to evaluate the effectiveness of a public office with innovative methods and tools.

With a questionnaire were collected feedback on the quality of the services and staff that provide them, introducing a new type of alternative assessment to the official one adopted by the Province of Benevento, a city located in southern Italy.

The survey was conducted at the Employment Office of the Province of Benevento in frequent contact with citizens via the front-office.

The questionnaire (Table 1) consists of a brief presentation of research indicating its purpose and of 20 questions. in it they highlight the need for transparency, accountability, and the measurement of company performance. Four final questions are intended to gather information on the characteristics of the investigated sample.
Employment Office of the Province of Benevento

CUSTOMER SATISFACTION SURVEY FOR THE IMPROVEMENT OF SERVICES TO CITIZENS USERS

The Province of Benevento, as a new local authority, in a general reorganization framework of powers and functions, and the changed relationship between Public Administration and citizen, intends to pay particular attention to the issues of transparency, accountability and corporate and individual performance. It want to adopt and enable new mechanisms of participation and collaboration between citizens/users and Public Administration, enable a new type of social control, placing at the center of its mission the citizen/user satisfaction.

The Employment office of the Benevento Province in addition to pursuing the primary goal of maximum employability through the match between supply and demand, providing to young and old people, tools and mechanisms for access to employment, intends, with this questionnaire, give practical effect to purposes of Legislative Decree no. 150/2009 on the optimization of the public labor productivity and efficiency and transparency in public administrations, as well as the most recent Legislative Decree no. 33/2013 subject of transparency and dissemination of information by public authorities.

In view of continuous improvement of the service offered, with this questionnaire, it want to collect the public feedback, find the strengths and weaknesses, paying particular attention to the critical situation in order to act on it to improve our service.

22. Titolo study:
23. Sex: ○ Female ○ Male;
24. Age ...... Only numerical values are allowed for this field
You want actively to thank in advance all those who will participate in this survey, knowing that your precious
collaboration is indispensable and irreplaceable element for achieving the maximum citizen satisfaction.

Table 1: Questionnaire
Initially, the questionnaire was in paper format and the compilation did not ensure the necessary
privacy for delivery on site to an employee in charge of the collection: it was feared that the
assessments were influenced or even “suggested”.
In fact the first paper questionnaires collected (over a hundred) had almost unanimously, for all the
questions, the maximum expressible judgment. It was necessary, therefore, to abandon the paper
instrument and prepare the on-line form, choosing http://app1.provincia.benevento.it/limesurvey/index.php/admin/survey/sa/index site that allows online
surveys line.
It must, preliminary report a first limit of such a tool, constituted by the fact that the values of ratings
vary from a minimum of 1 to a maximum of 5, not being possible to change the amplitude of such scale.
It would have been more interesting to have a range of values from 1 to 10, this would have allowed to
investigate the results with greater depth. The other limit is that of authentication. To preserve
anonymity and to the objective impossibility to customize because of the lack of economic resources
and processing times, access to the site was left free, it does not require personal credentials. It was
orally reported to users benefitting services of the Centre for Employment the Internet address to connect and recommended filling in this form.

The transition from paper-based tool to online has raised concerns, mistrust, fear among the employees of the Employment office to evaluation methods not approved by law, and had to ensure the them that questionnaire’ results were only an experimental value without any concrete implication on the assessment and delivery of monetary awards which continued to be made by the system formally adopted by the Province.

Such a reaction of concern and mistrust, for the transition from a system governed by law, to an online system that does not allow “adjustments” but that forces you to take note of an assessment given, can be considered a confirmation of the validity of the instrument itself but before of the basic idea of the experiment.

RESULTS AND DISCUSSION

Among the results of empirical research conducted in the period October 2014 - January 2015 must be reported, the modest subscription of those who have joined the survey: the average turnout of 30-40 users per day, for about 2000/2500 estimated users in the period investigation, led to the compilation of only 240 questionnaires, approximately 10% of the potential. This is probably due to the distrust towards to investigation in addition to the almost total absence, in the citizen/user of the culture of participation in an evaluation process. Table 2 below indicates, first of some statistical data related to the investigation.

<table>
<thead>
<tr>
<th>Total users estimated</th>
<th>Total questionnaires completed</th>

Table 3: Detailed Results of the questionnaire in descending order of score

The purpose of the investigation has tended to investigate citizen satisfaction with connection to services received, but also to redefine the flow of the activities conducted at the office to avoid waste and improve the quality of services. We must therefore focus primarily on summary data rather than analyzing the outcome of each individual question.

The Employment Office fulfills discreetly, without exceeding in any field, to supply utility moderately satisfying the citizen’s. This is confirmed by the average value, which stood at 3,72/5.

This result is different from that obtained from the official assessment, proposed by the evaluation council and confirmed by the political council, often positioned at the highest level.

A reflection is necessary if, using different evaluation systems and various players, you come to conflicting results.

To consider also that the official assessment leads to give out awards pecuniary from state finance.

The overall assessment registered by questionnaire it would position manager and staff at level “Adequate” which means “average in line with performance standards or expectations. Manifestation of average satisfactory behavior/results although with defects or sporadic and unsystematic gaps. The assessed needn’t to of support interventions”. The economic effect would be a curtailment of more than 40% of the pecuniary award.

Changing subjects, tools and method, then, you come to significantly different results!
The experiment conducted in the Province of Benevento, on Innovation footsteps, it proposes to change perspective; the centrality of the citizen, or stakeholders in general, on one hand and the quality of services other side and around these to hook the evaluation system of manager and the staff.

The macro objective of this experiment, stated above, in order to better analyze the feasibility and the degree of implementation of the same, is further divided into at least three sub-goals:

1. define a reproducible system and applicable in every Public Administration.;
2. gradually replace or come up beside the assessment of strategic and management objectives, the assessment of the services provided, timing and quality of the these;
3. reduce the large gap that exists between evaluation or rather we should say of self-assessment of Public Administration and evaluation (at the time only perception) that citizens have of the services offered by Public Administration.

With regard to the first point: despite the initial difficulties encountered however the test has continued and has produced results in a generally wary territory with respect to changes. In addition, it is having reached this result allows to state, with good conviction, that this experimental method, with the help of ICT technologies lends itself to be easily and instantly replicated anywhere in the national territory and in many other public offices.

In reference to the second point, starting from the premise that it is possible by changing the subject, the tools and the method, to evaluate and making judgments, it should be noted that the “evaluation of a service” is a synthesis of several evaluations:

- the baseline performance, and for a local authority may be a certificate, the registration, authorization or the concession, etc;
- of the structure: ease of access, service delivery mode;
- of the relations: courtesy and competence of the front office staff;
- of the top management that proposes innovation and change, able to anticipate the times by identifying new needs and then propose new services and modes of delivery them;
- of the back office staff that helps make possible, not only provide the service, but also the services’ quality;
- the quality of service received and time services delivered.

Hence, it is hoped that the evaluation of the services can replace the evaluation for objectives. The work of employees can and should be aimed at achieving the objectives but the estimation should not be made only on the objectives.
Regarding, finally, the third point we need to focus on “cultural” change that is fundamental in order to make evaluation of the public service in a way and with more consistent methods to the needs of citizen’s. Given that “the search for an indicator or set of indicators, that solves definitively every problem of measurement, control and decision, in the public sector is in vain an activity as well as little proper methodologically (Mussari, 2001)” or to quote Albert Einstein, “not Everything that can be counted counts, and not everything that counts can be counted” would be more appropriate to define and share a new evaluation system that has as its main focus to give credibility to the evaluation, as well as measure the “creation social value “in perspective” social innovation “and last but not least, make smart way assessment, in the sense of maximum accessibility, immediacy, security and reliability of the results. It should switch from artisanal assessment and self assessment to the Web assessment, using Media for the assessment of managers and staff, and especially considering the perception of user about services received.

The use of the web and, in general, of non-traditional tools and channels (wiki and social networks) should be used to capture, from stakeholder ratings, a different version of the public administration’s reality, being aware that open and diffused is more credible and more trustworthy than one’s own judgment.

Another problem that arises is the measurement of the assessment of the overall quality of services and therefore the measurement of a new concept “business reputation” and every person involved in the process, at all levels; reputation understood as the process of estimating and trust gained and to monitor it and maintain over time.

Quality and reputation, in fact, converge in a single evaluation system.

A comprehensive evaluation system should not only show the results of individual and organizational goals and / or performances, but must, on the one hand, seek and evaluate the overall quality required for customer satisfaction and, on the other hand, the measurement of the reputation. Reputation, it can be imagined as the equivalent of a rating system, then switch from a judgment of few to a widespread judgment.

This concept should allow us to abandon the current view of executive management as an incardined figure in an articulated, bureaucratized and enclosed system within the limits of the entity to reach a "public manager" rating and recognition of its capabilities / Quality in an enlarged system at a regional or rather national level between homogeneous entities or homogeneous professional figures.

Only in this way the evaluated subject acquire a spendable rating and it can build a labor market even within the public administration capable of selecting, attract and reward, finally, the deserving subject, which the current legislation was not yet fully able to implement.
CONCLUSIVE REMARKS, LIMITATIONS AND FUTURE RESEARCH

The paper have illustrated an experimental research carried out recently at employment office of the province of Benevento. Through questionnaires this paper wanted to analyze the degree of satisfaction of services provided to its citizens, considering different aspects. The survey has had several purposes: surely that of improve the effectiveness and office’s efficiency, but also to compare the results obtained with the official ones deriving from a different analysis methodology. The best reviews are about the structure of the Employment Office that offers a comfortable environment. The signage within the building is clear, appropriate and suitable for the purpose of informing. In general, employees are courteous, polite and respectful of others' needs; They strive to understand the needs of the public. Employees are expert and have a deep knowledge of the treated theme. The opening hours for the public of the offices are adequate.

The main criticisms are, however, relative to the time spent and the other sacrifices to access the service, especially because the staff is unavailable on the phone and is hardly contactable from the outside through computer contact (email, PEC). The information provided should be more detailed and clear. Surely it is useful to know the positive aspects of the service, even to gratify deserving staff. Criticisms that help increase the efficiency and efficiency of the service are much more useful. From the survey clearly emerges the need to enhance the means of distance contact between offices and citizens who wish to receive comprehensive and quickly responses. In the specific case, the offices should activate an easily accessible telephone service and also telematic contact tools that also use social networks that are increasingly popular with users.

It is also necessary to highlight some of the criticisms of the methodology used to probe the opinions of citizens. First, it is necessary to avoid the paper questionnaire of collecting information that cannot and does not guarantee anonymity and then the sincerity of the responses that could be easily changed. It is preferable and it must be encouraged the use of on line tools instead of the paper questionnaire. Only through universal diffusion and easy use of apps allows the citizen to play a key role in the evaluation of public services.

Another critical problem, occurring which leads to adequate reflections is the unwillingness to participate in investigations of this kind from the users. We witness an obvious paradox: citizens require a transparent and efficient administration but, at the same time, they are unwilling to cooperate with it in meaningful reform attempts. This could result from distrust towards to surveys which are sometimes considered useless or the little time available to devote to attempts of this kind. Adoption of scientific instruments of citizen’s satisfaction assessment has led to significantly different results than those that often follow official regulations: this can lead to a severe criticism compared to the existing rules governing the assessment of the quality of services. A significant reform of the legislation is
therefore necessary in favor of Tools and Methodologies that can really probe the evaluation of citizens, avoiding undue interference in the information gathering process.

In this sense, the survey provides a clear and indisputable guideline, proposing a different philosophy of the evaluation to be extended also to the reputation of the office and people working in it.

The illustrated research, however, is certainly not without limits, especially considering that it was realized in an office of a city of modest size with a questionnaire that can surely be richer and more articulate, expanding the range of possible evaluations and adding further matters to be evaluated. Just enough, also, the adhesion which obviously should be more massive.

The same outcomes, then, should be subjected to more rigorous statistical analysis that distinguishes the results in relation to sex, age, educational qualification, the employment status of those who participate, etc. thus reaching a disaggregated assessments certainly more useful for decision-making.

The attempt is, anyway, significant and could be exported to many offices of any other public administration in Italy and in many foreign countries, even considering the low costs for its implementation. However, it is necessary to find people who are really interested in knowing the user's judgment without prejudice and without leanings: some norms shall allocate awards pecuniary incentives in favor of manager and staff having a direct monetary interest in the outcome of the investigations. This could significantly compromise the design, performance and outcomes of any type of investigation.

ABSTRACT

This paper presents the preliminary results of a research study as part of: “SCIENT: A European University-Business Alliance aiming to foster young SCIEntists’ ENTrepreneurial spirit” (SCIENT), an ERASMUS+, KA2 project that runs for 24 months until end of 2017 in seven European Union countries: Cyprus, Malta, Portugal, Lithuania, the U.K., Spain and Italy. The main aim of the project was to develop the transversal skills of Ph.D STEM graduates and to provide them with a new professional path based on entrepreneurial skills. The research shows the feedback responses from the training, internship and mentoring activities from participants, trainers, and guest speakers. As methodological tools, the results are based on a set of online surveys on 98 participants and 34 trainers from the seven participating countries. The findings led to pertinent conclusions regarding the training programme content, organisational challenges, participant and trainer concerns and external practitioners’ input.

It was immediately apparent that different countries, presenters, participants, facilities and scheduling provided varying impressions regarding the overall programme and specific training modules. There were, however, some wide-ranging agreements across countries and throughout all the programmes, which are presented in this paper.

Keywords: entrepreneurship, start-ups, education, training, European project, Knowledge alliance, knowledge transfer, STEM education.

INTRODUCTION

This paper presents the preliminary results of a research study as part of: “SCIENT: A European University-Business Alliance aiming to foster young SCIEntists’ ENTrepreneurial spirit” (SCIENT), an ERASMUS+, KA2 project that runs for 24 months until end of 2017 in seven European Union countries: Cyprus, Malta, Portugal, Lithuania, the U.K., Spain and Italy.
SCIENT’s practical aim after a thorough research on E.U. countries gap on STEM entrepreneurial needs and skills, is to develop an innovative Pan-European entrepreneurship program for PhD STEM students/graduates. Since scientific knowledge lies at the heart of the European knowledge economy, SCIENT focuses in developing successful scientific entrepreneurs by fine-tuning their transversal skills and providing them with a new professional path.

This study aimed to identify both similarities and differences in terms of training content, participants, trainers and guest speakers, amongst the participating countries.

The ultimate goal of the research was to make doctoral students and graduates aware of their career options and about the possibility of using their research findings to start their own company, exploiting their opportunities beyond an academic/researcher career.

The present paper reports and presents the data obtained through an online survey from the students who have participated in a pilot training course during 2016, designed specifically for the STEM PhD students and graduates.

**LITERATURE REVIEW**

Previous research on entrepreneurship education specifically for STEM has been very sparse, (Boocock and Frank. 2008). Although, there have being some useful contributions that have indicated substantial difference in practice, both, between different STEM programs, different European countries and institutions within them. In a field where an official interpretation has been absent, there is a particular difficulty for all stakeholders involved in reaching a common understanding. In this literature review, therefore, an attempt is made to iron out some of these differences and also similarities by first establishing how entrepreneurship education is understood and defined and thus recognize and acknowledge the different approaches to it.

For example, much Entrepreneurship Education (EE) literature discussed the trend of the increasing number of EE programmes in universities, but also teaching associated to boosting creativity (Mihai Yiannaki, 2011; 2012) and knowledge transfer, a major factor in supporting entrepreneurship. Where others have moved the focus towards the actual process and content of EE programmes (Vesper & Gartner, 1997). Furthermore, more current works investigate the course content (Shepherd, 2004). Each of these authors, are making a serious attempt to merge practice and actual observation of what entrepreneurs do and how they learn.

Taking into consideration that the European Parliament, in (2006) recommended that 'entrepreneurship' should be one of the eight key competences for Lifelong Learning the understanding of the role of entrepreneurship education particularly for STEM is very important as it has a lasting impact on the student learning outcomes.
In the literature, there have been many attempts to identify the key obstacles of STEM entrepreneurship education. It is important to review the entrepreneurship obstacles in order to identify them and create measures to overcome them.

Such obstacles are summarized as: lack of finance (Schoof, 2006; Atieno, 2009), unawareness of the availability of government programs specifically designed to support STEM students and help them in launching their new venture (Maas and Herrington, 2006) and lack of training reducing the managerial and entrepreneurial ability (Orford et al., 2003). Shortages of education is another barrier (Schoof, 2006). Furthermore, there is lack of an integrated approach to policy in this field of study, which also leads to the absence of regular and robust tools for strategic orientation and assessment as well as a lack of replicability (Schoof, 2006).

What's more, scientists often lack the ability to spot business opportunities and develop products that meet customer needs even though they can often explain the general applications of new technologies (Markham et al., 2002). Besides, STEM has to move away from the long-standing functional approach to business education to one that also embraces specific skills specially designed for STEM students.

In summary, however, Baumol (2005) emphasizes the current view on STEM when he states that the linkages between education, innovation, and entrepreneurship are still not well understood.

**METHODOLOGY**

Methodology wise, the study used online surveys for both participants and the trainers, that included open questions for obtaining qualitative feedback, closed questions for statistics purpose, but also a Likert scale for several questions. The set of questions were developed following literature review findings, partner's experience in the field of training, and brainstorming techniques during the consortium meetings.

For the participants, the areas covered by the survey were: Country of Training, Age Group of Participants, Academic Background, Information about the Project obtained through, Prior Experience, Motivation for Training, Quality Dimensions, Interactivity and Engagement, Learning about Company Practices, Usefulness of Programme Topics, Comprehensiveness of Programme, Relative Appreciation of Individual Modules, Appreciation of Individual Programme Elements and Suggestions for Changes, Perceived Effects of Participation, Overall Testimonials by Participants.

The Qualitative questions for the participants were:

1. Decision Why did you decide to participate to this training?
2. Which part of the training did you like the most? Please explain.
3. Which part of the training did you like the most?
4. What would like to add to the present training programme?
5. What would like to change to the present training programme?
6. If this programme was structured differently, in terms of duration, training days/times, full
time or part time, online or face-to-face, what suggestions would you make?
7. In which training topics/areas would you like to receive further training?
8. Which entrepreneurial skills do you feel you need to develop further?
9. Testimonials

For the trainers the areas covered by the survey were: Country of Training, Prior Experience of
Trainers, Perception of Student’s Interest, Quality Dimension Choice of Topics, Quality Dimension
Coverage of Essentials of Entrepreneurship, Appreciation of Merits of Individual Modules, Verbal
Assessment of the Programme, Quality Dimension Mix of Theory and Practice, Support for Business
Creation, Perception of student’s Reaction to the Programme and Perceived Effects, Overall
Assessment.

The Qualitative questions for the trainers were:

1. Do you have experience with organizing similar trainings? If yes, which ones? Please explain.
2. Which part of the training material (including the exercises) did you like the most? Please
explain.
3. What would you like to add to the present training programme?
4. What would you like to add to the present training programme?
5. What would you like to remove/change to the present training programme?
6. Suggestions if this programme could be structured differently, in terms of duration, training
days/times, full time or part time, online or face-to-face, what suggestions would you make?
7. In which training topics/areas would you like to receive further information/material/additional support to develop your training better?
8. Please describe the participants’ reaction in a few words (enthusiastic, motivated, bored,
passive etc.)
9. Effects What were the main effects that you identified on students during the course
implementation?
10. Suggestions & Comments for the training as a whole.
Based on the answers obtained from the respondents, an analysis was performed in identifying the common findings and drawing relevant conclusions on the training performed.

Once the participants completed the theoretical (class) part of SCIENT Entrepreneurship Programme, they had the opportunity to participate in an internship activity working in interdisciplinary teams alongside other research students and under the guidance of academic faculty, employers/managers, investors and entrepreneurs. 10 pilot participants from each country visited companies within their own country and another 10 visited companies abroad. Specific instructions and guidance for all these stages have been provided in the train the trainers’ handbook developed as part of the SCIENT Entrepreneurship Programme. All partners provided a list with key words of the research topic of each participant and they sent those lists among themselves, to find the most suitable company for each person. SPS from Germany was the partner responsible for the organisation of the Internship Activity for all partner countries.

Once the internship activity was completed, the hosting company and the intern had to complete an online evaluation questionnaire, giving feedback about the internship experience and suggesting ways of improvement. The questionnaire for the survey was developed by ISOB with the valuable contribution of GrantXpert, Fundeun and EUC. The survey was hosted on the Lime Survey based online-survey system run by ISOB.

On the Internship survey, the directions of analysis sought were: Country of Internship vs. Country of Origin, Experience in Prior Internships, Expectations before the Internship, Quality Dimension Meeting Student’s Expectations, Satisfaction Quality Dimensions of Project, Own Achievements, Most Important Positive Aspects, Suggestions for Improvement, Future Contact with Host Company, and Testimonials.

Last, but not least, on the mentorship survey, the directions of analysis were related to the degree of advancement in the business creation and product prototype, besides filling the gaps of the in-class and internship training.

Overall the findings are presented in synthesis in the following part, in a way that combines both quantitative and qualitative results.

RESEARCH FINDINGS

The research findings are clustered in participants, trainers, internship and mentorship results.

Participants results
A preliminary analysis of the main findings regarding 98 of the participants that took part in the pilot training program are outlined below.

The participants’ ages ranged from 35 years old and younger, which is typical for PhD and graduate students. In fact, 78% were 35 or younger, while also some more experienced graduates took part in the trainings. For example, Cyprus and Portugal attracted a significant group of younger participants, while all participants in Italy belonged to the 25/35 group.

Almost 2/3 of the participants either had a PhD or were PhD candidates. Three quarters of the participants had no prior experience with similar programs.

The survey examined the following indicators in terms of quality and intensity of the training delivery: the motivation of the participants for their participation in the training program, the interactivity and engagement of the program, the usefulness of the program, the comprehensiveness of the content, which part of the program was more valuable. Also suggestions were made as to what other topics should be added for such training program.

Developing entrepreneurial competences was the main motivator for participation in the pilot training. Some of the participants intended at obtaining primarily knowledge, while others had already a business idea and were looking for ways to implement it in practice. Another reason was the possibility of networking and finding possible investors were also important motivators.

Interactivity and engagement was also used as an indicator of the quality of the program. Almost 70% of the participants agreed strongly that the program was both interactive and engaging with Cyprus, Spain and in the UK scoring the highest score.

Almost 60% of participants strongly agreed that the course managed to familiarize the students with actual practices of real companies. Again, Cyprus, Spain and the UK scored the highest score in this section.

Three quarters of the participants found the actual topics chosen for the program to be very valuable while an additional 23.5% found them to be somewhat valuable. Only one participant did not find the topics valuable. Furthermore, almost 4 out of 10 participants felt that the content was comprehensive in the sense that all fundamentals were covered. The program attained a high level of quality throughout the program. All of the individual modules are rated on a level of 8 or 9 out of 10, without much significant differentiation between them.

Students were also asked for their opinion of which parts of the program were the most valuable for them. A broad range of topics were mentioned. The topics that students found most valuable, in order of preference, were Business Model Canvas/Business Modelling, Pitching and Guest Speakers with, Group Dynamic.
Asked which components should be added, a broad range of suggestions were made amongst them were: to have more guest speakers, more practicing of pitching, organizing an additional summer school, direct contact with investors and more time allocation for the program.

When participants were asked of suggestions for the improvement of the program the vast majority of them did not suggest any changes. However, those who make suggestion for included more time to practice and shorter sessions over a longer duration.

Almost half of the participants were inspired by the training to start their own business. For around 10% of students the training helped them to clarify that they do not want to start their own business.

Again, the level of impact on the participants was the highest in Cyprus, Spain and the UK.

The preliminary conclusions on participants’ feedback on the training can be outlined as follows:

- The program was well received by the overall majority of the participants.
- Students evaluated the program as useful, comprehensive, interactive and engaging. All modules included in the program received more than 8 out of 10 points.
- Some of the suggestions made by the students included the involvement of more business quest speakers, allocate more time for pitching skills, shorter modules over a longer time.
- Almost half of the participants were inspired by the training to start their own business.

**Trainers results**

A pool of 48 trainers took part in the training, of which 71%, respectively 34 responded to the online survey, who agreed on above 80% average that the training material is ready for implementation, with several changes suggested. Their experience ranges from professional qualifications training, academic and business and start up incubators’ training, besides being themselves entrepreneurs.

The major concern emerging from this survey was if the training material is enough developed to continue the training of future STEM entrepreneurs. The findings were positive, as shown in the following table:

Table 9. Answers to question: Do you think the training material developed is ready for implementation and dissemination?

The preliminary conclusions’ on trainers’ feedback on the training can be outlined as follows:

- The trainers affirmed the merit of the programme by more than 75% in all of the quality dimensions covered, according to the internal evaluation indicator system.

- The mostly quite experienced trainers assess the program as useful, comprehensive, motivating and engaging, while the programme was well received by the trainers who delivered it.

- No clear weaknesses or points for improvement stand out in the sense that they were mentioned by a majority of trainers. However, a minority of trainers claims that the programme as a whole should be “fine-tuned” concerning the technical aspects of the training material and a number of elements that should be expanded, as the involvement of business practitioners, time for practicing and training in pitching skills.

- Suggestions for alternative structuring of the program (some suggest to use shorter modules over a longer period, while others appreciate the compact format) show that delivering the course in various formats could further increase the outreach.

- It is recommended that options for improvement should be discussed in each national pilot testing evaluation programme and that the synthesis pilot evaluation report should suggest a list of common points for final fine-tuning which should be discussed by the partnership as a whole.

The training material suggested in 12 modules indicated in general a good blend of theory and practice and appropriation, with over 70% interesting material and structure.

**Internship Results**

The internships were perceived positively by the majority of the participants and the hosting companies. Both mentioned that the overall quality of the internships has fulfilled the target values set in the evaluation concept and they highlighted that they will stay in touch after the end of the project. Participants mentioned that they had the opportunity to develop further their networking skills and be exposed on foreign business cultures having insights in new technologies. Hosting companies highlighted their readiness to assist and mentor promising young graduates as well as networking and expanding their company’s network. While the duration of the internships has been limited, many of those companies who made suggestions for future internships stated that longer internships and a more detailed structure could further enhance the value for both company and intern. It can be concluded that the internships have been implemented with success at this point from the perspective of the hosting companies and interns.

In general, through the internship period the participants had the opportunity to discuss and develop further their ideas, to network, to meet other people having the same interest with them, to develop their skills and their knowledge. The organisation of the internships for the participants was the most challenging activity of the whole project as the majority of the PhD students and graduates were facing difficulties to participate in this activity either at local level or at EU level. It was really difficult for them to dedicate time from their studies or from their work for an internship activity.

**Mentoring Results**

Each country conducted the mentoring activity more or less in its own way, with either the trainers of the course or with outside dedicated business people, each team benefiting of its own mentor or team of mentors.

One of the major challenge was to keep the mentees interested, despite a tight working schedule, while another was to deliver the actual business case via a final pitching.

The topics covered were in a way a review of the training material in the course, but filling in the gaps, especially related to the soft skills, business canvas, the pitching training, the marketing and commercialization part, the company registration and IPR, and the financial skills, while some even simulated the business case competition.

Despite the described idea generation and refinement efforts, it seemed most students didn’t progress to a degree of readiness for commercialization. They were either entrenched in their ideas, or remained too far away from ideas they could trust to take to market. However, several groups considered seriously starting a company and presented in the Local competition and then at the European level competition, which is to be held in September 2017 in Cyprus.
Gaps from the in-class and internship training were filled to a good degree, i.e. more was done on marketing, more on idea generation, actual brainstorming, company registration steps and documentation, IPR, more on finding investors. The main challenge was keeping participants enthusiastic and participative and to attend the regular mentoring hours.

CONCLUSIONS

The programme was very well received by the participants and this is an important conclusion in itself, as it reveals that there is indeed an untapped high quality entrepreneurial resource in PhD STEM students and graduates. Although many of these individuals had little knowledge of business matters, they appreciated its usefulness and the opportunities it provides. The participants affirmed the merit of the programme in all of the dimensions covered. Indicatively, participants assessed it as useful, comprehensive, interactive and engaging. All individual programme modules received evaluations of more than 8 out of 10 points in all countries.

The qualitative element of this project (verbal comments in free format) validated the positive quantitative ratings. There were just a few clear points for improvement, however there were a number of suggestions that some elements should be expanded in order to further the involvement of business practitioners, and to provide time for practicing and training in pitching skills. Suggestions for alternative structuring of the programme (some suggested using shorter modules over a longer period, while others appreciate the compact format) show that delivering the course in various customised formats could further increase the outreach.

Other general conclusions included:

- The best way to attract participation is through a blitz of communication techniques, including social media and traditional means. Moreover, contacting key influencers (e.g. professors, Deans) helps as well. Most important is personal communication with candidates.
- Scheduling and other organisational details (e.g. breaks, duration of each session etc.) must be customised, according to the audience’s preferences.
- The strengths of the trainers, guest speakers and the participants must be taken into consideration and utilised in the whole process.
- Local variations (e.g. specific industrial emphases) must not be ignored. In fact they should be used to strengthen the training programmes.
- The stage of development of participants’ business ideas is very important and ideally similar; however, training, as it has been structured, can actually combine varying entry level
development stages. Nonetheless, the resultant final outcome (i.e. how far each individual’s or group’s idea has progressed) will be affected.

- Group work should be encouraged further.
- The theory-practice combination is very important. Generally, students prefer the hands-on this-is-how-it’s-done approach.
- Though mentoring and internships are key, it is a challenge to arrange scheduling and to find participating companies and individuals. Possibly the best way to approach this is to find tangible benefits for both sides. The team also concluded that internships, due to regulations, even legalities, need to be separate from such programmes. Mentoring should be embodied within the training sessions, even though there is an argument that mentoring needs to follow an incubation period, during which participants can better absorb taught material.
- A key objective must be to coordinate the theoretical class with the practical one and the visit of the guest speaker. This way, they all had a major impact in the attendants’ comprehension of the project. But this is not always easy.
- The pitching unit needs a more solid foundation, with training in marketing, promotional and selling skills.
- PhD students in non-business areas can get excited about entrepreneurial projects, given the right training.
- Given the amount and diversity of new material, it is a challenge for the participants to absorb and then assimilate it all. Ideally, there should be an incubation period somewhere within the course.
- All modules should have the feel of workshops, with a very real result at the end.
- More incentives, or tangible benefits, are required to ensure an increase in registration demand. A learner’s contract of some sort is necessary, to ensure participation throughout. A certificate of participation is, of course, also necessary.
A final key conclusion was the need for close integration between industry and academia. Trainers and guest speakers from the field of entrepreneurship need to work together to plan and carry out the best learning experience for the participants.

LOCAL LIABILITIES AND INTERACTION BETWEEN NATIVE AND IMMIGRANT FIRMS

Milanesi, Matilde; Guercini, Simone

Department of Economics and Management, University of Florence, Florence, Italy

ABSTRACT

The aim of the paper is to analyze the interaction between native and immigrant firms in local systems focusing on the case of Chinese immigrant firms as a business community settled in a specific territory, that of an Italian industrial district. The coexistence of native and immigrant entrepreneurship may represent a fertile ground for the emergence of liabilities, namely the liability of outsidership, defined as the difficulties that must be addressed by those who are external to the most effective and important international networks, distinguishing outsiders from insider actors (Johanson and Vahlne, 2009; Schweizer, 2013).

The paper proposes a twofold perspective: on one hand, immigrant Chinese firms, despite being insider to global networks, can perceive a liability of outsidership in the local network; on the other hand, native entrepreneurs can perceive a liability of outsidership in the global network in which immigrant entrepreneurs are embedded. Interacting in business networks can offer an important perspective to explain the possible exploitation of opportunities as a result of interacting and facing local liabilities.

The paper adopts a qualitative methodology proposing a case study approach in which the empirical setting is represented by an Italian industrial district that has experienced huge immigration flows and the establishment of a large Chinese community of people and companies active in the textile industry. The study allows the authors to highlight the liabilities that may emerge locally, where a transnational oriented business network established by Chinese immigrants and local business networks established by native entrepreneurs coexist.

Keywords: Liabilities, interaction, network, outsidership, immigrant entrepreneurship, Chinese, industrial districts

INTRODUCTION

Industrial districts (IDs) have remained a focus of the economic debate in Italy and still play a central role in the Italian industrial system, although it is evident that they are suffering under the pressure of
globalization. An emerging strand of literature is looking at whether industrial districts are in fact reacting to the new challenges of globalization and investigating the directions in which they are evolving within today’s rapidly changing international context. Challenges that IDs are facing today are due to several factors such as globalization and its effects on the firm population of IDs and their fabric of inter-organizational relationships, the emergence of a multi-ethnic society within the local manufacturing area as a result of the phenomenon of worker immigration, the sociocultural discontinuity induced by generational turnover, and greater industry heterogeneity within the production structure of the local territories (De Marchi & Grandinetti, 2014). The workforce in industrial districts became increasingly multi-ethnic and heterogeneous from one district to another. The textile district in Prato, Tuscany, represents a particular case (Dei Ottati, 2009): alongside the original district, a second one has developed consisting of businesses founded by Chinese immigrants, and there are no connections worthy of note between the two districts, or sub-districts. Prato is specialized in textile production and is characterized by a production model based on small businesses with a strong division of work processes: in brief, the Prato industrial district has long been a workhorse of the Italian fashion industry.

Anyone who visits the industrial district of Prato today will however come face to face with a substantial number of Chinese owned companies. When the first immigrant workers arrived in Prato from the eastern province of Zhejiang in the early 1990s, they represented a tiny exception to the district’s overwhelmingly Italian population: some hundreds of people vs. the almost 50,000 already engaged in various textile-related activities throughout the area. In 2015, the Prato Chamber of Commerce registered more than 4,000 Chinese-owned companies, that represent more than 50% of companies in textile and clothing activities based in the district. Thus, the industrial district of Prato sees the coexistence of native and immigrant firms, the latter forming a “parallel district” and the integration and interaction between the two communities are still far from a satisfactory level.

Within this framework, the paper focuses on the interaction, where this exists, between native and immigrant firms, based on the case of Chinese immigrant firms as a business community settled in a specific territory, that of the Italian industrial district of Prato in which native and immigrant entrepreneurs coexist. Such coexistence may generate liabilities, namely foreigness and outsidership, concepts borrowed from the literature of management and international business and defined as the difficulties that must be addressed by those who are external to the most effective and important international networks, distinguishing outsiders from insider actors (Johanson & Vahlne, 2009; Schweizer, 2013). In cases like that of Prato immigrant entrepreneurs can perceive a liability of outsidership in the local networks, but at the same time are insider to global networks dominant in specific industries and markets. Native culture entrepreneurs can experience a relative outsidership,
and suffer from elements attributable to foreignness, with reference to the new global networks dominated by the immigrant entrepreneurs settled in the same territory. In other words, in the paper it is discussed that when two communities of persons and companies coexist within the same context, liabilities such as foreignness and outsidership are produced locally by the forces of globalization. The interaction approach (Håkansson et al., 2009), can offer an important perspective to explain the possible exploitation of opportunities as a result of interacting and facing local liabilities.

The paper employs a qualitative methodology, that of case study, analysing the case of a family business founded in 1987, in Prato, focused upon womenswear manufacturing and able to produce up to 500,000 items per year. Such company can be considered a virtuous case of interaction with locally settled immigrant firms, mainly Chinese suppliers of manufacturing activities. The case analysis shows that facing (and possibly overcoming) liabilities in interactions between companies embedded into a local context can boost the development of new combinations of local and transnational business relationships; the interactive perspective adopted in the paper highlights that opportunities, and liabilities, stem from the creation of interactions among migrants and natives actors with specific resources combinations and activity structures at a local and transnational level.

THEORETICAL BACKGROUND

Liability of foreignness and liability of outsidership are concepts that originate from the literature of management and international business. Much attention has been given to the liability of foreignness (Johansson & Vahlne, 1977; Zaheer, 1995), defined as as costs of doing business abroad (Hymer, 1976), in the sense that foreign firms incur additional costs when operating internationally, compared to local firms that have better information about their country, economy, laws, culture, politics etc.. More recently the literature of international business has stressed the growing importance of the liability of outsidership (Johansson & Vahlne 2009) from business networks in internationalization, defined as the difficulties that must be addressed by those who are external to the most effective and important (social and business) international networks, distinguishing outsiders by insiders actors. There can be a liability of outsidership both in the internationalization process of the firm and in the domestic market in the presence of problems of information constraints and uncertainties regarding network developments and opportunities that emerge in networks and business relationships (Hilmersson,
The liability of outsidership (LOO) is a situation when a firm enters a business environment without knowing who the business actors are, or how they are related to each other.

While liability of foreignness can be broadly defined to include all additional costs for the foreign entrant, such costs can be distinguished into two types (Calhoun, 2002): costs that may be easily identified and quantified and costs that may not be as easily identified. The majority of the work on liability of foreignness has focused on the former, while only few papers have focused on culturally driven aspects of the liability of foreignness. The question becomes how cultural differences manifest and impact on foreign firms differently from native firms and differently in the several countries in which the foreign firm is operating. The attention given to the less identifiable sources of liability of foreignness generally refers to the fact that firms enter countries that are culturally similar as measured by concepts such as psychic distance or institutional distance. Johanson and Vahlne (2009) maintain that the larger the psychic distance - defined as factors, such as language and culture, that make it difficult to understand foreign environments – the larger is the liability of foreignness. And the larger the psychic distance, the more difficult it is to build new relationships, thus there can be a liability of outsidership as an effect of the liability of foreignness.

In other words, foreignness and outsidership show the role of culture and cultural differences in building new relationships and knowing who the business actors are, or how they are related to each other, with consequences on the development of business opportunities. When discussing the Industrial Marketing and Purchasing (IMP) paradigm on interaction, relationships and networks, (Håkansson, 1982; Ford, 1997; Håkansson et al., 2009), Fang and Kriz (2000) argue that if the focus is on relationships and interaction, the reality is that culture always exists in the background through its fundamental impact on the behavior of people who are at the center of business relationships, and “[...] no account of business relationship is complete if culture is not sufficiently studied” (Fang & Kriz, 2000, p.3). Research focusing on the importance of culture in managing cross-cultural business relationships within the IMP Group is relatively limited (see Fang & Kriz 2000; Amelingmeyer & Moehringer 2002; Lowe et al., 2002).

When dealing with the Chinese culture – which views concepts such as connections i.e. guanxi and connected networks i.e. guanxiwang as key success factors for business - many Western managers are still failing to manage business relationships in the Chinese-culture dominated markets (Björkman & Kock, 1995; Itthiopassagul & Blois, 2000), and intercultural differences have been identified as one of the main reasons of failure in business relationships with Chinese companies (Ghauri & Fang, 2001; Battaglia et al., 2004).

Following this line of reasoning, when two communities of persons and companies coexist within the same context, such as the above mentioned area of Prato, the result is a cross-cultural business setting...
where culture has an impact on the formation, success/failure of business relationships and on interaction processes among native and immigrant firms. A cross-cultural business setting thus becomes relevant object of research on liabilities, namely foreignness and outsidership, when immigrant entrepreneurs can perceive a liability of outsidership in the local networks, and native culture entrepreneurs can experience a relative outsidership, and suffer from elements attributable to foreignness, with reference to the new global networks dominated by the immigrant entrepreneurs settled in the same territory. Interacting in business networks, according to the IMP approach (Håkansson et al., 2009), can offer an important perspective to explain the possible exploitation of opportunities as a result of interacting and facing local liabilities. Following this line of reasoning, the paper addresses the following research question: what are the liabilities emerging locally from a cross-cultural business setting and how are they related to interaction among business actors?

**METHODOLOGY**

Our objective is to apply a case-study method in order to analyze in depth liabilities in relation to interaction between native and immigrant firms settled in a specific territory. Recent literature in management research has stressed the importance of case research to generate and test theory (Eisenhardt & Graebner, 2007). Case studies can be useful when investigating a specific phenomenon and there is a need to better understand processes (Easton, 2010); we selected the case study for the learning potential it offers and the approach at this level is mainly descriptive and interpretative and in this sense we include some parts of the systematic combining process (Dubois and Gadde, 2002).

In particular, we present a single case study of a manufacturer located in the Prato textile district: Alpha, which was followed over the last four years. The case is the result of data collected mainly through interviews, supplemented by preliminary case study data (documents and records collected in the same period). The paper presents the findings emerging from semi-structured interviews organized in order to collect a large amount and variety of information on interaction between a native firm, Alpha, and immigrant firms, more specifically Chinese-owned companies settled in Prato from the beginning of the 90s. In a preliminary step, we analysed data collected from interviews with local textile associations representatives conducted by the authors in 2016 to ensure a more fine-grained analysis of the issues addressed. In particular, the Director and a manager from the local CNA (National Confederation of Crafts and Small and Medium Sized Enterprises) were interviewed as expert informants since their efforts over the years in studying Chinese entrepreneurship in the textile district and facilitating integration and the development of business relationships between Chinese and native firms. The interview lasted 2 hours and was recorded and transcribed.
The study of Alpha started in 2012 with two semi-structured interviews with the CEO, a third interview was done in 2016 with the CEO, after the suggestions that we were given by the Director of CNA, as Alpha is considered in the textile district a case of virtuous interaction with Chinese companies. Secondary data from the company annual report and website, and other documents, such as press articles, textile association literature/records, and so forth, were also collected to ensure data robustness and triangulation.

EMPIRICAL CONTEXT

The presence of Chinese immigrant firms in the industrial district of Prato is only the most visible component of a more complex phenomenon that has affected many Italian industrial districts in the late ‘80s and in the ‘90s, with migration flows from many different countries, but with relevant specific aspects of entrepreneurship when these flows have been from China. The area of Prato has therefore experienced this phenomenon since the late ‘80s, when Chinese migrants began arriving in the district giving rise to the birth of Chinese firms specialized mainly in goods typical of the fashion industry (knitwear, garments, leather products), with typical positions of sub-contractor. In an area, that of Prato, specialized in textile manufacturing – yarns and fabrics – Chinese immigrant firms focused on the apparel sector operating as subcontractors and garment makers (Guercini 2002; Milanesi et al. 2016).

Chinese migrants have resulted in the start up of new firms, typically Small and Medium sized Enterprise (SME), with specific characteristics of family business, entrepreneurial and self-employment dynamics. The Chinese working capability, mainly in the field of sewing, and generally as garment maker, has been an essential element in the development of ready-to-wear apparel, especially fast fashion for women, in the context of what had been until then a traditional wool textile district. The characteristics of Chinese immigrants, their manufacturing skills, the propensity to develop their own independent business, flexible and cheap access to workforce through family and community relations, were compatible with the characteristics and needs of the industrial district.

This situation of coexistence of Chinese and native firms within the same territory has resulted in the creation of a “parallel district” and the integration and interaction between the two communities are still far from a satisfactory level. Reasons are twofold. On one hand, many Chinese immigrant firms still operate under conditions of illegality (clandestine work, tax evasion to cite few), that led native entrepreneurs to have attitudes of discrimination and lack of trust. On the other hand, some typical cultural traits of Chinese entrepreneurship, profit-oriented in the short term, and generally suspicious of members not belonging to the community of origin, have disadvantaged the creation of long-lasting
and stable relationships with native firms. Moreover, most Chinese immigrant firms import fabrics from abroad (China and Turkey for example) and don’t rely on local producers.

Despite these difficulties, the case of Prato is different from that of other Italian fashion districts, since only in the Tuscan city at a later stage the condition of subcontractor of Chinese immigrant firms is exceeded and there is the development of manufacturing firms operating as “final” firms, which integrate design and have, as direct customers, other firms that control distribution channels and brands. This evolution concerns only a minority of Chinese immigrant firms, most of which continues to work as subcontractor for other Chinese garment makers or other Italian companies located outside the area of Prato.

CASE DESCRIPTION

Alpha is a family business, founded in 1987, in Prato, Tuscany. It is surrounded by a number of highly specialised companies dealing with the whole fashion design and production process. The company is focused upon womenswear manufacturing and it is able to produce up to 500.000 items per year. The high level of manufacturing standards and quality control are pillars to the company aiming to lift the quality control system up to 100% of items. The supply chain policy guarantees the full Made in Italy (from fabrics to craftsmanship).

In 1987, the year of its foundation, Alpha worked as a wholesaler in womenswear. Aware on one hand of the next crisis of wholesalers in fashion, and on the other hand on the potential of investments in retail, the company started to open in a few years six stores, supported by the production of garments in house. In the early 2000s Alpha decided to focus primarily on manufacturing activities and in 2005 the last store was sold. Between 2004 and 2011 the creative department and the logistics are created and consolidated within the company. In 2011 the cutting department is introduced, with 2 cutting lines and four employees: the decision and the corresponding investment in the purchase of ad hoc machinery are undertaken mainly because the cutting phase is the most exposed to the risk of imitation - having
to provide contractors all specifications of a clothing model - and therefore it is preferable to carry it out in house.

Source: Author’s elaboration

To date, the company has 18 employees and a turnover of 9 million euro (data updated to 2014), up 25% over the previous year.

Source: Alpha annual report

The business model adopted by Alpha has changed over the years. From a production of garments primarily for street vendors, shopkeepers and small chains of wholesalers, to a planned – or semi-planned – model following the timing of major
customers (2 annual seasons, spring-summer and autumn-winter, in addition to flash collections to be delivered in less than a month). Thus, the company is also able to provide seasonal capsule collections thanks to the organization of manufacturing process flow and to the short production cycle.

Customers have been reduced over the years, from around 150 to just over 30, according to a precise choice of qualified and well-positioned retailers as preferred customers that would guarantee orders for large quantities. Relationships with these customers are stable and with a strong fiduciary component, and involve a high level of customization. To this end, a fundamental role is that of the creative department, which offers every year to customers 500/600 models. The innovative and creative capacity characterize Alpha and widely different from other competitors in the area, especially from locally settled Chinese garment makers mainly characterized by the ability to imitate and not to create. In summary, design, collection development and production are core services offered to high level fashion brands as well as to the most prestigious retail companies. Alpha has maintained stable relationships for the past 12 years with Chinese subcontractors located in the Prato district. In particular, compared to a reduction of the number of customers, there has been a reduction in the number of suppliers. To date, Chinese immigrant firms with which Alpha works stably are four, all family businesses founded in Prato in the early 2000s; among these, one is a large company with 120 employees. Exclusive contracts imply that the Chinese suppliers can’t work for other companies similar to Alpha for positioning, type of products offered and customers served. The supplies mainly concern complex manufacturing and ironing. Other processes such as sewing buttonholes and buttons are done by Italian subcontractors.

Alpha is characterized by strong ethical principles that have resulted in an ethical supply chain involving also Chinese companies, which have had to adapt over the years to high quality standards, the regularization of employees and respect of safety laws at the workplace. These elements are related to problems among Chinese
enterprises in the district in terms of illegal labour, exploitation of workers and tax evasion, to name a few.

Alpha’s effort in this regard assumes that at the basis of integration between native and immigrant companies there must be a “cultural revolution” of Chinese immigrant firms, with a view not only to comply with regulations, but also to fully enter in district dynamics and strengthen relationships with native companies and local institutions, rather than develop a parallel district. The profit orientation regardless of compliance with the rules, the orientation to transaction rather than lasting relationship, the instability of labour relations are just some typical features and cultural traits of the way of doing business for many Chinese entrepreneurs. The interaction with Alpha brought major changes in terms of: changing the approach to the stability of labour relations between employees and employers as a result of the continuity of work guaranteed by Alpha; qualification of Chinese companies as suppliers of native companies from the Made in Italy tradition; dissemination of legality.

DISCUSSION OF RESULTS

The case under study allows to put forward some considerations about our research question concerning the liabilities emerging locally from a cross-cultural business setting and how such liabilities are related to interaction among business actors. The case analysed shows the interaction between a family business located in the area of Prato, and locally settled immigrant firms, mainly Chinese suppliers of manufacturing activities. The case confirms the existence of transactions between native and immigrant firms, mainly in the clothing sector than in the textile sector. The proposed case is not representative of what currently happens in the area of Prato in terms of interactions between native Chinese immigrant and native firms, which are limited especially in the textile sector, but it is a case, as confirmed by
representatives of local institutions, of positive business relationships established over the years with Chinese suppliers.

Chinese companies with which Alpha has significant relationships, namely the four subcontractors mentioned, by the very fact of having business relationships with Alpha, have embarked on a process that will differentiate them from other immigrant Chinese firms in the Prato area. This path takes the form of interaction, in which the main changes concern the Chinese suppliers that are placed in a learning position with respect to Alpha that in a first observation keeps a role of teaching. However, even Alpha has implemented a process of learning about cultural and relational specificities of Chinese actors. If on one hand Chinese suppliers start interactive processes with Alpha, on the other hand the same suppliers differ, as a result of the changes put in place, from the other Chinese immigrant firms. In addition, the four Chinese suppliers have implemented organizational and cultural changes that make them non-representative of the totality of the Chinese immigrant firms settled in Prato.

Interaction with native firms requires an adaptation of organizational processes, but also of the business culture and lifestyle (for example, stabilization of labor relationships and the achievement of a good level of quality of the workplace). Such adaptation is required by the native firm itself, in line with company policy, and according to a principle of consistency between buyers, suppliers and positioning of the entire supply chain, in a long-term policy aimed at influencing suppliers sometimes at the expense of profit. Interaction with some actors, however, doesn’t result in a reduction of liability of outsidership. While it is active the mechanism of teaching and learning, this does not seem sufficient to give a real insidership nor to the Chinese immigrant firms in the local network, or to native firms in Chinese business networks. Relationships appear as weak ties (Granovetter, 1973) which have a bearing on the level of individual actors, but the overlap between networks of different actors remain weak. Therefore a persistent psychic distance, related to the
liability of foreignness, remains, in addition to a lack of familiarity, which is acquired in the relationship with the individual supplier but does not imply the achievement of an insidership position, and discriminatory attitudes (see Eden & Miller, 2001). Thus, elements of foreignness and outsidership still remain locally and act as “local liabilities” that emerge when two (or more) separate communities (of persons and firms) exist in the same place (Guercini et al., 2017). The case seems to show an intermediate position between the lack of interaction and the achievement of insidership. It could therefore be assumed that the process is underway, but since relationships have existed for a long time, it’s more reasonable to imagine that it is a non-temporary condition.

FINAL REMARKS

The paper focused on liabilities traceable to elements of foreignness and outsidership that emerge locally. Such local liabilities imply that on one hand immigrant entrepreneurs can experience a liability of outsidership from local networks, yet may be insiders to the global networks that are dominant in specific markets. On the other hand, native entrepreneurs can experience a relative outsidership from the global networks dominated by immigrant entrepreneurs. Facing (and possibly overcoming) such liabilities that emerge in interaction processes between companies embedded into a local context can boost the development of new combinations of local and transnational business relationships; opportunities, and liabilities, stem from the creation of interactions among migrants and natives actors with specific resources combinations and activity structures at a local and transnational level. The contribution of the paper is twofold. First of all, the paper stresses the importance of culture in managing cross-cultural business relationships, which is still an under-investigated topic in streams of literature following and IMP perspective. Secondly, the paper contributes to the literature on liabilities in the international business domain by considering the emergence of local liabilities as a result of the
coexistence within the same territory of two (or more) separate communities of people and firms.

The methodology adopted in the paper is that of case study. A limit is the use of single key informants (the owner/entrepreneur of the selected company) as the main source of information could limit our understanding of the cases study. However, as the decision making activities and management of business relationships with suppliers tend to be conducted by a few key individuals, this method can be considered appropriate in studies such as this. In addition, an interactive perspective requires the inclusion of all actors involved in interaction processes. Future research may take into consideration the Chinese counterparts of the focal firm. Finally, that of Alpha is an emblematic case of fruitful interaction among native and immigrant entrepreneurship within a local context. A multiple case study might be conducted with the aim of providing some external validity for our findings so as to increase their generalizability.

ABSTRACT
Currently one of the main challenges for managers in the retail industry is to provide and sustain customer satisfaction. While the reasons for an initial purchase in a retail store may be due to factors partially outside the control of retail managers, the ability to create a satisfactory experience for the consumer remains, to a considerable degree, in the hands of both the management and the retail staff. It is crucial for managers of traditional retail store to have a good and clear understanding of exactly what the customers want. The main purpose of this research is to identify the dimensions of service quality and examining the interrelationships among customer satisfaction, image and customer loyalty and service quality in the traditional trade. A multi-level and hierarchical model is used as a framework to synthesize the impacts of customer satisfaction, service quality and corporate image on loyalty of customers in the traditional trade. The results revealed that service quality is the main determinant of customer satisfaction and corporate image. Also corporate image significantly influences customer satisfaction. Furthermore, customer satisfaction, corporate image and service quality significantly affect customer loyalty. This research is of particular significance to the literature in retailing and to practitioners, since there are few studies in this field applied to the Portuguese traditional retail.

Keywords: Customer Satisfaction, Corporate Image, Retail Service Quality, Customer Loyalty, Portugal.

INTRODUCTION
The replacement of small family owned traditional stores with modern retailing is a universal phenomenon. However, traditional retail systems still exist both in less developed countries as in
developed economies where traditional retail formats often operate alongside modern retailing. In recent years, the retail industry has drastically changed, with consumers increasingly informed and varying their route to purchase between in traditional store, online and modern retailing. Therefore, it is crucial for traditional retailers to offer an experience to someone going into their store that they could not receive thru another channel or in modern retailing. Some of the fastest growing sectors of global economy are related to the consumption of experiences (Pine & Gilmore, 1990). Despite the increasing variety of ways in which we can purchase merchandises, the in-store experience is still the first thing that springs to mind for the majority of people when thinking about a retailer; so whether it be through great customer service, a nice shopping atmosphere, cutting advantage in-store technology or a pleasant checkout experience, retailers are looking to create an in-store environment which will offer something different to their customers. During this evolution, quality has acquired a very important weight in all industries of the economy and has become a key factor of business survival. Undoubtedly, the term quality is very present in the retailing industry, where all organizations aim to provide quality to their customers. But it's not as simple as it sounds, because to benefit from quality, organizations must be ready to meet the expectations of their customers. With this, we can define that, in order to remain in the market increasingly competitive, companies from traditional retailing have already adhered to quality.

Numerous authors have studied the relationship between perceived service quality and customer satisfaction, confirming that service quality is an important antecedent of satisfaction. In this regard, Dabholkar, et al (2000) argue that traditionally, most researchers conclude that customer satisfaction resulting from a particular experience of consumption, leads to an evaluation about the quality of service over a period of time. Although the quality of service in the retail industry has been extensively researched internationally (e.g. Al Khattab & Aldehayyat, 2012; Zaibaf, et al., 2013) there has been little research done in Portugal to examine service quality as an antecedent of satisfaction and behavioural intention of customers in the Portuguese traditional trade. The choice of this topic is due to the need for traditional retailers to properly understand whether the service meets customer perceptions in the different dimensions of SERVQUAL, contribute to their satisfaction and customer loyalty (intention to return and recommend services), since they are determinant variables in maximizing profit, market share, and return on investment.

In this context, the main objective of this paper is to propose a methodology that allows for the examination of the antecedents and consequences of customer satisfaction, in traditional retailing sector in North of Portugal. We specifically intend to present a conceptual model is used as a framework to identify the dimensions of service quality and examining the interrelationships among customer satisfaction, corporate image and customer loyalty and service quality in the traditional retail industry.
In this paper, after this present introduction, a review of the main literature on corporate image, customer satisfaction and their customer loyalty is made, then we propose the conceptual model and research hypotheses, after presented the findings and discussion, ending with the presentation of the discussion and the conclusion of the research. This study is particularly important for retail managers (survival and growth of retail companies), politicians (wealth creation, economic growth, etc.) and for the development of the literature in the Portuguese traditional retail industry.

THEORETICAL BACKGROUND AND HYPOTHESES

Service Quality

In these last decades there has been several research in the area of service quality (e.g. Amin, et al., 2013; Ladhari, 2009) and it is discussed lots for the aim that no consensus has been reached thus far on its definition and measurement. Early studies on service quality defined it as a measure to which a service provides customer needs, and implicates a comparison of customer expectations with their perceptions of actual service performance (Parasuraman, et al., 1985; Parasuraman, et al., 1988). Service quality has assumed a major role both in public and private institutions, as an indispensable requirement to customer satisfaction. There are two basic ways to define quality: one from the viewpoint of the service provider and the other from the client’s perspective. Firstly, it should be noted that the measurement of service quality is an important area of academic and scientific interest, which has assumed special prominence after the contribution of various authors (Parasuraman, et al., 1985). These authors, who represent the American school, have designed an instrument for measuring quality of service, called SERVQUAL. Initially, the proposed model incorporated 10 dimensions of quality (tangibility, reliability, responsiveness, professionalism, courtesy, credibility, security, access, communication and customer understanding). However, these dimensions were revised and subsequently reduced to five (Parasuraman, et al., 1988). The dimensions of courtesy, credibility, security, competence and communication have led to a new dimension: assurance, while the dimensions of understanding/knowing customers generated the dimension of empathy. Parasuraman, et al. (1988) suggested the following definitions for the five dimensions: Tangibles, Reliability, Responsiveness, Assurance and Empathy.

Despite the diversity of studies in many fields, in this study, SERVPERF will be applied to the traditional trade in the North of Portugal in a similar manner as that of other studies realized at an international level, in the area of the trade industry (Al Khattab & Aldehayyat, 2012; Durvasula & Lysonske, 2010; Khare, et al., 2010; Tang, et al., 2015). According to Nadiri and Hussain (2005) service quality increases customer satisfaction, stimulates intention to return, and inspires recommendations.
H1: The perceived service quality by clients been a multidimensional construct. 

H2: The perceived service quality by the customers has a positive influence on their satisfaction. 

H3: The perceived service quality by the customers has a positive influence on corporate image. 

H4: Perceived service quality has positive relationship with customer loyalty. 

Customer satisfaction

Customer satisfaction is the outcome of the customer’s perception of the value received in a transaction or relationships, where value equals perceived service quality, compared to the value expected from transactions or relationships with competing vendors (Zeithaml, et al., 1990). Customer satisfaction is a mighty immaterial asset like to service quality and can be attained through the compliance of customer expectations (Jayasankaraprasad & Kumar, 2012; Oliver, 1980). Also, customer satisfaction is a function of the disagreement between a customer’s expectations previous to buying and their perception of the same service subsequently. Anderson and Sullivan (1993) and Oliver (1980) will be significant if the perception is placed at a higher level than the expectation. More value for customer incomes great satisfaction, which can benefit the retail enterprise in the long term (Cronin, et al., 2000) and generate higher profits. Customer satisfaction is found to be dependent on the quality of service presented to the customer and is one of the instruments to enhanced value for customers. The major challenges for service industry are service quality and customer satisfaction. According to Gundersen, et al. (1996) the central point of customer satisfaction is to identify the crucial attributes, considered by customers as their needs and expectations. As Valdani (2009) points out, enterprises exist because they have a customer to serve. The key to customer satisfaction lies in identifying and anticipating customer needs and especially in being able to satisfy them. Enterprises which are able to rapidly understand and to satisfy customers’ needs, make greater profits than those which fail to understand and satisfy them (Dominici & Guzzo, 2010). On the other hand Bennett and Rundle-Thiele (2002), argued that for customers to escalate their loyalty, their perceived value of the good or service presented need be at par with reality, forming an integral part of the corporate aims of the organization. Additionally, Sirdeshmukh, et al., 2002 reported that customers’ satisfaction has close relationship to brand loyalty as well as service quality. Analogous claim is presented by Hoq and Amin (2010) who postulated that customer satisfaction is the emotional tendency of a customer towards repurchase of products and services offered by a retail store. In order to be successful, especially in the retail industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing ones (Yuen & Chan, 2010). Based on these findings, it is proposed that: 

H5: Customer satisfaction positively influences intention to return.
**H6**: Customer satisfaction positively influences staff loyal.

**H7**: Customer satisfaction positively influences WOM recommendations.

**Corporate image**

The concept of brand image has been widely studied by researchers in the area of marketing (Abd-El-Salam, et al., 2013; Kim & Kim, 2005; Kim & Lee, 2010; Sahin & Baloglu, 2011; Yu & Ramanathan, 2012). For Kim and Kim (2005) a “brand symbolizes the essence of the customers’ perceptions of the organizations”. Also, Keller (1993) defined corporate image as perceptions of an organization reflected in the associations held in consumers’ memory. Corporate image is defined as the “general impression” left in the customers’ mind as a result of accumulative impressions or feelings, attitudes, ideas and experiences with the firm, saved in memory, transformed into a positive/negative sense, retrieved to rebuilding image and recalled when the name of the firm is heard or brought to ones’ mind (Bravo, et al., 2009). According to Sahin and Baloglu (2011) brand image is defined as the perception of customers about a brand or a product labelled with that brand. Different authors consider brand image as an important component of strong brands and a determinant in the obtainment of competitive advantages (Lim & O’Cass, 2001).

An overall assumption is that a promising corporate image will have a positive impact on consumers’ behaviour towards the brand, such as the opportunity to command premium prices, buyers who are more loyal, and more positive word-of-mouth reputation (Martenson, 2007). Some researchers developed in last years, have tested the effect of corporate image on customer satisfaction and loyalty (Kim & Lee, 2010; Yu & Ramanathan, 2012). Their empirical findings showed that corporate image plays the important role in founding and retaining customer loyalty in the markets. Additionally, these authors found that customer satisfaction and corporate image perceptions positively influence service loyalty, with satisfaction having a greater influence on loyalty than image.

Thus, corporate image is believed to create a positive effect on customers’ satisfaction. When customers are satisfied with the service provided of company, their attitude toward the company is enhanced (Srivastava & Sharma, 2013). Based on the reported research, it is proposed:

**H8**: Corporate image has positive relationship with customer satisfaction.

**H9**: Corporate image has positive relationship with customer loyalty.

**Customer Loyalty**

The literature suggests behavioural intentions as a construct which permits the evaluation of customer loyalty. These are behaviours related to the intention to repurchase and even to the intention of recommending the product/service (Sumaedi, et al., 2012; Yuen & Chan, 2010; Zeithaml, et al., 1996). Some studies developed in service industry have found the positive relationship between perceived service quality and loyalty. Customers frequently develop an attitude toward purchasing based on a
prior service experience or, still, this attitude can also be influenced by previous information, based on
the image of the retail in the market and even by word of mouth (WOM recommendation). With
reference to the previous conception, customer loyalty has been usually defined as occurring when
customers repetitively buying goods or services over time and retain positive attitudes towards the
enterprise delivering the goods or services (Yuen & Chan, 2010). Service providers are increasingly
developing loyalty, as they consider that it helps to rise income, and leads to largest market share,
effectiveness and profitability. In this sense, behavioural intentions can be define as the customer’s
judgment about the likeliness to repurchase in this firm or the willingness to recommend the firm to
others. We conceptualize behavioural intentions as a higher-order construct consisting of (1) positive
word of mouth, (2) willingness to recommend, and (3) intentions to continue buying from a particular
service provider. Based on previous definition, behavioural intention in this study may be described as
a stated likelihood to repurchase in the hypermarkets in the North of Portugal and to recommend the
hypermarkets to family, friends and others in the future. Research has established the many benefits of
behavioural intention, such as making it a tendency for retailers to follow, as well as developing and
maintaining a loyal customer base (Yuen & Chan, 2010). There is also ample evidence of the influence
of service quality on behavioural intentions, a huge body of research has demonstrated the significant
relationship between service quality and customers’ behavioural intentions (Parasuraman, et al., 2005).
It was expect customers who perceive the quality of the service as high to be more likely to demonstrate
intentions, and we again believe that this relationship will hold regardless of the buyers’ collectivist
orientation. Loyal customers are main assets to firms, they make proportionally more purchases at
their’ first choice’ store than customers who shift. Usually, great service quality leads to customer
loyalty, as it increases customer confidence towards and satisfaction with the company. It is supposed
that positive perceptions of service quality enhances the possibility of customers being dedicated in
supporting the company and developing and strengthening loyalty behaviour (Yuen & Chan, 2010).
Moreover, Oh (1999) found a positive and significant relationship between intention to return and
WOM recommendations. Based on these findings, it is proposed that:

H10: Intention to return positively influences WOM recommendations.

H11: Staff Loyalty positively influences Intention to return

**METHODOLOGY**

A questionnaire was designed as the survey instrument, which were included all the constructs of the
proposed model. The questions in the questionnaire were based on a review of the literature in the area
of the trade industry, described above in the theoretical background. This study was applied to
customers from of hypermarkets in the north of Portugal during the month of February, 2017. It was used a non-probabilistic sampling using convenience technique. The questionnaires were distributed online and the answers came from several cities and places of the north of Portugal. In this study, respondents were required to fill out a three-page three sections. The first section consisted of a standard demographic profile of respondents. The second section contained the characterization of purchase process. The last section includes the statements of dimensions and their sub dimensions. The measurement items to measure primary and sub-dimensions of service quality were adapted from several researchers (Chen, et al., 2011; Cronin & Taylor, 1992; Dabhokar, et al., 1996; Wu, et al., 2011) and a series of items focusing on the behavioural intentions, customer satisfaction, corporate image and service quality, which were adapted on the basis of several researchers’ results (Wu, 2013; Yuen & Chan, 2010; Yu & Ramanathan, 2012; Zeithaml, et al., 1996). Respondents were asked to use a five-point Likert-type scale (where 5-point scales anchored 1 = “strongly disagree” and 5 = “strongly agree”) to record their perceptions. Construct reliability was assessed by using the Cronbach’s alpha coefficient. Reliabilities ranged from 0.832 to 0.965, suggesting that the construct could be used with confidence. For the descriptive analysis it was used absolute and relative frequency tables. The Spearman correlation coefficient it was used to measure the intensity of the linear correlation between variables. Multiple linear regression was used in order to estimate models that could identify the determinants of the behaviour of the variables under analysis. The significance level of 5% was assumed.

DATA ANALYSIS AND FINDINGS

Demographic Profile

The sample of the North of Portugal was composed of total 211 respondents which 58.3% (123) were females and 41.7% (88) were males. The maximum number of responses was obtained from 35 - 44 years old with 43.1% (91) and the second age group from 45 - 54 years, with 28% (59) responses. Most respondents 66.8% (141), were married or in an unmarried partner, 23.2% (49) were single. It is verified most of respondents had higher education qualifications, as 33.2% (70) were graduates; 10.4% (30) had postgraduate degrees; 14.2% (30) had a master’s degree and 12.3% (26) were PhDs. As for the professional occupation mostly, 78.2% (165) were employed. In the activity sector, banking stood out with 34.1% (72) of the respondents, followed by education sector with 17.1% (36) of the individuals. Regarding the average annual income, it is observed that 28% (59) of the respondents earned between 7001€ to 20000€; 29.9% (51) earned between 20001€ to 40000€ and 21.3% (45) received annually between 40001€ to 80000€.

Purchase Process
The obtained results show that 98.1% (207) of the respondents purchases in traditional trade. It was verified that 74.4% (157) of the individuals had made purchases in traditional commerce there is more than 12 months. The most popular frequency of purchases registered was monthly, 33.6% (71) of the respondents go to the traditional trade once a month and 32.2% (68) do it weekly. As for the average annual spending on purchases in the traditional commerce, it was found that 30.3% (64) of the respondents spend under 100€ and that 39.8% spend more than 400€ annually.

Correlation and regression analyses

Analysing the shows that the sub-dimensions that constitute Service Quality (SQ) present strong and direct correlations with the SQ, namely reliability, responsiveness and empathy sub-dimensions with very strong correlation coefficients. These findings corroborate hypothesis 1.

*Table 3. Spearman correlation between dimensions of scale*
Ordinary least squares regression was used to analyse each path in the conceptual model. Statistical assumption tests were assessed for each of the six regression models prior to the analysis in order to ensure a robust result.

The results of the hypotheses tests are presented in Table 4 and Table 5. The application of the multiple linear regression model allowed us to obtain a parsimonious model that makes it possible to predict the dependent variable from a set of regressors (independent variables).

In the first regression model which tests the influence of service quality and corporate value on the variation of customer satisfaction is tested. The model obtained is at a statistically significant level of significance of 1% ($F = 263.672; p\text{-value} < 0.001$), that is, the variation of customer satisfaction is explained significantly by the estimated model. By the application of the test $t$, we conclude that service quality ($β = 0.783; p\text{-value} < 0.001$) and corporate image ($β = 0.097; p\text{-value} = 0.046 < 0.05$) determine significantly the behaviour of customer satisfaction. The adjusted coefficient of determination reveals that the model presented explains, on average, about 71.8% of the variation of customer satisfaction. Consequently, this model supports the octave hypothesis.

The second regression model that relates WOM with the regressors: customer satisfaction, retail service quality, corporate image and intention to return is at a significance level of 1% statistically significant. The determinants of the model influenced significantly the variation of WOM, as the test $t$, customer satisfaction with coefficient $β = 0.286$ and $p\text{-value} < 0.001$; service quality ($β=0.286; p\text{ values}<0.001$); intention to return with coefficient $β = 0.534$ and $p\text{-value} <0.01$; corporate image with coefficient $β = 0.209$ and $p\text{-value} <0.001$; are statistically significant. The estimated model explains, on average, about 77.3% of the WOM variation. The retail service quality regressor is not presented significantly in the variation of WOM. Thus, this model supports the sixth and the tenth hypothesis.

In the third regression model that relates intention to return with the regressors: customer satisfaction, service quality and corporate image is at a significance level of 1% statistically significant. The followings determinants of the model influenced significantly the variation of intention to return, as the test $t$, customer satisfaction with coefficient $β = 0.451$ and $p\text{-value} <0.001$ and corporate image with coefficient $β = 0.268$ and $p\text{-value} <0.001$; are statistically significant. The estimated model explains, on average, about 70.9% of the intention to return. The service quality regressor is not presented significantly in the variation of intention to return. Thus, this model supports the fifth and the seventh hypothesis.

The fourth regression model that relates loyalty to staff with the regressors: customer satisfaction, service quality, corporate image and intention to return is at a significance level of 1% statistically significant. The estimated model explains, on average, about 43.1% of the loyalty to staff. The followings determinants of the model influenced significantly the variation of loyalty to staff, as the test...
t, customer satisfaction with coefficient $\beta = 0.254$ and $p$-value $= 0.021 < 0.05$ and intention to return with coefficient $\beta = 0.447$ and $p$-value $< 0.001$; are statistically significant. The service quality and corporate image regressors are not presented significantly in the variation of loyalty to staff. Thus, this model supports the eleventh hypothesis.

The fifth regression model that relates customer loyalty with the regressors: customer satisfaction, service quality and corporate image is at a significance level of 1% statistically significant. The determinants of the model influence significantly the variation of customer loyalty, because by the test $t$ customer satisfaction with coefficient $\beta = 0.536$ and $p$-value $< 0.001$; service quality with coefficient $\beta = 0.173$ and $p$-value $= 0.013 < 0.05$; corporate image with coefficient $\beta = 0.248$ and $p$-value $< 0.001$; are statistically significant. The estimated model explains, on average, about 74.9% of the customer loyalty variation. Therefore, this model supports the second, fourth and ninth hypothesis.

The sixth regression model that relates corporate image to the service quality regressor, is at a significance level of 1% statistically significant. The estimated model explains, on average, about 41.6% of the corporate image variation. By the application of the test $t$, the service quality with coefficient $\beta = 0.648$ and $p$-value $< 0.001$, can be conclude that, determines significantly corporate image behaviour. Therefore, this model supports the third hypothesis.

Table 5. Hypothesis test results

DISCUSSION AND CONCLUSION

The objective of this study was to identify the dimensions of service quality and examining the interrelationships among customer satisfaction, corporate image and customer loyalty and service quality in the traditional trade, in addition to investigate the effect of customer satisfaction, service quality and corporate image on customer loyalty in the traditional commerce in the North of Portugal. The results from exploratory factor analysis indicate that service quality consists of five dimensions (tangibles, reliability, responsiveness, assurance and empathy). For traditional trade in the North of Portugal, reliability; responsiveness and empathy play an important role in determining service quality, and are followed by assurance and tangibles, which confirms the H1.
The results of this study demonstrate that service quality has a direct influence on corporate image, which in turn, influence customer loyalty. The positive relationship between service quality and corporate image suggests that customers who received high service quality during service delivery would form a favourable image of the traditional retail store. Additionally, service quality was also found to have direct effects on corporate image, supporting the H3. Furthermore, the relationship between customer satisfaction and corporate image is significant, thus, H8 is supported. Increased service quality then results in greater corporate image that results indirectly in greater customer loyalty, based on the positive relationship between image and customer loyalty, since the H9 was supported.

A positive relation between service quality and customer loyalty was expected, in this study also is confirmed, the relationship between service quality and customer loyalty is significant, though in this study the service quality does not have a positive influence on intention to return and on loyalty staff, however the service quality influences directly the customer loyalty overall, thus, H4 is supported. However, the results nonetheless show that service quality has an indirect effect on behavioural intentions via customer satisfaction and corporate image, since the H2 and H3 was supported.

Moreover, the findings showed that the service quality is an antecedent of customer satisfaction and this is indirectly influence customer loyalty. The level of satisfaction of the customers positively affects their word of communication about traditional stores retail of the north of Portugal and the customers’ intentions to revisit these store. Findings found have supported the H5, H6 and H7, are also consistent with the literature. In other researches such as this, satisfied customers have higher levels of intention for revisiting traditional stores of the north of Portugal and their satisfaction levels induce them to provide positive word of mouth communication.

Both customer satisfaction as corporate image directly influence customer loyalty. In general, satisfied customers form their favourable behavioural intentions to return or recommend the traditional store retail while experiencing a high level of service quality that produces a favourable corporate image. Customer satisfaction has a positive influence on behavioural intentions, suggesting that satisfied customers will return or revisit hypermarkets to repurchase again and may recommend their favourite traditional store to friends or relatives. Corporate image has been found to have a positive effect on behavioural intentions, implying that customers forming their positive overall impressions of the image of traditional store retail are more likely to return or revisit the similar store in the future.

This study identified five primary dimensions of service quality in the traditional commerce in the north of Portugal. For example, management can use the information from this study to improve their understanding of the factors that create a pleasant purchasing experience and act to increase customers’ positive customers’ loyalty. Furthermore, the customers who return or revisit the traditional retail
stores can help management to establish a good reputation through the positive word-of-mouth. In addition, retail management should know and resource the customer-important sub-dimensions to improve traditional trade’ competitiveness. This information will enable management to accurately measure customers’ perceptions of their overall experiences in the traditional trade. Therefore, management should realize that service quality in the trade industry definitely influences customers’ future favourable behavioural intentions through satisfaction and corporate image.

As observed in this research, the main purpose was studied the relationships among higher order constructs such as customers’ loyalty, customer satisfaction, corporate image, and service quality in traditional trade in the north of Portugal. Nevertheless, the interrelationships among these constructs and their supporting dimensional structures have not attracted a lot of attention in the retailing literature of Portugal. The results of this research provide commerce management with a better understanding of the effect of service quality on corporate image, which then influence customer satisfaction.

The study results aid traditional trade stores owners and managers to recognize and prioritize the primary and sub-dimensions of service quality. Trade management should realize that the significance customers accentuate is based on each of the primary and sub-dimension of service quality. Moreover, traditional trade management should structure their infrastructure, processes, operations and resource allocation in terms of the relative importance of the service quality dimensions to their target at specific customers. Simultaneously, the retail managers should dedicate special attention to the corporate image that gives to the market, whether through communication actions or interaction with society where operate.

IMPORTANCE OF CULTURAL INTELLIGENCE IN INDIAN MANAGEMENT EDUCATION

Naik, Kasturi1; Bobade, Anita2

1MMS, Mumbai University’s DES NMITD, SCSVMV University, India,
2MMS, Mumbai University’s DES NMITD, India

ABSTRACT

Advent of globalization, workforce mobility, and international projects are generating demands for culturally proficient employees. Education, training and development of these employees begin in the classroom (Van Dyne, Ang, Livermore, 2010). The major purpose of this paper is to investigate whether management education plays an important role in developing cultural intelligence and the importance of cultural intelligence as a separate subject in final year (Master of Management Studies) MMS curriculum. Non parametric chi square test analysis is used to determine whether management education plays an important role in developing cultural intelligence with the respondents being 150 (Master of Management Studies) MMS final year students. For testing reliability of the questionnaire, Cron Bach α is used followed by factor analysis to determine prominent factors to decide content of the syllabus of cultural intelligence. The respondents for the same are 50 (Human Resources) HR recruiters dealing with international recruitment. These results, coupled with the formal and informal discussions with institute faculties and global corporate managers, suggest that in general the (Master of Management Studies) MMS students have a strong understanding on why cultural intelligence is essential in an increasingly globalized business world, as well as an earnest desire to interact with other cultures. Though, students seem extremely driven to study about other cultures, the results indicate that many of the (Master of Management Studies) MMS students lack an in-depth knowledge of the values, beliefs, and practices of other cultures due to lack of a well defined curriculum on the subject of “Cultural Intelligence” (Rich, Lepine, & Crawford, 2010).

Keywords: Cultural intelligence, Knowledge, Globalization, Training and Development, Education

INTRODUCTION

Thomas, Elron, Stahl, et. al (2008) outline Cultural Intelligence as a system of interacting knowledge and skills, coupled by cultural metacognition, that permits individual to adapt to, select, and form the
cultural aspects of their environment. Cultural intelligence is a multidimensional concept comprising mental (metacognitive and cognitive), motivational, and behavioral dimensions.

Interaction between any two individuals is an intercultural intelligence as culture is a pattern of learned behavior. Cultural intelligence refers to the flexibility to adapt effectively to new cultural settings (Imai, 2010). Researchers of cultural intelligence make an attempt of investigating the construct of cultural intelligence and why some individuals are more capable than others when they have to adapt to new cultural settings (Imai, 2010).

Though previous research perceived intelligence narrowly as the ability to resolve issues in educational context, there’s currently increasing agreement that intelligence may be exhibited in places apart from the classroom (Sternberg and Detterman, 1986). This rapidly increasing interest in ‘real world’ intelligence includes intelligence that focuses on specific content domains such as social intelligence, emotional intelligence and practical intelligence (MacNab, B., Brislin, R., and Worthley, R., 2012). Cultural intelligence takes into account the sensible realities of globalization (Earley and Ang, 2003) and focuses on a selected domain – intercultural context. Thus, following Schmidt and Hunter’s (2000) definition of general intelligence, cultural intelligence could be a specific style of intelligence centered on capabilities to understand reason and behave effectively in context characterized by cultural diversity. In current international economy, human resource professionals, managers and staff operate with individuals from a range of cultural backgrounds daily. Several employees witness uncomfortable and ambiguous situations on a frequent basis. For example: You’re conversing with an individual from a different culture, and he doesn’t have an eye contact with you. Is it a cultural difference or a personal whim? How do you know, and how do you tackle it? (McCray, 2012).

Success in such context needs a novel set of abilities known as cultural proficiency. Organizations and managers generally dismiss cultural proficiency as a combination of indefinable soft skills that cannot be quantified or instructed. However that’s not the scenario (Livermore, 2010). These proficiencies can be developed, and variety of intercultural models and inventories exist that may facilitate the learning (Smith, 2014). This research is centered on cultural intelligence (CQ), a novel, research-based approach for operating effectively globally.

The major objective of this paper is to investigate the importance of cultural intelligence as a separate subject in final year MMS curriculum. This paper has utilized the Cultural Intelligence Scale (CQS) – metacognitive, cognitive, motivational, and behavioral – to capture data from MMS students and HR managers dealing with international recruitment with reference to need of developing a new subject of Cultural Intelligence with respect to final year. Overall, there are four Cultural intelligence capabilities: Drive, Knowledge, Strategy and Action. Cultural Intelligence drive is the motivational
dimension of cultural intelligence, measuring the level of interest, drive and energy required to adapt cross-culturally. Cultural Intelligence Knowledge is the cognitive dimension of cultural intelligence, with reference to knowledge about culture and its role in shaping interactions and work. Cultural Intelligence Strategy is the metacognitive facet of cultural intelligence, quantifying a person’s ability to strategize throughout the process of operating globally (Livermore, 2010). Cultural Intelligence Action, the behavioral dimension of cultural intelligence, is the ability to act appropriately in a variety of intercultural context and effectively accomplish goals.

LITERATURE REVIEW

Cultural intelligence (CQ) is a blend of cultural, social, and individual undercurrents that takes place in cross-cultural context (Ang, Livermore, & Van Dyne, 2010). Cultural intelligence is widely mentioned these days particularly in those global corporates which are engaged in international projects and expatriation as expatriate act and cross-cultural adaptation are identified as challenging areas for such organizations (Ng, Van Dyne, & Ang, 2009).

The concept of cultural intelligence

Cultural intelligence is comprised of many dimensions and made up of four components; metacognitive, cognitive, motivational, and behavioural component (Ang et al, 2007).

Meta-cognitive dimension of CQ represents cognition part, i.e. gaining and understanding of awareness about other culture (Ang et al., 2007). It basically includes the cognitive strategies that are used to obtain and create coping strategies (Ng & Earley, 2006). It enables in structuring and strategizing plans for culturally diverse situations (Van Dyne, & Livermore, 2010). It takes into account whether an individual can utilize his/her cultural awareness to make strategic decisions, it also considers how cultural differences influence individual’s behavior. It emphasizes on deciding on how to prepare groundwork for cross-cultural meetings by approaching people, situation, topic (Van Dyne, Ang, Livermore, 2010, pp. 7). This dimension enables to adapt and adjust activities of communication strategy from understanding cultural issues to estimating the actions taken and improving strategy in a long-time perspective (Earley, Peterson, 2004).

Cognitive factor is composed of knowledge regarding norms, practices, and conventions of other cultures, which can be acquired through educational and personal experiences (Ang et al., 2004; Ang et al., 2007). It is one of the important dimensions as individual’s thought processes are highly influenced by the knowledge they gain about the other culture. Thus individual with high level of cognitive CQ are generally able to understand the similarities and differences exist in other cultures.
The Motivational (Drive) factor is based on showing the interest, confidence and drive to adapt to cross-cultural environment. It does not consider the premise that individuals are all naturally motivated to learn about cultural issues (there’s always the risk of resistance). There are different levels of motivation: Intrinsic where in individual is motivated from within and has a natural inclination to learn about cross cultural components. Extrinsic means motivation of the individual is linked to external events or tangible benefits like praise, appreciation etc. Both are important to achieve success at international front. Self-Efficacy is the self-reliance that individual is able to perform effectively in cross-cultural encounters (Van Dyne, Ang, Livermore, 2010, pp. 4-5).

The Behavioral (Action) factor exemplifies action component as the ability to appropriately adapt verbal and non-verbal communication to a cross-cultural context. It takes into consideration individual’s knowledge when these actions need to be taken and when not so it shows the flexibility and the highest level of cultural awareness (Van Dyne, Ang, Livermore 2010, pp. 8). In other words, behavioral intelligence focuses on what individuals do rather than what their though process is or what they feel. It is vital because it exposes the primary attributes of maintaining a relationship (Earley, Mosakowski, 2004).

Management education and cultural intelligence

Experiential Learning Theory pronounces learning as a process and highlights the importance of experiential learning rather than focusing only on knowledge acquisition. As per experiential learning theory, learning comprises of four stages, experiencing, reflecting, thinking and acting. When an individual’s attempt fail, s/he uses the feedback to formulate new strategies to correct behavior. According to Knight (2003), individuals differ in the extent to which they translate experience into positive outcomes. It is acknowledged that individuals who more effectively utilize the four stages of experiential learning will process more insightful experience from their international assignments. The individuals with higher Cultural intelligence dimension are more effective learners and in turn produce more positive outcomes from global assignments. Ng et al. (2009) proposed all-inclusive model incorporating the four dimensions of Cultural intelligence and the four stages of Experiential Learning Theory. Based on this integration as a base model this research paper aims to investigate by means of factor analysis the components which can form the part of the subject of “Cultural intelligence” proposed to be introduced for MMS final year students to introduce the students to cross cultural norms, values etc.
Management education in India

In India multiple committees on management education have recommended areas of improvements. Significant change is not reflected in management education yet except in the top ranking B-schools. It is essential to investigate and address the important components related to management education in India which will enable the corporate to optimally utilize the demographic dividend provided by our country. The important components include focus on quality of faculties, promotion of faculty development programs, facilitating research, developing evaluation systems based on individual and team appraisals, strict corporate governance of all the management institutes, focus on institute-industry interface and developing global mindset. This paper focuses on using management education to develop cultural intelligence a means to create global mindset by means of internationalization of management education.

Emotional intelligence

Although globalization has made the world seem smaller and ‘flat’ in many ways (Friedman, 2005), increasing cultural diversity creates challenges for individuals and organizations, making the world ‘not so flat’ after all. Earley and Ang (2003) developed the construct of cultural intelligence and Cultural Quotient(CQ). CQ is a multidimensional construct targeted at situations involving cross-cultural interactions arising from differences in race, ethnicity and nationality. (Earley and Ang, 2003; Ang and Earley, 2006). Cultural intelligence primarily examines individual’s capability to adapt effectively in new and unfamiliar cultural settings and perform effectively in such culturally diverse situations (Earley, 2002; Ang et al., 2007). This cross-cultural competence construct is analogous in comparison to the emotional intelligence construct (Earley&Mosakowski, 2004). It is a new corresponding type of intelligence, which explains variability in coping and functioning with culturally diverse scenarios.

Salovey and Mayer coined the term "emotional intelligence” in 1990 (Salovey and Mayer, 1990). They were cognizant of the preceding studies on non-cognitive parameters of intelligence and they described emotional intelligence as "a form of social intelligence that involves the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and action” (Salovey and Mayer, 1990). Emotional intelligence can be seen to be a pre-requisite for cultural intelligence.

Role of management education in developing cultural intelligence

In today’s fast paced world, management students seldom withstand one ‘job for life’ and are progressively employed by, global organizations while competing in a world job market (Koster, 2010,
On the same terms, competition for positions in India requires management students to not solely be competitive against international candidates but to be able to work effectively and achieve success in a multi-cultural environment (Brünnemann, 2013, pp. 4). The management students therefore need the knowledge, skills, attitudes, and professional networks to undertake a successful career; together with the ability to work across cultures and nations. In short, the management students need the ability to be global citizens that can influence the world for the better.

Cultural intelligence (CQ), outlined as an individual’s capability to operate and manage effectively in culturally diverse settings, is according to Schmidt and Hunter’s (2000, p. 3) definition of general intelligence as ‘the ability to grasp and reason correctly with abstractions (concepts) and solve problems.’ Though previous research perceived intelligence narrowly as the ability to resolve issues in educational context, there’s currently increasing agreement that intelligence may be exhibited in places apart from the classroom (Sternberg and Detterman, 1986). This rapidly increasing interest in ‘real world’ intelligence includes intelligence that focuses on specific content domains such as social intelligence, emotional intelligence and practical intelligence (MacNab, B., Brislin, R., and Worthley, R., 2012). Cultural intelligence takes into account the sensible realities of globalization (Earley and Ang, 2003) and focuses on a selected domain – intercultural context. Thus, following Schmidt and Hunter’s (2000) definition of general intelligence, cultural intelligence could be a specific style of intelligence centered on capabilities to understand reason and behave effectively in context characterized by cultural diversity. In current international economy, human resource professionals, managers and staff operate with individuals from a range of cultural backgrounds daily. Several employees witness uncomfortable and ambiguous situations on a frequent basis. For example: You’re conversing with an individual from a different culture, and he doesn’t have an eye contact with you. Is it a cultural difference or a personal whim? How do you know, and how do you tackle it? (McCray, 2012).

Success in such context needs a novel set of abilities known as cultural proficiency. Organizations and managers generally dismiss cultural proficiency as a combination of indefinable soft skills that cannot be quantified or instructed. However that’s not the scenario (Livermore, 2010). These proficiencies can be developed, and variety of intercultural models and inventories exist that may facilitate the learning (Smith, 2014). This research is centered on cultural intelligence (CQ), a novel, research-based approach for operating effectively globally.

Advent of globalization, workforce mobility, and international projects are generating demands for culturally proficient employees. Education, training and development of these employees begin in the classroom (Van Dyne, Ang, Livermore, 2010). Thus this research focuses on survey of 150 students pursuing final year MMS course from management institutes located in Mumbai, financial capital of
India and 50 HR managers dealing with international recruitment with two major objectives. The first one being investigation of the significance of management education in developing cultural intelligence and second one focusing on development of contents with respect to introduction of Cultural intelligence subject in final year of MMS course.

Research Gap
After taking into consideration the above mentioned literature highlights on cultural intelligence (Ang et al, 2007), this research focusses on two dimensions important for cultural intelligence –emotional intelligence and physical endurance as essential components. Limited research is done in India with respect to introduction cultural intelligence as a subject in MMS final year curriculum. The research paper makes an attempt to fill in above mentioned research gap.

RESEARCH HYPOTHESIS AND MODEL

Research Models related to Cultural Intelligence and Management Education

Figure 1: Four Factor Model of Cultural Intelligence

Ang, Van Dyne and Livermore (2012) provide some insight into how cultural intelligence develops. They suggest that metacognitive factor is important to strategize the development of cultural intelligence. Cognitive factor enables to imbibe the knowledge with regards to norms, values, rules, regulations etc. with respect to cultural intelligence domain. Motivational Cultural intelligence provides blend of intrinsic and extrinsic motivation required along with the essence of self-efficacy to learn about cultural differences. Behavioral factor focusses on activities involved while dealing in cross cultural context. Questionnaire development for the research paper is based on this model (Ang, Van Dyne and Livermore, 2012) with addition of two important dimensions from the researcher end physical endurance and emotional intelligence.

Following table gives insight into research questions, objectives, hypothesis and tools used

Table 1: Research questions, objectives, hypothesis and tools used

**RESEARCH METHODOLOGY**

Research is an academic activity and as such the term should be used in a technical sense. According to Clifford Woody (1927 pp172), research comprises defining and redefining problems, formulating hypothesis or suggested solutions; collecting, organizing and evaluating data; making deductions and reaching conclusions; and at last carefully testing the conclusions to determine whether they fit the formulating hypothesis. Further, D. Slesinger and M. Stephenson in the Encyclopedia of Social Sciences, (1930 page 54), define research as “the manipulation of things, concepts or symbols for the purpose of generalising to extend, correct or verify knowledge, whether that knowledge aids in construction of theory or in the practice of an art.” Thus, research is, an original contribution to the existing stock of knowledge making for its advancement. It is the pursuit of truth with the help of study, observation, comparison and experiment. In short, the search for knowledge through objective and systematic method of finding solution to a problem is research. The systematic approach concerning generalization and the formulation of a theory is also research.

*Research Philosophy*

A research philosophy is a belief about the way in which data about a phenomenon should be gathered, analyzed and used. The term epistemology (what is known to be true) as opposed to doxology (what is believed to be true) encompasses the various philosophies of research approach.
The purpose of science, then, is the process of transforming things *believed* into things *known*: doxa to episteme. Two major research philosophies have been identified in the Western tradition of science, namely positivist (sometimes called scientific) and interpretivist (also known as antipositivist) (Galliers, 1991).

A large number of research methodologies have been identified, Galliers (1991) for example listed fourteen, while Alavi and Carlson (1992), reported in Pervan (1994), use a hierarchical taxonomy with three levels and eighteen categories. In Table 5.1 below, there is a list of methodologies identified by Galliers (1991, p.149), indicating whether they typically conform to the positivist or interpretivist paradigms. This research uses a positivist approach focusing on survey.

Table 2. *Various research methodologies*

*Source: Galliers (1991)*

*Research Design*

The type of research conducted is quantitative and explanatory in approach. Explanatory studies look for explanations of the nature of certain relationships. Hypothesis testing provides an understanding of the relationships that exist between variables.

*Data collection method*

The 1st questionnaire focusing on understanding the significance of management education on developing cultural intelligence comprises of 10 items (Van Dyne, 2010).

The 2nd questionnaire consisted of CQS (Ang et al. (2007), with 10 items covering the four dimensions of CQ: metacognitive CQ items, cognitive CQ items, motivational CQ items and behavioral CQ focusing on syllabus components of cultural intelligence. All CQS items were measured on seven-point Likert scales, ranging from 1 ("strongly disagree") to 7 ("strongly agree").

*Sample design*
Participants included 150 MMS students of final year and 50 HR managers dealing with international recruitment selected by means of convenience sampling from Mumbai financial capital of Mumbai. Questionnaires were distributed, accompanied by a letter emphasizing the confidentiality and anonymity of responses. The study was conducted during 2016-2017.

Tools for data collection
Non parametric chi square test analysis is used to determine the significance of role of management education in developing cultural intelligence.

For testing reliability of the questionnaire Cron Bach \( \alpha \) is used followed by factor analysis to determine prominent factors to decide content of the syllabus of cultural intelligence.

Data Analysis and Interpretation
The results of the statistical analysis, coupled with the formal and informal discussions with institute faculties and global corporate managers, suggest that in general the MMS students have a firm understanding on why cultural intelligence is essential in an increasingly globalized business world, as well as a strong desire to interact with other cultures. However, although students seem extremely driven to study about other cultures, the results indicate that many of the MMS students lack an in-depth knowledge of the values, beliefs, and practices of other cultures due to lack of a well defined curriculum on the subject of “Cultural Intelligence” (Van Dyne et.al 2010).

Table 3. Management education and cultural intelligence

Interpretation (table 3)
I can be seen from the table 3 that the significance (0.00) is less than the assumed value (0.05). So \( H_0 \) is rejected and alternate hypothesis is accepted. This means that management education play a significant role in developing cultural intelligence.

Components of Cultural intelligence

Cronbach Alpha (\( \alpha \)) (Cultural Intelligence)
Cronbach Alpha (α) is calculated as a measure of internal consistency. Alpha is calculated on the same scale as a Pearson (r) correlation coefficient which varies between 0 and 1. The closer the value of α to 1, the greater the internal consistency of items in the instrument being assessed.

<table>
<thead>
<tr>
<th>Cronbach’s Alpha</th>
<th>N of Items</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.718</td>
<td>10</td>
</tr>
</tbody>
</table>

Table 4. Reliability Statistics

It can be observed from the Table 4, the value of Alpha (α) is 0.718. We can conclude that the variables are having high internal consistency and hence these variables are considered to be suitable for conducting factor analysis.

</tbody>
</table>
Based on the table of factors which is graph which is plotted to know the number of factors which are available in the analysis.

Graph 1. Scree plot for cultural intelligence

From the above graph of Scree plot 1, it can be concluded that the factors having the Eigen values more than 1 have to be considered. This study determines 3 factors.

**Interpretation (From Table 6)**

From the Table 6 of Component Matrix, it can be seen that the three factors can be classified as follows:

**Factor 1:**
- Emotional Intelligence
- Motivational Dimension
- Behavioral Dimension
- Verbal Communication
- Nonverbal Communication

**Factor 2:**
- Physical Endurance
- Metacognitive dimension
Legal and Economic Knowledge

**Factor 3:**

Cognitive dimension

So the cultural intelligence syllabus can focus on the above mentioned factors devised by factor analysis method as these factors are highly significant for developing cultural intelligence.

The interpretation of the analyzed data for successful implementation of development of cultural intelligence among students is as follows:

The students’ evaluation must ite items align with concepts, issues and events from the curriculum that are relevant to the development of cultural competency

It is essential to actively acknowledge the cultural heritage and home languages of international and Indian students and stimulate discussion, on-campus and/or virtually, of each other’s culture and practice in connection to discipline and to exchange of knowledge and ideas;

Due importance should be given to both verbal and non-verbal communication.

It is essential to respect and understand the importance and significance of sacred days or religious holidays relative to Indian as well as international students on campus

Encouraging students and faculties to learn a second language to enable improved communication and to develop an awareness of the challenges of self-expression in languages other than English is essential for successful exchange programs

Providing motivation for students to complete a subject or short course in cross-cultural communication or perhaps an international studies subject is essential

Teaching practices encompassed should be culturally sensitive and actively discourage language or behavior that is racist or involves cultural stereotyping

Attention should be given first to the development of emotional intelligence and physical endurance of the students as a pre-requisite for the development of cultural intelligence.

**FINDINGS, DISCUSSIONS AND IMPLICATIONS**

This is an era of globalization. Corporates needs managers with world-class talent. The issue is how to inculcate a global mindset through the managers who act locally. The survey Conducted by Andrews & Tyson brought out some issues like - In the ever evolving economic context at international level the important issue is to develop individuals with management & leadership capabilities on a world wide scale. The study shows that there has been a shift in Companies while recruiting from knowledge to skills attributes. In the current market scenario as the business is getting international, day by day there is an increasing need for the management institutions (B-schools) to focus on generating global
managers by means of internationalization of education. Taking this into consideration following are the implications of the study.

**Student exchange program should be promoted**

The business schools must admit international students and provide opportunities to their own students for international education exposure to the program. The Indian management institutes have limited international participation. Indian B-schools should collaborate with some well-known foreign B-schools by which Indian students can do part of their education in those institutes. Students who have exposure to an international short term program or exchange program usually improve their grades and are more likely to progress to further higher qualifications. Such students often describe the experience as ‘lifetchanging’ and report an increase in their own soft skills, personal maturity and commitment to their chosen field of study. Hosting incoming exchange students contributes to campus culture and internationalization of the student body while inspiring the student community. The availability of a good international student exchange program, with participation strongly supported by the institution, has been shown to be a major factor in creating a brand name for the institute and students choice of university. Also participation in student’s exchange program schemes increases the employability of students, a major reputational gain for any university, its students and the teaching faculties. Physical endurance dimension along with the other dimensions of cross cultural intelligence can be practically tested in the short term exchange programs of the students to get an perspective on support of physical health of the student in different climatic conditions and precautionary measures to be taken in case of emergency conditions.

**Faculty exchange program culture should be instilled**

The management institutes interested in developing culturally competent students should induct a few international faculties & provide an opportunity to the students to listen about other country’s business culture & systems. The management institutions should also groom and provide opportunities to their faculties for exploring teaching assignments internationally. The presence of ‘visiting’ or exchange faculty program raises the global profile of the institutes, leading to enhanced international engagement which, in turn, assists in building a reputation and presence in international student recruitment markets. Teaching faculties accompanying students on an short term exchange program have the opportunity to build networks with international colleagues which can lead to the formation of research linkages and improved cross cultural networking opportunities.

**Introduction of cultural intelligence as a subject in curriculum**
To ensure success of student exchange program it is essential to add cultural intelligence as a subject in curriculum with focus on international economics, International Marketing, International Financial Management or international Business Management, emotional intelligence etc.  

Provide placement opportunities internationally  
Management institutes can also collaborate with some foreign placement consultancies to make sure at least some competent students can obtain jobs abroad (Saha, 2012). • Employers value the skills developed by participation in international exchange programs, including cross-cultural communication skills, personal maturity, the ability to adapt to cross cultural context and deal constructively with cultural differences in procedure and practice.

LIMITATION OF RESEARCH  
Limitation of this study is it is necessary to examine the caliber and aptitude of the faculties teaching cultural intelligence competencies to the MMS students. To deal with this limitation, future scope of this research can be to screen the faculty development programmes and investigate their significance with respect to increasing cultural intelligence of faculties.

SCOPE OF FUTURE RESEARCH  
Future scope of this research can be to screen the faculty development programs and investigate their significance with respect to increasing cultural intelligence of faculties. Longitudinal time series studies can also be conducted on different implications suggested by the researcher. Future research can also investigate the role of emotional intelligence in developing cultural intelligence. Future research can also focus on financial dimension of the exchange programs to be initiated for students and faculties.

CONCLUSION  
In the current globalized economy, where business is transnational, there is an increasing need for the management institutions (B-schools) to focus on generating global managers by means of internationalization of education. This includes providing students with international viewpoint of their discipline, providing the students with a cross-cultural understanding; information focusing on meta-cognitive, cognitive, motivational, behavioral, emotional and physical level for their future careers with respect to being successfully in diverse cultural context.”

Knowledge of cultures provides students with insights, skills and capabilities to deal with multicultural context and behave effectively in culturally diverse settings. Cultural intelligence (CQ) is an
capability to progress effectively and efficiently in culturally diverse settings when the main focus is differences in cross-cultural behaviors (Crawford, LePine and Rich et al., 2010). This skill is increasingly becoming beneficial for MMS students, as those who have high cultural intelligence can quickly adapt their management style in order to handle issues raised from multicultural background (concerning customers, suppliers, associates, etc.) (Kanfer et al., 2008).

ABSTRACT 
Managing workforce diversity adds value and augments organization’s effectiveness. The magnitude of diversity differs from country to country. While designing strategies for managing diversity, one has to study country-specific aspects and the socio-cultural landscape of the country. While studying the HR systems in India, one must appreciate that India is home to almost all religions of the world and presents in its people and races one of the most diverse congregations of cultures, dialects, castes, ethnicities and customs rarely matched by any other nation. This mystic and diverse culture has generated a set of challenges, which also makes its HR system unique (Rao and Verghese, 2009). 
India is a very diverse country demographically as well as in terms of social and economic development. There is a significant difference in view of the social, cultural, economic and ecological diversity that is pervasive in India (Chaurasia A R, 2012). Constructed on Harrison, Price and Bell categorization of diversity dimensions, the demographic and socio-cultural diversity dimensions of India are categorized as visible, partially visible, partially deep and deep (Harrison et al; 2015). This paper contributes to existing knowledge on diversity management and strategic HRM in the Indian ITes sector. The purpose of this paper is to discuss vital diversity dimensions of India, and its implications for various organizational challenge with focus on ITes sector by means of case study approach. 
This research paper focuses on multiculturism and workforce diversity management with focus on ITes sector in India. In conducting the research, it quickly became clear that ITes sector took diversity and inclusion very seriously and that this was not limited to surface level diversity, but focused upon deep level diversity issues also like leadership skills, interpersonal skills, organizational commitment etc. and the connectivity between surface level and deep level diversity. 

Keywords: Diversity, Multiculturism, Strategic HRM, India, commitment,
INTRODUCTION

India is a very diverse country demographically as well as in terms of social and economic development. There is a significant difference in view of the social, cultural, economic and ecological diversity that is pervasive in India (Chaurasia A R, 2012). Constructed on Harrison, Price and Bell categorization of diversity dimensions, the demographic and socio-cultural diversity dimensions of India are categorized as visible, partially visible, partially deep and deep (Harrison et al, 2015). This paper contributes to existing knowledge on diversity management and strategic HRM in the Indian ITes sector. The purpose of this paper is to discuss vital diversity dimensions of India, and its implications for various organizational challenge with focus on ITes sector by means of case study approach.

Multiculturalism in India and its influence on Indian society

Multicultural concerns have long informed India’s history, traditions, constitution and political arrangements. Many writings on Indian history, culture and politics are marked by some kind of multicultural consideration. Even the recommendations of the successive Finance Commissions of India, to take an unusual example, show that the changing criteria for allocating resources to states accommodates the country’s social and cultural diversity (Bhattacharyya 2001). India’s constitution can be said to be a multicultural document in the sense of providing for political and institutional measures for the recognition and accommodation of the country’s diversity. But multiculturalism as a term of scholarly discourse of society and politics in India is of a very recent vintage, originating in the 1990s when some scholars felt the need to respond with Indian experience to the global debate on the subject. The central question in any discussion of multiculturalism in contemporary India is how a vast, multi-ethnic country – in terms of religion, language, community, cast and tribe – has survived as a state in conditions of under development, mass poverty, illiteracy and extreme regional disparities. Given that many less diverse and plural postcolonial states have failed, what is the secret of India’s success? Kohli (2001) argues that the question assumed added significance after the disintegration of the multiethnic former Soviet Union and its European empire in the early 1990s.

India and China are socially and culturally the most diverse in the world. Formed over thousands of years as a country of immigrants who brought their own cultures and traditions, India’s diversity is huge. According to Kohli (2001) India, though predominantly inhabited by Hindus (over 82% of the population) who are regionally rooted, plural in beliefs and practices and divided by castes and languages, its population also includes a large proportion of Muslims (about 12%), Sikhs, Buddhists, Christians and Jains (Kohli, 2001). India is also linguistically diverse, being the home of some hundred languages and dialects – so far eighteen languages have been ‘officially’ recognised and placed under the eighth schedule of its constitution. However sizeable sections of the population, most notably in
the North-East, are yet share the privilege, despite their language comprising a majority in their locality (Kohli, 2001).

**Workforce Diversity**

India’s diverse workforce largely depends on how well it is tactically managed for the effectiveness of organization. India is one of the diverse countries in the world. Its diversity aspects are rooted in the socio-cultural factors and emerging trends in demography. The diversity dimensions are discussed under two heads: socio-cultural dimensions and demographic dimension. Plurality and multiplicity characterize Indian society and culture. India has accommodated and assimilated various outside elements into its growing culture. However, it has never been a ‘melting pot’ in which all differences got dissolved and a uniform identity was created. India is a shining example of a ‘salad bowl’ in which different elements retain their individual identities and yet, together, they form a distinct recipe (Sharma, 2012).

**LITERATURE REVIEW**

**Multiculturism in India and its influence on Indian society**

In India most of the states have some dominant ethno-linguistic and ethno-religious groups (Punjab, Jammu and Kashmir in the North-East), although within each of them there are religious and linguistic minorities (Pandharipande, 2002). The fact that today most of the states of India correspond, by and large, to ethno-linguistic or ethno-religious groups has been achieved through a major reorganisation of territories in the 1950s and 1960s. Given that some kind of ethno-linguistic factor is the prime contributor in according statehood, scholars have tended to see the reorganisation as part of a multicultural state-building process in India (Pandharipande, 2002). This does not mean that each of the reorganised states is unilingual. On the contrary, states are multilingual and diverse. To a great extent the reorganisation process only simplifies the reality. But even throughout India today, linguistic minorities live under a state dominated, not just demographically but in other ways too, by a majority linguistic group. For example Tamil Nadu, one of the early major successes of linguistic (Tamil) sub-nationalism in independent India, had 3,975,561 Telegu speakers (representing 7.1% of the population) in 1991 and 1,208,296 Kannada speakers (2.2%) (Pandharipande 2002). Occasionally minorities speaking unrecognised languages have, with different degrees of success, demanded statehood (Weiner 1989: 45). Such demands have often been made by those linguistic groups mainly concentrated in a particular region of a state where the group has a strong sense of its distinctive identity. The success of such movements has depended on the strength of, amongst other factors, the political formulation of their demands in the eyes of the elites (Mitra and Lewis, 1998).
Given the wide range of variation as already described, it should be impossible to generalise about society, organisations and leaders in India, as it should for organisational and leadership practices in Indian organisations (Singh, 1990). Through his empirical research Singh studied Hofstede's five dimensions and concluded that they vary with age, level of education, size and level of organisation, industrial and economic sectors and the nature of job, location, etc.

A key finding of the study was the lesser use of power in highly industrialised locations. Another major finding was related to economic sector influences. On the power distance measure the scores for PSU, Indian private (Family Managed and Professional) and MNCs were 9, 22 and 0 respectively. On the uncertainty avoidance measure the scores for PSU, FMP and MNCs were 27, 57 and 39 respectively. On the individualism measure the scores for PSU, FMP and MNCs were 19, 6 and 31 respectively. On the masculinity measure the scores for PSU, FMP and MNCs were 33, 31 and 77 respectively. Decisions based on these findings can have a varying impact on the culture of a region.

Singh opines that India, as a highly populous democracy and an important emerging economy, is seeking to modernise and transform its institutions without sacrificing its commitment to economic progress, socio-cultural heterogeneity and traditional social hierarchical values. Implicit to the concept of cultural effect is the notion that societies are considered to vary in terms of the arrangements which their institutions and organisations are composed of, and that these variations reflect their distinctive traditions, values, attitudes and historical experiences. In this regard, culture can be defined as the “crystallisation of history in the thinking, feeling and acting of the present generation” (Hofstede, 1993: 5). Bartlett and Ghoshal (1998) also suggest that the history, infrastructure, resources and culture of a nation state permeate all aspects of life within a given country, including the behaviour of managers in its national organizations.

**Workforce Diversity and Implications for Effectiveness of HRM**

Inspite of growing educational interest in diversity management, it has been taken into consideration that “diversity management” is a poorly understood, increasingly slippery, and controversial concept that is used “in an all-embracing fashion to include not just the social categories of AA [affirmative action] such as race and sex but a wide range of personal characteristics” (Ferner et al., 2005, p. 309). For this paper, we adopt the broad definition of diversity management Arredondo (1996) suggested and Wentling (2000) adopted: “diversity initiatives are defined as specific activities, programmes, policies, and any other formal processes or efforts designed to promote organizational culture change related to diversity”.

It has been instructed that the aim of diversity management is for organizations to be aware of cultural differences; incorporate the ability to acknowledge, accept, and value diversity through organizational intervention to reduce configurations of inequality felt by those not in the majority; and transform
organizational culture and leadership practices so that “members of all socio-cultural backgrounds can contribute and achieve their full potential” (Cox, 1993, p. 225). Diversity management is treated as a better approach than equal opportunity (EO) as it “focuses on valuing people as unique individuals rather than on group-related issues covered by legislation” (CIPD, 2007, p. 6). In congruence with advocates of the importance of strategic HRM to organizational effectiveness, proponents of DM have justified that organizations committed to DM perform better than those that are not (Konrad et al., 2006). Indeed, existing studies have provided some proof to support the idea that strategic diversity management can result in increased HR productivity, such as attracting talent, retention (e.g., Ng & Burke, 2005).

Recent studies conjointly reveal a powerful correlation between diversity and monetary performance. Increasing diversity inclusion in organizations leads to win high talent and improve their client orientation, worker satisfaction, and decision making ability, resulting in a virtuous cycle of accelerating returns. As a result, ITes sector operational within India have long appreciated the requirement to secure these advantages for his or her staff and therefore the future success of their business.

There are many different types and meanings ascribed to the term diversity. Within the broadest sense, diversity is solely the visible variations between staff in age, gender, race, religion, sexual orientation and incapacity. However it’s conjointly the variability of experiences and outlooks every individual worker can have. In this sense, diversity describes the popularity of those variations and, in doing therefore, celebrates them (Nishii et.al 2008).

RESEARCH MODEL

Harrison, Price and Bell Model and its implications on effectiveness of ITes Sector in India

Harrison, Price and Bell model (1998) concentrates on two major types of diversities noteworthy in an organizational context, which every manager should take into account –

Surface level diversity is the differences that are easily evident such as age, gender, ethnicity/race, culture, language, disability etc. Surface level diversity is easy to be noted and managers/recruiters can fall into the malpractice of discrimination based
on these factors. For example, thinking that efficiency reduces with age, they might prefer younger employees. Surface level diversity is commonly tough to vary. For e.g. racial differences cannot be scaled down to zero (Harrison et al 1998)

**Deep level diversity** on the other hand, is not easily noticeable and noted since they are communicated through verbal and non-verbal behaviors over a period of time. Examples are individual variations in attitudes, value system, beliefs and personality. Deep level diversity usually starts with identifying surface level differences and when people gets to know each other, they start noticing the deep level individual differences and have a tendency just to accept or dislike it. Many a times the surface level diversity like educational qualification may give clue to the deep level diversity also like organizational commitment or employee engagement etc. This paper is focusing on exploring this connectivity by the basis of case study model in ITes sector.

Diversity can have both negative and positive impact on work environment in the organization. Negative effects can include miscommunication, creation of barriers, and dysfunctional adaptation behaviors. Positive effects can include building a sound knowledge base with in-house talent, which can make for smoother integration of the organization into foreign cultures.

Diversity management provides strategic competitive advantage. Effectiveness which demands doing things right is an organizational performance factor (Unyimadu, 2006). Therefore, to effectively manage workforce diversity will enable to lowers costs and improve employees' attitudes (Kreitner and Kinichi, 2004). Effectively managed employee diversity has a positive effect on corporate share and profits.

This is because employee diversity reflects consumer diversity (Kreitner and Kinichi, 2004). Researchers such as Richard, 2000 have revealed that workforce diversity promotes creativity, new ways of problem solving and productivity. Similarly, effective education whether full or part time enhances exposure, training and development.

*Kaleidoscope Perspective of the Individual*

Maier (2005) made a point that prior researchers on diversity have focused on limited dimensions and out of these, a few, such as ethnicity, race and gender, are over-emphasized. According to him, an individual can be modeled by a kaleidoscope. Just as a kaleidoscope contains definite amounts of
particles of varied shapes and colors, an individual is composed of various diverse attributes. The individual kaleido-scope can be characterized as a multi-colored pie chart, with each pie reflecting a unique attribute, and size of the pie illustrating the prominence that an individual gives to a particular attribute. On the basis of this viewpoint, Maier defines diversity as, “the variety of kaleido-scope.”

Figure 1: Example of Kaleidoscope compositions of an individual
Source: Diversity at Workplace, HRM Review

Connectivity between Harrison, Price and Bell model and Kaleidoscope model

Harrison, Price and Bell Model talks about surface level and deep level diversity on the other hand Kaleidoscope model talks about the individual kaleido-scope which can be represented as a multi-colored pie chart, with each pie reflecting a unique attribute, and size of the pie focusing the importance that an individual gives to a particular attribute.

One of the major aspects of the kaleidoscope is the surface level diversity which can be connected to the deep level diversity for example with respect to our case study educational qualification and organizational commitment.

According to Ferner et al. 2005, there is a strong relationship between educational level and organizational commitment. This research paper by means of case study model wants to examine if employees with high educational qualifications occupy higher ranks and therefore have more responsibilities which consistently require more commitment to the organization and that educational level may lead to high level of commitment. The employees with professional degrees can also enable to provide their expertise to process management and also enable ITes industries to have a positive brand image in the eyes of potential candidates.

RESEARCH METHODOLOGY

Research philosophy is a belief about the way in which data about a phenomenon should be gathered, analysed and used. The term epistemology (what is known to be true) as opposed to doxology (what
is believed to be true) encompasses the various philosophies of research approach. The purpose of
science, then, is the process of transforming things believed into things known: doxa to episteme.

There are two types of research methods – quantitative and qualitative. In contrast to the qualitative,
quantitative research focuses on measurement and the analysis of causal relationships between
variables rather than processes (Denzin and Lincoln, 2003). Quantitative research has five main
methods, such as social surveys, experiment, official statistics, structured observations and content
analysis (Silverman 2000). Both quantitative and qualitative methods are evaluated from different
perspectives: quantitative research has been described as superior because it is considered objective
and value-free, whereas the qualitative is claimed to be influenced by the researcher’s subjectivity
(Silverman, 2000). In certain cases researchers might share a sense of belonging to the ethno-national
community and consider him/her to be an insider (Coffey et al.,1996), such as in the case of this
research. Quantitative research has also been considered reliable, while in its crisis period qualitative
research has been thought of as unscientific and explanatory (Denzin and Lincoln, 1994).

Research Methodology

Researcher Robert K. Yin defines the case study research method, “as an empirical inquiry that
investigates a contemporary phenomenon within its real-life context; when the boundaries between
 phenomenon and context are not clearly evident; and in which multiple sources of evidence are used”.
(Yin, 1984, p. 23).of complex issues. It can be considered a strong research method particularly when a
holistic, in-depth investigation is required. It is also considered suitable in social sciences, when
research deals with community based problems like poverty, illiteracy etc. It is one of the standard
and accepted tool in many social science studies. (Gulsecen&Kubat, 2006). The paper uses case study
as a research method to illustrate the diversity management in Business Process Outsourcing (BPO)
MNC in India.

Case study research, through reports of past studies, allows the exploration and understanding of
complex issues in a developing country like India. Qualitative case study is rich source of data and is
an appropriate technique especially to answer “how” and “why” research questions. The data
documented in the case study, has been collected using multiple sources and techniques namely
research reports, newspaper articles, observation in various SISSO centers. SISSO is not just an
organization, but a social movement and a revolution in India.

CASE STUDY

Workforce diversity has become an important topic in today’s organizations, as they are becoming
increasingly diverse with respect to their workforce. Diversity exists in an organization when its
members differ from one another along one or more important dimensions (Thomas and Ely, 2001). Diversity should be thought of in terms of degree or level of diversity along relevant dimensions (Dora and Keith, 1998). In business terms, diversity can be defined as a set of differences of individual traits including socio-economic and demographic variables which are noticed both at the surface and deep level in an organization’s various levels (Cox, 1991; Thomas, 1991). Surface level dimensions of diversity include age, ethnicity and culture, gender, race, religion, sexual orientation, and capabilities (Das, and Wagar, 2007). Deeper level dimensions include values, attitudes, leadership styles and adaptability of employees to changing business environment and business challenges. Education, status, language, income levels, etc. Diverse workforce (diversity) refers to the co-existence of people from various socio-cultural backgrounds within the company. Diversity includes factors such as race, gender, age, colour, physical ability, ethnicity, etc. (Kundu and Turan, 1999).

The Indian information technology industry is playing a key role in putting India on the global map. The merits of the workforce diversity has been debated everywhere throughout the world. Workforce diversity and management is on the emerging trend in Indian organizations. Diversity Management has already begun in the Indian IT industry and numerous companies have multiple locations abroad and are realizing the need to develop a global workforce. The need of the talent mix pressurizing the employers of IT companies to attract and to retain diverse workforce. Employers are being urged to embrace diversity and advised against neglecting it. Management scholars warn that while organizations may run the risk of losing their competitive advantage and innovativeness by failing to effectively utilize and manage diversity. The projected changes in organizational demographics combined with employers” concerns about motivating and obtaining satisfactory levels of performance from a diverse group of employees has created an urgency to understand and recognize the value of diversity in all organizations. IT industry is one of the major industries in India, which has embraced workforce diversity as a strategy to remain competitive, innovative and productive in the face of changing demographics and the rapid globalization of business.

Syntel Mumbai - Empowering Diverse Human Assets – Case Study

Syntel has been defined by evolution and innovation, since 1980. From pioneering the global delivery model to implementing the latest digital solutions, Syntel has expanded its geographic footprint, adapted our services, and evolved our core business model to stay ahead of industry and technology trend. Syntel, is headquartered in Michigan, USA having over 30 offices abroad including India and a staff strength of over 22,000 employees and the Mumbai office has about 4,500 employees.

Mumbai is experiencing rapid growth and is one of the financial capital of India. By the fiscal year 2020-21, its GDP per-capita at PPP is expected to reach US $23,000, making it south Asia’s richest city.
Regarding its IT and ITeS-BPO firms and hubs, Mumbai ranks as the second most favoured destination globally for ITeS-BPO services, next only to Bengaluru or the Silicon Valley of India, according to ‘Tholons Top 100 Outsourcing Destinations 2013’. It enjoys a cosmopolitan culture and is home to all the religions and regions of the world. Hinglish is a colloquial spoken English language and the 1750 year old University of Mumbai – and over 0.1 million graduates graduating every year and equal amount of engineers, graduating each year from this coveted Indian university.

Syntel has employed 30% of its workforce in Mumbai is in the age group 18-25 years. Further, r 40% are female employees. More than 5% of employees are from economically backward sector of society and 58% of the employees are from Tier II and Tier III cities (This classification is based on population less than 1 million. Also the company of employing about 5% differently abled employees, as their corporate social responsibility.

The main talent management challenge for a BPO career includes, negative employment image and social stigma attached to this industry. Suggested below mentioned model documents diversity management and inclusion of professionals in Indian BPO industry.

**PROPOSED MODEL, FINDINGS, DISCUSSIONS AND IMPLICATIONS**

*Figure 2: Steps to include diversity in organization*

*Steps to include diversity at the workplace*

*Focusing on qualified individuals*

The perception of the employee about the BPO has to change from being a life style to a career option and diversity inclusion by means of establishing connectivity between educational qualification and organizational commitment can enable the same. One way of doing this is to re-construct the organization structure. The chances to climb the corporate ladder should be made to look bright. Some modification done to this corporate ladder in increasing the number of levels, can give a prospective
picture to the path ahead for a call center agent, and also will aid to change the perception from lifestyle to career, which will control attrition to a reasonable extent.

The BPO industry can work in tandem with the government so that it can start educational institutions on the line of BPO requirement and ensure steady and uninterrupted skilled manpower that will not only keep attrition at bay, but also keep the Indian BPO industry far ahead of its competitors.

*Attracting qualified individuals and designing individual career paths*

Organizations should concentrate on individual career growth of employees and succession planning in the organization. Planning for growth both vertically and horizontally can bring a little reprieve to the employees. For eg. Horizontal growth can be in the form of promoting the employee from simple to more complex processes within the organization. This will enhance the learning of the employee and make him "feel-good". A proper career graph should be charted out with the due consideration to the growth and development of an employee. Promotion with enriched and new title to a job should be lied down in the HR Practices of Industry. So that he/she thinks twice and thrice before switching.

*Build brand name by streamlining corporate culture*

BPO is not considered as a career option by professionals as there is a social stigma attached to it. BPO career includes late night shifts, unhealthy lifestyle, burnout syndrome, and vices, hence there is a need for brand building. BPO firms would do well by defining a concrete corporate hierarchy thereby setting the tone for a proper career path for every employee in the organization. Empowering qualified individuals and creating job diversity is essential to retaining staff in a BPO firm for as long as possible. A career-oriented, valued employee must experience growth opportunities within the organization. This will also lead to process improvement and provide brand name to the BPO which is much required in ITes sector.

*Initiatives to deal with Night Shits*

Different initiatives that can be taken by BPO’S to deal with night shifts include -

Have people from other walks of life to talk about their experiences. Other professions like Army, Medicine, and shop floor workers also have to work in night shifts. Have doctors to advise & guide them about their biological clocks and ways & means to deal with them. Dietary advice with regards to do’s and don’ts can be given. Create the passion that they are doing a yeomen service to the nation by bringing the much-required Foreign Exchange. They are helping people (clients) to make their life easier. Special lights in the office/workplace to ensure their bodies get sufficient vitamin D. One distinct disadvantage of night shifts is the sense of disorientation with friends and family members. Concentrate on this problem and develop innovative solutions and ways to deal with it.
LIMITATION OF RESEARCH
The study is limited to the Metro City of Mumbai the Financial Capital of India. Quantitative study can be done on predicting the relationship between surface level and deep level diversity of the individual followed by comparing it with the longitudinal studies to check the validity.

SCOPE OF FUTURE RESEARCH
Quantitative study can be done on predicting the relationship between surface level and deep level diversity of the individual followed by comparing it with the longitudinal studies to check the validity. The study can be carried out in other sectors also to generalize the findings.

IMPLICATIONS FOR EFFECTIVENESS OF HRM
With the dynamic demographics in today’s employee base, employers are currently featured with new challenges in the workplace. The difficulty of recruiting and retaining a diverse workforce has become a dilemma for Human Resource departments. The composition of the labor force is changing with increasing numbers of women and individuals of diverse race, religion, caste entering the labor market.
Training and development is one of the HR functions that have seen the most impact through magnified levels of diversity in organizations. By means of development of diversity coaching and mentoring programs, Human Resource departments will be able to influence corporate culture, recruitment, compensation, and the performance of the organization’s diverse workforce. Organization’s that considers the ever-changing demographics of their labor force will remain competitive in today’s market. With respect to diversity management the main role of HR should be to train and develop the diverse workforce with focus on employer and employee growth. The key mantra to successful diversity management is dedication by the HR department to create and foster a work environment which reflects respect and growth for all employees. *Strategically handling employee diversity is a value-adding HR function that augments organizational effectiveness.*
Increasing number of studies have developed in the last decade that examine diversity management practices at country and organizational levels (e.g., Dameron& Joffre, 2007; Sowell ,2002). These studies, though, often concentrate on Western countries. Limited studies have examined systematically the degree to which diversity management has been positioned as part of planned HRM across various ownership forms in a less developed country, where the approach to HRM may be less subtle and the diversity management framework may differ considerably from that in the West.
This research paper focuses on multiculturalism and workforce diversity management with focus on ITes sector in India. In conducting the research, it quickly became clear that ITes sector took diversity and inclusion very seriously and that this was not limited to surface level diversity, but focused upon deep level diversity issues also like leadership skills, interpersonal skills, organizational commitment etc. and the connectivity between surface level and deep level diversity.

**CONCLUSION**

ITes sector should develop a healthy long run relation with the possible stake holders which will be helping it uplift the image of industry. This will also enable brand building for the sector as it lacks the same. Diversity management provides strategic competitive advantage. This competence and advantage is generated from the process in which the management of diversity positively affects organizational behavior and effectiveness. So the ITes industry can make use of diversity inclusion in terms of employing qualified individuals as shortfall of talented workforce coupled with a high attrition rate may have a crippling effect on the industry. Ability to arrest attrition, therefore, assumes strategic significance and can be used as a competitive advantage for long-term survival in the industry otherwise industry will be captured with shortage of human capital in coming years.

LEAN INTERNATIONALIZATION OF BORN GLOBAL FIRMS

Neubert, Michael¹; Van Der Krogt, Stijn²

¹International School of Management (ISM), Paris, France
²Universidad Paraguaya Alemana (UPA), Asuncion, Paraguay

ABSTRACT

This study examines the internationalization of high-tech start-up firms (HSF) from small and open economies (SMOPEC). It explores how HSF may differ in their speed of internationalization relying on information collected via interviews with the CEOs or founders of 32 HSF that operate internationally. It uses a comparative cross-national multiple case study research design to answer the research questions. The findings provide the basis for developing propositions for further comparative analyses of the early and fast internationalization of HSF based in emerging and developed markets. The study contributes to the literature on networks, internationalization and international entrepreneurship.

Keywords: High-tech, start-up, small and open economy, early internationalization, fast internationalization, speed of internationalization, born global firm, Uppsala model, Lean internationalization, Paraguay, Switzerland

1 INTRODUCTION

Early and rapid internationalization of high-tech start-up firms (HSF), particularly in the sense of born global firms (BGF) (Cavusgil & Knight, 2015; Coviello, 2015), is one of the topics that has attracted most attention in international entrepreneurship (e.g. Bailetti, 2012), yet is among the least researched. One of the most important characteristics of the BGF is the rapidity and speed of internationalization soon after their incorporation (Acedo & Jones, 2007) and the development of their products and services (Neubert, 2015). So far, the international entrepreneurship field has placed more interest on the process of internationalization and in particular, on the distinct characteristics of firms that internationalize rather rapidly (Acedo & Jones, 2007) and not so much on the reasons for early and fast internationalization (Neubert, 2015).

Early and fast internationalization of BGF is considered as entrepreneurial and risk-seeking (Oviatt & McDougall, 2005). It is often associated with the ability, experience, and willingness of the entrepreneur (Hennart, 2013). Bacq & Coeurderoy (2011) and Verbeke, Amin Zargarzadeh, & Osiyevsky (2014) found evidence that the entrepreneur went through the first phases of the Uppsala internationalization process model (Johanson & Valhne, 2009) before founding the new HSF.
BGF that internationalize early and fast are often HSF with innovative products and services, which operate in a small global market niche (Zucchella, Hagen, Denicolai, & Masucci, 2016; Andersson, Danilovic, & Huang, 2015). They have a higher probability to be located in a small and open economy (SMOPEC) (Luostarinen & Gabrielsson, 2006) with a limited home market potential (Andersson et al., 2015; Cannone & Ughetto, 2014). Due to its small size, HSF are often forced to internationalize early and fast to become profitable (Trudgen & Freeman, 2014). Hence, fast and early internationalization is highly significant (Neubert, 2016b), necessary for survival, and complex. The BGF has to manage innovation processes parallel to international market development with limited resources (Cavusgil & Knight, 2015; D’Angelo, Majocchi, Zucchella, & Buck, 2013; Lemminger, Limkilde Svendsen, Zijdemans, Stavnsager Rasmussen, & Tanev, 2014).

The notion of early and fast internationalization is still not well understood and requires additional research (Acedo and Jones, 2007). Neubert (2016b) and Ciravegna, Lopez, & Kundu (2014) called for research about location effects of HSF based in different economies of Europe and Latin America. In a comparative cross-national multiple case study research design, the results of a previous study about Swiss HSF (Neubert, 2016a) are compared with a sample of Paraguayan HSF. Even though both countries are landlocked SMOPEC with almost no natural resources and a similar population (seven respectively eight million), Paraguay is an emerging and Switzerland a developed economy.

2 LITERATURE REVIEW AND THEORETICAL FRAMEWORK

2.1. The Uppsala internationalization process model

In 1977, Johanson & Vahlne (2009) developed the Uppsala internationalization process model. Their first finding was that firms enter new foreign markets using a so-called establishment chain (Verbeke et al., 2014). In the first step of this gradual internationalization process, firms enter geographically and culturally closer markets (Cavusgil & Knight, 2015; Coviello, 2006; De Villa et al., 2015) with low-risk market entry modes, such as ‘export’, ‘licensing’ or ‘franchising’ in collaboration with a local partner (Neubert, 2016b). With growing international success and market knowledge, they increase their investments establishing for example a wholly owned subsidiary and gradually start to enter more distant foreign markets. Obviously, the level of resources dedicated to a foreign market might also decrease leading for example to a market exit (Neubert, 2011) or a disinvestment, if the market attractiveness is decreasing. Based on this framework, Paraguayan firms are expected to enter foreign markets like Bolivia and Brazil before they export to the European Union, and Swiss firms predominately export to neighboring EU member states like Germany, Austria, France, or Italy.
The second finding is the concept of liability of foreignness. Firms need a firm-specific advantage (FSA) in every new foreign market, which compensates at least for the liability of being a new foreign firm without significant client relationships or sufficient market knowledge. The larger the geographical, administrative, economical, and cultural distance between the home and the foreign market, the larger is the liability of foreignness (Johanson & Vahlne, 2009) and the bigger the FSA needs to be. Local partners like distributors or resellers help to bridge these differences. The speed of internationalization depends on the speed of learning (Johanson & Vahlne, 2009) about every new foreign market. This means that the firm must be able to transfer its FSA to a sustainable and relevant competitive advantage in every new foreign market to cover the cost or the liability of foreignness (Johanson & Vahlne, 2009).

In 2009, Johanson & Valhne (2009) revised the Uppsala internationalization process model and introduced the concept of liability of outsidership. This concept reflects the increasing importance of networks (Johanson & Valhne, 2009; Coviello, 2006) and tries to explain the internationalization of BGF. As the main market entry barrier for BGF is the access to client networks and to market opportunities. Thus, the speed of internationalization depends on their ability to develop these local networks and market opportunities into a new client relationship.

According to Johanson & Valhne (2009), the Uppsala model can also be applied to firms that start to internationalize soon after their birth like BGF (Cavusgil & Knight, 2015). A BGF, as defined by Cavusgil & Knight (2015), is a young firm that is active through early export sales (Cavusgil & Knight, 2015; Coviello, 2015). The market entry mode ‘export’ is also the first step in the establishment chain of the Uppsala model (Johanson & Vahlne, 2009).

2.2 A new type of firm – The born global firm

Most empirical research on early and fast internationalization focus on HSF in the sense of BGF (Servantie, Cabrol, Guieu, & Boissin, 2016). A BGF (Cavusgil & Knight, 2015; Knight & Liesch, 2016 is a young firm that is active through early export sales (Coviello, 2015). Thus, the BGF concept focuses on a market-seeking internationalization strategy using for example a global exporter internationalization model (Neubert, 2013a). This is the link with the establishment chain of the Uppsala internationalization process model (Johanson & Vahlne, 2009). Both concepts focus on the market entry mode ‘export’ as a first step to enter a new foreign market. Further, the word ‘global’ in BGF should not be understood in the sense that BGF export immediately to all global markets. Often, BGF start to export to a limited number of the most attractive markets or to a region like for example a free-trade area (Coviello, 2015).

2.3 Early and fast internationalization
In 2015, Cavusgil & Knight wrote that the internationalization of BGF might challenge the traditional Uppsala internationalization process model. According to Johanson & Vahlne (2009), the Uppsala model can also be applied to firms that start to internationalize soon after their birth like INV (Oviatt & McDougall, 2005), LGS (Rasmussen & Tanev, 2015) and BGF (Cavusgil & Knight, 2015), because the speed of internationalization depends on the firms' ability to learn about new foreign markets and to adapt its FSA to the respective market needs. Due to advances in communication and transportation technologies and the emergence of global social networks (Coviello, 2015) even firms from traditional industries might internationalize faster and earlier.

Cavusgil & Knight (2015) developed a list with a number of drivers for fast and early internationalization. First, there are internal characteristics, which drive internationalization. Agile and adaptable HSF with profitable high quality products and services, and strong marketing and sales capabilities internationalize earlier and faster. Further, Cavusgil & Knight (2015) mention the abilities of the entrepreneur like international experience, the existence of a global vision, innovativeness (Casillas & Moreno-Menendez, 2014), or entrepreneurial and market orientation. Romanello & Chiareseio (2016a; 2016b) point out the entrepreneurial capabilities like networking, opportunity creation (Zucchella et al. 2016), and product promotion play an important role during the early market entry stage (Neubert, 2016b). Thus, the ability to acquire new clients in new foreign markets is a required key competence for an international entrepreneur. Depending on the personality of the decision-maker and market conditions, the respective processes are well structured or rather unplanned (Nummela, Saarenketo, Jovela, & Loane, 2014).

2.4 Influence of the location on the speed of internationalization

Multiple authors call for further research about the effect of BGF's home country on the speed of internationalization (Knight & Liesch, 2016; Hitt, Li, & Xu, 2016), because findings from studies, which analyze the fast and early internationalization of high-tech firms from developed economies, are not necessarily transferable to emerging economies (Zander, McDougall-Covin, & Rose, 2015). So far, there is still little research focusing on BGF from EE (Gonzalez-Perez, Manotas, & Ciravegna, 2016). The existing studies of for example Musteen, Datta, & Butts (2014) and Ciravegna, Lopez, & Kundu (2014) emphasized the importance of social networks respectively the networking ability of the entrepreneur as driver for the speed of internationalization. Hitt et al. (2016) and Zucchella, et al. (2016) found out that the reputation of the home country and the quality of institutions also influence early and fast internationalization.
3 RESEARCH METHOD

3.1 Research questions

The statement of the research problem has led to the following two research questions:

- **Research question 1.** What are the perceptions of subject matter experts about the significance of early and fast internationalization for high-tech firms?

- **Research question 2.** What are the perceptions of subject matter experts about how high-tech firms may differ in their speed of internationalization?

3.2 Method

The choice of the research method is based on the purpose of this study. This study uses a comparative cross-national multiple case study research design to answer the explanatory (= how/why) research questions (Yin, 2014). According to Hennart (2013), a qualitative comparative case study research would help to answer the research question. In contrast to an experimental design or a survey, a multiple case study has more flexibility (Stake, 2010), allows an in-depth analysis of a complex research problem (Yin, 2014) within a highly contextualized environment (Rosenberg & Yates, 2007), and a comparison between different cases and countries (Baxter & Jack, 2008). The primary source for data collection is qualitative, semi-structured, in-depth, face-to-face interviews with SMEs (Yin, 2014). The data of the Swiss sample was collected in July and August 2015. The data of the Paraguayan sample was collected in October and November 2016 using the same research design.

3.3 Sample

The choice of the sampling strategy is based on the purpose of this study. This study uses a purposive case selection strategy (Seawright & Gerring, 2008), because it produces a representative sample (Seawright & Gerring, 2008) with typical and successful examples of the total population. After a random sample (= probability sampling) is drawn from a database of Swiss and Paraguayan HSF (Zikmund, Babin, & Carr, 2012), the typical cases of the sample are selected (Seawright & Gerring, 2008). According to Eisenhardt (1989) and Yin (2014), this sampling strategy produces a statistically representative sample, if at least six to ten cases are selected. This study uses a sample size of twenty Swiss and twelve Paraguayan cases to allow a better triangulation of data and to strengthen the results of the whole study (Yin, 2014).
4 FINDINGS

The results of this comparative cross-national multiple case study are presented in this chapter to answer the research questions individually. First, the findings of the survey from Switzerland are presented. Second, the findings of the survey from Paraguay are presented.

4.1 RQ1: Significance of early and fast internationalization

The analysis of the data collected from the SME interviews revealed the following themes. These themes individually and together will answer the research question one.

4.1.1 Findings from Switzerland

Early and fast internationalization is considered essential for the survival of HSF from SMOPECs like Switzerland due to the small size of its home market (Neubert, 2016a; Zander et al., 2015). Consequently, early and fast internationalization is part of the business model as well as the strategic and financial plan (Neubert, 2016a; Andersson et al., 2015; Cannone and Ughetto, 2014). Investors use these documents to calculate the corporate value, to invest, and to hold the founders accountable, if they are not reaching the planned and agreed goals (Neubert, 2016a).

The study of Neubert (2016a) revealed that Swiss HSF face significant delays of in average two and more years in the execution of their international market development activities in comparison to the time originally planned in their business plans. This comparison is based on the business plan, which the SME have used to calculate the valuation of their HSF for their last external capital increase before internationalization. The reasons are an often unstructured and unplanned internationalization process (Neubert, 2016a), unexpected long sales cycles (Neubert, 2016a), and missing resources.

Despite of these delays HSF couldn’t benefit from government programs like for example export guarantees and export support due to program restrictions and missing expertise (Neubert, 2016a). This information is highly important because many SMOPEC invest significant resources in the development of a national HSF sector (Trudgen and Freeman, 2014; Almor, 2013). While policy makers have a national perspective, and support the local creation of new jobs and economic growth (Gerschewski et al., 2014), SME have a global perspective on their HSF.

4.1.2 Findings from Paraguay

Early and fast internationalization is considered essential for the survival of HSF from SMOPEC: Especially younger HSF with internationally experienced and educated founders and investors and above the average size consider early and fast internationalization as essential for the survival of HSF from SMOPEC like Paraguay.

Immediate internationalization is part of the business plan of 58% of all SME: Due to an less developed professional private equity and venture capital market, Paraguayan HSF rely on their family, friends,
and founders to finance their start-ups. Especially friends and business angels are quite conservative, risk averse, and lack international experience. Consequently, they don’t push hard for early and fast internationalization.

Paraguayan HSF don’t ask for financial support from the government or from government agencies: However, they would appreciate (indirect) support in the sense of a better technical training and international promotion.

Paraguayan HSF face significant delays in the execution of their international market development activities in comparison to the time planned in their business plans: The majority of the SME indicate that a lack of resources like for example specialized human resources, and higher required quality standards abroad are the main reasons for delays.

Paraguayan HSF are starting to internationalize in neighboring markets like Bolivia and Brazil using low risk market entry modes like export in combination with strong local distribution partners and/ or they are following their existing clients. This research finding confirms the Uppsala internationalization process model (Johansen & Vahlne, 2009).

Paraguayan HSF are born regionals, because they internationalize within their home continent (Gabrielsson, Gabrielsson, & Dimitratos, 2014). There are some younger HSF with internationally experienced founders, which might also be considered as born global (Cavusgil & Knight, 2015).

4.2 RQ2: Difference in the speed of internationalization

The analysis of the data collected from the SME interviews revealed the following themes. These themes individually and together will answer the research question two.

4.2.1 Findings from Switzerland

Swiss HSF differ in their speed of internationalization due to the timing of the recruitment of international sales managers (Neubert, 2016b), because they bring in a market perspective, experience, and a network of potential clients. International sales managers acquire the first clients and distributors, and maintain long-term relationships with them (Kumar & Yakhlef, 2015). This is especially important, if the founders have no sales background.

Another driver of the speed of internationalization is the existence of market opportunities (Neubert, 2016b). These market opportunities (Coviello, 2006; Gabrielsson et al., 2014) are created based on the existing network of the management team, investors, or the sales management team. In a quite unstructured process, the existing networks are leveraged to grab low hanging fruits and to generate quick wins in the sense of showcase projects or lead users (Neubert, 2016b).

The size of their home market (Zander et al., 2015) is the third driver for the speed of internationalization. A small home market increases the pressure to internationalize early and fast.
(Neubert, 2016b). Therefore, founders from SMOPECs only use business models with IP protected and innovative products, which are globally scalable respectively focus on value chain activities with lower market entry barriers (Neubert, 2016b), and implement structured internationalization processes soon after incorporation (Neubert, 2011; 2013a; 2013b; Zander et al., 2015).

Based on a first mover niche market strategy (Neubert, 2016b), Swiss HSF use less resource-intensive market entry modes like export, licensing, and franchising (Neubert, 2016b; Almor, 2013), because they allow for a faster global market penetration and the simultaneous entry in several markets (Neubert, 2015).

4.2.2 Findings from Paraguay

Paraguayan HSF differ in their speed of internationalization due to the following reasons. They acknowledge the importance of an international strategy and a well-structured market development process before going abroad. However, in practice they often follow their clients, use their network, and exploit market opportunities without analyzing the market attractiveness. This unplanned internationalization often results in reduced speed of internationalization.

Second, Paraguayan HSF prefer to cooperate with local distributors instead of developing their own network or depending on market opportunities abroad. Thus, the access to competent local partners is a key driver for the speed of internationalization.

More than 75% of all SME are aware that a Paraguayan HSF needs to offer a unique, innovative, and high quality niche market product at attractive prices to be competitive abroad. They understand that the FSA must be higher than the liability of outsidership in the foreign market.

The availability and the access to qualified human resources in the product development and client service department is also crucial. Thus, most SME call for government support to increase the quality and quantity of graduates with technical degrees.

The fifth and final reason for a difference in speed of internationalization are product characteristics. One example is the IT industry. Paraguayan HSF, which develop high quality cloud based applications as plug-in of an ERP system internationalize earlier and faster than developers of fully integrated, stand-alone software products.

5 CONCLUSIONS

This study provides new evidence on the speed of internationalization of HSF from emerging and developed SMOPEC. It analyses how these BGF differ in their speed of internationalization using a comparative cross-national multiple case study research design with 32 SME interviews as primary source for data collection.
Switzerland is a developed economy. The brand “Swiss made” has an excellent reputation for high technology products, quality, and reliability. The access to capital and the existence of powerful research institutions has led to a diverse start-up ecosystem with HSF from different industries (e.g. medtech, biotech, IT). The reputation and the framework conditions of a location is one important driver for the speed of internationalization. HSF from emerging economies are mainly from the IT industry focusing on application research based on technologies from developed countries. Chen, Saarenketo, & Puutalainen (2016) call it the liability of their country of origin in comparison to developed markets.

In spite of the differences that distinguish both countries-of-origin, the vast majority of both Swiss and Paraguayan SME consider early and fast internationalization as important for the enduring survival of their HSF. It would be interesting to expand this finding to other emerging and developed economies.

Both, Paraguayan and Swiss HSF face significant delays in the execution of their international market development activities in comparison to the time estimated in their business plans. The main reason is an often unstructured and unplanned internationalization behavior. HSF often enter new markets based on their networks, use market opportunities or follow existing clients without analyzing the attractiveness of foreign markets.

Most SME understand that this unstructured internationalization behavior reduces the speed of internationalization. They acknowledge the importance of a structured market development process starting from a detailed evaluation and selection of foreign markets before they actually enter them.

While Paraguayan HSF start their internationalization primarily in neighboring countries, Swiss HSF have a global approach.

HSF from both samples apply an establishment chain using low risk and low cost market entry modes like ‘licensing’ or ‘export with local distributors’ to increase the speed of internationalization. They adapt their products and pricing strategies to local market needs, focus on market niches to speed up internationalization and to create a FSA, which compensates for the liability of foreignness and outsidership.

The findings of this study contribute to the field of research of international entrepreneurship, because researchers will gain a better understanding of how and why HSF from SMOPEC differ in their speed of internationalization. The findings of this study contribute to managerial practice, because they will help managers to increase the efficiency of international market development.

THE ROLE OF BUSINESS MODELS IN THE INTERNATIONAL GROWTH PATH OF STARTUPS

Onetti, Alberto 1; Pisoni, Alessia 1; Riva, Giada2

1 Department of Economics, University of Insubria, Varese, Italy
2 CrESIT, University of Insubria, Varese, Italy

ABSTRACT

Despite a significant body of research focused on the variances of startup growth rate, the aspect of analysis related to how - i.e. the unique way to maximize the resource base of the startup (core activities organization) - and “where” international growth occurs has been insofar largely overlooked by scholars. Startups creation through the implementation of new innovative value propositions and business models that enable the company growth at global level need to be further investigated. Business models design and implementation appear to be of crucial importance in startups survival and growth. The present study is based on a single case-study analysis and follows an exploratory and qualitative methodology. The paper aims at analysing the business model of a new venture operating in the ICT industry that showed a fast and praecox internationalization. We thus interview the CEO/founder, who plays a crucial role in defining the international approach of the company, especially for startups. In this respect, the analysis of the business model of an innovative technology-based startup showing fast and praecox internationalization could be particularly useful in shed new light on how and where startups growth occurs. In doing so, it is also possible to investigate how company’s day-by-day decisions affect business model evolution. Managerial implications, limitations and future research directions conclude the article.

Keywords: business model; international growth; startup; web-based company; CEO.

1. INTRODUCTION

In recent years, there has been a growing interest towards startups. As pointed out by different scholars (Stangler and Kedrosky, 2010; Kane, 2010) startups are accountable for almost all the new jobs created in the United States (about 63%). However, to contribute to economic growth, startups are supposed to survive, break the early stage barrier and scale-up at international level (Pisoni and Onetti, 2016). Scholars involved in the field of Entrepreneurship - and specifically International Entrepreneurship (IE) - have studied companies’ international growth paths for many years (Coviello
and Jones, 2004; Rialp et al., 2005; Gupta et al., 2013). Despite a significant body of research focused on the variances of startup growth rate, the aspect of analysis related to how and where growth occurs has been insofar largely overlooked by scholars (Gilbert et al., 2006). In this respect, startups creation through the implementation of new innovative value propositions and business models (Onetti et al., 2012) that enable the company growth at global level need to be further investigated. Business models design and implementation appear to be of crucial importance in startups survival and growth (Onetti et al., 2012; Onetti and Zucchella, 2014). Recent researches approach the study of startups international growth path by adopting the business models framework (Bouncken et al., 2015; Rasmussen, 2016; Rask, 2014). The business model approach focuses on the holistic view of the firm’s core activities and argues that the ability and speed of the firm to adapt to foreign markets relies on effective business model design and implementation.

In this respect, the analysis of startups business model could be particularly useful in understanding how, i.e. the unique way to maximize the resource base of the startup (core activities organization), and where international startup growth occurs. The framework we have developed for the business model analysis also represents a basis on which further debate and case studies may be built.

The remainder of the paper is structured as follows. The first section introduces the theoretical framework and provides a comprehensively review of the relevant literature on business model. Following this theoretical context, the research framework and methodology is presented. The discussion and conclusion summarize the results and conclude with managerial/research implications and future research directions.

2. THEORETICAL FRAMEWORK

2.1 Business Model Definition: State of the Art

Notwithstanding the increasing adoption of the business model concept, in the academic literature there is no agreement about a general framework definition. This problem is not new. Over the years, various authors have tried to address this problem by comparing different definitions and mapping business model components in order to provide an attempt of common framework. In this respect, Shafer et al. (2005) reviewed the relevant literature, covering 12 publications from the years 1998-2002.

Analysing these definitions, the authors mapped 42 different elements that represent the substrate of the business model definition. The output of this article is an affinity diagram which groups the 20 components cited two or more times into four categories: “strategic choices”, “value network”, “create value” and “capture value”. Later on, Morris et al. (2005) carried out a content analysis on 30 definitions, identifying three major categories of definitions, i.e. economic, strategic and operational.

The authors mapped 24 items; of these ones, 15 were cited in the literature two or more times. From
the analysis arises a general framework, composed of six factors, “factors related to the offering”, “market factors”, “internal capabilities factors”, “competitive strategy factors”, “economic factors” and “personal/investor factors”.

More recently, Wirtz (2011) proposed a new attempt to systematize the existing business model literature. In particular the investigated dimensions are: the business model concept (definitions & scope); the business model structure (forms & components, value system, actors & interaction, innovation); and the business model management process (design, implementation, operation, change & evolution, performance & controlling). Later on, to test the above-presented framework, a survey was submitted to scientists involved with business model (Wirtz et al., 2015). As a result, business model innovation, evolution and design appear to be the three more important areas of study for the future development of the business model research field.

Notwithstanding the significant amount of research insofar carried out on business models, scholars are still debating about the relationship between business model and strategy as well as between business model and corporate processes. On the one hand, some authors consider the business model as the goal of the strategy: concrete choices design the operational logics of a company and its ability to create value (Casadesus-Masanell and Ricart, 2010). On the other hand, other scholars clearly mark the difference between the business model and company’s strategy. Under this point of view, strategy has a more static valence. While the traditional concept of strategy tends to describe strategic positioning, the business model represents a dynamic and radical transformation in the market position (Yip, 2004). By contrast, according to George and Bock (2011) strategy is a dynamic set of activities, initiatives and processes, while a business model is a static configuration of organizational elements and activities. Implementing a business model may change the organization itself, but it is worth noting that business models are opportunity-centric, while strategy is competitor or environment centric.

As regards the relationship between business model and strategy, Osterwalder (2004) theorizes the business model concept recurring to a three layers framework. The first layer - the strategy - considers all planning activities. In this layer, companies deal with vision, goals and objectives. The second layer - the business model - is an architectural layer, in which companies schematize their value architecture and the logics to earn money. The last layer - the processes - represents the implementation level, in which companies organize the workflow. In the above-described framework proposed by Osterwalder, the business model represents the connection among business strategy, business organization and ICT. This triangle is influenced by external forces, such as social environment, legal environment, competitive forces, customer demand and technological change. It follows that is of key
importance for managers to design and rapidly adapt the business model to the above mentioned external forces.

Along the years, scholars have also considered the business model concept as a systemic and holistic activity system able to connect individual actions and organizational activities to company performance (Zott and Amit, 2010). Also Chesbrough (2010) pointed out the barriers to business model innovation and the importance of attitude toward business model experimentation. In this respect, businesses face significant barriers to business model experimentation. The business model concept has been adopted trying to explain companies’ performance, in terms of value creation and competitive advantage. The topic has been addressed also by operations management scholars. Among the others, Lee (2004) underlined how radical changes in some parts of a firm’s business model could improve company’s performance.

Another interesting issue addressed by scholars is the business model sustainability. Teece (2010) considers the implementation of a successful business model as a contingency competitive advantage, since it could be copied and shared among competitors. In this perspective, the business model is a more generic concept than strategy and it is more difficult to protect. Therefore, business models must be highly differentiated and difficult to replicate. In doing so, it is possible to avoid or limit copycat behaviours by creating a business model that requires systems, processes and assets hard to replicate and by maintaining a level of opacity that makes it difficult for outsiders to understand in detail how a business model works.

As shown above, business model is a useful tool to link opportunities to organizational changes, and to analyse the development of routines. In this perspective, it could be interesting to study company growth by adopting the business model framework.

2.2 Company Growth: The Stages Model Approach

Similarly to stages models and life-cycle theories, business models could be used to represent the growth path of companies. Enterprise growth has been studied by scholars for many years (Gupta et al., 2013). Among the others, the well-known five stages model proposed by Churchill and Lewis (1983) affirmed that all companies pass through five stages of development, growing gradually in terms of sales (or failing in the attempt). Each stage is characterized by five managerial factors: extent of formal systems, major strategic goals, managerial style, organizational structure and the owner’s involvement in the business, that change in importance in relation to the company’s growth. Furthermore, Christensen and Scott (1964) theorized a three stages model in which companies evolve from a one-unit management with no specialized organizational parts to multiple operating units, passing through a one-unit management with some functional parts. Later on, Lawrence (1969)
presented a four stages model based on direct supervision, supervised supervision, indirect control and divisional organization. A different five stages framework was theorized by Greiner (1972), who linked each stage of the company’s lifecycle to the management style and related managerial problems.

Furthermore, Cardon et al. (2005) propose to analyze the stages in the entrepreneurial procreation process by applying parenthood as a metaphor for entrepreneurship, i.e. comparing the founding of a new firm to the birth of a child. Through this metaphor, they explore a preliminary stage of conception and gestation followed by infancy, toddlerhood, childhood, adolescence - growth and maturity. Focusing on entrepreneurial exit as a critical component of the entrepreneurial process, DeTienne (2010) expanded the model proposed by Cardon et al. (2005) by including also entrepreneurial exit. For high-growth ventures, exit is often considered as the ultimate goal of building a profitable venture aiming at a successful exit to satisfy liquidity demand of both entrepreneur(s) and investors. He analyses the entrepreneurial process in different phases conception and gestation, infancy, adolescence and maturity, acknowledging that entrepreneurial exit may occur at any time during the entrepreneurial process.

All these models are based on the assumption that companies are similar to organisms, characterized by a sort of genetic code embedded in them that drives the development, as a pre-established path to be achieved. This assumption is not coherent with the current competitive scenario, in which companies often anticipate their environment or contribute to modify it, and eventually could represent a barrier to managerial research (Pfeffer, 1993). A step forward in the research of companies growth and performance - in particular of entrepreneurial ones - has been addressed by Levie and Lichtenstein (2010) who introduced a dynamic states model. According to them, stages model may evolve towards the analysis of viable business models, able to convert environmental threats and opportunities into value.

2.3 Company Growth: The Business Models Perspective

As previously mentioned, one of the key aspects of a business model is dynamism. In this respect, business model connects strategy with value creation and market changes to gain competitive advantage. Business model dynamism has been studied by scholars under different perspectives. According to Nicholls-Nixon et al. (2000), business model is a tool helping entrepreneurs in continuously matching internal competencies and capabilities with external opportunities and threats. Svejenova et al. (2010) study the dynamic nature of business models and the mechanisms associated with their changes over time. Furthermore, business models are tools that can drive innovation and change within organizations, as point out by Demil and Lecocq (2010). The focus is more internal and
takes into consideration a company’s portfolio of resources and competences. The ability of an entrepreneur to manage business model innovation is strictly linked with the exploration and exploitation processes (Mason and Leek, 2008) and dynamic capabilities (Achtenhagen et al., 2013; Bock et al., 2012).

By managing internal resources, companies are able to modify and evolve their business model, while offering new value propositions to their customers. The evolutionary vision of the business model is related to its ability to recognize the continuous state of disequilibrium in a company’s lifecycle. In this perspective, business model can be considered as the general framework, which does not evolve following a pre-defined path. A recent contribution of Achtenhagen et al. (2013) points out the need of business models to change over time, continuously adapting to the uncertain competitive scenario and strengthening the relationships among strategic actions and critical capabilities. It follows that managers need to take into consideration the diagnosis and feedback loops in order to achieve sustainable value creation. Effective business models generate virtuous cycle, in which feedback loops are self-reinforcing and creating a dynamic similar to that of network effects (Casadesus-Masany and Ricart, 2011). The feedback loops pull managers to reorient the company’s business model, or to dramatically change the strategy (at business or corporate level).

From the business model perspective, company survival and growth depend on effective design, implementation and re-orientation. Business model related decisions encompass core activities organization and resources allocation, but also decisions about location of activities. By including the latter aspect – location choices – in the business model framework, it is possible to study also the international growth path of innovative technology-based startups. A business model framework – centered on company activities, in terms of “focus”, “modus” and “locus” – is proposed by Onetti, Zucchella, Jones and McDougall-Covin (2012). By adopting this framework it is possible to study ‘how’ and ‘where’ startups growth (Onetti and Zucchella, 2014).

Specifically, Onetti, Zucchella, Jones and McDougall-Covin (2012) developed a framework that groups business model components into four different levels. The authors included in their analysis 48 definitions identified in the literature, shrinking the 42 components identified down to a shorter list of 26. At the top level there are mission and objectives, which define the long-term direction of a company. Strategy belongs to the upper level of the business decision process, since it selects the businesses (corporate strategy) with which to compete and defines how to position for each of them (business strategy). Although, for successful execution, a business model is required, to support/design the comprehensive set of decisions that jointly determines and shapes the company’s activities architecture. A business model defines otherwise how to execute the strategy, representing the firm’s strategic choices in terms of “focus”, “modus” and “locus” (Onetti and Zucchella, 2014).
While focus considers the allocation of resources among activities, modus performs the related integration-outsourcing decisions. According to this framework, locus represents the critical aspect involved in any business model decision, due to the growing importance of clustering and spillovers phenomena. In this respect, location decisions can open up new business opportunities or develop new partnerships. Business model may change over time. Company’s day-by-day decisions affect focus, modus and locus. Each decision, separately considered is not necessarily a radical change, they are often just a fine-tuning of prior decisions. The sum of these decisions may radically change the way the company works and its business model.

3. RESEARCH METHODOLOGY

In order to analyse the international growth path of new ventures adopting the business model perspective, we focus our research on a single-case study. In doing so, we follow an exploratory and qualitative methodology (Corbin and Strauss, 1990; Eisenhard, 1989; Yin, 1989, 1998, 2003; Maxwell, 1996, 1998). In order to assure the validity and reliability of the research, design and analytical requirements were followed (Yin, 1994). First, we defined a protocol according to the theoretical framework to be tested prior to the interview phase; the target company was then interviewed following the same defined structure specifically built for the research.

By adopting the above-described business model framework developed by Onetti, Zucchella, Jones and McDougall-Covin (2012) - namely “focus”, “locus”, “modus” approach - we developed a semi-structured questionnaire for interviewing the CEO. Accordingly, we asked the interviewee to prioritize activities, which are critical to create value. We decided to interview the Chief Executive Officer (CEO), who is usually the founder of the startup and, in the early stages, the key figure and decision maker for the company (Papadakis and Barwise, 2002). Furthermore, strategy and strategic orientations are strictly linked to the mindset and individual-related characteristics of the CEO, that represent usually the most important and compelling person of the founders’ team (Papadakis and Barwise, 2002; Miller and Toulouse, 1986; Kisfalvi, 2002). It follows that business model decisions resides in the mind of the CEO-founder, who can choose among alternative business model configurations on the basis of his/her perception of external competitive scenario.

We conducted an open-ended and semi-structured interview at the executive level (founder/CEO). The interview was recorded and then transcribed into a text format, resulting in 32 pages of textual material. We then integrated the interview with multiple sources of secondary information, e.g., corporate documents, websites and press releases, which provide more accurate and unbiased information. Moreover, several data about the industry and the market in which the firm operates were collected from articles, websites and other sources of information. Relying on different sources of
information allows data triangulation to ensure the validity of the study and to obtain a more comprehensive and accurate view of the topic analysed.

To provide an insightful picture of the company along the crucial stages of its international growth path, we analysed the business model during two different periods of the startup’s life: at the foundation phase in 2011, and in 2014, when the startup was characterized by systematic international growth.

4. CASE STUDY DESCRIPTION AND DISCUSSION

The startup selected for the business model analysis is Spreaker. The company provides a web and mobile app to broadcast live audio content. It enables users to create tracks, podcasts and playlists, upload files, and distribute them to social networks such as iTunes, YouTube, Facebook, and more. Furthermore, all the podcasters can participate in and interact with a rich community of audio creators and listeners. Currently, the company is continuously looking for new business opportunities and it aims at taking advantage from the crisis of old technologies in the audio online market.

Spreaker was founded in 2009 in Bologna (Italy) by three Italian entrepreneurs, but shortly thereafter, in 2011, the cofounders established a new company in San Francisco, namely Spreaker Inc. The main reasons for headquarters relocation concern the local market opportunities, as well as the exploitation of the American legislations in term of music royalties licensing and stock option compensation. The Italian branch has absorbed all the initial costs for setting up a company and has enabled the founders to collect the financing for further growth, while the US-based company, has carried out the commercial activities.

At the moment of foundation, the entrepreneurial team was composed by three founders, who are serial entrepreneurs, since they have previously founded other companies, in which they are no more involved. At the moment of the interview, there are only two out the three original founders, i.e. the CEO and the CTO. One founder of the original team left the company.

Table 1 provides a brief description of the activities initially performed by Spreaker, in the very early-stage of the company. As previously mentioned, the framework adopted to analyse Spreaker’s business model is the one proposed by Onetti and Zucchella (2012; 2014). The business model analysis is of crucial importance to study company survival and growth (Onetti et al., 2012) and is therefore particularly suitable to understand how and where company’s growth occurs (Bouncken et al., 2015; Rasmussen, 2016). In this respect, how and where have been explored by analysing focus/modus and locus decisions implemented by the company under investigation. According to the business model framework proposed by Onetti and Zucchella (2012, 2014), the interviewee has been asked to evaluate
on a “1 (low) to 10 (high)” scale the importance of each activity performed, also considering the resources allocated in each different business activity and location.

Table 1 – Spreaker’s business model in 2011

The aforementioned activities are those related to the execution of the company’s business model. Since funding at the initial stage of a startup is usually a scarce resource, the management has to evaluate the activities’ priority according to an order of importance. In this respect, at the beginning of Spreaker’s life cycle, the firm’s focus was on the development of a valuable product. Activities such as product development and product design had the highest priority, as well as seeking external funding since the company was not profitable yet; efforts on marketing activity were marginal.

The international-oriented mindset of the founders, push them to look for investments either in Italy or in the US, although the main investors of Spreaker were Italian business angels.

4.1 Business model evolution

The analysis of the company’s business model under a dynamic point of view, i.e. focusing on its changes over time, has been stressed by scholars as being crucial to understand the way entrepreneurs match internal competencies and capabilities with external opportunities and changes (Svejenova et al., 2010; Nicholls-Nixon et al., 2000; Achtenhagen, 2013). The business model framework we adopted for our analysis is particularly helpful to study the company “evolution” over time, since it clearly shows how companies modify their business model by continuously adapting their activities’ focus/modus and locus decisions to the competitive scenario (Onetti and Zucchella, 2014; Bouncken et al., 2015).

The product developed by Spreaker is able to serve the global market since the beginning. However, along the years, the business model has slightly changed. The strategic importance of the marketing
activity has increased, and new operations such as the so-called “flitcher list” and external communication have been introduced starting from 2014.

Table 2 – Spreaker’s business model in 2014

At this stage, the company has decided to focus on activities such as marketing and external communications, as well as on further service’s development in order to increase the users base and consequently the profits’ margins. The acquisition of new clients is pursued by strengthening external relations rather than through the offering of new services. Moreover, as regards Spreaker’s future activities, the interviewee point out that company’s plans are to focus on marketing and commercialization, rather than on technology development, by only adding marginal incremental innovation to the existing product.

As previously mentioned, business model related decisions encompass activities organization and resources allocation, but also decisions about activities localization. By analysing also the latter aspect, it is possible to study the company’s international growth path, i.e. the “where” question.

As regards Spreaker’s location choices, the headquarters have been moved to the United States early after company’s inception, and at the same time an office in Berlin was also established. The main reasons for headquarters relocation in the US concern the fact that the American audio online market was wider and homogeneous, and the service offered by Spreaker has more chance to exponentially grow. In this respect, in Italy – in 2011 - there were few instruments for the online payments that allowed the monthly subscription. The reasons behind the choice of opening a German-based office were mainly due to the search of high-qualified employees with software development skills.
Notwithstanding the relocation of the headquarters, Spreaker is still performing some operational activities from its Italian office.

Graph 1 and 2 summarize the main activities performed by Spreaker at the time of foundation (2011) and at the time of the interview (2014). In doing so, we focus the analysis on the “locus” and “focus” aspects, since as regards “modus”, the vast majority of activities are performed by the company itself without partnerships. According to the proposed business model framework of analysis (Onetti et al., 2012; Onetti and Zucchella, 2014), as previously mentioned, the interviewee has been asked to evaluate on a “1 to 10” - scale the importance of each activity performed, in terms of resources allocated in each different business activity and location.

Graph 1 – Business model “focus” and “locus” perspective in 2011

As a consequence of the above-mentioned company’s development, in 2014, Spreaker’s main focus shifted towards marketing and communication activities. The outcome of such a decision is an increase of resource allocation - and attention - towards the US location, representing the US also the main market of the company.
5. CONCLUSIONS

Despite a significant body of research focused on the variances of startup growth rate, the aspect of analysis related to how and where growth occurs has been sofar largely overlooked by scholars (Gilbert et al., 2006). In this respect, the study of the business model architecture could help in filling this gap by identifying which are the critical aspects/business model decisions that influence the company growth at global level. In doing so, we adopted the business model framework developed by Onetti and Zucchella (2012; 2014), which specifically analyses company activities in terms of “focus”, “modus” and “locus” decisions.

The startup selected for our conceptualization, namely Spreaker, shows how “focus/modus” and “locus” decisions are strictly intertwined. Activity location decisions at the early stage of development of company life cycle appear to be crucial to boost the company’s scale-up at international level. Spreaker started the business in Italy in 2009 (stand-up phase) when the founders showed their willingness to build a scalable business and started to raise initial financing from business angels. However, as previously said, the main commercial operations started in 2011 (start-up phase) when the company moved the headquarters to San Francisco and focused its efforts and resources to enter that market. In addition to this, also a Berlin-based office was established to carry out mainly operational and administrative activities. As time goes by, the number and the complexity of the companies’ activities at international level have increased, as well as the company’s revenues, to the

Graph 2 – Business model “focus” and “locus” perspective in 2014
extent that, today, Spreaker is profitable and does not require any financial contribution to run its business (scale-up phase/international growth).

Furthermore, the case study analysis clearly shows how important is the dynamism of the business model, thus supporting previous research findings (Achtenhagen et al. 2013; Nicholls-Nixon, 2000; Svejenova et al., 2010). Spreaker’s business model changed along the years to adapt to the specificities of the competitive scenario and, being the company in its early stage of development, also to finalize their offer to the final customers.

Some limitations of the study should be remarked. Specifically, we cannot check the influence of the company’s international growth path on company performance, since these data are undisclosed, due the presence of external investors in the equity capital of the company. Nevertheless, results have important implications for entrepreneurs and managers of startups at an early stage of development.

The case study analysis shows how properly implementing and continuously adapting the business model to the competitive scenario is of crucial importance for startups survival and international growth.

Moreover, stated the importance of business model architecture and specifically the localization choice decisions of startups, we encourage future research to focus on cross-case business model analysis to shed new light on the specificities of the international growth path of startups.

DOES FUND RAISING TRIGGER THE INTERNATIONALIZATION OF STARTUPS?

Onetti, Alberto; Pisoni, Alessia

Department of Economics, University of Insubria, Varese, Italy

ABSTRACT

Recent studies about startup ecosystems - carried out with the purpose of identifying the European fast-growing companies - highlighted the emergent phenomenon of the “Dual Companies” for European ICT startups. According to these studies, dual companies are new ventures founded in one country that relocated abroad, shortly after inception, their headquarters – and, with that, part of their value chain – while maintaining a strong operational presence in the country of origin. Initial research shows that dual companies typically move to countries that have a more developed financial market with the goal of having access to capital. To investigate the proposed issue, we choose a multiple case study approach. We analysed in-depth the characteristics of the funding rounds of the above-mentioned dual companies to better understand how the fund raising process and their international growth path are intertwined. The study contributes to shed light on the issues that European ICT startups face in scaling-up in Europe due to the lack of adequate domestic (either national and European) funding. It also identifies novel paths of international development that startup companies follow to deal with the obstacles that prevent them to grow rapidly in their home country.

Keywords: Dual Companies, fund raising, Born Global, internationalization.

1. INTRODUCTION

In the last few years, vibrant startup ecosystems have been growing in almost every European country. However, new venture creation per se does not imply societal wealth creation and just new firm counts may be misleading. To contribute to economic progress, startups are supposed to survive, break the early stage barrier and scale-up, i.e. to expand in terms of market access, revenues, and number of employees and turn into growing businesses. Entrepreneurial activity through the exploration and exploitation of new opportunities - also at international level - and the implementation of new innovative value propositions and business models able to grow in this new competitive landscape is of crucial importance for all the economies. Nowadays, market globalization
claims for more and more companies characterized since inception by a strong international attitude - i.e. global market view – and exponential growth (Ismail et al., 2014).

Recent studies about startup ecosystems (SEP, 2015) - carried out with the purpose of identifying the European fast-growing companies - highlight the emergent phenomenon of the “Dual Companies” among European ICT startups. According to these studies, dual companies are new ventures founded in one country that relocated abroad, shortly after inception, their headquarters – and with that part of their value chain –, while maintaining a strong operational presence in the country of origin.

Due to their fast pace of internationalization, these companies could be defined by academic literature as Born Globals/Global Startups (Oviatt and McDougall, 1995). Born Globals are often technology-oriented and go international from inception or very shortly thereafter not following “traditional” path of internationalization. In this perspective, dual companies could be considered as a subset of born global firms characterized by peculiar features. Initial research shows that European dual companies typically move to countries that have a more developed financial market with the goal of having access to capital (faster and in larger quantity). Headquarters relocation may be also motivated by the decision to root in recognised industry centres of excellence or emerging tech clusters, but the access to financial resources - specifically venture capital - seems to be the triggering factor for their early internationalization choices. Despite the relocation of the headquarters abroad, they continue to invest large part of the capital raised in their home country also because there is a plentiful supply of highly qualified technical graduates and an appealing wage structure.

The lack of financial resources is the most limiting factor for startups’ growth. Several studies highlight the crucial role played by equity financing in the survival and successful development of new high-growth ventures (Davila et al., 2003) and for their international expansion (Loustarinen and Gabrielsson, 2004; Laanti et al., 2007). It follows that a low availability of venture financing in the home country could encourage early internationalization of the new venture towards those countries where founders have more chances to get access to financial resources. Therefore, it could be of great importance to explore in-depth the characteristics of the fundraising path of the above-mentioned dual companies (i.e. number of rounds, time, amount, typology/nationality of investors) to better understand their international growth path. We specifically aim at understanding whether:

1) the international growth path for innovative new ventures is affected by the need of financial resources (and the lack of financial resources in the home country);

2) the geographical expansion of the new venture is correlated to the nationality of investors.

These aspects of analysis emerge as being largely overlooked by scholars, mostly focused on the phenomena of the early internationalisation – mainly in terms of intensity or degree, speed of
internationalization - rather than on the reasons behind and on related operational and structure-related decisions.

The paper is structured as follows. The first section introduces the “Dual Company” concept and provides a definition of this emerging phenomenon. The second section offers a comprehensive review of the relevant literature concerning the major factors leading to early internationalization of firms. In this respect, on the basis of the resource dependence view, particular attention was also devoted to the financial constraints that usually technology-oriented startups face. Following this theoretical context, the research framework and methodology is presented. The paper is based on a multiple-case study and the findings of the study are limited to the qualitative research approach. The “Discussion and conclusion” section summarizes the results of the cross case analysis and concludes with managerial/research implications and future research directions.

2. THEORETICAL FRAMEWORK

2.1 Traditional internationalization and born global phenomena

Internationalization is a multidimensional process observed over the past decades under different perspectives. Management of multinational corporations (MNCs) - especially of large ones - has attracted the interest of scholars for many decades. Starting from the pioneer studies of Dunning (1958) and Vernon (1966) and proceeding to analyse more recent studies, it is possible to notice how the research objective has shifted from foreign investments to the internationalization process and MNCs strategic organization and management. In this respect, a considerable amount of important studies have been developed on the internationalization process of companies, the so called “stage models” (Johanson and Wallhne, 1977). In recent years, stage models as well as the incremental, step-by-step internationalization processes - according to which firms go international in a slow and incremental way and reduce the uncertainty and risk of the internationalization process by gradually accruing market knowledge - have been questioned by the worldwide emerging phenomenon of “born global” firms, i.e. companies that internationalize their activities from inception or shortly thereafter (Oviatt and McDougall, 1994).

Based on the model of influences on the speed of entrepreneurial internationalization developed by Oviatt and McDougall (1995, 2005), explanations of accelerated internationalization have been found in relation to variables at different levels of analysis, i.e. individual/entrepreneur level, firm level and national level (Knight and Cavusgil, 2004; Madsen and Servais, 1997). Specifically, major factors leading to early internationalisation of firms identified in literature can be categorised in:
macroeconomic issues, such as globalization, uncertainty and dynamism of the firm’s business environment (Laanti et al., 2007; Oviatt and McDougall, 1995); home country conditions, such as small and saturated domestic markets (Madsen and Servais, 1997; Oviatt and McDougall, 1995), keen competition in the home market (Oviatt and McDougall, 1995), as well as financial constraints or low availability of private equity funds in the home country that encourage internationalization towards those countries where there are more venture capital funds (Oviatt and McDougall, 1995); industry-specific issue, such as belonging to a high tech or knowledge intensive sector (Preece, Miles and Baetz, 1998; Jolly); firm specific factors, such as organizational flexibility and innovation propensity (Knight and Cavusgil, 1996; Oviatt and McDougall, 1994); the access to network links to explore and exploit international opportunities (Zain and Ng, 2006); the entrepreneur’s background and experience, its international attitude and human capital related factors (Oviatt and McDougall, 1994, 1995; Zucchella et al., 2007; Cannone et al., 2014).

As shown above, several studies have been carried on this topic, searching for the factors that made possible to born global firms going through this fast pace of internationalization (Jones et al., 2011). Although born globals have been studied for over a decade, the lack of conceptualization regarding this field of research makes it difficult to do valid comparative research (Rialp et al., 2005; Gabrielsson et al., 2008). Over two decades after Oviatt and McDougall seminal works (1994, 1995), there is still a need to analyse more in-depth what happens to born globals after their initial phases from the establishment to the global phase (Gabrielsson et al., 2004; Gabrielsson et al., 2008). Previous researches identified the importance of better understanding the different phases of the internationalization process and the growth of born globals over time (Jones and Coviello, 2005; Gabrielsson et al., 2008) as well as the need of financial resources, which is associated to the “globalization” process of born globals (Gabrielsson et al., 2004).

2.2. Resources dependence view: the financial perspective

Drawing on this conceptual framework, in this paper we focus on technology-oriented born global startups that due to their small size, young age and ambitious expansion plans usually face significant financial constraints. As pointed out by Clarysse, Bruneel and Wright (2011), the growth paths for young technology-based firms result from structuring resource portfolios. The basis of this approach is in the resource dependence view (Pfeffer and Salancik, 1978), which posits that firms are dependent on externally controlled resources for their survival. This entrepreneurial model is usually associated to a need for capital exceeding the founders’ ability to self-fund and the company’s capability to self-sustain. Consequently, startups in the early stages base their development on the resources collected
through external financing, which comes from investors specialized on equity (seed and venture capital providers, as well as business angels, incubators and accelerators).

The lack of financial resources has been identified as the most limiting factor for new technology ventures aiming at globalising their business. Several studies highlight the crucial role played by equity financing in the survival and successful development of new high-growth ventures (Cooper et al., 1994; Davila et al., 2003; Talaia et al., 2016), in particular for the most innovative ones (Venturelli and Gualandri, 2009) that operate in high tech industries (new technology-based companies/NTBF) (Colombo et al., 2010). For born global companies, this issue is of crucial importance (Luostarinen and Gabrielsson, 2004; Laanti et al., 2007) and also represents a particularly interesting research gap (Gabrielsson et al., 2004) since it has been insofar largely overlooked by scholars. The environment they refer to is characterized by global competition. In order to survive and consequently grow in such a competitive landscape, new technology ventures do not have time to grow following traditional “stage model” paths (Gabrielsson et al., 2004). They need the necessary resources to foster exploration to respond very fast to opportunities in the global marketplace. Consequently, rapid internationalization claims for organizing adequate financial resources for a fast, pervasive and effective global market penetration. The amount of capital raised is therefore a key factor for startup growth (Cooper et al., 1994). Early stage new ventures looking for capital usually rely on local or domestic investors, since they are easier to access due to geographical proximity (Fritsch and Schilder, 2008; Gabrielsson et al., 2004). When the domestic venture capital financial market is too little or is not enough structured, new ventures may start looking forward international (cross-border) funding sources. It follows that a low availability of venture financing in the home country could also trigger early internationalization of the new venture towards those countries where founders have more chances to get access to financial resources (Oviatt and McDougall, 1995).

Therefore, it could be of great importance to explore in-depth the characteristics of the fund raising process of the above-mentioned dual companies to better understand if and how they are related to their international growth path.

3. DATA AND METHODOLOGY

To shed light on the proposed issue, we chose a multiple rather than a single case study approach (Eisenhardt, 1989; Yin, 1994) in order to analyse pattern-matching properties between the cases analysed (Rialp et al., 2005) and specifically to understand the peculiar features of the dual companies in terms of commonalities and differences in their international growth path. Our approach is exploratory. Accordingly, cases are first studied as standalone entities and then compared across
cases. We targeted European ICT startups - included in the Startup Europe Partnership (SEP)\textsuperscript{15} database - that showed an international expansion since the initial phases of their life cycles. For this article, we selected 6 cases from the above-mentioned database that are most illustrative to substantiate our conceptualization. We choose new ventures initially founded in one European country that have moved their headquarters abroad – specifically in the US - while maintaining a strong operational presence (such as R&D activities) in the country of origin.

In doing so, data from the SEP database have been integrated by involving multiple sources of secondary information, e.g., corporate documents, articles, books, websites and press releases, which provide accurate and unbiased information. For each company selected for the study, we collected documentary information about services and product offered and the geographical reach were gathered through different sources. The interview process is still ongoing. In order to respect anonymity, we name the case study according to the 2-letter country of origin code. Name of investors have also been omitted.

We focused the analysis on the fund raising process of each of the selected startups to understand the “geography” of each financing round (i.e. the nationality of the investors of each round) and possible linkages with the localization choices of the company. Specifically, the ultimate goal is to better understand the relationship between the fund raising process and the international growth path of the new ventures.

Table 1 – Case studies: main characteristics

\textsuperscript{15} Established by the European Commission in January 2014, SEP is a Startup Europe initiative dedicated to support the growth and sustainability of European startups able to compete and raise funds internationally. SEP mapping and scouting database contains up-to-date data on the company investment profiles of more than 2,000 ICT European scaleups.
4. CASE STUDY DESCRIPTION

Before presenting in-depth exploration of each of the selected case studies, we briefly summarize their peculiar features in Table 1. According to the selection criteria, all the considered firms are ICT new ventures initially founded in a European country that have moved their headquarters in the US, while maintaining a strong operational presence in the country of origin, specifically R&D activities. Most of them provide web-based software solutions, in some cases also available on mobile.

Case #1 – FR1
FR1 is an open-source software provider offering enterprise-ready solutions and big data software and services. FR1 is a typical dual-model company, a “French-American scaleup.” Founded in 2005 by French nationals, FR1 early after inception located the company’s headquarter in California “avec un pied en France”, where R&D activities are located. The company has more than 400 employees and offices in North America, Europe and Asia. FR1 raised $102M in six rounds (the last one of $40M in December 2013). French-born, after two initial seed funding round, the company obtained from French investors - respectively of $4M and $3.5M - raised other two rounds for an overall amount of $20M from a mix of British and French investors. In 2010, the company raised a large amount of money - $34M – from a pool of US and UK investors. The latter was already involved in the company, by participating in the previous two round of financing. The last round of funding - $40M - occurred three years later, and was entirely backed/led by two French investors.

Case #2 – IT1
IT1 produces white-label software (OneMediaHub), which is a cloud digital locker that wirelessly syncs rich media (pictures, video and music), files and PIM data across smart phones, tablets, PCs. IT1 was founded in Italy in 2002 from a serial entrepreneur with a Computer Science PhD. The company’s headquarter was moved to San Francisco in 2004, after two years from its inception in order to complete the Series A financing. This decision helped the company to go through different rounds of funding for over $25 million mainly from US investors. The R&D activities are still located in Italy.

Case #3 – PT1
Portugal-born, the company is an easy-to-use, cloud-based call center software solution that helps growing businesses improve customer interactions, while simultaneously reducing costs. The company initially founded in Portugal in 2011, moved headquarters to San Francisco. At the very beginning, the Portuguese founders applied for a competition in San Francisco and, thereafter, they have been invited to join 500 Startups Accelerator. They realized since inception how a presence in the
US could help them both in terms of market and funding potential. Investors are mostly from the US. Today PT1 has a marketing and sales team in the US, while maintaining relevant operations in Portugal, such as design, customer support and engineering. The company raised $24.5M in four rounds. As previously mentioned, the Portuguese founders applied for a competition in San Francisco and, thereafter, they have been invited to join 500 Startups Accelerator, that help the company to get off the ground with an initial angel investment of $450K. Three years later PT1 receive an additional $3M seed investment from US investors. The series A occurred in 2015, when the company secured $21M – in two rounds – from “old” US investors and new ones.

Case #4 – DK1
DK1 is a leading cloud-based customer service software solution that offers help desk ticketing, issue tracking, and customer service support. Founded in Denmark in 2007, DK1 first moved to San Francisco in the fall of 2009. After an initial seed funding secured in 2008 from a German investor, the company obtained its Series A in 2009 from a US investor. In the same year DK1 secured another $6M from the previous investor and another US venture capital firm. One year later the company raised another $19M from previous investors and another US venture capital. When they moved to the US in 2009 they start hiring the local team that would be the core of DK1 engineering. Over the next two years, investors in the Bay Area were getting increasingly optimistic about technology and it became incredibly hard to find great engineers in such a competitive environment. So they decide to look back home, Denmark and leveraging their Danish heritage, network and brand in the local startup and technologies communities they built their first remote engineering team operating out of the capital city. The largest funding round occurred in 2012 when DK1 secured $45M from a pool of investors led by a US investor. The company also went public on the NYSE in 2014, securing $100M. Before the IPO, DK1 raised $71M in six rounds.

Case #5 – SE1
Founded in Sweden in 2007, but building on technology being in production since early 2000, SE1 is a leader company in graph database with over 500,000 downloads. The company now has 120 employees in 12 countries and offices in Sweden, UK, Germany, and France. SE1 raised $44.1M in four rounds. In 2009, the company raised an initial seed funding round of $2.5M from Nordic investors. In 2011, the company secured a Series A round of $10.6M led by a UK venture capital with the participation of the investors of the previous round. In 2012, the company raised another $11M from the same investors, while last funding round (January, 2015) was led by a Nordic investor in participation previous investors. In 2011, the company’s global headquarters were moved to San
Mateo, CA. Eight years before SE1 founders came to Silicon Valley to pitch for seed capital to fund the startup. Besides moving to the Valley for funding reasons, they realized since inception the importance to access the worldwide-recognised tech industry centre of excellence. Having an office in Silicon Valley is considered as a competitive advantage for those who aim at ramping software related business. The company’s engineering headquarter is still located in Sweden, while sales, marketing and finance operations are in Silicon Valley.

Case #6 – NO1
No1 develops open source identity management solutions for the enterprise and government organizations. Founded in 2010, the company chose an international profile from the very start, and established several companies in parallel in Norway, UK, France and US where the founders lived. The head office was in Norway, but the working language was English. They immediately understand how important was to be located in the US to boost the business with US customers. In the first two years, without having any funding to build a sales team in the US the founders travel a lot from Europe to the US. Two years after founding the company in Norway, the co-founders decided to relocate the business from Oslo to San Francisco looking for the big opportunities in the US market. The company raised $52M in 3 rounds. After the initial Series A of $7M secured in 2012 from a Californian venture capital firm, one year later the company raised another $13M from the previous investor a US investor. Last funding round occurred in 2014, when the company secured $30M in a funding round led by a US investor with the participation of the previous two investors.

5. CROSS CASE ANALYSIS AND FINDINGS DISCUSSION
As the next step, in this section, a cross-case comparison was made. This included the search of similarities and differences between cases. The iterative process of comparing collected information/data and findings is important to improve the internal validity of the study.
To support the purpose of the study and better understand the relationship between the fund raising process and the international growth path of the new ventures (the localization choices of the company), the above described data are also summarized in Table 2. The table provides an in-depth description of the “geography” of the fundraising path of each company providing for each financing round details about the date, the amount of capital raised, and name and nationality of the investors involved in each financing round.
The multiple case analyses highlights how - for almost all the above analysed companies (5 out of 6) - the Series A – the first major round of financing undergone after the seed capital - was backed and led by foreign venture capitals. Additionally - for 4 companies out of 6 - also the seed financing was
backed from foreign investors, either business angels or seed capital providers. Not surprisingly, companies declared that the purpose to pitch the business idea in foreign - mainly US - startup contests/competitions was “looking for funds”. This was particularly clear in PT1 case, when the founder applied for a competition in San Francisco and thereafter joined 500 Startups Accelerator securing their first round of financing. This aspect is relevant to our analysis since access to financial resources has been identified as a crucial barrier for young technology-based companies aiming at globalising their business early after inception (Luostarinen and Gabrielsson, 2004; Laanti et al., 2007; Gabrielsson et al., 2004; Cannone et al., 2014).

In this respect, the cross-case analysis also highlights how in almost all cases the headquarters relocation in the US - specifically Silicon Valley - occurred early after inception (on average within 2/3 years since company foundation), but after - or almost concomitantly – obtaining/securing a funding round from a US investor. Furthermore, US investors providing initial funding to the company continued to invest in the same companies in the subsequent rounds, also together with other venture capital funds either from the US or from different countries. It is also worth noting that - in 4 cases out of 6 - the largest funding round (on average $25M) was led by foreign investors (3 out of 4 are US investors).

Table 2: Startups fundraising path vs. internationalization path
It appears clear that a low availability of venture financing in the home country could trigger early internationalization of startups towards those countries where founders have more chances to get access to financial resources, either in terms of quantity and/or quality. The US and specifically the Silicon Valley - where there is a large and dynamic capital market - represent a recurring destination, thus confirming previous research carried out on new technology-based born globals (Cannone et al., 2014). Besides moving to the US - and specifically to Silicon Valley - for “access to finance” reasons, the decision to relocate the headquarters in some cases is also based on market reasons. Silicon Valley is the worldwide-recognised tech industry centre of excellence. Having a presence there enables commercial and strategic opportunities. Notwithstanding headquarters relocation, companies continue to maintain relevant operations, such as the R&D and operations, in the country of origin. For technology-based startups, the R&D centre/function is of crucial importance.

The cross-case analysis finally led to the model/matrix that is introduced in figure 1. The following matrix maps the dual company fundraising path as well as its international expansion.

Fig. 1 – Startups internationalization vs. fundraising path

Step a) highlights the initial “fund raising driven” internationalization path: in case the startup does not find adequate capital to fuel its growth process, it starts looking abroad for funding, while remaining in its country of origin; this path is typical for seed financing and from our analysis it looks like a preparatory stage for dual company setting. The following step b) describes the “fund raising” internationalization path and shift towards dual company: as the company gets relevant funding rounds abroad, the startup shifts towards a dual company model. The headquarters and some activities are...
relocated abroad – typically - in the country of the lead investors, while maintaining a strong operational presence in the country of origin (such as R&D and operations). It is also possible to identify a generic step/path c) “fund raising” internationalization and shift towards full relocation: for different reasons, that need to be further investigated, after a growth “path b” – or shortly after inception - the company might decide to completely relocate its activities abroad (“path c”) without maintaining any operational presence in the home country besides “the blood in its veins”. In this respect, the company is not longer to be considered as a dual company, since it does not maintain any relevant linkage with the country of origin.

6. CONCLUSIONS

This study analysed the relatively new/emerging phenomenon of “Dual Companies” among European ICT startups. Accordingly, dual companies are new ventures founded in one country that relocated, shortly after inception, their headquarters – and with that part of their value chain – abroad, while maintaining a strong operational presence in the country of origin. Due to their fast pace of internationalization, these companies could be defined as sub-set of Born Globals/Global Startups (Oviatt and McDougall, 1995) but characterized by peculiar features. The multiple case study highlights how the limited access to financial resources in the home country – either in terms of quantity and/or quality - seems to be a triggering factor for startups to adopt an early internationalization approach. As previously mentioned, the crucial barrier for young technology-based companies aiming at globalising their business early after inception has been the access to external financial resources (Luostarinen and Gabrielsson, 2004; Laanti et al., 2007; Gabrielsson et al., 2004). As previously mentioned in the cross-case analysis, it is evident that the vast majority of the analysed dual companies rely on foreign financial sources to fuel their expansion process and follow a “fund raising driven” internationalization growth path. In the vast majority of the cases analysed, the headquarters’ relocation in the US and thus the shift towards a dual model company occurred early after inception of the company, but after - or almost concurrently – obtaining/securing a main funding round from a US investor.

Some limitations of this study must be remarked. Since this is a case-based study, the findings above summarized are limited to the qualitative research approach (e.g. case selection) and therefore one should be cautious in generalizing results beyond the startups analysed. Findings need to be further tested with respect to number of cases, sectors and investigated context (in terms of geographical scope, i.e. country of origin of the analysed startups). The phenomenon is evolving in parallel with the growth of the venture capital industry in various regions and countries. Dual companies appear to be
less widespread in countries whereas the venture capital industry is more developed, while it is a more frequent phenomenon in new emerging entrepreneurial/startup ecosystems. Furthermore, to better understand why and how entrepreneurs pursue their new ventures by exploring and exploiting opportunities simultaneously in two countries, the degree of embeddedness of the entrepreneur in the two different social environments and economic areas should also be taken into consideration. This could represent a related topic of investigation to be run in parallel.

Nevertheless, the results have important implications both for policy makers and entrepreneurs. The study contributes to shed light on the obstacles that European ICT startups face in scaling-up due to the lack of adequate domestic funding (national or European). In doing so, novel paths of startups international growth have been identified.

NETWORK PERSPECTIVE ON ESTABLISHMENT PROCESS IN TRANSITION ECONOMIES

Osarenkhoe, Aihie1; Fjellström, Daniella1; Abraha, Desalegn2; Awuah, Gabriel Baffour3

ABSTRACT

This paper contributes to extant literature on market entry strategies in several ways. First, while previous literature focuses either on entry modes or entry timing, comparatively little efforts are made to illuminate the establishment process. Secondly, it addresses emanating impediments and development of supporting relationships with significant actors during the processes of establishment in transition economies. Establishment model, developed from network approach, facilitated the capturing of various supporting relationships that enabled the focal relationships to function properly during the establishment processes in less-structured markets. In-depth interviews were held with key informants in two Scandinavian firms. Findings show that Statoil’s ability to leverage a number of significant actors in its network for support during its establishment in Estonia makes the process less cumbersome and less resource consuming. Lack of home and host country support for Scania resulted in an arduous and costly process, with the firm’s position changing several times as different problems cropped up. In conclusion, relationship orientation requires adaptation by an organization, but more critically by its managers. Lack of cross-cultural relationship skills and orientation could impede a company’s growth in international markets. We call for more research efforts in the area of cultural dimensions of market establishment processes.

Keywords: relationships, networks, establishment processes, actors, resource exchanges, transition economies.

INTRODUCTION

There is a need for more studies on entry modes (Hennart & Slangen, 2015) in international business. A focus on the particular entry mode a firm uses to enter a new market, rather than on the process of establishment, dominates in extant literature. While earlier research (Wheeler et al., 1996; Williams, 1997; Sun, 1999; Koch, 2001; Kim et al., 2002; Floyd, 2002; Blomstermo et al., 2006; Hennart, 2009; Hennart & Slangen, 2015) focuses on the entry modes firms use to enter foreign markets, we focus on
managerial problems associated with the establishment and development of supporting relationships with significant actors during the processes of establishment in transition economies.

This paper aims to address the extent to which firms utilize a number of significant actors in their network of exchange relationships for support in their establishment processes. The two Scandinavian companies studied have both established business operations in markets endowed with features that are different from those that prevail in their domestic markets. The network model (Axelsson and Easton, 1992; Chetty, S. and D. Blankenburg-Holm, 2000; Mattsson and Johanson, 2006) could not be adopted in its entirety to illuminate the establishment processes of the firms (Scania and Statoil) in transition economies. Because the network perspective (Tikkanen, 1998; Ashton, 2006; Blankenburg-Holm, 1996; Johanson and Vahlne, 2003) takes a more general approach to market establishments as a process of development, we argue that, without some modification, the network approach is not always appropriate for all types of economies. One of focus areas suggested by Hennart and Slangen (2015) is how the entry decision process is structured. Hence, the establishment model, (a modified version of the network model) (Abraha 1994, 2002), enables us to illuminate the establishment processes of two Scandinavian firms (Scania and Statoil) in less developed and loosely structured markets (Croatia and Estonia). Manolova, Manev and Gyoshev (2010) note that inter-firm networks are important and calls for more research in particular on transition economies. Their study was limited to Bulgaria measuring the network effect on internationalization. Dikova and Bruthers (2015) discuss that few theoretical lenses have been used in their review of establishment mode and that there is a lack of research from 2010 onwards.

The establishment model applied in this paper facilitated the capturing of, among others, the various supporting relationships that enabled the focal relationships to function properly during the establishment processes in these markets. According to Fallon (2004), transition economies such as those in Central and Eastern Europe are a complex environment for investment in which firms are subject to institutional and governmental pressures and where significant differences in business culture and practices are a product of past economic and political systems based on communism. This may increase uncertainty and risk for firms.

The network model draws on the theories of social exchange and focuses on firm behaviour in the context of inter-organizational and interpersonal relationships. It emphasizes the role and influence of social relationships in business transactions (Johanson & Vahlne, 1990). Companies are connected by networks, which develops the interaction between them. The usefulness of applying a network perspective to study international business has long been emphasized in the literature (Turnbull and Valla, 1986; Johanson and Mattsson, 1988; Keeble et al., 1998).
According to Root (1994:23), “traditional presentations on foreign market establishment represent the following set of decisions: assessing products in foreign markets; choosing the target product/market; setting objectives and goals; choosing the entry mode; designing the marketing plan; and controlling for performance”. In our view, the approaches do not sufficiently emphasize the relationship dynamics of international market establishments. This view is also supported by Donaldson and O’Toole, 2007) when he writes that: “firms operate as independent actors making rational analytical choices about which markets to enter, the optional method of market entry, and modes of operation in particular countries” (p. 213). Such an approach, which is the focus of attention in extant literature (Wheeler et al., 1996; Williams, 1997; Sun, 1999; Koch, 2001; Kim et al., 2002; Floyd, 2002; Blomstermo et al., 2006), leads companies to focus on a particular entry mode. Moreover, we are conversant with the notion that market entry refers to what a firm does in the introductory phase of entering foreign countries, while market establishment refers to how the firm builds a position once it has entered the foreign market. In this paper, we aim to fill this void by concentrating our efforts on the latter, namely, the processes of establishment in a loosely structured market.

RQ1: How did Scania and Statoil establish their operations in the Croatian and Estonian markets, respectively, by developing a web of relationships and ties with various actors to enhance the processes of establishment? To answer this question, we conducted two in-depth case studies to capture the essence of the establishment processes of these two Scandinavian firms in Croatia and Estonia. Consequently, a modified network model that facilitates an understanding of the web of relationship forms embedded in the establishment process of firms in transition economies is operationalized in this paper. It is our view that this perspective leads companies to focus on the process rather than on the particular entry mode to add more research on perspectives on entry modes (Hennart & Slangen, 2015).

The remainder of the paper is divided in the theoretical framework. We then discuss the methodology, followed by presentation of two rich and descriptive case studies. Thereafter follows the analysis and the establishment process model. Finally, the conclusions and implications are discussed.

THEORETICAL FRAMEWORK

The network approach

Networks are important for the establishment process (Greve, 1995) where contacts and resources are essential to support the establishment in a new market. Furthermore, Yu, et al (2011) advanced the network perspective on new venture internationalization by examining the role of networks in accelerating new venture sales into foreign markets. Consequently, market establishments are
facilitated through interactions between a number of identifiable and significant actors operating within a specific network (Blankenburg-Holm, 1996; Axelsson and Easton, 1992). Unlike the FDI (foreign direct investment) perspective of management’s planning of the establishment process (Hennart, 1982; Dunning, 1980, 1993) the focus lies on understanding the managerial problems associated with the establishment and development of business relationships (Johanson and Vahlne, 2003) with actors such as customers, suppliers, intermediaries and local authorities. What is happening in one relationship affects the interaction and activities in others (Håkansson and Snehota, 1995). Hence, the establishment process of a firm cannot be seen as a development solely under the influence of the firm that is entering certain foreign markets.

Actors in interaction possess specific resources and perform specific activities that create the exchange that make them interdependent on each other (Hägg and Johanson, 1982; Johanson and Mattsson, 1988; Håkansson, 1987, 1989; Håkansson and Snehota, 1995; Ford, 1980). Once the relationships are interconnected, a development in one relationship can affect others, positively or negatively. Hence, faced with some establishment opportunities and/or challenges, an actor will draw on certain significant actors for certain complementary capabilities that will enhance the solution to the emerged situation. For Axelsson and Easton (1992), for example, one actor’s action must be viewed in the context of those of other actors in a network and relationships between the actors in the network. Hence, a firm’s establishment processes in foreign markets should be seen in how well it exploits networks of exchange relationships that not only enhance the establishment processes but also the building and sustenance of a strong position, which gives the firm a competitive edge.

The interdependence between actors thrives best when there is a mutual relation; thus, the interacting parties give and take from each other and are mutually committed (Hägg and Johanson, 1982). The interacting parties strive after openness, understanding, patience, and trust (Håkansson, 1982; Morgan and Hunt, 1994). They also engage in mutual learning (Ford et al., 1986). Being committed to and willing to adapt in the mutually beneficial relationships allows the interacting actors to strengthen the bonds – knowledge, technical, commercial, social and administrative – between them (Håkansson, 1982; Hägg and Johanson, 1982; Ford, 1997). A firm’s position in its network becomes crucial (Johanson and Mattsson, 1988). This position gives the firm direct control over its own resources and activities and indirect control over those of others. All this enables the firm to draw on others in its network for support in the establishment process.

The establishment process model

The establishment process model (Abraha 1994, 2002), as a modification of the network model, enables us to understand the establishment processes of firms in less developed and loosely structured
markets. It consists of four stages: (1) the historical development of the establishment process, (2) the identification and the discussion of the focal relationship(s), (3) the various supporting relationships developed by the establishing firm that enable the focal relationship(s) to function properly, and (4) the general or macro-environment.

**Figure 1: The model of establishment processes**

Variable definitions

A = Agent  
Co = Consultant  
CC = Customer’s Customer  
CS = Complementary Supplier  
FC = Focal Customer  
FI = Financial Institutions  
GI = Government Institutions  
S = Supplier  
SS = Supplier’s Supplier

The historical development variable of the establishment process focuses on the actors that were involved (Abraha, 2002) in initiating the establishment process itself and influenced its course of direction, as well as resource allocation within the local market. In view of the availability of, and the access to these resources, actors and industrial activities, a judgment would have to be made on the part of the establishing firm regarding whether or not there exists a potential network in the local market. Hence, an actor, in search of other actors that can complement the former’s efforts, can abandon old relationships and/or add a relationship to already existing ones (Johanson et al., 1994; Axelsson and Easton, 1992).
The second variable relates to the focal customer relationships and assesses these relationships in terms of their stability and strength. It also deals with the identification of resources that are to be exchanged between the establishing firm and its main customer(s). These resource exchanges are grouped under products, services, and human- and financial resources. In order to strengthen their relationships, the actors in interaction may make several adaptations (Håkansson, 1982). It is therefore crucial that the parties mutually undertake technical, financial, organizational, logistical, social and economic adaptations.

The supporting relationships, as encompassed by the third variable, are the relationships of the establishing firm to other actors. The other actors help to ensure that the focal relationship functions properly. Evidence suggests that the establishing firms often have to build these supporting relationships (Abraha, 1994; Johanson et al., 1994) because a well-developed network of industrial actors' is unlikely to exist in the local market at the time of entry.

The fourth variable constitutes the general operating environment within which the process of establishment takes place. Here, issues such as the availability of qualified manpower, financial institutions, government rules, regulations and policies, political factors, infrastructure conditions and culture are considered.

The following additional information can broaden our understanding of Figure 1: (1) the historical development of the establishment process is the one next to the general environment, what we call the “establishment process”, (2) the focal relationship is the one indicating the connection among the supplier (S) and the focal customer (FC), (3) the supporting relationships are all the other relationships surrounding the focal relationship, and (4) the general environment is the outer part of the figure immediately adjacent to the establishment process variable.

METHODOLOGY

A qualitative (Marshall and Rossman, 1995) case study approach was appropriate since “case studies are the preferred strategy when how or why questions are being posed, when the investigator has little control over events, and when the focus is on a contemporary phenomenon within some real-life context” (Yin, 1994, p. 1). Selecting the researchers as the “instrument” for data collection and analysis enabled the researchers to get “close” (Lincoln and Guba, 1986, p. 210) to the respondents and develop trusting relationships. This allowed the researchers to understand the realities of the respondents and uncover issues of relevance in understanding the substantive issues regarding the adopted establishment model, which in turn facilitate understanding of the establishment processes of firms in less developed and loosely structured markets.
Data collection process

The cases were selected according to the criteria’s: (1) companies that established in Croatia and Estonia during 1990s, (2) actively participated in the establishment companies’ interest in the research problem and (3) their willingness to provide information for the study (Fjellström & Guttormsen, 2015). The interview guide covered: the history of the establishment process and how it evolved over time; the main actors (company and non-company actors), and, vital relationships and ties (economic and non-economic) between the various actors that facilitated the processes of establishment. Interviews were conducted with key informants at Statoil’s subsidiary office in Stockholm, Sweden, in the autumn of 2004 with duration of each interview between 90 minutes and two hours.

After the interviews with managers at Statoil, it was deemed necessary to seek additional information from other significant actors by the managers as having played an active role in the process. Additional sources of information on the macro-environment were therefore collected from the following: officials at the Swedish and Norwegian Trade Councils, and Norwegian and Swedish Embassies in Estonia: and press attachés responsible for cultural, trade and commercial activities. Data was collected from them through telephone conversations and complemented by e-mail contacts to elaborate on issues not properly dealt with during the telephone conversations. Everyone interviewed participated actively in the establishment process.

In the second case, most of the interviews were conducted through telephone and follow-up emails due to limited resources and geographical distance. The interview guide was sent electronically to the respondent in advance in order for the interviewees to prepare for the interview. The telephone interview was taped and the interviewer also took notes.

According to Maxwell (1996), “the main threat to valid description, in the sense of describing what you saw and heard, is the inaccuracy or incompleteness of the data. The audio or video recording of observations and interviews, and verbatim transcription of these recordings, largely solves this problem…” (p. 89). In compliance with Maxwell’s observation, audio recording of the interviews enabled us to be attentive during the conversations with the respondents. To avoid potential challenges during the interview, the respondents were informed about how the interviews were going to be conducted and the purpose of recording the interviews. For ethical reasons all respondents remain anonymous.

Data analysis

The data collected was analysed in three steps: data reduction, data display, and conclusion drawing and verification (Miles and Huberman, 1994). Data reduction entails selecting and excluding/filtering data in order to focus, discard and organize the data in such a way that conclusions can be drawn and
verified (ibid.). As for the tape-recorded interviews, this analysis process began while transcribing the interviews. The aim of data display is to organize the data into a compressed assembly of information to elucidate appropriate conclusions and action. Accordingly, main themes were extracted by using the various main parts of the analytical framework as a framework to give the research findings an appropriate structure. Conclusion drawing and verification focuses on reflecting and understanding the data chosen for display.

Although the process was initiated already at the initial stage, this step was more dominant during the later stages of this research. Despite the fact that these three steps are viewed as separate processes of analysis, it is important to note that the processes were going on simultaneously in this study. The findings that emerged have been analysed on a case by case basis to look for convergence and divergence with the theoretical framework. This approach reduces the introduction of bias into the interviews and results by a particular researcher, and conforms to recommendations regarding source, interviewer and analytical triangulation in qualitative research (see Yin, 1994).

THE CASE OF SCANIA IN CROATIA

The Historical Development of the Establishment Process
Scania operated in the former state of Yugoslavia in the 1960s. The firm was represented by an agent for nearly 30 years, Auto Makedonija (AM), who mainly sold heavy trucks since foreign firms were not allowed to import or to set up fully owned business entity. AM mediated deals between Scania and local customers. Contracts were signed directly between Scania and its customers. Scania’s personnel visited AM several times and transferred necessary marketing knowledge. Market share was about 30% of then. AM was located in Macedonia, south of the six republics that made up Yugoslavia. Geographical distance was the main problem. It was difficult to interact with customers in northern Yugoslavia, where the largest volume of the transportation market was located. While AM was successful and acquired a market share of over 50% in the south, it was less successful at gaining market shares in the north.

In the 1980s, it opened several representation offices in Sarajevo, Belgrade, Zagreb and Ljubljana to sell Scania trucks in the northern part of the country. Customers in Macedonia, i.e. the state-owned transport company, Vardar, were satisfied with the services. However, some customers located in Zagreb and Belgrade complained about the distance, technical support and spare parts delivered by Skopje. Despite its efforts, it was unable to achieve a meaningful market share in the north. Consequently, in 1991, it terminated the agency contract and to work with an exclusive agent following the independence of Slovenia and Croatia.
From 1991 until 1998, Scanadria SC, a private Croatian firm, was appointed as Scania’s agent, located in the north. Various problems were encountered during that time. Geographical distance was again a problem since they were unable to achieve a large market share in other parts of the country. Secondly, Scanadria other activities comprised about 90% of its sales volume and could not specialize in Scania’s operations. Furthermore, Scanadria was not prepared to make the necessary investment in Scania’s program (garages and after service). Customers had to travel to Italy to get services. Consequently, the contract was terminated and Scania took on full responsibility of its operations by opening a fully owned sister company.

In 1997 our key informant was assigned Managing Director (MD) to form and lead Scania East Adriatic Region SC (SEARSC) the company located in Slovenia. A market research showed GDP growth potential to grow five times in the coming five-years period. Scania Hrvatska SC, was established 1998 to serve the Croatian market. The demand for trucks was high. An ‘entrepreneurial spirit’ who had developed two sales centres in East Germany with competence to build and manage Scania’s local sales company in Croatia was employed. Sales people, technicians and economists with a Croatian background and the necessary qualifications were also employed. All goods were imported from Scania’s plants in Sweden, Holland and France with both sales and after-sales service since trucks require both repairs as well as maintenance services.

The Focal Relationships.

Repair services could now be executed in the garage in Zagreb instead of travelling to Italy. These service opportunities enabled Scania Hrvatska to inherit the old circle of customers. Potential new customers were identified in Northern and Eastern Croatia, after about two years, it managed to develop a network of customers in those areas. Customers who bought Scania’s trucks and services at the initial stage were companies that dealt with international transport. Later, Scania started to sell to state-owned companies like Hrvatske Autoceste, a road construction company, and Hrvatske Sume, a timber exporter, and PAN a paper industry firm.

Due to the lack of domestic production in Croatia, “Scania Hrvatska’s main duty [was] to sell trucks, perform repairs, and provide other related services.” Its products are the most expensive ones in the market and that is because Scania’s trucks are of a higher quality than those sold by its competitors. According to the customer relations manager, “in less developed markets such as the one that existed in Croatia when the sales office was first established, much emphasis was put on pricing, as the customers did not have the financial capacity to buy such expensive trucks.” However, as the market became more developed and demanding, customers started to value other things in addition to price, such as high quality services and better equipped garages, as well as
availability and accessibility of the garages, i.e. the opening hours of service centres, and financial solutions (credit sales, leasing and rental) since there was a lack of well-developed banking services. One problem was that customers could not pay in time and had no liquidity although payment period was extended from 30 to 60 days or from 60 to 90 days. According to the MD, Scania was aware of the prevailing economic conditions adapted to the situation so that customers could make partial payments and offering other financial benefits.

"The social adaptations made by Scania are also of major significance, as Croatian customers expect to have strong social relationships with sales representatives." Because most of Scania’s salespeople were Croats, the social issues did not pose a problem. Customers like to establish a personal relationship with a senior manager in the company, and thus the MD was expected to learn the local language. The technical adaptation made by Scania involved adapting their trucks according to the customers’ technical preferences and demands.

The organizational adaptation made after the transformation of the country from a planned- to a market economy was extremely significant for the company’s continued operations, according to the Croatian manager. Scania’s strategy was to appoint a West European MD in CEE, who could transfer the market economy perspective to the local employees. “Scania’s principle is to be a local Croatian company with foreign ownership. It endeavours to follow all local rules and regulations, as well as traditions, and to act as a Croatian company,” according to the regional manager. “During the early stages of its operations, Scania had problems with transferring the market economy approach to its employees, as the planned economy perspective was deeply rooted in their ways of managing a company and doing business,” said the regional manager. Searching for customers was not considered important. The Croatians maintained a belief that, as a foreign firm, Scania should invest in Croatia and, as it was financed from Sweden, it should not receive any profit. According to the Croatian manager, Scania Hrvatska’s goal, on the other hand, was to be self-financing and to operate at a loss during the initial years of its operations if necessary, but to generate revenues as soon as possible that can be reinvested in its operations.

Supporting relationships

There was a demand from the market to open more garages with financing and equipment from the head office in Sweden. Potential partners were primarily small family businesses, who were interested in being trained and authorized by Scania. A local branch office and service centre opened in Split since no partners were found in the South. Scania quickly learned how important it was to develop good relationships with the authorities. The authorities were very willing to cooperate, especially with foreign firms. However, although they welcomed foreign investment, the bureaucracy was difficult to
deal with and has a serious effect on a firm’s operations. The certification of all documents, import documents and contracts must be performed personally by a notary public. So a back office was established in Zagreb to provide administrative assistance in connection with imports. The bureaucratic set-up was complicated and made operations time-consuming with additional costs.

The local competition was very strong. Seven strong European truck producers were represented; Volvo, Mercedes, MAN and Iveco had a market share between 15-20%, while Renault and DAF had a relatively small share. Croatian competition law was very strict and did not allow extensive cooperation among competitors. Scania’s local contacts with the other truck producers (competitors), never discussed prices or marketing issues.

Scania’s prices were higher than its competitors, while it offered the most reliable product with less time spent in garages and service centres, consume less fuel, and have a lower repair frequency. Another advantage of Scania was the organizational structure with a network of garages and service centres for after-sales services. If a certain spare part is missing in one garage/service centre, it can be delivered within 24 hours from another garage or service centre in the country. In cooperation with MAN, Scania has succeeded to build the best and most widely spread distribution net in the country, an edge over its competitors According to our key informant, “the company’s weak point was purely geographical distances, and its location in Southern Croatia where Scania Hrvatska has a lower market share than in other parts of the country”. It attempted to address this problem by opening a branch office in Split and attract more (state-owned) customers. The company expects the situation to improve, as the ideological (friendship) corruption of the old system has slowly started to disappear, making it easier to get closer to and develop intimate relationships with the state-owned transport companies, according to the same source. Scania does its best to develop social contacts with other significant actors in the market so that it can get the state-owned companies as customers.

Scania Hrvatska SC increased its market share from 5% (1998) to 17% (2003). To achieve 20% market share level several measures were initiated. First was active marketing by identifying potential customers, developing personal contacts, visability on exhibitions, trade fairs and sales representatives. Parallel to this they built up a national service network.

The General or Macro-Environmental Factors.

Corruption was not as widespread in Croatia as in other countries in the region, but bribes were required in order to facilitate speedy service. A ‘friendship corruption’ of a non-economic character (also known as ‘ideological corruption’) was common in state-owned companies and was practised mainly from 1991-1999 (during transition from a planned- to a market economy). A typical example involves that of the German firm MAN that was represented in the market for several years. The
government ordered all state-owned companies (e.g. Hrvatske Autoceste and Hrvatske Sume) to buy ‘Croatian’ products, i.e. trucks from MAN, which were sold by a Croatian agent. Although Scania won state contracts on several occasions, showing that it could offer the best products at the most attractive prices, the government stepped in and stopped the purchases. The MDs of these state-owned firms, which are inherited from the old regime, are still in power and have personal contacts with certain individuals in high positions in the government apparatus. Both the MDs and the government bureaucrats favour each other and do business according to the same old style.

Concerning the social environment, business is often done with people you know. Having the right personal contacts is considered extremely important in business deals. If it lacks these personal contacts, a new company in the market is seen with scepticism. Croatian business deals are less formal so, before one does business with other actors, the parties must know each other. These personal relations have a significant influence on business deals between companies and the building of social networks,” according to our main source.

A CASE STUDY OF STATOIL IN ESTONIA

The historical development of the establishment process.

Estonia was no longer a part of the former Soviet Union when Statoil entered the market. But since the legislation was still part of the old Soviet system, Statoil needed Soviet approval to enter the market. Negotiations and relationships were initiated with the Estonian and Soviet authorities responsible for international establishments, i.e. key officials in the foreign trade department. An appropriate strategy was to let the Estonian authorities act as mediators and translators in the process.

According to a key informant, during the final phase of the establishment process, Statoil management presented its Corporate Social Responsibility (CSR) strategy. The strategy covered perspectives from society, health, safety and environmental protection, to conditions of employment, industry and labour standards, social development and human rights. This strengthened the level of trust and commitment for both parties. Statoil was able to gain an understanding and new insights into the Estonian market and society as whole. Statoil would be better prepared for potential risks and be regarded as a contributor to the wellbeing of the society at large. Statoil’s market involvement was on a long-term basis since they offer a necessary and important product for society. While, one informant considered it risky for Statoil to enter the Estonian market because the culture was different, the technological level was low, and business legislation was poor. Statoil managed to gain the support from influential organizations and authorities, which reduced the risk of investment. Estonian authorities were very risk-adverse. Statoil arranged information meetings where plans and problems
were discussed to that contributed to a more open communication between the parties and reduced the risk for misunderstandings during the establishment process.

The focal relationships

A network of relationships was developed with different actors in the industry, i.e. the supply chain. The objectives for forming the relationships with the actors were twofold: “firstly, to increase the probability of success of the establishment of Statoil in Estonia; and secondly, the quality of the relationships formed with various actors that constitute the supporting relationships would facilitate proper functioning of the focal relationships between Statoil and its ultimate (business) customers.” Furthermore, the key informant stressed that the company knows that availability of the company’s products is of utmost importance in the oil industry. It was necessary for the company to be present in Tallinn for its brand name to have adequate exposure for domestic and international communities. One informant expressed: “We therefore claim that branding is vital for every company in the oil industry. Lack of familiarity can have negative consequences in a business such as this and the enormous job done during the establishment process may be jeopardized if our relationships with our customers are not maintained. This means that it is very important to develop strong bonds with different local actors in the supply chain, including all categories of customers throughout the value creation process”.

Supporting relationships

Relationships proved to be important, “…(they) played a decisive role in facilitating proper functioning of relationships with the focal actors.” The Swedish Ambassador and the Swedish Foreign Minister helped Statoil develop contacts with the Estonian Foreign Trade Department. The Norwegian ambassador was involved in negotiating sites to establish service stations. Another informant explained: “The relationship network was of utmost importance for the establishment, but the managerial approach, which was characterized by great respect, was also a part of the winning concept. To avoid problems and discuss plans, information meetings were arranged. Service management was taught by Swedish employees, who at the same time facilitated the transfer of market knowledge back to the company”.

Contacts were established with International Monetary Fund, the World Bank and the European Union. Statoil management was aware of the fact that these financial partners were ready to assist firms based in market economies, with the financial resources necessary to facilitate establishment in a
transition economy. This facilitated the establishment of the institutional framework necessary for gradual introduction of a full-scale market economy.

One of our informants pointed out that “the Nordic countries had in place the Baltic Investment Programme, a program financed by the Nordic governments and the European Bank for Reconstruction and Development. Furthermore, to improve regional co-operation, the Council for the Baltic Sea States was established 1992. Companies that were able to bring these sources of finance together and establish a local contact base had a competitive advantage in entering the market. Consequently, Statoil was able to do this and use its home nationality and ownership to its edge in assembling a contact and finance network to establish operations in the Estonian market. The Norwegian government has also established trading agreements with the Baltic States, as other Nordic countries would have.

The role of the Swedish Trade Council was to assist Statoil’s management in securing all of the services required to establish a company and its products, services or ideas in the new market. Knowledge was acquired through, among other things, feasibility studies, marketing plans, export strategies, market surveys, and competition analysis carried out and supplied by the Swedish Trade Council. The Swedish Trade Council’s Information Centre also provided advice and information about regulations and trade practices in Estonia. These tasks were accomplished through close collaboration with the Swedish Embassy, Consulate and Chamber of Commerce in Estonia.

The General or Macro-Environmental Factors

The administrative system was rigid and centralized, business legislation was defective and a general suspicion against Western investments existed; trust was totally decisive. Government and local actors compromised. Prior to the establishment decision “Statoil management was informed by reliable sources such as the Baltic Investment Programme, the chambers of commerce in Sweden and Norway, as well as the trade councils in both countries, that many Western-based companies had failed in their attempt to enter Eastern markets at that time.” Statoil possessed a “respectful negotiation manner” in which parties were very culturally sensitive during its encounters with authorities. Our source explained: “Statoil tends to show respect for the local culture and traditions and in doing so avoids misconceptions that might otherwise arise when foreign investors enter a market. Statoil tries to anticipate potential problem areas through political, environmental and social impact studies. Cultural differences influence attitudes towards information, openness, communication patterns, flexibility, adaptability and risk.”

Statoil management discovered at the inception of the establishment plans that data available was inaccurate and sources inadequate. To overcome the lack of market knowledge, was through the use
of network of relationships with industrial actors, institutional actors (Baltic Investment Programme) and NGOs provided Statoil with crucial market knowledge. Statoil could supplement the available data with its own market research. According to one key informant, “Estonian authorities were willing to cooperate, since the country was then negotiating its membership in the European Union. Letting foreign companies invest is contributing to an open economy. Consequently, Statoil takes advantage of this quest by developing relationships with the appropriate government and state agencies in Estonia as well. “Such actors are key players when it comes to national interests. The establishment also created vacant jobs for the Estonian society.”

ANALYSIS

In the case of Scania in Croatia, developing market position was successful in a certain region but difficult and less successful in other areas during the early stages of the establishment. In most of the areas, two main reasons led to unsuccessful operations: one was the geographical distance between the agent and the customers with large market shares, and the second was the government regulation preventing foreign firms from operating with fully owned subsidiaries. These two reasons provide practical confirmation of what is theoretically discussed in Ford (2002), Abraha (1994) and Johanson et al. (1994). Ford specifically indicates that geographical distances can have a major impact on the development of buyer-seller relationships.

Abraha (1994) has also demonstrated that government policies and regulations have a major impact on the development of buyer-seller relationships in particular, and on the establishment process in general, which the case of Scania in Croatia confirms. Both of these factors, which create obstacles to establishment, are due to the absence of a market economy model being applied in the region (see also Dikova & Brouthers, 2015). In one area, success was achieved, but can be attributed to the economic system applied there, as it was the state that used to determine the location of where firms could operate. This study shows that there is a network in the market and that how and to what extent a firm can utilize the network depends on the form of operations/establishment allowed and where a firm is located. This in turn demonstrates the importance of interacting intimately with customers and positioning oneself in market networks, one of the central concepts of the network approach (Axelsson and Easton, 1992; Blankenburg-Holm, 1996; and Håkansson and Snehota, 1995). Some customers were very satisfied, whereas those in the major portion of the market were not, the main reason being that there was no direct relationship between Scania and the customers, and a second being the distance between the agent and the customers. This led to Scania taking the decision to terminate the contract with its agent and look for an exclusive agent.
Due to the reasons mentioned above, and others, the appointment of a new agent did not improve Scania’s position. The other related reasons were that the agent, which also represented a number of other companies, neither assigned priority to Scania’s establishment, nor wanted to make the necessary investments to improve the situation, indicating a clear lack of market commitment. ABB faced the same problem in its Kenyan establishment (see Abraha, 1994), which affected its position. It can thus be argued that the second agent was not able to function in a way that enabled it to manage the relationships with the focal customers properly either. In other words, it could not develop the necessary network to successfully establish Scania and its products. With the establishment of the subsidiary, Scania developed necessary spare parts and services network that enabled the focal relationships, called the building of supporting relationships to facilitate the establishment process (Abraha, 1994; Hånell & Ghauri, 2015).

Moreover, Scania acquired manpower with adequate knowledge and experience of how to operate in a state-controlled economy. It also made several significant adaptations, one of the main ones being financial. In the absence of this adaptation, it would have been difficult for the customers to meet their financial obligations and for Scania to make sales. In brief, Scania supplied all the necessary resources and made the necessary adaptations. Resource exchange and adaptation are at the very heart of the network approach and market establishment, as argued and confirmed by Axelsson and Easton (1992), Ford (2002), and Abraha (1994, 2002).

However, two significant environmental factors were also observed to affect the establishment process. One was the achievement of prior social/personal contacts in the market in order to make a successful business deal, which was not exactly easy for Scania as it had not operated in the market for long (Donaldson & O’Toole, 2007). The second was what we have called “ideological corruption”, i.e. a reliance on supplier-customer relationships developed during the former socialist regime. Scania lacked these connections and relationships, which affected its establishments to a certain extent. However, the impact of ideological corruption is gradually decreasing, even though it can not yet be completely ignored as a potential obstacle in the establishment process. These market realities both confirmed and deviated from Abraha’s model (1994, 2002). Confirmation is drawn from the fact that the same problems were also observed to be typical in the Kenyan market, while deviation is found in that, in the Croatian case, the problems were substantial and dealing with them very resource-consuming.

The establishment of Statoil in Estonia can be said to have been smooth as it received the support of the various domestic and international actors and their respective networks. These included Swedish and Norwegian authorities, as well as other authorities in the Nordic countries, the Estonian authorities, and several regional and international financial institutions, i.e. the World Bank, the IMF.
and the European Bank for Reconstruction and Development. Statoil received the support of these actors in the domestic market and abroad. It can thus be argued that Statoil combined the various types of resources it received from these institutions in providing its products and services to the customers in the local market and in developing the networks necessary to manage its relationships adequately. In sum, Statoil combined domestic, regional and international networks of relationships, and was thereby able to establish itself successfully in the Estonian market. The network approach calls this the “centrality” of a certain market position (see Ford, 1997, 2002; Hägg and Johanson, 1982; Blankenburg-Holm, 1996; Ford et al., 1986).

Statoil can be said to have developed a central position that connects to several significant actors in many directions. In Abraha (1994), these relationships are called “supporting relationships”, as they support and facilitate the concerned firm’s establishment in the market in focus. Once it has developed a successful market network, it will also continue to utilize those networks of relationships in the management of the network developed in Estonia. For example, when it needed its entry permit approved, it followed this process. It first approached the Estonian authorities, which were positive to the initiative. However, it was also necessary to negotiate and gain the approval of former Soviet Union authorities. To do this, Statoil involved the Estonian authorities, who were prepared to get involved and helped to facilitate the permit approval. The Swedish Trade Council also did its part in helping Statoil to become established as a company and to establish its products and services, which can be a real push towards successful establishments. The connections of these authorities also lend further support and confirmation of Abraha’s model and findings (1994, 2002), which suggest that relationships with government agencies are a prerequisite to building a network and managing the network once built.

Major problem that Statoil was confronted with in Estonia was the cultural difference. This is because there was some degree of suspicion of Western investment. In parity with our findings, one of the main concerns of Hennart and Slangen (2015) is how the entry decision process is structured. For example, we could not adopt the network model in its entirety because it takes a more general approach to market establishments as a process of development, and therefore not always appropriate for all types of economies without some modification. As discussed earlier in this paper, firms are exposed to irrecoverable entry costs or transaction costs in international markets (Osarenkhoe, 2009). However, the magnitude of the market entry costs and managerial problems associated with the establishment to leverage a number of significant actors in its network for support during its establishment invariably makes the process less cumbersome and less resource consuming (Johanson & Vahlne, 2003). In a similar vein, Tseng & Kuo, (2008) also suggested two kinds of network strategies: business and social. And that, compared to firms with FDI in the USA, firms investing in
China rely more on co-operative production systems and are more likely to utilize social relationships with the local community and government authorities. Furthermore, internal social and economic cohesion (Buckley et al. 2005) maintained is likely to exert a greater impact on market entry costs and its efficacy.

However, Statoil also makes careful pre-preparations of all possible and potential problems and takes whatever measures are necessary to handle the actual problems. The typical strategy Statoil applies to handle such problems is their Corporate Social Responsibility strategy. This is in agreement with the study conducted by Sankar et al (2006). This clearly indicates that Statoil cares about the society where it operates and that it is not only interested in making money. It also helps the company to show how committed it is and to gain the necessary trust from the authorities and the society.

CONCLUSIONS

The main objective of this paper has been to provide insights into the extent to which firms draw on a number of significant actors in their network of exchange relationships for support in their establishment processes in foreign markets. The companies studied in this paper have all entered markets that are relatively different from their own domestic markets. Croatia and Estonia are economies in transition, which still exhibit traits of a lack of essential resources, state interventions, and a high level of bureaucracy from their planned economy period. Of importance is a firm’s ability to address problems associated with the establishment and development of relationships (Johanson and Vahlne, 2003; Axelsson and Easton, 1992) with significant actors such as customers, intermediaries, local authorities and foreign authorities, because they facilitate a firm’s establishment process.

In this study, it has been crucial for Scania (having Sweden as its domestic market) and Statoil (having Norway as its domestic market) to identify and develop exchange relationships with significant actors such as customers, agents, local authorities, embassies, banks and trade councils. As a result of the complementary resources and activities (Yu et al, 2011; Hånell & Ghauri, 2015) which have emanated from the focal and supporting relationships (Abraha & Mukhtar, 2002) that the establishing firms had to develop and maintain, Scania’s or Statoil’s establishment processes have been both positively and negatively influenced. The positive impact from the various relationships and the environmental conditions are manifest in areas where Scania and Statoil gain a satisfactory market position in their respective markets: the market share seems to grow, access to critical resources does not pose a problem, and bureaucratic obstacles are virtually negligible. Statoil has enjoyed a smooth establishment process due to network access to resourceful actors such actors such as central and local...
authorities, industry actors, the World Bank, IMF and EU, Swedish Trade Council, Swedish and Norwegian ambassadors.

However, the negative influences on the firm’s (Scania’s) establishment processes are manifest in poor market position in large areas of Croatia due to difficulties in reaching end customers, lack of mutual orientation and commitment between the agent and Scania (supporting relationship), and, of course, bureaucratic impediments. The lack of mutual orientation, commitment and trust between the establishing firms and various local actors is attributed to different developmental levels between the domestic markets of the establishing firms and their respective host markets. These have even led to a breakdown of some exchange relationships (Scania versus an agent) and re-creation of others and/or greater commitment to the market by opening the firm’s own sales subsidiaries (Scania). All in all, for survival and consolidation of their relative positions, the interacting actors (local actors versus the foreign companies, for example) have to undertake mutual adaptations in a number of areas, for example, finance, business practices and managerial attitude. The study also shows that mutual learning, on the part of the interacting actors, is constantly taking place.

IMPLICATIONS FOR THEORY AND PRACTICE

The context in which this study was conducted further illustrates that a fundamental shift is occurring in the world economy. We are moving progressively further away from a world where national economies were relatively isolated from each other: by barriers to cross-border trade and investment; by distance, time zones, and language; and by national differences in governments, culture and business systems (Hewett et al 2006). This study takes a relationship and network perspective to international business decisions made by international business managers. Specific decisions evaluated from a relation and network perspective include market entry and the establishment process. Earlier we mentioned that traditional approaches to market entry do not emphasize a firm’s embeddedness in a social structure and, moreover, that such interdependence is fundamental to a network approach.

The relationship-centred approach demonstrated through the cases that emphasis should be placed on the need for cultural learning to aim, in a close relationship, to know and treat the international partner in the same way as a domestic one. Gaining an international relationship orientation requires adaptation by an organization, but more critically by its managers. Lack of cross-cultural relationship skills and orientation could impede a company’s growth in international markets (Osarenkhoe, 2009). Socio-cultural differences between a firm’s home country and its host country can create internal
uncertainty for the firm, which influences its establishment processes. The two cases show the importance of the role of culture in international business relationships (Fjellström & Zander, 2016). Culture represents an added dimension to what may be more complex relationships to start with. This type of relational embeddedness requires sensitivity and probably gives companies that try to use a relational approach to understanding international business barriers an added edge.

The question, then, is: What does this imply for managerial decisions in international relationships? Firstly, a need to understand the cultural context of foreign relational partners (see also Hewett et al, 2006 and Fjellström & Zander, 2016). Secondly, managerial skills, for example, the ability to negotiate and integrate socially across cultures, are important. Consequently, to operate in a company’s external environment, its managers must have not only knowledge of business operations, but also a working knowledge of the basic social sciences: political science, law, anthropology, sociology, psychology, economics and geography (Kodama, 2006). This assertion or implication is further legitimized in part by the cases presented in this paper, and in part by the theoretical framework, the network approach, which has its roots in sociology rather than economics and takes a contrasting view of the firm’s links with its environment (Johanson and Mattsson, 1988; Axelsson and Johanson, 1992).

Cultural differences influence relational processes and attitudes such as openness, the propensity of trust and commitment, communication patterns, attitudes toward risk, adaptability and flexibility, and business ethics (Hunt & Morgan, 1994; Fallon, 2004). This paper shows that in order for these differences to be incorporated into strategy, when managing relationships across cultures, they need to be examined in depth, and thus subjected to more scientific scrutiny in future research of similar scope and context (Donaldson and O’Toole, 2007). We therefore call for more research efforts in the area of cultural dimensions with regard to market establishment processes. Once entry has been considered, attention then turns to the growth and development of the firm or the internationalization of the firm. In future research, the void can be filled by investigating how markets can be expanded using a relationship approach. Moreover, future studies might consider providing questionnaire study with a comparison from other countries, especially CEE, and put more attention on economic data than on historical story.

Against this background, it is apparent from this paper that one of the principal challenges of entering a new international market is that developing network connections may involve restructuring the firm’s network: To become established in a new market, that is, a network that is new to the firm, the firm has to build relationships that are new both to itself and to its counterparts (Hollensen, 2001; Osarenkhoe, 2009). Aharoni (1966) argues that, because each decision influences later decisions, international investment decisions should not be viewed in isolation. If a firm enters a country using a
distributor, but then disagrees over the terms of the contract, it may not make any further investment in the country. A manifestation of this can be found in the Scania case, in which Scania terminated its relationship with Scandria in Croatia because of its lack of trust and commitment. Kinch (1992) highlights the difficulties of breaking into advanced economies where the actors tend to have long-established and stable relationships. A new entrant might find it difficult to form links with a distributor who does not supply products for one of his competitors. At the opposite end of the continuum, if the network of relationships in the host market is changing rapidly, as in emerging markets, there may appear to be greater opportunities, but it may be difficult to identify appropriate partners and attractive investments.

CLUSTERING AND NETWORKING AS A SINE QUA NON FOR SMES AND REGIONAL INTERNATIONAL COMPETITIVE ADVANTAGE

Osarenkhoe, Aihie; Fjellström, Daniella
University of Gävle, Department of Business & Economic Studies, Gävle, SWEDEN

ABSTRACT

Extant literature gives the impression that formulation of a firm’s strategic intent is a unilateral process solely confined to a single firm. This study respond to calls to expand inter-firm relationships study beyond the narrow dyadic relationship focus and not solely conceptualize collaborations as one of firms’ strategic intent to implement mechanistic growth strategy. Hence the following research question: How are the collaborative networks of private and public partnership organized to enhance competitiveness for actors in a cluster? And what are the perceptions of the actors in the cluster on the usefulness of clustering and networking? The objective is to map the salient features of existing clusters and networks and unveil firms’ perceptions of benefits accrued from clustering. Theoretical lens builds on clustering as an interactive learning process, and happens in the interaction between actors as open innovation postulates and that innovation is born out of reshuffling resources inside and outside of the firm and considers the mutual value creation between the involved. Methodology draws on focus group interviews, semi-structured and open-ended survey in cluster initiatives and strategic networks in Kronoberg region. Findings show that networking, dialogue, and experience exchange were the recurrent themes when firms expressed the benefits of collaboration in a cluster/network setting. Conclude that unveiling the salient features of existing clusters and networks and perceptions of the actors on gains accrued from clustering and networking, accomplished in this study, is the first step in a cluster development process. The implications are that relationships of firm in a domestic network are critical avenues for acquisition of resources and knowledge for enhancement of competitiveness, and as bridges to other networks in other countries. We present an explanatory model of cluster and regional competitiveness which emerged from our findings.

Keywords: Clusters, Networking, International competitiveness, Strategic network

INTRODUCTION

The extant literature stresses that having foreign market presence is imperative for most firms these days (Awuah, Osarenkhoe and Abraha, 2011). This is particularly vital for Small and Medium
Enterprises (SMEs) which are increasingly considered an important, though neglected, research field despite the fact that SMEs are considered the engine of a country’s economic growth (Sawers et al., 2008; Zeng et al., 2010; Suhail, 2014; Resnick et al, 2016). SMEs attract interest of policy makers, since they represent the majority of the economic structures and they are the main employers of a country (Tödtling & Tripl, 2008; Solleiro & Gaona, 2012). According to Hossain & Kauranen (2016), SMEs have the ability to react and adapt faster to the changing needs and environment, and argue that the successful development of these enterprises enhances the competitiveness of a country.

Against this background, it is paradoxical that “little is known about the conditions under which SMEs may be able to achieve growth when facing specific constraints. For example, it has been argued that SMEs could enter into coalitions with external organizations in order to obtain resources and information” (Hessels and Parker, 2013, p.1). Furthermore, Costa et al. (2016, p 1) argue that “the current literature is unclear about the way SMEs can access information and assimilate knowledge in a collaborative network context, to support decision-making”. And they continue “in the current literature, it is not clear how SMEs assimilate information from their networks and collaboration activities for making better decisions in terms of internationalization” (ibid). Thus firms are reeling from discontinuities created by a growing level of globalization, heightened volatility, hypercompetition, demographic changes, and the explosion of knowledge (Tödtling& Tripl, 2008; Ter Wal & Boschma, 2011). Ever faster means of communication alter today’s business climate and it is becoming more evident every day that we cannot anticipate the environment of tomorrow. The paradox highlights the importance of SMEs in the global economy, while current researches discuss the shortcomings of in-depth and detailed knowledge into how SMEs interact with their surroundings.

It is evident from this scenario that globalization process and benefits accrued from global market opportunities, and “pushing the companies to develop and adopt a proactive international approach in order to take advantage of the new situation” (Portero, Hervás-Oliver & Puig, 2012, p. 266) have given rise to two main challenges currently being faced by SMEs: first, to transform themselves and increase their individual competitiveness (Fassoula, 2006 cited in Karaev et al. 2007), and second, due to their limited size to take advantage of synergy effects created by entering into cooperative relations with other SMEs and related partner institutions. Hence increased interest in regional development among policy-makers is spurred by an upsurge in interest in regional issues on the part of researcher, which is manifested in greater attention to the cluster concept and the somewhat overlapping concept of industrial districts (Johanson & Lundberg (2011).

A perspective that has gained a great impact in recent years is that which is based on the so called open innovation (Chesbrough, 2003). Chesbrough et al., (2006, p. 1) define open innovation as the use
of purposive inflows and outflows of knowledge to accelerate internal innovation, and to expand the markets for external use of innovation, respectively. Open innovation requires much more interactions between different actors with different organizational cultures: large firms and SMEs (i.e. industry), universities and research institutions (i.e. academia), as well as national and regional authorities for building the legal or incentive framework of innovation (i.e government) (Lecler et al, 2015).

There are calls in extant literature (e.g. de Vrande et al. 2006) that Open innovation should not be solely studied from the perspectives of large, high-tech multinational enterprises (MNEs), as most commonly done (e.g. Chesbrough, 2003), rather the scope should be broadened to capture SMEs in general and services industries in particular. Even though flexibility of SMEs is seen as an advantage for accelerating their innovation, only few of them achieve to manage the whole innovation process on their own in order to turn their inventions into products or services. They often lack resources and capabilities (Antoldi et al 2011; Cerrato & Depperu, 2011; Coviello & McAuley, 1999; Crick and Spence, 2005) at the stages of manufacturing, distribution, promotion and research funding, and this leads them to cooperate with other firms, in order to reduce risk, cost and time required for innovation, as well as to gain access to sales and marketing networks during the last stages of innovation process.

To answer to some of the calls and shortcomings discussed, we suggest cluster analysis as a tool for meeting and understanding these challenges, as there is mounting evidence that clustering and networking help SMEs to raise their competitiveness (Venkataramanaiah and Parashar, 2007). However, while networking is viewed as vital for enterprises of all sizes (Ojala, 2009; Kontinen & Ojala, 2011), clusters alone cannot solve the complex problems and constraints encountered by SMEs and break the vicious circle of SMEs competitiveness (Dasanayaka and Sardana, 2010). Clusters, unlike networks, are not based on membership.

Lamentably enough, although it is apparent in extant literature that the cluster concept has been shown to be an efficient instrument for strengthening regional and national economies, its applicability for improving the competitiveness of participating SMEs has yet to be fully examined. However, extant literature gives the impression that formulation of a firm’s strategic intent is a unilateral process solely confined to a single firm (Driffield & Love, 2007). This study is a response to calls made in Osarenkhoe (2010) and Awuah et al (2011), Hessels and Parker (2013) and Costa et al., (2016), to expand inter-firm relationships study beyond the narrow dyadic relationship focus and not solely conceptualize collaborations as one of companies’ strategic intent to implement mechanistic growth strategy.
This paper aims to highlight the importance of interaction within and between society’s stakeholders and how different forms of clustering/networking can contribute to long-term value creation that strengthens the competitiveness of companies at the domestic level as well as in international contexts. Succinctly, mapping the salient features of existing clusters and networks and unveiling firms’ perceptions of benefits accrued from regional cluster, to be accomplished in this study, is the first step in a cluster development process. To address the overarching objective, the following research question is formulated:

RQ 1: How are the collaborative networks of private and public partnership organized to enhance competitiveness for all stakeholders in the cluster? And what are the perceptions of the actors in the cluster initiatives on the usefulness of clustering and networking?

Consequently, this paper extends our earlier works and existing literature by illuminating the complementarity-based and the continuum nature of actor bonds, resources ties and activity link of hybrid level of inter-organizational relationship prevailing in strategic networks and its impact on collective strategies for value generation among actors in network setting. An epitome of this is the increasing interest in regional development among policy-makers spurred by an upsurge in interest in regional issues on the part of researcher, which is manifested in greater attention to the cluster concept and the somewhat overlapping concept of industrial districts (Johanson & Lundberg (2011).

The rest of this paper proceeds as follows: First is the theoretical underpinnings, which consists of a review of literature that views markets as organized behaviour systems, manifesting network structures and clusters, as complex adaptive systems (Martin & Sunley, 2011; Menzel & Fornahl, 2010), made up of components with varying characteristics, that interact with each other in a systemic way. This is followed by the Methodology section includes data collection strategy and process that facilitated the mapping of the salient features of clusters and strategic networks in a specific region in Sweden. Thereafter, a presentation and discussion of the case study are carried out. We present an explanatory model of cluster and regional competitiveness which emerged from our findings. The paper ends with concluding remarks and a discussion of the implications of the study.

THEORETICAL UNDERPINNINGS

A great deal has been written about the new role of the state in what is described as a more globalized, more competitive world (e.g. Birkinshaw & Hood, 2000). Arguments have been advanced that the state has lost power upwards to supranational actors like the EU, the World Bank and the OECD, and downwards to increasingly active regions, and that public policy is more often being formed in complex interaction between actors in the public, private and education/academic sectors (Keating, 2006; Säll, 2012). The transformation from industrial society to information and service society
accompanied by great economic, political and social globalization constitute an important platform for the ideas of new regionalism. It has thus become a central tenet of politics for regional growth to create new kinds of arrangements, mobilize local and regional actors and interest in horizontal network constellations and utilize information and knowledge assets by means of partnerships (Lovering, 1999; Hudson, 2005; Hessels & Parker, 2013).

**Strategizing in networks**

Our knowledge on business relationships and networks as well as business strategies devoted to them has progressed substantially since 1970s, when the Industrial Marketing and Purchasing (IMP) Group were formed. Corresponding with IMP tradition, we define networking broadly as all of the actions of a company or an individual in business relationships and networks (Ford, Gadde, Hakansson, & Snehota, 2003). Such networking is embedded within specific institutional contexts. Thus sizable efficiency gains can be achieved by actors in strategic collaborative networks of exchange relationships (Awuah, Abraha & Osarenkhoe, 2011; Ojala, 2009; Kontinen & Ojala, 2011) through their activity links, resource ties and actor bonds to other actors in the network.

Early IMP research contributed to the understanding of companies’ internationalization processes, by the interaction model of international seller-buyer relationships (Håkansson, 1982) and the network model of internationalization (Johanson & Mattsson, 1988; Johanson & Vahlne, 1977). However for some time internationalization has not been in the forefront of IMP research. Meanwhile, the companies’ international business environment and perception of processes associated with foreign activities have changed and the importance of network relationships for internationalization has received more and more attention in business practice, government policies and in academic research. Kalinic and Forza (2012) discuss how SMEs use strategic focus rather than the gradual approach of building experience. They further argue that the internationalization of SMEs is taking place without sufficient experience or specific market knowledge. Against previous research, the SMEs can often do rapid internationalization (Osarenkhoe, 2009). Building on this, Hessels and Parker (2013) highlight the importance of interfirm collaboration strategies. Collaboration, in particular when it unfolds in the context of networks, is an important facilitator in the internationalization of SMEs (Johanson & Lundberg, 2011; Ter Wal & Boschma, 2011; Kontinen & Ojala 2011). By taking part of collaborative networks, SMEs’ internationalization processes can benefit (Hessels & Parker, 2013) by providing decision-makers with channels of information and knowledge; introducing partners, influence decisions on foreign market selection and entry mode.

The past twenty years have, however, seen a shift in the economic policies pursued in many countries. Networks and networking have become buzz words in business, academia, as well as regional and
national governments as the traditional macro-perspective on economic conditions has increasingly been superseded by a greater interest in the micro-economic business environment (Zeng et al 2010). The focus is no longer on specific companies or on the market in general; instead, specific relationships and networks between companies in a region are the object of policy-makers priorities (Ciravegna et al., 2014). As a result, vast (public) resources are now being poured into projects and programs that are aimed to support the development of relationships between various companies in a specific region in order to achieve growth. It is therefore not surprising that in recent years, various research disciplines have increasingly showed interest in the collaboration among various stakeholders.

**Utilization of joint innovation and clustering**

A basic assumption about the nature of the innovation process is usually taken as the starting point of modern innovation studies. And that innovation process interactive in nature. Very few innovations arise from single isolated source (Håkansson & Snedhota, 1990). Rather, most innovations are created through complex, interactive, iterative and cumulative learning processes in which a variety of actors (individuals as well as organizations) are involved in different ways (Curran et al. 1993; Dasanayaka & Sardana, 2010). The embryo of an innovation (or radical renewal process) are not always created at development department and then passed on to other units. Instead, the development department is, in many cases, integrated in all parts of the chain. Thus innovation process is considered also as a socially embedded process where the user perspective is often put in focus (von Hippel, 2001).

Building on innovation as an interactive learning process, and happens in the interaction between firms as open innovation postulate (von Hippel, 2001; Chesbrough, 2003), it is of importance to study how the innovation generates value for the involved parties (Håkansson & Waluszewski, 2002 & 2007; Van de Ven et al., 1999. Van de Ven’s (1999) definition of innovation suggests that innovation is born out of reshuffling resources inside and outside of the firm. Thus it is virtually impossible for a single company to reprocess and accommodate all the necessary skills within organizations. Instead, organizations rely on various forms of cooperation with external actors, companies and other organizations (such as universities).

De Vrande et al. (2006) discuss that SMEs pursue open innovation primarily for market-related motives such as meeting customer demands, or keeping up with competitors. Their most important challenges relate to organizational and cultural issues as a consequence of dealing with increased external contacts. Thus, clusters as a network can provide a common platform to help SMEs overcome these barriers. The values resulting from the presence in a specific local area of firms with similar or complementary skills and expertise is widely analyzed in the literature (Porter, 1990 & 1998; Martin &
According to Porter (1990), national clusters are formed by firms and industries linked through vertical (buyer/supplier) and/or horizontal (common customers, technology, etc.) relationships with the main players located in a single nation/state. This definition was modified by Porter (1998) to encompass institutions (formal organizations) such as universities.

It has long been recognized that related firms and industries tend to locate in certain geographical proximity but they will concentrate in a location only if that agglomeration brings benefits to them, which are greater than the costs of locating in the area (Martin & Sunley, 2011; Menzel & Fornahl, 2010). Some authors have distinguished between various geographical benefits from agglomeration economies, and found that geographical benefits are related to a certain geographical location (e.g. specialized labour, infrastructure, etc.), whereas agglomeration economies (benefits) describe how these and other factors are created by increasing the number of firms (Martin & Sunley, 2011; Menzel & Fornahl, 2010).

Consequently, geographical proximity is regarded as a vehicle to enhance the dissemination of knowledge and the development of institutions, which in turn may enhance cluster effectiveness. Geographical proximity creates competitive advantages to SMEs which closely cooperate and compete, since a host of linkages among cluster members results in a whole greater than the sum of its parts (Porter, 1998). Competitors within the cluster will benefit from agglomeration effects in a way that they will gain cost advantages and have access to resources that are not available to competitors not located in the cluster (Valdaliso et al., 2011; Maskel, 2001). The geographic concentration of clusters contributes to developing additional financial benefits and technological externalities (Niu et al, 2012). Technological externalities are defined as those consequences of activity which directly influence the production function in ways other than through the market (Ter Wal & Boschma, 2011; Martin and Sunley, 2011). As a result of geographical proximity, communication between cluster members is strengthened and the exchange of knowledge is intensified. Besides, the codified knowledge, which can be easily transferred through different communication media, informal, or so-called tacit knowledge, is exchanged rather accidentally because the senders and the receivers are not aware of its relevance before they are involved in the communication process (Gomes & Hurmelinna-Laukkanen, 2013).

Karaev et al. (2007) addressed effects of cluster on competitiveness, and conclude that belonging to a cluster has a strong positive effect on the SME policy in industrialized countries. This invariably reinforces the notion that geographical clustering of economic activity can impact on the creativity and competitiveness of firms in a number of different ways (Suhail, 2014; Zaheer and Manrakhan, 2001; Malecki, 2012). It is expected that firms in a cluster can benefit from productivity improvements due to reduced transaction costs, access to a common pool of labour (skilled or unskilled), benefits associated
with collective intelligence, technology spillovers and increased competitive pressure. Against this background, local contexts and clusters become an important source of international competitive advantage, where companies (SMEs, MNEs, etc.) can interact effectively among them and with other institutions so as to cooperate and learn.

A way to conceptualize clusters is to view them as complex adaptive systems (Martin and Sunley, 2011) which consists of various stakeholders (large firms and SMEs, universities and research institutions, national and regional authorities, etc.) with different characteristics, that interact with each other in a systemic way (Menzel and Fornahl, 2010, cf Valdaliso et al. 2016). Firms in cluster setting are heterogeneous in nature and, therefore, endowed with different organizational cultures, knowledge and capabilities (Ter Wal and Boschma, 2011) and, hence, cluster “do not develop evenly and as a whole” (Menzel & Fornahl, 2010, p. 224; Valdaliso et al. 2016, p. 68). However, Social capital, in particular, is widely understood as conducive to the promotion of intellectual capital, collective learning and the creation and transfer of knowledge both inside and outside the firm’s and cluster’s borders (Kuah, 2002; Maskell, 2001; Malecki, 2012; Valdaliso et al 2011).

According to Birkinshaw & Hood (2000, p. 12), “it is not just cluster membership but the specific characteristics of the cluster in question that impacts the likely subsidiary role”. Ceglie (2003), on the other hand, argued that the geographical concentrations of SMEs that operate in the same sector are not sufficient for producing “external economies”. According to him other factors, such as trust building and constructive dialogue (Niu et al 2011; Malecki & Fornahl, 2012) among cluster actors, exchanging of information, identifying common strategic objectives, agreeing on a joint development strategy and its systematic and coherent implementation are of paramount importance for building an efficient cluster.

**Reflections on the theoretical underpinnings**

For the purpose of this study, it is pertinent to mention that innovations in various types of enterprises tend to be defined as creative ideas put into practice, by management seeking to resolve persistent problems faced while pursuing the goals of the enterprise. The decision for SMEs in a cluster/collaborative strategic network or industrial district settings to internationalize their business operations in markets with varying magnitudes of physical and psychological distance is an example of innovative business practices. Inter-organizational collaboration covers lasting and well-structured relationships, resource flow and other interactions between specific organizations seeking to attain both common as well as individual targets. With reference to the review above, it seems that cluster-based strategies could really improve the competitiveness of SMEs and a cluster approach among
SMEs may be used as a tool for meeting their challenges related to globalization and trade liberalization.

Companies’ strategic partnerships with other companies and organizations create synergies for the parties involved, which increases the potential for positive regional development. To achieve this requires a strategic collaboration between various actors from various settings - businesses, private and public organizations and academic institutions. Thus epitomizing the notion that innovation entails new ways of configuring the resources of many actors, where the goal is to generate value for all of the parties involved. This places high demands on both internal coordination in existing supplier chains as well as the ability to work together across industry and institutional boundaries.

Finally, it is pertinent to mention that innovating in networks can result to a scenario of oxymoron because, business relationships have been described as the enabler of firms and their strategic intentions, in how resources are provided by business partners. At the same time, literature refers to how present relationships disable firms from conducting their strategies independent of others. This is explained by how companies act and react to strategies performed by other companies in the network-context. Parallel to this, strategy research emphasizing strategic flexibility point to how companies need to be adjustable to their environment, and focuses on the actual strategic practice.

**METHODOLOGY**

Findings reported in this study constitute the second paper from a longitudinal study. The first paper, which is published elsewhere, highlights the complementarity-based nature of coopetition strategy and its impact on collective strategies for value generation among actors in three network settings in Sweden. In this study, a qualitative and, to some extent, a quantitative research strategy was adopted. Qualitative research methods were believed to be most appropriate to facilitate the mapping of the salient features of clusters and strategic networks and perceptions of actors in a specific region (Yin, 2002). This allowed the researchers to uncover issues of relevance in understanding the substantive research question: RQ 1: How are the collaborative networks of private and public partnership organized to enhance competitiveness for all stakeholders in the cluster? Mapping of existing clusters and networks, as accomplished in this study, is the first step in a cluster development process.

Data collection process entails two steps: The first phase started in conjunction with workshops carried out in a network created by the researchers. The network includes researchers from three Swedish universities and representatives of clusters from five regions in Sweden. Joint cooperation on research on sustainable innovation driven clusters and network configurations has been initiated through six workshops organized in this network between 2013 and 2015. The first part of data
collection entails all clusters initiatives and networks in Kronoberg County. Process leaders were identified in collaboration with Heads of Business Enterprise in the municipalities. Thereafter, all cluster initiatives were subsequently contacted for in-depth interviews. 25 clusters, regional and local networks from all municipalities in the county were included.

**Focus Group discussion** with process leaders of cluster initiatives, regional and local networks was conducted. A total of ten groups were formed. There were six members in each group, and a session with each group lasted for two hours. A moderator guided the group through a discussion that probed: How are the collaborative networks of private and public partnership organized to enhance competitiveness for all stakeholders in the cluster? In compliance with requirements in which focus group interview should be conducted, the discussion was observed from behind a one-way mirror. Participants could not see out, but the researchers could see in. A video camera recorded each of the discussions carried in each group. Transcripts were created from the ten video tapes from the ten separate sessions. Questions were asked in an interactive group setting where participants were free to talk with other group members. The discussion was loosely structured, and the moderator encouraged the free flow of viewpoints on the main theme for discussion which were solely based on the research questions. “Having key themes and sub-questions in advance lies in giving the moderator or researcher a sense of order from which to draw questions from unplanned encounters (David & Sutton, 2004).

The second part of the data collection process aims to unveil the how firms in the clusters and networks perceive benefits or gains from collaboration in clusters, a loosely structured questionnaire which consists of semi-structured and open-ended questions were used. The survey was sent to 53 companies and other actors in the Aluminium Works, the Energy Agency, the Furniture Works, and Heavy-Duty Vehicles cluster initiatives. The survey was conducted through a combination e-mail and telephone questionnaire, with a response rate of 81 %. The open-ended part of the questionnaire enhanced the possibility for the respondents to provide additional in-depth comments. Both semi-structured and open-ended questionnaire focused on benefits of collaboration in clusters were identified from literature. They include the following: Benefits accrued in conjunction with strategic collaborations in the region manifest themselves in different forms: Advanced dialogue and consensus between companies and other significant actors; Potential to pool resources between companies, e.g. at production peaks; Collaboration with the school and the education system to safeguard workforce supply; Potential for common marketing and profiling; Potential to establish collaboration with various universities and academic and research institutions; and level of satisfaction with the work form used by the clusters.
Data analysis: Analysis consists of three steps: data reduction, data display, and conclusion drawing (Miles and Huberman, 1994). Data reduction entails selecting and filtering data in order to focus, discard and organize the data in such a way that conclusions can be drawn and verified (ibid.). As for the tape- and video-recorded interviews, this analysis process began while transcribing the interviews. The aim of data display is to organize the data into a compressed assembly of information to elucidate appropriate conclusions. The main themes, in our case the focus, objectives, activities and organization of the clusters and networks and perceptions, were extracted so as to provide succinct insight on the salient features of the cluster initiatives, regional and local networks in the region studied. Conclusion drawing and verification focuses on reflecting and understanding the data chosen for display. Although the process began at the initial stage, this step became more dominant during the later stages of the research. Despite the fact that the three steps are viewed as separate processes of analysis, it is important to note that the processes were going on simultaneously in this study.

PRESENTATION OF THE CASE STUDY ON CLUSTERING AND NEWORKING

The case study draws on cluster initiatives and strategic networks in Kronoberg County - a region where there are a number of examples of strategic collaborations between companies, academia and public institutions both at regional and local levels. These collaborative arrangements, according to our respondents, together contribute to strengthening and reinforcing the fertile conditions for SMEs and regional competitiveness and growth. Firms in Kronoberg County have, in comparison to Swedish peers, fewer bankruptcies - only 2.6 per 1,000. Kronoberg has during the last years been holding the top position in terms of its capability of running gazelle or fast-growing companies, approximately 300 gazelle companies per million employees. Gazelle are vital for growth, as these are the ones creating most new jobs. Kronoberg County’s share of exports is very high. In 2010, Kronoberg had the highest export value in the country per capita. When looking at the different forms of internationalization, a regional pattern emerges. In most counties, the number of importing and exporting companies is relatively similar. Kronoberg county show a higher share of exporting companies. It is otherwise more common that counties have a larger share of importing than exporting businesses.

Mapping of the salient features of strategic collaborations platform

The strategic collaborations identified consist of three categories: Cluster initiatives: A cluster initiative is an organised development process, associated with a common area of business activities. The purpose of such collaboration projects between companies and authorities, and/or research- and educational institutes, is to fortify the growth and competitiveness of a cluster. Development
processes running solely in conjunction with authorities or other companies are not considered as cluster initiatives, since they do not constitute a collaboration that intersects industry, administration, and academy.

Table 1 consists of five cluster initiatives in Kronoberg County. These are linked to established sectors in the county - in traditional manufacturing industry as well as in new areas of growth: The Aluminium Works – comprises regional and national companies in which aluminium is a strategic material; Bioenergy Cluster Småland – generating support to companies’ and organisations’ marketing of bioenergy technology; The Glassworks – collaboration in marketing and selling of experiences and activities around the glass manufacturing in the region; The Furniture Works – includes design- and furniture companies in Småland, and aims at developing a strong trade region; Heavy-Duty Vehicles – comprises manufacturers of heavy-duty vehicles and their subcontractors, facilitating collaboration between the companies.

The table sets forth selected financial data for five cluster initiatives (Swedish krona amounts in thousands)

Table 1: Cluster initiatives in Kronoberg county

The main purpose of the cluster initiatives identified in this study is to stimulate economic growth in various business sectors, and through collaboration reinforce the competitiveness of the firms and the cluster. This is achieved through, for instance, promoting innovations and entrepreneurship within a branch/business sector and facilitating increased research input and collaboration with academic institutions. According to the respondents, activities in the cluster initiatives consist, among other things, of common marketing, business profiling, and lobbying. They furthermore include collaboration with universities and university colleges as well as cooperation around shared projects, e.g. development of competence, production processes, and products. The cluster initiatives encompass over 150 companies, the municipalities in the region, and more than 24 other collaborative
partners, like universities and university colleges. The companies consist of over 21,000 employees in and outside the region (based on information from 114 of the companies), and recruiting members to the clusters is conducted from branch perspective rather than a geographic. Number of members range from one-man enterprises to large global corporations. Operations of the firms cover trading as well as manufacturing and services on both local and regional and international markets. Most of the cluster initiatives receive financial support from the region, and several of these are participating in national programs and ventures towards cluster development.

Regional networks
Entail interactions between actors at a regional level having an interest in collaborating around a common matter. Regional networks are not necessarily geographic; nor do they promptly represent a specific cluster or innovation system. The following regional networks were identified in this study. They include initiatives focusing on mobilizing individuals and actors in their work on regional future issues, but also initiatives with a focus on supporting branch development: CIL – Centre of Information Logistics – pursues efforts towards education in information logistics, based on the needs and priorities in the business sector; Delta Garden – aims at strengthening the competitiveness of companies by developing new forms for communication and dialogue, based on interaction and a participatory perspective; Destination Småland – promotes tourism and the visitor industry in the region by collaboration between the region, the municipalities, and companies in the visitor industry; Energy Efficient Buildings in Southeast – GodaHus – aims at developing the work on energy efficient buildings in the region by collaboration between public actors, universities, and companies; The Governor’s Ambassador Network – a relatively newly established network that mobilizes actors and resources for the future development in Kronoberg. The assignment of the regional networks is to support the development of the regional business sector, collaborate around education for the business sector, and to strengthen the attractiveness and competitiveness of the region. The work entails generating strategies for joint efforts, coordination of projects, and communal education.

Local networks in the municipalities
Primarily focus is on interactions between actors at a municipal level having a mutual interest in collaboration. Business networks are present in all municipalities in the county, and municipalities often have more than one. In Ljungby municipality, five business networks were identified, three of which are presented below. However, in other municipalities there are more networks than those presented below: There is a long history behind several of the networks; they were initiated and operated on the initiative of the local companies. One of the networks, Lagan Products, started under
the name The Thursday Club already during the 1960s, while others have been active since the end of 1990s, like Vi företagare in Tingsryd and Growing Älmhult. Some networks started relatively recently and have established themselves with the purpose of finding a form for promoting development of the industry and local companies through collaboration. Other local networks include: Alvesta municipality: The Business Sector Council; Lessebo municipality: Hovmantorp Business society Abbakuse; Ljungby municipality: Ljungby Partnership group, Ryssby Business society, the Thursday Club Lagan; Markaryd municipality: Tillväxt Markaryd AB; Tingsryd: The Private Health/Welfare network, Vi företagare; Uppvidinge municipality: Alstermo Utvecklings AB, Vilda Uppvidinge; Växjö municipality: BNI, Expansive Växjö, Ingelstad Business pool, The Network SIP; Älmhult municipality: Growing Älmhult.

The local networks primarily focus on support and development of the local business sector. Promoting attractiveness of the municipality, subsequently promoting companies and the industry there, is however also important. Interaction between companies, and between companies and the municipality, is the core of the network activity. The fifteen local networks encompassed in this study have more than 700 members. The members of local networks range from micro/one-man-enterprises with primarily a local market, to global companies acting on an international market. Thus, IKEA is a member of the network Growing Älmhult. All kinds of business sectors are represented in the networks.

Several local networks arrange recurring breakfast meetings on several occasions per season to exchange experiences, and to learn more about each other’s businesses. Other kinds of shared activities are common marketing, participation in trade fairs, educational initiatives for future competence supply, and collaboration with the municipality around pupils’ practical work orientation. The local networks have developed substantial collaborations with their municipalities, with well-established forms for continuous dialogue with the municipal government. Collaboration with the university is also high up on several of the network agendas, but is still in the process of development. The project “Student in the region” has contributed to establishing a framework for such a partnership.

Collaborations in clusters and gains accrued from Clustering and Networking

Viewpoints commonly expressed by all respondents, which are also in line with extant literature (Osarenkhoe, 2010; Suhail, 2014), were that collaboration holds no value in itself. It is hence crucial to substantiate any benefits derived from collaboration. Benefits must be palpable to all actors involved – collaboration is not viable in the end if not all partners can recognize their gain. There is consensus among actors included in this study that benefits are what motivate actors to continue to collaborate
and to contribute to jointly created preconditions for growth, locally as well as regionally. Benefits accrued in conjunction with strategic collaborations in the region manifest themselves in different forms: Advanced dialogue and consensus between companies and other significant actors; Potential to pool resources between companies, e.g. at production peaks; Collaboration with the school and the education system to safeguard workforce supply; Potential for common marketing and profiling; Potential to establish collaboration with various universities and academic and research institutions; and level of satisfaction with the work form used by the clusters.

In Table 2 below, we present findings showing firms perceptions of the actors in the cluster initiatives on the usefulness of clustering and networking. Benefits accrued from clustering and networking were extracted from extant literature (Martin & Sunley, 2011; Menze & Fornahl, 2010; Osarenkhoe, 2010; Antoldi et al 2011; Cerrato & Depperu, 2011) and operationalized as: advanced dialogue and consensus between companies and other significant actors; Potential to pool resources between companies, e.g. at production peaks; Collaboration with the school and the education system to safeguard workforce supply; Potential for common marketing and profiling; Potential to establish collaboration with various universities and academic and research institutions; and level of satisfaction with the work form used by the clusters. The findings from the survey which consisted of a combination of semi-structured and open-ended questionnaire sent to 53 companies and other actors in the Aluminium Works, the Energy Agency, the Furniture Works, and Heavy-Duty Vehicles cluster initiatives are presented below. The survey was conducted through a combined e-mail and telephone questionnaire, with a response rate of 81 %.
In a nutshell, networking, dialogue, and experience exchange were the recurrent themes when the companies expressed the benefits of collaboration in a cluster initiative setting. Here are some examples of their opinions:

“Seminars and dialogue groups offer a good exchange of experiences, and increase the competence of the participating co-workers. Collaboration with the university provides an opportunity for specific, need-based competence development activities and special education. In certain R&D-areas, collaboration opens up for external co-creation and finances. The largest benefit of the cluster for my company, are the recurring meetings and the exchange of information. This information is sharper and more relevant than the general reviews of the market situation in various countries (like conferences, seminars, workshops, etc)”. 

Other benefits of cluster collaboration are the strengthening and development of the position of the business sector and that the cluster, as a lobbyist, is able to pursue common matters. The collaboration in the cluster is also viewed as a way to market the region and make it visible, and as a means to increase the attractiveness, which might contribute to entice new companies and entrepreneurs to the branch and the region. The respondents expressed their views on these as follows:

“The branch is seen and heard in a better way, and arrangements and meetings have gained a greater weight and a higher quality (The Cluster initiative is) a means to market the region. Many more are attracted when companies come together. Sales volume increases, and by increasing the visibility, so does the possibility of attracting more to the branch… It is however up to each company how to utilize the resource”.

TABLE 2: A summary of firms’ views on collaborations in clusters and gains accrued from Clustering and Networking
One of the firms described the different aspects of benefit to firms, and what collaborating in clusters may be about: “We are subcontractors. Dialogue is of utmost importance to us, not just with our current customers, but also with potential customers from segments where we are not represented today. Similarly, holding the same kind of dialogue with the university and other research institutes is vital. Running joint projects, product- as well as knowledge-related, where staff from different companies and actors within the cluster are participating, offer considerable more-values to everyone, since the shared knowledge foundation in the projects is growing considerably larger and in particular, wider. We are furthermore running projects and activities that each actor would not be able to carry out on their own. The society being present in the cluster is also very valuable. The companies, the education-/research-sector, and the society all have the same goals, and it requires collaboration and understanding if we are to reach these goals. My company must have access to manpower with the right competences. Beside adequate education opportunities, this calls for a region where people want to live; a region one wants to move to with the whole family, and where one wants to stay on. This involves housing, work availability, schools, communications, health care, after school-activities, and much more. I am convinced that cluster initiatives are incredibly important and efficient when creating relevant common goals”.

The companies’ descriptions of the benefit of cluster collaboration convey a multifaceted picture of the needs and underlying rationale that motivate the firms to allocate time for collaboration with others. This picture is important in order to comprehend the dynamics of cluster collaborations, and that a number of different questions and aspects are involved in how the collaboration benefits are experienced by various actors. These may include issues that will not directly or within a short time make an impact on the company revenue or economic viability. As is illustrated by the viewpoints in Table 2 above, 78 % of the 53 companies and other actors in the Aluminium Works, the Energy Agency, the Furniture Works, and Heavy-Duty Vehicles cluster initiatives were very happy or exceptionally complacent with the work forms in the cluster. The companies believe that collaboration in the cluster to a limited degree has been beneficial to these matters. Regarding the development of the company markets and of products and services, 20 % of the companies maintain that collaboration, to a large/very large degree, has contributed to this. It is furthermore believed that collaboration to a large/very large degree has safeguarded the future supply of manpower and competence. In terms of collaboration with universities/university colleges, 36 % are of the opinion that this is accomplished to a large/very large degree. Only 8 % of the companies agree however to a large/very large degree that collaboration has led to reduced costs, e.g. by joint purchases or increased productivity.
DISCUSSION OF FINDINGS

“Soft and “Hard” Benefits Accrued from Collaborations in Clusters and Networks

The foremost benefit of collaboration in clusters is, according to the companies, “soft”. It concerns experience exchange, networking, and dialogue between companies and between companies, academic institutions and public sector. The benefit has not encompassed “hard” results, like reduced costs, product- and service-development, or development of new markets, in equal measure. Nonetheless, the companies are largely pleased with the work forms in the cluster initiative. As a matter of fact, the most remarkable of the findings is that only 8% of the companies agree that collaboration in clusters has led to reduced costs, e.g. by joint purchases or increased productivity. This is a far cry from other findings in extant literature (Porter, 2000; Curran et al, 1993; Martin & Sunley, 2011; Menzel & Fornahl, 2010; Karaev et al 2007; Venkataramanaiah & Parashar, 2007), that geographical proximity brings so-called agglomeration effects in terms of higher specialization, innovation and knowledge transfer, which results in costs reduction and improving the competitiveness of industrial sectors, regions and nations.

The above-mentioned anomaly seems to be in contrast to the basic assumption of open innovation model (von Hippel, 2001; Chesbrough, 2003) that much of useful knowledge to develop new products and services lies outside the boundaries of the company. This is particularly vital for SMEs as they often lack resources and capabilities (Antoldi et al 2011; Cerrato & Depperu, 2011) to manage the whole innovation process on their own in order to turn their inventions into products or services. We, therefore, suggest cluster as a tool for alleviating these challenges, as there is mounting evidence that clustering and networking help SMEs to raise their competitiveness (Venkataramanaiah and Parashar, 2007).

However, firms perceptions of benefits accrued from regional cluster, illustrate the complexity of the underlying motives for the companies’ participation in clusters. A number of different aspects of long-term sustainable growth of the companies and of the region are involved. In the literature review section, we mentioned that clusters alone cannot solve the complex problems and constraints encountered by SMEs and break the vicious circle of SMEs to reach the next level of growth (Dasanayaka & Sardana, 2010). However, clusters, unlike networks, are not based on membership. They are simply geographic concentrations of interrelated companies and institutions of sufficient scale to generate externalities. The minimum number of firms with common or overlapping needs to be acknowledged as a “cluster” is the number that attracts suppliers and specialized services and resources.

Figure 1, which emerged from our findings, aptly depicts an explanatory model of cluster and regional growth. It shows that successful regions base their growth and development on established
areas of strength; they do not seek to develop completely new activities, but rather build on tradition, history, and competence in the region. Success does however not come from acting in the same way as always. It is rather the capability of renewing and developing existing assets in a region that creates the preconditions for competitiveness and growth in companies and regions. Renewal and development of existing assets place focus on the capability of innovation and entrepreneurship in the region, and need individuals that (in collaboration) engage in development, renewal, and enhancement of these assets into new products, services, and production processes that can compete on a global market.

Innovation capability and entrepreneurship at an individual level do however not sufficiently explain why certain regions are more successful than other regions in terms of creating the necessary preconditions for growth in companies and in the region. In prosperous regions, there is a contexture, a regional innovative environment founded on a common consensus, and a capability of interaction between actors from different sectors of society. This is about cultures and values, attitudes towards change and development, along with a framework for interaction between various actors. The regional leadership decisively affects the capability of a region to cultivate common values and joint actions. A regional leadership, capable of creating a common consensus and establishing different forms of interaction, where different actors in the region are moving in the same direction, is imperative for building a regional innovative environment that promotes competitiveness and growth.

Figure 1: Towards an Explanatory Model of Cluster and Regional Growth

In a nutshell, it can be deduced from the model (Figure 1) that interaction can be viewed as a four-phase process. It starts with dialogue (to mobilize actors and resources) (Håkansson & Waluszewski, 2002; Van de Ven et al., 1999) and consensus (the forming of a common strategic idea around the present level and the should-be level). The process continues with collaboration (the forming of
common action plans for implementation) followed by joint action (implementation of the commitments and activities within the developed common frame and strategy). Partnership may also be regarded as a process over time, where the actors gradually acquire a shared view, with faith and trust simultaneously maturing between the actors, thus facilitating joint commitments and inputs (Ciravegna et al., 2014; Johanson & Lundberg, 2011; Ter Wal & Boschma, 2011; Zeng et al 2010; Kontinen & Ojala 2011). The process calls for, and denotes, developing a social capital that connects actors (see findings above on salient features of strategic collaborations platform). This is particularly important when the setting consists of actors with different organizational cultures: large firms and SMEs (i.e. industry), universities and research institutions (i.e. academia), as well as national and regional authorities for building the legal or incentive framework of innovation (i.e. government) (Lecler et al, 2015).

These observations are in line with the basic assumption of open innovation model (von Hippel, 2001; Chesbrough, 2003) that much of useful knowledge to develop new products and services lies outside the boundaries of the company. This is particularly vital for SMEs as they often lack resources and capabilities (Antoldi et al 2011; Cerrato & Depperu, 2011) to manage the whole innovation process on their own in order to turn their inventions into products or services. We, therefore, suggest cluster as a tool for alleviating these challenges, as there is mounting evidence that clustering and networking help SMEs to raise their competitiveness (Venkataramanaiah and Parashar, 2007). Consequently, despite the great success and interest that the topic has stimulated in both academics and practitioners in the past decade, several areas such as open innovation in small medium enterprises, open social innovation and outbound open innovation need further investigation.

CONCLUDING REMARKS AND IMPLICATIONS OF THE STUDY

Mapping the salient features of existing clusters and networks and unveiling firms’ perceptions of benefits accrued from regional cluster, as accomplished in this study, is the first step in a cluster development process. We mentioned earlier in this paper that we aim to highlight the importance of interaction within and between society’s stakeholders and how clustering and networking can contribute to long-term value creation that strengthens the competitiveness of companies at the domestic level as well as in international contexts. This study takes its point of departure in complex and interactive learning processes being able to help to create positive synergies in which actors with different goals, perspectives and expertise are involved in the work and contribute their respective views on how to work toward common goals. The basic premise is that companies and organizations can no longer rely solely on their own core competence and innovation capabilities but must work...
together across organizational boundaries to manage a dynamic environment. This is particularly vital for SMEs because they are seldom able on an individual basis to produce the competence development, technology coverage, marketing skills, etc. that are required for meeting all demands from the environment (Antoldi et al. 2011; Cerrato & Depperu 2011). However, these functions may well be developed by the companies if they collaborate (Carbonara, 2002; Osarenkhoe, 2010). They will hereby be able to acquire strategically crucial knowledge that can be converted into new products and services, realizing the dynamic potential of small enterprises, and in the end, this contributes to economic growth.

Although many countries all over the world have developed cluster policies and programmes to enhance the impact of their research and innovation policies (Porter, 1990; Säll, 2012), and clusters provide governments with an excellent opportunity to address social and economic challenges through business development and innovation support programmes, clusters have to be considered as a tool not as an objective in itself. Findings from this study which led to the identification of “Soft and “Hard” benefits accrued from collaborations in clusters invariably strengthen our understanding of the prerequisites for regional growth and competitiveness. In addition to these, “soft factors” such as regional leadership/governance, interaction- and joint action capabilities, the importance of a consensus and a social capital, an increased impact are also identified. These critical factors are summarized in a model which unveils the factors relevant to cluster development and regional growth and how they interact with each other. Some implications of this study are outlined below:

Lessons learned from the preceding sections aptly depict that innovation capacity in companies, clusters and regions is an increasingly important factor in the development of competitiveness and growth. In order to establish a long-term competitiveness, continuous development of new products, services, and production processes is crucial. Innovation capacity is, along with entrepreneurship, decisive for sustainable development of companies and regions. In other words, efforts made to stimulate growth and competitiveness amongst companies and regions is increasingly being focused on developing and renewing the resources available in the region. To achieve this requires a strategic collaboration between various actors from various settings - businesses, private and public organizations and academic institutions. Thus epitomizing the notion that innovation entails new ways of configuring the resources of many actors, where the goal is to generate value for all of the parties involved. This places high demands on both internal coordination in existing supplier chains as well as the ability to work together across industry and institutional boundaries.

The dynamics between short-term and long-term goals cannot be overemphasized in this case study. It is crucial to show results and tangible benefits early. As a matter of fact, the most remarkable of the findings is that only 8 % of the companies agree that collaboration in clusters has led to lowering costs,
e.g. by joint purchases or increased productivity. This is a far cry from other findings in extant literature. Indeed an anomaly that requires further scientific enquiries. It seems that short term goals are important in order to attain driving force in the process. This creates the necessary conditions for a more strategic and long-term effort (e.g. firms establishment in cultural distance markets). Processes of this kind demand perseverance and trust between the actors in order to succeed (Niu et al 2011; Malecki & Fornahl, 2012). In the world of clusters, much of the public funding is founded on a project perspective. Since the definition of a project, according to respondents, in all simplicity comprises start-end and budget, and a process really do not have an ending, distorted expectations might rise among the stakeholders. It must be made clear to actors in the clusters right from start that the process is one thing, and the projects within the process are another. Achieving tangible results from a cluster initiative often takes years. The perseverance and trust among the stakeholders are by that time put to test.

More research is needed on how SME clusters could be significantly upgraded to enhance the levels of cluster productivity and participation in international markets. However, mapping of existing clusters and networks, as accomplished in this study, is the first step in a cluster development process. Since cluster concept has been shown to be an efficient instrument for strengthening regional and national economies (Johanson and Lundberg, 2011; Venkataramanaiah and Parashar, 2007)), future studies should focus on its applicability for improving the competitiveness of participating SME, by conducting a thorough analysis of cluster. Such analysis can help diagnose a region’s economic strengths and challenges and identify realistic ways to shape the region’s economic future. Future research directions in clustering should also include the constraints associated with innovative capacity. Constraints are due to the variables related to firms’ innovativeness in a specific territory, such as the rate of labour mobility, technological development, and the consideration of dynamic effects of spillover issues together with specific characteristics of the environment. Unique regionalization effects of the business environment on firm’s innovativeness (e.g. legal, supplier, and customer profiles) as well as the actors (e.g. government’s role) are also supplementary issues that ought to be emphasized in future research.

CYBER RISK MANAGEMENT IN CREDIT COOPERATIVE BANKS: A CASE STUDY

Ossola, Giovanni; Giovando, Guido; Crovini, Chiara

Department of Management, University of Turin, Turin, Italy, giovanni.ossola@unito.it

ABSTRACT

Our research explores the Italian banking sector. In particular it focuses on the analysis of the cyber risk management in Bene Banca, a Credit Cooperative Bank (BCC) in the North-West of Italy.

This research represents a case study that can help us understand the context and the main characteristics of the methodology implied by Bene Banca in managing cyber risk. Data were collected through semi-structured interviews of an open-ended nature and questionnaires to directors, members of the audit committee, risk managers, compliance managers, internal audit function and anti-money laundering responsible.

We decided to concentrate on this small bank because of its size and its role on the local territory and because the cyber risk management is outsourced.

Furthermore we focus on the topic of cyber crime because IT attacks have increased drastically in recent years, both in terms of complexity and resources, and they cannot be stopped by single organizations, because they need a response at country level.

Consequently this paper has been motivated by the gaps in the understanding and in considering cyber risk and cyber risk management as an integral part of the business management.

Keywords: cyber risk management, credit cooperative bank, cybercrime, threats, IT, case study

INTRODUCTION

Companies with the constant need to adapt to the needs of the surrounding environment have increasingly developed information and communication technologies (ICTs), leading companies to be heavily dependent on cyberspace.

In the banking system in particular, nowadays in order to be competitive, each bank must be increasingly connected to the technological world. However, cyberspace and its components are influenced by a high number of potential hazards. First of all, since they are complex and rapidly evolving systems, their vulnerability is always present. One or more of these vulnerabilities can be
exploited by hackers that illegally might have access to an organization's IT systems, allowing them to read, steal or delete critical information, or even take control of their IT or physical resources. These vulnerabilities make cyber risk very relevant from the point of view of both financial and reputational risks.

In this paper we want to analyze how a small banking reality addresses this issue.

The bank is Banca Credito Cooperativo di Bene Vagienna - BeneBanca, an Italian credit cooperative bank in the North-West of Italy.

The banking system of the Credit Cooperative in Italy finds its origins in the last quarter of 1800. Since their inception, these institutions were closely linked to the local communities in which they were established, in fact thanks to the deep knowledge and mutual members of the community, their family situation, their personal reputation were singled out to creditworthy people. Since then, Rural and Artisan banks have maintained a very close relationship with the territory of reference, weaving their own story with that of the communities, as to be “local banks call”. The rural banks were able to grow in number and spread over time, supporting the socio-economic development of their local areas.

In 1993, the Banking Act lays down a radical change since the naming ranging from "Rural and Artisan banks" to the current "mutual banks". By means of this decree are not operating limitations of BCCs that can offer all the products and services of other banks.

The system of mutual banks in Italy today includes 364 banks for a total of over 4,400 branches throughout the Italian territory. The employees of the banks are over 37,000.

In total there are more than one million and two hundred thousand members of the mutual banks and mutual banks are more than 6 million customers.

In December 2016, total managed amounts on behalf of customers - consisting of direct deposits and indirect deposits - amounted to EUR 977.2 million. Direct collection amounts to 599.3 million euro. Cash receivables with customers net of value adjustments (asset item 70) amount to euro 460.3 million.

Our research, as it is a case study, fits into this framework. In fact we concentrate on the topic of cyber risk management in a credit cooperative bank.

The remainder of the study is organised as follows: in paragraph 1 a brief literature review is presented, in section 2 methodology and research design are described, paragraph 3 instead presents findings, while comments and discussion follow this section and finally we present the conclusions.

1. LITERATURE REVIEW

With reference to the topic of credit unions and credit cooperative banks, Smith et al. (1981) discussed about the economic theory of these businesses and Labie and Perilleux (2008) studied the Corporate Governance in Microfinance. Several researchers concentrated on this kind of banks, in terms of
characteristics and role within the Italian banking sector (Bonfante, 2010; Agostini, 2009; Costa, 2007; Capriglione 2005; Vella, 2004; Appio, 1996). Zago and Dongili (2014) examined in depth the impact of the financial crisis on the Italian credit cooperative banks and the technical efficiency of the Italian BCCs for the period 2003 to 2012, discussing and testing different specifications and objective functions for BCCs. The importance of local small banks, such as BCCs, was emphasized in few studies. Ferri and Messori (2000) stressed that close and long lasting customer relationship between small banks and firms can promote a favourable allocation of credit for economic growth. Usai and Vannini (2005) distinguished among various types of banks while studying the finance-growth nexus in Italian regions. Good capitalisation, stable funds availability and liquidity give BCCs the ability to provide credit even during the recent financial crisis, replacing other banks suffering more from the credit crunch. These elements positively affect the local community in which the BCC operates, by supporting families and the development of businesses. In 2007-2008, the financial crisis caused significant new problems in risk assessment and management. As a consequence, some researchers tried to locate the perimeter within which identify the financial risk and study methods for good management, in accordance with the requirements of Basel (Álvarez and Rossignolo 2015; Angelini et al. 2011).

This research is a contribution in the field of cyber risk management and cybercrime in the banking system.

There are several works using different methodologies that focus on cyber risk. They concentrate on cyber security as a tool to manage exposure to IT risk and protect an organization against a new form of business loss (Biener et al., 2015; Mukhopaday et al., 2013; Mukhopaday et al., 2005; Laurence et al., 2003). Others focus on specific tools to mitigate this risk (Hoffman and Ramay, 2011; Hieb, 2007). There are some professional guidelines that underlines the importance of building cyber resilience (PwC, 2015; MMC, 2016).

They all stress the importance of developing sound risk management and an appropriate approach, without mentioning a possible solution for companies. In particular, in the business literature, little has been studied in the subject of the banking world and its problems in dealing with cyber risk.

2. METHODOLOGY

Research design

A case study design using multiple levels of analysis was employed for this study. This approach was necessary to ‘get close’ to the actors’ perspectives on the complex processes of network interaction (Blackburn and Kovalainen, 2009; Curran and Blackburn, 2001). Data sources included interviews with directors, members of the audit committee, risk managers, compliance managers, internal audit function and anti-money laundering responsible. The case reported here is represented by Bene Banca,

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
a small credit cooperative bank in Piedmont, North-West of Italy. It was founded in November, 14 in 1897. We decided to concentrate on this small bank because of its size, its role on the local territory and because one of the authors is a member of the audit committee. Furthermore this is the second step of a far deeper analysis that would involve other realities, by elaborating a multiple case study. In addition, it is interesting to analyse how a small financial institution assesses and manages cyber risk.

Data collection and procedure

The case study research was conducted by the authors over a period of six months from September 2016 to February 2017, during which time the main method for data collection was through semi-structured interviews of an open-ended nature. Thirty-five interviews were conducted in total, from which eleven interviews were carried out in the case study reported here. The major data collection was accompanied by a brief questionnaire. The purpose of the questionnaire was to collect information regarding the risk methodology employed to manage cyber risk and to build RM capability.

The study has the aim to formulate research questions by problematizing some dominant assumptions in existing research (Davis, 1971). In particular, the main research questions are the following:

- Research question 1: How do a small financial institution manage cyber risk?
- Research problem 2: How effective is the methodology pursued?

This approach would support a more reflective-scholarly attitude (Abbott, 2004) and consider a different epistemological approach.

In this case the epistemological approach is that of induction because it finally helps reach a verdict on the hypotheses, previously analysed in the phase of abduction, and the nature of the verdict is dependent on the number of testable consequences that have been verified.

Furthermore, we decided to focus on the topic of cyber crime because IT attacks have increased drastically in recent years, both in terms of complexity and resources, and they cannot be stopped by single organizations, because they need a response at country level, as they tend to diminish its economic prosperity and independence.

Consequently this paper has been motivated by the gaps in the understanding and in considering cyber risk and cyber risk management as an integral part of the business management. And the attention here is on a critical infrastructure (as defined by the NIST Framework, elaborated by the FSSCC), which is also a small company.
3. FINDINGS

Thanks to the interviews and questionnaires, we found that Bene Banca applies a methodology common to all banks in the consortium. The consortium carries out an outsourced function to the bank in relation to IT risk management. This function complies with:

- Banca d’Italia - Circolare n. 263, of 27 December 2006 15° update of 2 July 2013;
- Provisions provided by applicable privacy laws (D. Lgs. 196/2003 “Codice in materia di protezione dei dati personali”, and subsequent measures of 10.13.2008 and 11.27.2008);
- “Linee guida per la definizione di una metodologia di analisi del rischio informatico e di un processo di gestione del rischio informatico” - Support Project adjustment to the 15th update of 263/06 - new information technology and business continuity - September 2014;
- “Policy di Metodologia di analisi del rischio Informatico” Risk Analysis methodology - Support Project adjustment to the 15th update of 263/06 - new information technology and business continuity - in January 2014;

In addition this function follows international best practices, such as: ISACA Cobit 5 for Risk; ISO/IEC 27001:2005 Information technology - Security techniques - Information security management systems - Requirements; ISO/IEC 27005:2011 Information technology - Security techniques - Information security risk management; and ISO 31000 Risk management - Principles and guidelines.

The Cyber Risk Model contains a representation of the elements and scenarios that must be considered in the field of Cyber Risk, defined on the basis of best practices in the industry.

The Cyber Risk Model consists of:

- business processes of banks;
- the representation of the main elements IT (risk factors);
- the relevant relations between elements and processes;
- threats that insist on such elements;
- the related impact on the business of the banks.

In particular, in the IT environment it is important to identify all the IT Application on which may insist Threats of IT; relationships between IT resources and the ways in which banks perform integration of IT risk with Enterprise Risks, especially reputational, strategic and operational.

It is illustrated a representation of the elements and of the scenarios that characterize the Model, and which therefore must be considered in context Risk Computer.

a) Business Processes

They are a component of the IT risk model since they contribute, through the hazards to which they are subject, to:
• assessment of impacts associated with the Risk Scenarios relating to the components of the information system that support them;
• Identification of critical components of the computer system.

b) Business Organizational Units

The contact people of the organizational business units of banks in the consortium are the reference actors for the evaluation of impacts. Among them, the Banks of the Consortium identify Users Officers representing end-user systems and IT applications and in dealing with internal ICT Department to the Bank.

c) IT Elements

The complexity of IT elements that must be analyzed and evaluated within the model, using a proportional approach to the analysis dimensions, is described below.
• IT services: consist of one or more IT applications, whose purpose is to support the delivery of the functionality required by business processes to achieve its strategic and operational objectives.
• IT Applications: a group of components in support of one or more IT Services.
• IT Processes: the management and governance of IT operational machine common to all IT applications.
• Infrastructure: elements of the model constituted by the technological and infrastructure components that support the operation of the other IT elements.

d) IT Threats

The IT threat is any event or circumstance that may lead to negative consequences (impact) on information systems. Any threat can be characterized in terms of vulnerability of the components of the computer system, exposure of the components to the threat and types of consequences, whereas some threats can be realized according to different modes.
The IT Threats are declined according to a hierarchical structure (Threats of I, Level II, Level III, ...) depending on the granularity of the same. This organization supports the Risk Analysis implementation at different levels of detail, depending on the availability and quality of information available on the elements to be analyzed.

e) Risk Scenarios Computer

It defines "Cyber Risk Scenario", or simply "Scenario IT Risk ", a homogeneous set of IT threats that can cause a certain type of impact for the business.
The main features of the IT risk scenario are:
• identification of a type of consequences for business and, accordingly, the association or one or more IT threats that have the character to generate the sort of consequences identified by the scenery or
one or more types of operational, reputational, strategic and compliance defined by the methodology in place at the individual bank of the Consortium;

- Association, through threats, to one or more elements of the IT model;
- definition, for banks, the rules of distribution of impacts from the Enterprise Risks on IT Threats;
- definition of the rules of distribution of probability values associated with threats;
- Identification of security measures to mitigate the risk associated Threats to the scenario.

The outsourcer for the portion of outsourced resources by the Bank is in charge of preparing, updating of IT Risk Scenarios and related documentation.

f) Probability of occurrence

The probability of occurrence of one or more IT threats is the frequency with which they may occur on one or more IT elements in a given period of time causing an impact on the consortium that will result in a negative impact for the Bank.

The estimated probability of occurrence, as well as the characterization of the associated risks, requires specific skills and knowledge of the IT environment, as well as the availability of appropriate time series.

g) Impact of IT

The impact of IT is the negative consequence for each bank of the Consortium, caused by the realization of one or more IT Threats. A IT Impact can be assessed qualitatively or quantitatively and includes economic damage, operating costs, violations of regulatory compliance and can be evaluated as part of the risk management process.

h) Measurements of IT Security

A IT security measure, whose main purpose is to reduce the risk that hangs over a computer IT element where it is applied, may act by reducing the exposure of a certain element to a IT Threat or limiting the impact of a threat. A security measure may act with respect to the various threats with a different degree of effectiveness which is defined as the level of risk that the measure helps smooth.

The set of security measures, called "IT Security Measures Library", is defined by identifying all the measures that have the ability to mitigate the impact or likelihood of occurrence of the threats contained in the "IT Threats Library". The library may take into account the fact that different security measures can act alternately in order to mitigate the risk associated with a threat to an appropriate level. In the identification of Security Measures to counter the IT Threats must be taken into account all the policies, procedures, regulations and guidelines in order to identify easily organizational security measures and procedural.

The methodology therefore identifies the essential safety measures for the mitigation of risks related to IT Threats associated with a scene.
The principles that have guided the definition of the Technological Risk analysis methodology are: the consideration of the impacts of ICT on the corporate operation risks; the desired level of granularity for analysis; compliance with general principles such as repeatability of the methodology, compliance and consistency with regulatory, and feasibility.

The prerequisites including the main stages of analysis and IT risk management are:

- **Defining the Context**: establish the main parameters of the process, collect all the key elements of the IT risk management process, define the scope of analysis and prepare a work plan;
- **IT risk identification**: identify the risk scenarios applicable to IT resources object of analysis. For the correct identification of the applicable scenarios it is necessary to consider the consequences defined by each scenario and determine whether such impact may occur on the Application IT under examination;
- **Census of IT applications**: identify IT Applications in the scope of analysis to provide sufficient information for risk analysis. This level can be redefined in successive sessions of application of the methodology;
- **Identification of IT Risk Scenarios and Threats**: such as Total Unavailability of information systems, Degradation of service quality, Breach of data privacy, Compromised data integrity, Loss of Data Quality. The association between each scenario of IT Risk and Threats IT is contained in the "IT Threats Library".
- **Definition of metrics for the evaluation of the probability of occurrence**: the evaluation of the probability of occurrence of one or more IT threats is calculated on the basis of certain assumptions criteria and the subsequent evaluation of the likelihood is represented using a qualitative scale of increasing levels of probability assessment: "Very Low", "Low", "Medium ","High", "Criticism". It is defined: a)Very Low: probability that an event will occur 1 once every three years; b) Low: probability that an event will occur 1 once a year; c) Media: probability that an event will occur 1 time every 6 months; d) High: probability that an event will occur 1 once every 3 months; e) Criticism: probability that an event will occur 1 time per month.
- **Definition of metrics for impact assessment**: the impact assessment is performed taking into account at least the aspects regarding a) the economic impact resulting from reduced or absent in the Bank's ability to generate profits through its business processes, arising from destruction or damage to physical or logical assets, of any penalties arising from non-compliance with contracted, connected service levels impossibility to comply with a legal obligation due to the occurrence of the adverse event; b) operating cost related to staff that is employed in the resolution of adverse event that occurred phases, supported by the Bank to compensate for the failure to support IT; c) the risk of non-compliance for compliance violations that may occur as a result of the occurrence of the adverse
event; d) reputational damage to the bank, generated by the event and its adverse package delivery and the modes reputational damage to the bank, generated adverse event and its consequences; e) strategic damage to the bank, generated by the event and its adverse consequences.

- **Definition of thresholds for acceptance of the risk Computer**: the bank defines the correlation to operational risk, as well as their thresholds of risk acceptance, in relation to the Risk Appetite Framework (RAF).

- **Definition of IT risk calculation model.**

In this context, there is the annual production of "synthetic report on IT risk situation."

The process of analysis and management of Computer Risks must be repeated, at least every three years and in any case in the following cases:

- for all new projects related to the development of new IT Services / IT Applications, with particular urgency for the most critical areas;
- for all infrastructural projects that may alter the level of risk previously assessed on infrastructure;
- in the event of serious accidents or deficiencies in the controls carried out;
- in the event of new threats or the dissemination of news regarding new vulnerabilities in IT applications, if either of them is of such magnitude as to be able to significantly change the threat and risk scenarios previously defined;
- In the case of new legal provisions, regulations, standards and industry standards imposed by contract that have effects on the IT and that modify the reference scenarios and may entail risks of non-compliance and, therefore, restrictive measures, sanctions or other measures that can affect the business;
- occurrence of events or threats that may affect the effectiveness of data quality assurance measures and controls covered by the Data Governance perimeter.

### 4. CRITICAL COMMENTS AND DISCUSSION

We have noticed the importance and significance of this risk for the bank. In fact, although it is a small reality, the issue of cyber risk is particularly monitored. This topic is dealt with by Bene Banca in a compliant manner with the rules of the Bank of Italy and has established all the procedures necessary to detect and limit this risk.

We recommend modifying the procedures when specifying that the Computer Risk Analysis and Management process should be repeated at least every three years unless clearly identified in the document. This time frame seems too broad and we propose to see it again as well as the underlying risk is constantly evolving. That because cyber risk requires a prompt reaction when a threat
materialises, while with this long time frame in updating the evaluation model, the bank risks to undergo too heavy damages.

We also suggest to analyze the NIST Framework for Improving Critical Infrastructure Cybersecurity, elaborated from the FSSC, in 2014, which is a conceptual theoretical framework that focuses on the internal organisation of financial institutions and has the fundamental aim to clarify the understanding of the organisation’s business drivers and security procedures. The Framework refers to the risk management process to enable organizations to inform and prioritize decisions regarding cybersecurity. It supports recurring risk assessments and validation of business drivers to help organizations select target states for cybersecurity activities that reflect desired outcomes. From this document there may be some interesting steps in implementing the procedure.

Furthermore, in 2015, CIS Sapienza in cooperation with CINI Cyber Security National Laboratory National Interuniversity Consortium for Informatics translated and adapted the NIST Framework to the Italian context, considering both listed companies and small- and medium-sized enterprises, underlying the differences and the specific problems in implementing the framework.

5. CONCLUSIONS

Our research is a case study, in which we studied in depth the cyber risk management mechanisms of one Italian credit cooperative bank, by delineating the key characteristics of the model implied.

There emerged the difficulties of this small reality to sustain costs related to the management of cyber risk, in fact the elaboration of the methodology is outsourced.

However the topic of cyber crime and threats cannot be underestimate because of the potential impact on reputation, image and market share.

Therefore it is essential, despite laws and regulations, to develop, spread and communicate the right culture at every level of the organisation because every company bases its own activity on people and their values. The proper organisational behaviour impacts on growth and value-creation, not only of the bank itself, but in particular on the local community in which the BCC operates because sound corporate governance and internal controls have become the determinant elements for the stability of every single institution and of the overall financial system.

This last element can help us underline that this study represents the second step of a far deeper analysis regarding the risk management process in credit cooperative banks. In the following analyses we would like to compare and contrast other realities, elaborating a multiple case-study. It would be interesting to evaluate the impact of cyber risk on the overall performance and on the efficiency of these banks.

AN EXPLORATORY STUDY ON CONSUMERS ATTITUDES TOWARDS ETHICAL FASHION CONSUMPTION: MOTIVATORS AND BARRIERS

Öztürk, Selen; Engizek, Nil
Marketing Department, School of Business, Istanbul University, Istanbul, Turkey

ABSTRACT
This study aims to identify how generation Y consumers approach to ethical fashion, the main factors that motive them for having this kind of a lifestyle and factors which act as a barrier in ethical consumption. In order to find out the answers to these questions, an exploratory study was carried out with three focus groups in Turkey. Through focus group discussions it became apparent that participants find these products unfashionable and expensive and also see it as a luxury lifestyle. People generally approach with skepticism. They perceive financial and performance risk for organic and fair trade products or products made of recycled materials. Consumer’s spendable budget for fashion, lack of awareness and trust are mentioned as the most effective barriers, while beliefs on the health, emotional and social image benefits, environmental and social consciousness are declared to be the motivators behind.

Keywords: Ethical consumption, ethical fashion, sustainability, fair trade, organic, attitudes, environmental consciousness, social consciousness, apparel, focus group

INTRODUCTION
Ethical consumption has gained remarkable attention from both businesses and academia over the last decade (Carrigan et al. 2004, 2011; Carter, 2009; Newholm and Shaw, 2007; Pinto et al., 2011; Szmigin et al., 2009). Szmigin et al. (2009) defined ethical consumption as “positive choice behaviors such as the purchase of fairly traded or environmentally friendly products, and can involve avoidance and boycott of certain goods or companies” (p. 224) which also include issues such as animal welfare, human rights, fair wages, and self-interested health concerns (Carrigan et al., 2004). Another definition was given by Jobber (2006, p. 217) as “the taking of purchase decisions not only on the basis of personal interests but also on the basis of the interests of society and the environment” and it is for that reason ethical consumption, social and environmental sustainability are strongly associated with each other. Sustainable and ethical consumption terms are often used interchangeably as they are directly related concepts (Goworek et al., 2012).
Ethical issues have also come to light in fashion industry (Moisander and Personen 2002, Joergens, 2006) due to the “fast fashion” trend (Paulins and Hillery, 2009 cited in Shen et al., 2012; Chan and Wong, 2012; Joy et al., 2012). Fast fashion means that retailers offer fashionable products in a wide variety, at reasonable prices and also they change their offerings in a very short time (the product lifecycle of these products is no longer than weeks – and even days) in order to gain customers’ attention and make them purchase more often (Bruce and Daly, 2006; Cachon and Swinney, 2011; Kim et al., 2013). Fast fashion strategy has been widespread amongst fashion retailers since the turn of the twenty-first century (Caro and Martínez-de-Albéniz, 2015). Stores like H&M and Zara are the examples of global fast fashion retailers (Mo, 2015; Bruce and Daly, 2006). These fast fashion retailers, including brands such as Wal-Mart, Nike, Disney and Gap Inc., may choose to produce apparel items in developing countries such as Indonesia, China and Thailand to lower production costs with cheaper labor compared to developed countries, because they have to offer consumers at affordable prices (Iwanow et al., 2005). As a result, ethical issues have come out such as labor exploitation in the form of low wages, hiring child laborers, and excessive working hours in countries such as India, China, and other Southeast Asian countries (Clark, 2008; Ro, 2010 cited in Kim, et al., 2013) and ethical consumption gained a considerable attention by the industry and academia. Several studies have been made to understand consumers fashion choices and related factors. For example, Joergens (2006) found that when it comes to fashion purchase, consumers are prompted more by personal needs for the most part to buy garments compared to ethical issues. Manchiraju and Sadachar (2014) mentioned that personal values of self-enhancement and openness to experience influence a consumer’s intention to engage in ethical fashion consumption. Also in this study it was found that women are much more into ethical fashion consumption and age is positively correlated with this behavior. Chan and Wong (2012) studied how consumers make ethical consumption decisions in fashion and found that only store-related attributes of eco-fashion positively influence consumers’ eco-fashion consumption decision. Even though there were plentiful academic research in relation to ethical issues in fashion, the bulk of studies are U.S. and European-based. Until this time, only one study (Kipöz and Atalay, 2015) has been published about eco fashion in Turkey. Belk et al. (1997) suggested that ethical consumption is a phenomenon in which culture plays a great role. Thus examining and understanding ethical fashion consumption in Turkey is essential for the growth of the ethical fashion market.

Given the above background, the purpose of this study is to investigate generation Y consumers’ awareness of eco fashion, and to find out the factors that motivate or prevent them buying those products, or behave accordingly. Generation Y consumers, born between 1977 and 1994, have been selected for this study because they tend to be socially concerned, aware of global issues and
interested in purchasing environmentally friendly apparel (Gam, 2011; Hiller Connell, 2010; Nayyar, 2001; Williams and Page, 2011). Moreover, according to Goldsmith and Clarke (2009) because they are more likely to be fashion leaders there is a high likelihood that it can become a fashion trend very quickly when they are targeted (Hill and Lee, 2015).

**DEFINITIONS OF ETHICAL FASHION**

Even though as Joergens (2006) mentioned that it is tough to make a definition of ethical fashion because there is no standard in the industry, the author described it as “fashionable clothes that incorporate fair trade principles with sweatshop-free labor conditions while not harming the environment or workers by using biodegradable and organic cotton” (p. 361). The criteria for ethical fashion developed by Eco Fashion World (2011) are: (1) Vegan (2) Ethically Produced (3) Artisan (4) Custom (5) Fair trade certified (6) Organic Locally made (7) Recycle and (8) Vintage. (http://www.ecofashionworld.com/Search-by-Eco-Criteria.html) Studies about ethical fashion showed that even though consumers are aware of ethical issues in fashion industry and have positive attitudes towards, when it comes to purchase decision they are not that willful (Birtwistle and Moore, 2007; Joergens, 2006; Niinimaki, 2010). Solomon and Rabolt (2004) declared that there is an attitude-behavior gap in consumers’ ethical attitude and purchasing behavior in apparel industry. There could be several reasons for this gap. According to Joergens (2006) it arises from the idea of their health does not directly influenced by their unethical choice in fashion as opposed to food sector etc. Another reason could be the difficulty to sense and see the impact of ethical product/consumption choices on the environment (Sima, 2014). Besides fashion consumption is symbolic for consumers and people use it to express their selves (Berger and Heath, 2007), “for many consumers drivers to be ‘fashionable’ often outweigh drivers to be ethical or sustainable consumption” (McNeill and Moore, 2015, p.212). Since there is a perception among consumers that eco fashion is unfashionable and the choices in this sector is limited, consumers’ interest in ethical fashion is low (Carey and Cervellon, 2014). In addition, many consumers find eco-friendly apparel and textiles expensive compared to non-eco-fashion products and this lessens their purchase intent (Fletcher, 2008 cited in Fu, 2016; Niinimaki, 2010).

In order to understand which factors affect consumers’ eco fashion purchase decision several research have been conducted (Beard, 2008; Niinimaki, 2010) and attributes of product and retail stores are found to be one of the main reasons.
METHODOLOGY

An exploratory research model was designed in an aim to identify how people approach to ethical fashion, the main factors that motive consumers for pursuing this kind of a lifestyle and factors which act as a barrier in ethical consumption. This approach was considered appropriate for investigating Turkish consumers’ beliefs and attitudes towards a relatively new concept “ethical fashion consumption”. In first and some of the following studies on the subject, qualitative research techniques were employed to reach a deeper understanding on the consumers attitudes also (Carey and Cervellon, 2014; Hassan et al., 2013; Joergens, 2006; Joy et al., 2012; McNeill and Moore, 2015; Perry and Chung, 2016; Shaw et al., 2016).

Study design

As a qualitative method, focus group interviews were planned and conducted with the guidelines of Krueger and Casey (2001); Hair et al. (2003: 224-236) and Malhotra and Birks (2007: 188-194). Focus group study is appropriate for this study with its’ exploratory nature of searching for themes that occur across a topic (Breen, 2006) about which little is known (Parker and Tritter, 2006) to uncover the main ideas behind. To ensure that all focus group discussions were executed in the same manner and with similar principles, a discussion guide was prepared on the topics with the help of research questions in existing literature. In development of discussion guide, established guidelines for conducting focus groups (Kitzinger, 1995; Krueger and Casey, 2001; Wilson, 2006: 115) were used as a base. Moderators gave proper attention to discussions to develop freely with the participation of research subjects interacting with each other (Kitzinger, 1994) and did not interfere in the discussion unless it is necessary. Focus groups lasted for nearly 2 hours for each. Focus group discussions were audio-recorded with permission, with specific notes on the facial expressions and toning of research participants with regarded statements. In analysis and reporting, important themes with most remarkable quotes and interesting findings are presented (Breen, 2006; Folch-Lyon and Trost, 1981; Onwuegbuzie et al., 2009; Rabiee, 2004).

Sample characteristics

The participants were selected based on convenience sampling. Three focus groups were conducted with five to seven people participated in each. These numbers are appropriate according to existing literature on focus group sizes and the number of focus groups to be conducted (Krueger, 1994 cited in McLafferty, 2004; Morgan, 1997 cited in Cameron, 2005). Ages of participants differ between 23 and 35 by an average of 29. This recruitment was to represent generation Y. Ensuring group homogeneity is
recommended in focus groups (Grudens-Schuck et al., 2004; Parker and Titter, 2006; Zikmund and Babin, 2010:105). There was an equal gender mix in one group, while two groups mainly constitute of men or women intentionally to be able to gain a deeper understanding in a more synergetic atmosphere. First group consisted of mostly male, with an age range of 23-28. They are all single and have undergraduate degree. Fashion spend was declared as low to moderate and have low fashion watch in general. Second group contained both males and females, aged between 29-34, who are single and/or married people, and have a relatively higher education degree than the first group. Their fashion involvement was declared as medium - high and spendable budget for fashion clothing is moderate in average. Last group consisted of only women, between the ages of 25-34, all married and have one or two children, with a high school and/or an undergraduate degree. Their fashion involvement was very high and fashion spend was higher than the others also. Before centering on the ethical side of fashion consumption, participants were asked to define themselves as a shopper for apparel products. First group described themselves mainly as who are quality conscious but sensitive to discounts, shop both offline and online, collect product-related information on the internet, social media, from close friends and family. They stated that brand name is important for outwear, shoes, coats etc. They pay attention to quality they can reach within their budget. Second group consisted of quality and brand conscious consumers who are skeptical about price discounts because they do not believe that they are in advantage even with the reduced prices. Social-image is important for their decisions in apparel as well as financial and health issues. Last group was more brand conscious (mostly for shoes, bags and accessories) who shop mostly from traditional stores. They generally declared that if they attach to a specific brand or clothing, they buy it anyway without considering the price tag.

RESULTS

Five major themes were identified from the focus group studies are as follows: familiarity with ethical fashion as a concept, product and consumer characteristics, motivators of ethical fashion consumption and perceived barriers (see Table 1).

Table 1. Research themes and key concepts

**Familiarity with ethical fashion as a concept and ethical fashion consumption**

On the concept of ethical fashion consumption, organic consumption and its’ effect on personal health was the most frequently mentioned theme. The concept of fair trade and sustainability issues are less known. Most participants mentioned that they are interested in the materials used in clothing production and working conditions/ terms of employees time to time. A participant stated: “I don’t intentionally buy a clothing brand that does manufacturing on bad terms and use harmful materials and dyes for human body. It is important for me that a brand do not employ child labor. Companies must be more conscientious.” (Group 1)

Huge amount of focus group participants mentioned that they don’t prefer to buy genuine leather or fur. A small portion stated they buy organic clothes in specific categories such as underwear, sleepwear etc. (for their children especially). In general, they tend to talk good things about ethical brands they know and boycott unethical acts. They occasionally check for the country a product was manufactured in. On the other hand, people approach the term ethical fashion with skepticism. First of all, they don’t see it as a priority for fashion choices. There is an overall understanding that even ethical fashion consumption is a favorable thing, they do not strictly follow the ethical principles sometimes knowingly and willfully. One female participant mentioned the following on the case: “I am concerned about jeans especially. I am aware of the dying processes and denim sandblasting. I know most firms manufacture in developing or under-developed countries where production is still not under the control of the authorities and employees have less or no legal rights. But to be fair, it does not affect our buying decision for most of us. However I don’t want my child to wear jeans. First for her health. I don’t buy any clothes for her which are produced from that material for now, even if I wear jeans occasionally.” (Group 2) Another participant mentioned the following because she desires
to see the same attention from legal authorities: “Eco-Labels or information on the tags sometimes seem to me not convincing. I approach them with doubt.” (Group 3)

People are generally skeptical about current implementations on fair trade principles. They don’t believe in corporations about working ethics in practice and their activities/campaigns on social responsibility. One participant expressed her feelings on the issue with the following sentences: “Today’s fashion industry killed local tastes and local production. Everybody wear the same things on, we look very much alike. Fashion may lead people to overconsumption, we buy more than we need. I see it as hypocrisy when brands communicate that they give too much attention to it, to us. I do not find it sincere.” (Group 1) There is a general understanding that they are not adequately informed about the results of these campaigns also.

Sustainability is another issue that need to be addressed. Recycling behavior was the first thing participants generally mentioned. They stated that they are careful in electricity and water use, use of plastic materials, etc. But for fashion choices, it is not likely for people to consider the operations of brands in terms of sustainability, at least for now. While exchanging used/old clothes between close family members and friends is a common thing, buying second hand or vintage clothing is not preferable. When asked if there are any brands that they associate with the concept of ethical fashion, brands such as TOMS, PUMA, H&M and as local brands, LCW and PENTİ had been mentioned. H&M was mentioned by three of the respondents for recycling campaign and sustainability concerns. Some declared that they have seen the informative green tags in H&M. While discussion evolved on the ongoing recycling campaign of the brand which is called “conscious”, some participants mentioned that they are skeptical about a sales coupon in return of recycling behavior. They found it unattractive and not credible because of corporate benefits. They stated that they desire to see the results and the reports of these kinds of campaigns.

Product characteristics

In ethical fashion, as already mentioned, it is necessary to pay attention to the use of organic raw materials and the efficient use of scarce environmental resources, taking into account the health and environment of all living things in order to produce products that are not harmful to the environment. It refers that both products and manufacturing conditions may better be harmless for individuals and public health in general, keeping future generations in mind. In terms of organic products and production, people tend to judge the producers and/or retailers by pricing much higher than the market average, even sometimes unduly. Most of the participants expressed that ‘organic means expensive’ to them. Also, most participants describe clothing with organic materials as colorless,
boring, not so useful, not fashionable etc. They expressed their opinion on the topic by relating it to the past experiences and people around who wear. Organic clothing lines generally cover child wear and underwear/sleepwear categories in adult fashion in Turkey. They mentioned them as colorless and boring because they generally see clothing by organic cotton in lighter colors, white, beige, light green etc. Besides they tend to judge the usefulness of the product. There is such an idea in their minds that it is not a material that can be worn for a long time because it may not withstand too many washes or machine wash. For following the acts of ethical fashion consumption behavior (buying second hand clothing, pay attention to recycling, donating or making use of old clothes, boycotting unethical actions, supporting fair working conditions etc.), consumers are less motivated also. There is a general belief that in daily life pursuing these behaviors can be very expensive in terms of money and time and exhausting by physical effort.

**Consumer characteristics**

Participants were asked to describe a consumer that follow out or would follow ethical fashion consumption behavior. First of all, nearly all of them define it in close relation to environmental-social consciousness and education level of a person. A specific group with slightly higher education degree noted that: “This type of consciousness has nothing to do with a school education actually, it is up to self-educating and social and cultural environment in which a person lived and grew up.” (Group 2) According to them it is just not enough to say that a person is conscious and sensitive to environment and society, that person should be able to demonstrate this through every act of daily life. A participant exemplified this by saying that: “Educated or not, someone who uses a jeep can’t claim to be environmentalist or that someone who helps the needy rarely can’t be socially conscious.” (Group 2)

While one participant mentioned that he finds himself environmentally conscious because he never wears genuine leather, another one criticized herself by: “We know much on the subject (recycling, use of scarce resources, use of plastic etc.), but we don’t imply with the rules of a sustainable environment. We don’t act proactively, caring for the future.” (Group 1)

Also age, gender and marital status were often mentioned. The role and involvement of women in fashion consumption differ from men. Participants generally claim that they would be more careful in choices of clothing for their children in the future. According to participants, having a moderate-high income is crucial for shopping from organic clothing brands. Also social responsibility comes with some expenses. Consumer involvement in the concept is needed. For recycling, donating or making use of old clothes or boycotting unethical actions, people may spend from their leisure time. These activities also require cognitive effort. Social media has been a trendsetter nowadays. People
associated ethical fashion consumption to being active and demanding as a consumer in real life and also online via social media. If a person faces a problem with a product, s/he can reach the brand in various platforms if the brand has a social media presence. So social media will provide a unique environment for an activist to communicate own ideas in this regard. In summary, an average consumer following this trend is pictured as environmentally and socially conscious, highly educated, female, single or married (have children), between the ages of 25-35, have moderate to high income, a social media user, an activist, and an experienced shopper.

**Motivators / perceived benefits**

Consumer involvement in the concept of ethical fashion consumption, beliefs on the health, emotional and social image benefits and environmental - social consciousness are found to be the motivators behind. Health issues was the most stated motivator for the consumption of organic products. People are primarily concerned with the health of themselves and their close family members. According to participants, clothes made of organic cotton are more likely to be comfortable, healthy and functional for underwear/sleepwear category especially. For child wear, it is more favorable to wear organic in all kinds of clothes. On social responsibility activities and fair trade topic, the conscience of the consumer is the foreground. Focus group studies revealed the common idea of internal relief by spending for a good cause. Participants generally mentioned that they are emotionally into the subject when they genuinely believe in the acts of the brand. Transparency is important for them as one participant expressed: “I support social responsibility activities of companies. I know brands that communicate their support for local production and producers. I know some fashion brands that donate goods or money to some underdeveloped countries in exchange for a product we buy. I can contribute to those campaigns by paying even an extra price charged for this product. But I need to see the results to be sure whether that brand fulfilled its promise or not. I prefer that brand only if there is a good message on the benefits.” (Group 1)

When brands communicate on sustainability (recycling etc.), people may also approach with suspicion. It is a favorable thing to be able to contribute to future generations by paying attention to such activities. One participant stated: “I don’t have a child. But I care for this issue for my future children and grandchildren. Because I want them to be proud of me, as I am of mine.”(Group 1) But they need to trust this brand and see the effects they make. There is a consensus on the demand of consumers to be informed more clearly and correctly. Brands need to be more honest and transparent in their claims. When asked to describe their overall sensitivity to the environment and social events and whether it affects their consumption behavior or not, one male respondent stated: “It is very
essential in my brand choice, especially recently and from now on. We need to be given much more information on the issue” (Group 2)

On the other hand one female respondent answered the following: “I don’t think it will change my brand choice but I will consider it in my mind for further. I think myself as a conscious consumer anyway” (Group 1) According to another view, brands’ favorable approach to environment and the society is good but again not enough: “To be honest, we don’t prefer a brand only because it is environmentally or socially conscientious but if a brand I like do it so, I may think of buying it again instead of others in the near future.”(Group 1)

Another emotional benefit is self-expression. By purchasing eco-fashion brands and exhibiting behaviors in this way, people can find a way to reflect their thoughts on others. Most participants approached the behavior as an expression of status and lifestyle.

**Barriers / perceived risks**

Even people generally declared that they are conscious consumers for especially health and environmental issues, they are aware that it is not very much the same for their fashion choices. Price can be both a motivation tool and a barrier for consumers. Focus group discussions revealed that for pricing of organic and fair trade products, companies need to consider the value they transfer to the end users. If price is low (lower than or equal to the similar other which are not organic or fair trade), consumers can be skeptical about it based on personal expectations on quality, performance, etc. If price is too high, they may not buy because it is over their budget even they trust the brand. Besides, nearly half of the respondents agreed to buy the ethical fashion brand when it has the same prices or slightly above the non-ethical competitor. The other half supported their decision with justifications on their personal budgets. Some people declared that environment and social issues are not a priority for them. There are many different ideas on the issue. Some of them are as follows: “Am I the only one to save the world?”(Group 3), “I consider buying it for my child, not for myself”(Group 2), “If it is a huge trend, I may follow or buy an ethical fashion brand” (Group 3), “I need to be able to shop whenever I want. I don’t know many fashion brands offering this kinds of products especially near my neighborhood”(Group 1), “They are limited in number and in product variety I think.”(Group 1) Participants discussed the amount that they must earn to continue living on the same standards, and all the other things they need to buy. They think there will be no end in it when it comes to pursuing an ecological lifestyle in metropolis, as one participant mentioned: “We have to buy so many products for several needs in our life. Neither our money nor time is enough.”(Group 3) Another participant declared her view by: “I am not a social or environmental activist. I try to comply but there is so much
to do, so…” (Group 3) With a different perspective, a participant stated this based on his past experiences: “Most ethical fashion brands are of foreign origin. We don’t buy it so overpriced if our local producers do launch ethical fashion brands.” (Group 2)

There were several ideas on consumers’ lack of trust in organic brands. Some ideas presented by two different participants are as follows: “I trust a brand more if it sells organic products only. I need to be sure of the organic production terms.”, “I buy an organic brand with the recommendation of people to whom I trust” (Group 2). People are generally skeptical about ethical fashion. They perceive some level of financial and performance risk for organic and fair trade products or products made of recycled materials. Consumer’s spendable budget for fashion, education-based consumer awareness and lack of trust are mentioned as the most effective barriers by all groups. A respondent interpreted the fact as: “Perhaps such an approach is caused by culture and our current living standards. Speaking for our country, previous generations were more conscious about using clothes properly and they made the longer use of them. But even we have more information around, we don’t pay attention to it and consume so fast and in the wrong way.” (Group 2) Also on the topic, he made a suggestion that brands can make informative campaigns targeting older consumers. Because he find them more conscientious.

DISCUSSION AND CONCLUSIONS

The aim of this research was to understand generation Y consumers’ ethical fashion consumption knowledge, motivators and barriers which affect their purchase decisions for these products in an emerging country, Turkey. When asked, possibility of overpayment due to higher prices was appeared to be the one of main barriers. As Carrigan and Attalla (2001, p.571) mentioned ethical purchase behavior will occur if consumers perceive that buying these products do not cost them in terms of higher price, loss of quality or having to “shop around”. In this study a similar result was found: all participants wish for ethical fashion products were affordable. Turkish Y generation consumers also believe that purchasing ethical fashion products as luxury consumption due to higher prices and lack of availability. Another barrier mentioned in the study was the lack of knowledge of the participants about ethical fashion products. Throughout the discussions, a specific H&M example was given (a fast fashion retailer following organic production and sustainability principles in specific apparel products), but they were not aware of it. For this reason marketing managers of fashion brands should create awareness first regarding ethical products, sustainability and its’ effect on environment and society as a whole. They can use public service broadcasting, social media and trustworthy famous people in their campaigns. As Hill and Lee (2012) stated in their study;
educational providers, companies, and public service sector should work together in order to give a correct description of the general principles of eco fashion and to offer a practical and essential base of knowledge in consumers’ mind.

Participants mentioned that they are skeptical and do not believe in the acts of these firms. This is consistent with past studies as Yan (2003) mentioned that young consumers have high levels of skepticism. For this reason, consumers need to be informed about the ethical fashion products, why they should prefer and the negative effects of unethical fashion consumption. Moreover, companies should convince customers about the sincerity of ethical concerns in production. To convince and gain the trust of consumers, fashion companies may use corporate social responsibility as a tool. As Hartmann et al. (2005) declared that consumers’ general and sustainable buying intentions are considerably affected by perceived corporate social responsibility of firms. This means that if consumers recognize a company as making CSR campaigns they are more likely to make sustainable purchases from it. At this point, it is worth to mention ‘attribution theory’. The attribution theory in the context of CSR is that “favorability towards a social program is likely contingent on certain attributions consumers make concerning the motives behind an organization’s actions” (Du et al., 2007; Ellen et al., 2006; Klein and Dawar, 2004; Menon and Kahn, 2003; Sen et al., 2006; Webb and Mohr, 1998 cited in Walker et al., 2010, p. 663). An attribution (or corporate association) is about feeling or belief of a person about a specific organization (Brown and Dacin, 1997). Past studies have found that these attributions can directly have an effect on consumers’ purchase intent (Ellen et al., 2006). To sum up, understanding what a consumer attributes about firm’s sustainable behaviors is important in terms of affecting their ethical buying behavior. Another barrier mentioned was that ethical products are not fashionable, similar to Joergens’s study (2006). This perception regarding ethical fashion products is opposite of the nature of the fashion. Fashion and trends are the main purchase motivators in the clothing industry (Solomon and Rabolt, 2004) and marketing managers of fashion brands must take this into consideration. Producing aesthetic and fashionable products while taking sustainability issues into consideration is the best thing to do, although it is not easy. Firms should create awareness and need for the category by taking into account the several motivators mentioned before. This study is the start of ethical fashion consumer research in Turkey and can develop into various directions in the future. However this study has an important limitation: it is not representative of all generation Y in Turkey as it was a qualitative study with three focus groups. Further research may examine a broader range of consumer typology, different characteristics and drivers by several ethical consumption behavior respectively. Theoretical models can be applied on the subject with the help of conclusions made on exploratory studies with Turkish consumers.

CORPORATE CRISIS IN ITALY: YOMO SPA

Pavone, Pietro; Migliaccio, Guido

1Italian Ministry of Economy and Finance, Tax Police - Special Unit, Milan, Italy
2Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

This paper presents the most relevant Italian scientific teachings and an itemized analysis of the crisis of an important company: Yomo spa which, despite the fact that it first introduced yogurt in Italy, mismanaged strategies, marketing plans and production choices. The objectives of this paper will be achieved with some theoretical considerations based on a qualitative approach including an updated conceptualization of the literature review and references to one case study (Yomo spa). This paper describes some possible mismanagement of a medium-sized company and offers useful reflections to prevent new corporate crises.

There are some practical and social implications: prevention of new corporate crises in Italy and other countries and prevention of depletion of economies, unemployment, the reduction of the gross domestic product and the lowering of the living standards of the people.

Keywords: Causes of Enterprise Crises, Mismanagement, Crisis Enterprise System, Imbalances System Enterprise, Case Study Method.

1. INTRODUCTION, HYPOTHESES AND RESEARCH QUESTIONS: AIMS AND STRUCTURE OF THE PAPER

For many years the dramatic international crisis has been affecting the major economic powers and perhaps Italy is slowly emerging; this event revives the theme of corporate instabilities. As a result of globalization, the current years are involved in the reorganization of the production sector because of the implications of the vast international crisis.

The article points out the importance of economic and financial balance and, at the same time, specifies the possible causes of the looming decline that sometimes in the initial stages escapes the attention of top management bodies, but then appears suddenly when the crisis is already deep and has already caused irreparable damage.

The paper is the result of a collaborative work. However it is possible to attribute to Pietro Pavone: Yomo Spa: the company and its history, the crisis and strategies for the redevelopment and relaunch. The other sections are of Guido Migliaccio.
This paper investigates the Italian situation: first, there are references to thoughts of the best international and national doctrine, and then it focuses on a specific case which stimulates reflections.

This paper aims to answer the following questions:

- What are the most frequent causes of a corporate crisis?
- Has the external environment any impact on the balance of a company?
- What function can be due to a disruption?
- What are the most significant measures derived from the experience of Yomo spa?

In particular, the objectives of this paper are:

- to emphasize the importance of a proper and balanced production of a productive, economic and financial management;
- to highlight how the environment can have a relevant impact on corporate goals;
- to stress that the information system can constantly monitor the operating trends to predict and prevent imbalances, decline and crisis;
- to propose the control of individual business functions that prevent malfunctions which can spread throughout the productive organism.

In the first section, this paper discusses the International and the Italian literature and some notes relating to the most important scientific theories which build the basis for the interpretation of the company crisis.

Subsequently, it will highlight the methodology used inside this article: the explanation of a real Italian company case useful for learning some crisis factors. Furthermore, it will explain the importance of the informative system crisis prevention. Finally, the paper will reach its conclusion: with an efficient informative system, constantly updated and with an expert staff inspired by ethical values, honest and devoted to the company you can identify imbalances and solve the situation before the decline becomes critical.

2. RESEARCH APPROACH
The objectives of this paper will be achieved with some theoretical considerations based on a qualitative approach (Maylor and Blackmon 2005; Yin 1994 and 2003), including an updated conceptualization of the literature review and references to one case study (Yomo spa).

Case study is an ideal methodology when a holistic, in-depth investigation is needed (Djurić et al. 2010) A case is an instance of a more general category. To conduct a case study is therefore to investigate something, which has significance beyond its boundaries. Case studies provide intellectual gearing, making a contribution to a wider debate as well as offering a rounded account of a particular subject. They offer a double return on the research investment. Economics scholars do not have a single theoretical model to underpin their research. They must proceed by inspecting cases rather than by making deductions from first principles. In the absence of overarching theory, case studies are the building blocks from which economic science constructs understanding of the managerial world (Yin 2012, Gerring 2007, Naumes and Naumes 2006).

In this paper the case study is linked to qualitative research. One of the key benefits of qualitative research is that it allows an understanding of the context in which all decisions and actions take place (Myers 2013). It is often the case that human decisions and actions can only be understood in context because the context helps to ‘explain’ why someone acted as they did. This context (or multiple contexts) is best understood by observing the evolution of technology, the economy and culture, which greatly influence people’s behavior.

This paper, therefore, offers results from a specific case study and instead proposes a number of critical considerations taking into account the latest developments, as described by the best International and Italian bibliography. This work offers interdisciplinary value because it originates from the combination of technical, general economic, managerial, ethical, and other fields.

3. LITERATURE REVIEW

3.1 Causes of enterprise crises in international literature (notes)

A large number of studies are devoted to the general economic crisis and its implications on companies. Giesecke et al. (2014) using an extensive data set on corporate bond defaults in the US from 1866 to 2010, study the macroeconomic effects of bond market crises and contrast them with those resulting from banking crises: corporate default crises have far fewer real effects than do banking crises. Even Gonzalez (2015) analyses the influence of the financial crisis on corporate debt maturity for 39 countries during the period 1995-2012. The financial crisis had a stronger negative effect on corporate debt maturity in countries with less bank concentration, while the debt maturity of
larger firms decreased less as a result of the financial crisis than the debt maturity of smaller firms in countries where banks play an important role in the financing of the private sector.

De Fiore and Uhlig (2015) show that the flexibility offered by banks on the terms of their loans and firms' ability to substitute among alternative instruments of debt finance are important to shield the economy from adverse real effects of a financial crisis.

The serious crisis in the international financial system has also stimulated new depth studies on the causes of the crisis are attributable to management errors.

Pirson and Turnbull (2015), for example, focus the responsibility of corporate governance. Contrary to popular opinion the principal cause of the crisis was not sub-prime mortgage defaults but a failure of corporate governance.

In the international literature there are also specialized studies on crisis management. Morel and Chauvin (2016) identify four methodological challenges: modelling and analyzing the crisis management activity of a collective, capturing the flows of information and interactions between actors; identifying the deficiencies in information management; and choosing between on-site and simulated analysis. Topper and Lagadec (2013) aim to clarify why the crisis management world has profoundly changed and how the current understanding of crises and theoretical frameworks is becoming increasingly less adequate. They therefore propose a fractal approach.

The topic of corporate crisis demands the need for an ethics of the economy (Janssen et al. 2015) that must be taught to future managers (Simola 2014).

The theme of relations between crisis management and planning is also widely developed in Pang et al., (2006).

Even corporate communications and advertising, and thus the reputation and image of a company, may have an important role before and during corporate crises, as shown by the studies Ho et al. (2016) and Coombs and Holladay (2006).

Finally, it is necessary to remember that there are numerous studies concerning specific sectors of the economy and also publications related to situations of some States.

3.2 Causes of enterprise crises in Italian literature (notes)

The causes can be divided into external and internal.

Among the internal causes: the possible problems of each business function and especially the information system that did not show malfunctions promptly.
The Italian theories considering the crisis caused by imbalances of the entire company system are numerous (Migliaccio 2012 and 2015).

A first theory (Riparbelli 1950) attributes the crisis to insufficient adaptation of the company to the economic and social environment that leads to the alteration of internal co-ordinations and external relations. This may be due to errors in the perspective of future phenomena, and/or the low elasticity of the company.

A second approach (Prosperi 2003) completes the previous theory, with further considerations: the business purposes are achieved more easily if you get an optimum degree of order dynamic internal and external, closely related, favouring a financial and economic balance sheet. Dysfunctions, which are often in preparation for the crisis, are the effects of a disorder caused by lack of cohesion between inputs, by badly systematized operations or by disharmony between internal and external forces.

A third hypothesis (Vergara 1987) arises from an interpretation of the system company according to which two groups of factors can be identified: the first consists of goals, decisions and actions; the second, however, structures, procedures and institutionalized relationships, processes and flows. This system interacts with the surrounding environment. The crisis could arise from failure of the balances in these reports.

Another hypothesis (Canziani 1986) study the origins of the crisis: the companies taking excessive global profile of risk than management skills. Another theory (Vergara 1988) is developed by identifying the first business purposes: they cannot be limited only to economic dimensions, but must extend to the competitive and social dimensions that are distinct, even if they are closely related to the first. The synergies between the objectives may operate in the opposite direction, starting a company motion representing the descending imbalances, decline, crisis and instability.

You must also consider the argument (Sorci 1987, Viganò 1996, Confaloni 1995, Poddighe 2006), that the origin of every crisis is man’s responsibility and, therefore above all, the responsibility of the entrepreneur. The entrepreneur is responsible in large and small companies, even if the property is distributed among a large number of members.

The crisis can be generated by the alteration of the relationship between the logical categories in constant osmosis that characterize the dynamic business (Paolone 2008): the crisis originated in the possible discrepancies that jeopardize the beneficial relationship transforming, in severe cases, in a vicious circle.

The company consists of three structures: the owner, the business summit and the operating system (Moliterni 1999, Passeri 2011).
A) The ownership structure consists of shareholders who hold venture capital. They take the main decisions and perform functions guidance and control.

B) The entrepreneurial attitude, however, centralized decision-making power, choosing the formula management and strategies to implement it. The entrepreneurial attitude must also organize and govern the operating system.

In order for the enterprise, complex system, to be able to last it is necessary that the interdependence between its different elements are coherent to achieve the goals.

However it can happen that some mutations, especially if unexpected, can generate situations of inconsistency, physiological (if temporary and solvable); pathological (if sustained). Because of inconsistencies the crisis begins (Moliterni 1999). The permanent inconsistencies denote the inability of the company to adapt to the new situation: the company is stiffened on previous consistencies that are inadequate to deal with the current situation, or it is crystallized on new consistencies unsuitable changing situation.

The theory of Vital Systemic Approach (SVA) (Golinelli 2002, 2006, 2010) delivers the business crisis in a different light (Piciocchi 2005): it interprets reality with a business model of the anatomy (as is done) and physiology (how it works).

The crisis would then be due to the decrease in the time of the vitality of the enterprise as a result of low efficiency and effectiveness of government (systemic crisis) and/or operational structure (structural crisis). The Italian theories considering the crisis caused by errors of each corporate department identify crises arising out of errors in strategy, marketing, finance, production, organization, function research and development, in the information system.

4. YOMO SPA: THE COMPANY AND ITS HISTORY

Owned by the Vesely family, Sitia Yomo Spa was the company that created the yogurt market in Italy. It has operated since its establishment, mainly in manufacturing and marketing of yogurt to which, later, were added productions and tradings of milk, cheese and other dairy products distributed throughout the national territory.

Yomo was born in 1947 when Leo Vesely created the homogenous yogurt (hence the name Yomo), after several attempts and laboratory experiments on the properties of lactic acid bacteria. Following several acquisitions, which made it possible to incorporate key brands and to extend the offer, which was originally not including cheese and dairy products, the industrial activities of the group came to be “detected” from Sitia Yomo spa, from subsidiaries “Torre in Pietra spa”, “Istituto Italiano Fermenti...
spa”, “Centro Sperimentale del Latte spa”, “Caseificio Pasquale Pettinicchio spa”, “Caseificio F.lli Merlo spa” and the subsidiary in fact “Leo Marven System Spa”.

By judgment of the Court of Pavia, filed on May 31, 2004, the company was admitted to the agreed group estimate procedure which involved, in addition to Sitia Yomo, the subsidiaries “Caseificio Pasquale Pettinicchio spa” and “Leo Marven System spa”. Simultaneously, the Court authorized the lease of Yomo companies, Pettinicchio, Merlo and Leo Marven System to the vehicle Yogolat, specifically established by the Granarolo Group to manage the operation. Therefore, in 2006, the company took part in the transfer of receivables, relating to investments and properties of Granarolo, and then Yomo Group, was sold on the 22nd of July 2008.

With the acquisition of Yomo, even Centro Sperimentale del Latte spa became part of Granarolo group. The table and chart provided below shows the amounts (in thousands of euro) of Yomo turnover from 1996 to 2004. It is represented in the charts how the Yomo Group has always made most of its turnover in the mass distribution channel; the least share of turnover resulting from the catering and restaurant sector.

5. YOMO SPA: THE CRISIS

To understand the crisis of YOMO it is necessary first to understand the competitive dynamics of the industry of yogurt in the years preceding the crisis.

The following chart sets a comparison in terms of market share between the four main players in the yogurt market from 1994 to 2000.
In particular, the yogurt market in Italy during 2000, had a value of over 750 million Euros and cooperated with about sixty manufacturers of yogurt, the majority of which were multi-product companies, constituting the yogurt just one of multiple managed businesses. 60.3% of this value was achieved by the first four companies: Yomo, Danone, Parmalat and Muller, with the market share referred to in the above diagram.

The loss of market share of Yomo is clear; the graph draws attention to the growth of Danone, the stability of Parmalat and the rise of Muller, which emerged in the late nineties.

The Italian yogurt market set entry barriers in order to protect itself from new possible competitors. This belief was confirmed by the failure of the attack in 1992 by one of the most important worldwide companies: Yoplait, part of the French Kraft Group.

In 1996 there was a second attack by Muller, a German company very strong in the field of yogurt and dairy products in Germany and Britain. This time the experiment was successful (table n. 2): as a consequence, the market became sensitive to a specialized market niche.

During the same years, Yomo invested economic efforts in terms of marketing and advertising, without reaching the desired effects. A significant example is the Yomo advertising campaign of the late nineties, “as Yomo you can find only Yomo”: while Danone communicated the importance of a health-conscious yogurt, Parmalat a quality yogurt and Muller considered yogurt as a hedonistic pleasure, the slogan of Yomo was an empty message: apparently the company had nothing to communicate.

The crisis that Yomo has gone through has thus been a crisis of economic and industrial nature, revealing the financial imbalances that led to negative economic results.
2000 was the most critical year for Yomo and marked a clear break with the past. In spite of very adverse balance sheet data Yomo, still remained the company holding the largest share of the yogurt market. The turnover, although declining, was still in line with the principal direct competitor: Danone Italia.

The sales volume in 2000 was accounted for by approximately 81% of sales of yogurt and 19% for cheese sales. This explains why Yomo has suffered the rise of Muller in more than its competitors: because their offer was more vast and so they were less exposed to the only yogurt market risk. This difference played a crucial role: the preponderance of the business “Yogurt” that has always been the main source of revenue for Yomo, became one of the major causes of decline.

The management wasn’t able to read the competition strategy implemented in the market where Yomo operated. Guatri (1986) states that the methods based on intuition “are based on the recognition of the external factors of crisis”. Working in declining sectors, progressive loss of market share, production or sales inefficiencies are external elements indicating a state of decline of the company. As shown by Muller, Yomo has not been able to interpret the evolution of the market or innovate in a market where product innovation meant success.

The brand still enjoyed absolute prestige in 2000 and decisions about Pettinicchio and Yomo made by Granarolo were a proof. Dairy products preserved Pettinicchio brand and yogurts kept the Yomo brand even after the control acquired by Granarolo. These choices can be identified in a strategy of maintaining a strong market position, which the two companies already enjoyed before the acquisition and so before the crisis.

However, from the quantitative point of view, the data resulting from the balance sheet, recorded discontinuity precisely since 2000. The following table n. 2 shows the data of the fiscal year closed on the 31st of December 2000 compared with those of 1999.

</tr>
</tbody>
</table>

Table 2. Main balance sheet items in 1999 and 2000

In 2000 a prompt action was required to reduce the debt of the company by injecting capital and the reorganization of several cost components was necessary, already constantly monitored by management. Current liabilities within a year had almost doubled: in 2000 the amount of assets was not sufficient to cover maturing liabilities. This constituted an important first alert of lack of liquidity.
The net working capital deficit of -40,861, an increase compared to 1999 when it amounted to 37,881, showed a clear short-term financial imbalance, indicative of a precarious enterprise solvency; in 2001 the net working capital deficit widened further and stood at -47,877.

</table>

Table 3. Comparative analysis of the main financial indicators in 2000

Table n. 3 is extremely significant because the comparison with similar entities underlines the economic difficulties. If it is true that in 2000 the yogurt market showed a decrease compared to the previous year by 3.4% in value and by 0.3% in volume (Data source: Nielsen), the data for the indicators ROS, ROI and ROE, in a comparison between the main competitors, it doesn't seem to leave room for assumptions of merely cyclical crisis, confirming, however, an internal inefficiency.

The following table summarizes the main balance sheet items of Yomo 1999-2000.

Table 4. Main items and financial ratios 1999-2001 (Data source: Aida)

A progressive growth in debt is obtained:
Especially from 2000, the negative trend of Yomo determined financial consequences: as reinforcing the debt in respect of credit institutions and extending the term of payment with suppliers. In 2003 the company’s ability to recover a convenient management and the inability to obtain new equity in the company structure, resulted in the further stiffening of the main financing institution of society and this led to block the activity and sales. In 2000, Yomo had to dramatically increase the rate of borrowing but the economic trend was negative even before.

</table>

Table 5. Evolution of net and operating result from 1996 to 2004 (in thousands euros)

Table 6. Return On Sales from 1996 to 2004

It is clear that the painful economic dysfunction of Yomo, which started in 1998 and became permanent in 2000, is another confirmation of a crisis that has its causes in persisting income gaps. Since 2000 we continuously evidence a lack of support for sales combined with an increase in production costs, both productive and commercial. In 2001 the decrease in the total volumes of sales of the products of Yomo Group, caused a logistic activity superstructure with costs not covered, and in 2002 a further reduction in sales volumes and turnover.

<table>

<td>-4.309</td>
<td>-3.920</td>
</tr>
</tbody>
</table>

Table 7. EBITDA from 1999 to 2001 (in thousands of euros)

The productive inefficiency is made evident by the collapse of the gross operating margin and has affected several areas of management: first of all the trading one. The advertising investments, which characterized the action of Yomo, have gradually reduced trade margins, only in 2000, they fell by about 3 percentage points from the previous year. In detail, the costs for advertising and other promotional activities amounted during 2000, to 65.7 billion (old Lira) compared with 54 billion during the previous year.
6. YOMO SPA: STRATEGIES FOR THE REDEVELOPMENT AND RELAUNCH

The crisis of Yomo was known as “stiffness crisis” and had commercial and industrial nature features with financial consequences. In an evolving and dynamic market, with rules and structures far from the original ones, Yomo was forced to pay for its mistakes.

This paper highlights the rigidity of structures and the processes that brought “the inability to adapt, quickly and timely, the company in times of crisis or to the market change (Sirleo 2009)”.

The delay and the inability of the management to oppose the economic decline, allowed the control to fall “in the hands of external actors” - funding agencies in this specific case – “often carriers of partial objectives (the debt rescheduling) (Danovi and Quagli 2012)”.

The gradual decline in total sales volumes of Yomo Group’s products caused a superstructure of the logistics which involved only Yomo, without revealing other events in the sectoral level. In such situations - declares Sirleo - «the only chance to avoid the crisis is a cost adjustment process (Sirleo 2009)». Yomo started to adjust its costs from 2000.

As mentioned, the operating model of the company was totally inefficient; therefore, in addition to the need to offset the negative net financial position, it was necessary to undertake a reorganization of cost components.

The analysis of consolidation strategies implemented by Yomo management for the revitalization of the company was carried out from the fiscal year closed on the 31 of December 2000. Since 2000, the income statement presents settings which are not directly comparable with those of the previous years. Moreover, it is since 2000 that it was possible to notice a change, not just in the management but also in the whole cultural group, with the renewal of different positions.

Yomo and its subsidiaries modified the structure of the entire supply chain by introducing financial and economic recovery plans. In particular, in order to create opportunities for the development it was decided to generate strategic plans aimed at achieving operational synergies (for example, by centralizing non-specialized activities of its subsidiaries to their attention). From the start of the organizational process, Yomo and its tradition always maintained the leadership.

During 2000, the company maintained the levels of advertising investments chosen in the past and subsequently made new and expensive advertising campaigns. In 2001 new lines of products were planned but were put into effect just in 2002: the increase in advertising and promotional expenditure was one of the points provided for in the business plan pursued.
In order to implement the restructuring plan, in the end of 2002, Yomo became assisted by a consulting firm, but the execution of the Business Plan had disastrous effects on the company’s results, with a further increase in costs.

The reorganization also concerned the logistics and distribution system, in the direction of achieving distribution and commercial synergies and seeking economies of scale: with the advent of large retailers, Yomo decided to keep following its own distribution network. Therefore, in 2002 the company decided to entrust the distribution and logistics of the entire Group to Leo Marven System, specialized in refrigerated distribution, which was really necessary for daily consumer goods with reduced shelf life such as yogurt.

During 2002, the reduction of variable costs, the lowering of the break-even point in the industrial and manufacturing costs and the change of managing director were not sufficient for saving the position of the company. In conclusion “the most attractive company, thanks to the power of its brand, had the only chance to agree its output» as stated in Balance sheet at 31.12.2003, Board of statutory auditors’ Report.

7. CONCLUSIONS

The dramatic evolution of Yomo, main protagonist of the establishment of the yogurt market, is a significant case study, whereas the undoubted initial competitive advantage was gradually eroded by its competitors.

Considering the Italian culture and departing from the description of the evolution of Yomo, there are different interpretative schemes that can be illustrated to answer the initial research questions: What are the most frequent causes of a corporate crisis? Has the external environment any impact on the balance of a company? What function can be due to a disruption?

The main error regards the inability to understand the evolution of the external environment and the competitors supply and demand. There are consequent marketing and strategy mistakes that led to a progressive loss of market share.

The missing element was an adequate information system which could promptly understand mutations and also a capacity to innovate gradually adapting to the changed economic reality.

There were also errors in communication that was weaker than that of the competitors. Therefore there was a mistaken strategy, because the advertising was just focused on one product (yogurt) instead of being differentiated on other dairy products.
Obviously, the progressive decline in revenue and profitability was translated into the requirement for cash flow resulting in lacking report sources/uses that gradually generated financial insolvency. In response to the crisis Yomo took inadequate financial measures, reduced sales support and relied too late on inadequate consultation.

Unfortunately, all the strategies to solve the various problems that were first described were inadequate: the company was assimilated by another company. The Yomo brand continues to exist, but production is carried out by another industry.

The limit of this study is the analysis of a single case. It contributes less to building theory than studies with more cases. In order to have a more detailed analysis, it would be necessary to compare the Yomo case to other Italian company crisis cases. This could help to focus on the frequent errors and causes that happen in different sectors. It may be a future development of this study. The development of corporate crisis cases is useful in the scientific sphere to improve the theoretical framework for crisis management. It also helps managers to prevent crises: they must understand the importance of a proper and balanced production of a productive, economic and financial management. They should also always monitor the environment to prevent imbalances, decline and crises, using an appropriate information system.

Every company crisis has its prerogatives! However it’s easy to understand and predict that, in many situations, professional shortcomings and ethical values are the basis of the errors that lead to the closure of business activities.

THE QUALITY OF MISSION STATEMENTS IN THE TOURISM INDUSTRY: AN EMPIRICAL ASSESSMENT

Penco, Lara; Profumo, Giorgia; Scarsi, Roberta
Department of Economics and Business Studies, DIEC; Centre of Excellence for Integrated Logistics, CIELI; University of Genoa, Genoa, Italy

ABSTRACT

The present paper tries to advance knowledge on the quality of mission statements in the tourism industry. Despite the importance that strategic management literature have already recognized to a high quality mission statement for formulating, implementing and evaluating firms’ strategy, minimal attention has been given to the understanding of the role and quality of mission statements in tourism firms. Mission statements of cruise companies are, in fact, an under-researched topic, considering that a relevant systematic study does not exist in the literature review. The theoretical analysis is completed by an empirical exploration, where we evaluate, using a content analysis technique, the mission statements of 44 cruise lines operating in the standard/ocean market and in the luxury/niche segments. We employ, in particular, three measure of “quality” derived from academic literature: (1) inclusion of stakeholder groups; (2) mention of specific “mission” components (Target/Customers/Segments; Products; Location; Technology; Concern For Survival; Philosophy; Self Concept; Concern For Public Image; Concern For Employees); (3) reference to four goals assigned to mission statement: disclosure of the sense of future direction, definition of control mechanism, decision making guide, and a motivation tool for employees. The results suggest that the statements fall short of meeting the quality criteria suggested by the strategic management literature and provides useful insights both for academics and practitioners. Variations from the “ideal” and high quality missions are discussed, together with the differences between the two market segments.

Keywords: Mission statement, mission statement quality, stakeholders, goals, cruise companies
INTRODUCTION

The cruise industry has been considered as one of the fastest growing segments of the global travel and leisure business since the late 1980s (Cruise Market Watch, 2016; Dowling, 2006; Wild and Dearing, 2000), reaching over 24 million passengers worldwide in 2016 (Figure 1).

Figure 1. Evolution of the world cruise industry (Our elaboration on Cruise Market Watch 2016).

Despite this dramatic expansion in the last three decades, the cruise industry has only recently attracted increasing interest from academics and practitioners (Papathanassis and Beckmann 2011). Most managerial and economic contributions dealing with the cruise industry refer to the tourism and service management perspectives or to the maritime economic approach, and are focused on several research domains, such as the evolution of the supply/demand of the industry (Dowling, 2006), the economic impact on cruise port destinations (Satta et al. 2015, Penco and di Vaio, 2014; Brida and Coletti, 2012; Dweyer and Forsith, 1998) or cruiser behavior (Caber et al., 2016; Duman and Mattila, 2004). Following the results of an in-depth systematic review of the cruise research literature, Papathanassis and Beckmann (2011) stated that extant literature is still limited with respect to the wide managerial and economic implications stemming from cruise activities. In particular, few academic contributions have addressed the topics of strategic management (strategy formulation, implementation and evaluation) and business administration (managerial accounting, human resource planning and development, supply chain management and outsourcing) of cruise companies (Vogel, 2009), despite the increasing competition in the industry has stressed the relevance of this research domain’s. The present paper tries therefore to bridge this literature gap, focusing on a strategic management issue: the quality of global cruise line mission statements. The relevance of mission statements as a weapon for effective strategic management decisions is highlighted by previous scholars; in particular, the mission statement is the first step in the process of formulation,
implementation and evaluation of business strategy (Pearce and David, 1987) and it helps to communicate the corporate orientation towards different stakeholder groups. In light of this relevance, in the last decade, several managerial studies provided recommendations in order to determine the quality of mission statements (Bart, 1997).

Despite the substantial attention awarded to this matter, a “minimal attention has been reserved to the role and the quality of mission statement in the strategic management of tourism firms” (Kemp and Dwyer, 2003). Cruise company mission statements remain an under-researched topic, given that, to the best of our knowledge, a systematic study on this topic does not exist.

The cruise industry represents an ideal setting to study such issues. First of all, the rapid growth of the cruise industry has brought a significant impact on society at economic, social and environmental level, both positive (i.e. job creation, revenues created by passenger expenditures, capital expenditure for port terminal and office facilities, development of tourism and transport facilities in cruise destinations) and negative (modification of natural and social environment, noise, traffic, increased waste production). Therefore, the relationship with the stakeholder groups and the ability to communicate with them has become more and more critical. Secondly, as the cruise industry is a segment of the global travel and leisure business, a clear definition of the mission may help to better communicate the components of the service management system (package; the role of the personnel; the corporate philosophy). Thirdly, considering that the increasing turbulent environment has forced cruise operators towards growth strategies, a good mission statement can help such companies to meet their strategic objectives in a long term perspective.

In light of these considerations, the aim of the paper is to explore such issues, answering the following research questions (RQ): i) RQ1: What is the quality of cruise line mission statements based on the criteria provided by the mainstream literature? ii) RQ2: Do cruise companies operating in different market segments differ in the quality of their mission statements?

In seeking to answer the aforementioned research questions, the present study contributes to extant tourism management academic literature exploring the role and quality of mission statements of cruise lines companies. The study has also several managerial implications since it clarifies the role of mission statements in accomplishing the strategic direction of cruise lines.

The remainder of this paper is organized as follows. The first section, by addressing the extant literature on the definition and quality of mission statements, provides the theoretical background useful for the analysis in the cruise industry. The second Section proposes instead the followed content analysis method for analyzing the components of the mission statement of the selected cruise lines. The third Section presents the results of the content analysis. The last Section discusses the results as well as
the suggested implications for academics and managers, together with the main limitations of the study and presents indications for further research.

THE QUALITY OF MISSION STATEMENT: A LITERATURE REVIEW

A mission statement “tells two things about a company: who it is and what it does” (Falsey, 1989, p. 3), responding in this way to two basic questions asked by the stakeholders (Levin, 2000, p.93). Other contributions offer a similar definition (Desmidt et al., 2011; Abrahams, 1995; Bart et al., 2001; Collins and Porras, 1991; David, 1989; Drucker, 1973; Ireland and Hitt, 1992). Mission statements contribute to reveal an organization’s products or services, markets, customers and philosophy (Pearce and David, 1987). Sufi and Lyons (2003) consider that mission statements explain the company’s “reason for being”, helping to understand the goals the company is planning to achieve and how it will attain them. Drucker (1974), instead, states that mission statements are the antecedents of the formulation of strategic objectives, because they help to trace a future orientation.

In light of these definitions, mission statements have been considered as tools for the strategic management process. Drucker (1974) recommends firms to define their missions because the definition of a clear and well-designed mission statement makes the company aware of its strategic planning and the feasibility of its strategic objectives. This is the reason why the mission statement should be defined before strategy formulation. Secondly, the mission statement helps the company to translate its strategic objectives into organizational actions and provides a rationale for allocating resources (David, 2007). Mission statements are useful to assert leadership (Klemm et al., 2001) and to inform employees and the entire organization about the corporate strategic direction in order to connect them in the implementation of the strategic objectives. Moreover, a mission statement is an effective public relation tool for communicating with the different stakeholder groups (Falsey, 1989).

Considering all these purposes, Pearce and David (1987) state that high performing firms have a more comprehensive mission than low performing firms. Moreover, previous scholars consider that the quality of a mission statement is generally related to the wealth of its content and the presence of different defined topics (Fitzgerald and Cunningham, 2016, Bartkus et al., 2004; 2006).

In order to evaluate a well-designed mission statement, three criteria have already been used in literature; the first useful method is based on the stakeholder theory (Freeman et al., 2004). While the company has been regarded as an economic entity with the goal of profit maximization and satisfaction of the interests of company owners, Freeman (1994) considers that business objectives should be consistent with the interests of other stakeholder groups. Stakeholders includes both internal stakeholders, i.e. shareholders, managers and employees, as well as external stakeholders, i.e. customers, suppliers, local community, environment. Following this theory, firms are expected to
include their relationships with stakeholders in their mission statement (Abrahams, 1995; Amato and Amato, 2002; 2000; Collins and Porras, 1991; Klemm et al., 1991; Williams, 2008). Ireland and Hitt (1992) state that mission statements can help firms to communicate a positive image to stakeholder groups. Moreover, it is possible to identify the importance of each stakeholder group in mission statements and the firm’s willingness to satisfy their specific interests (Bartkus and Glassman, 2008). Bart (1997) analyzes the mission statements of 88 firms in order to detect the number and the typology of stakeholders identified. He found that the primary stakeholders are “customers”, as they are included in most of the missions (78%), followed by employees (52%), investors (41%), society (33%), and suppliers (21%). Leuthesser and Kohli (1997) confirmed these results: the analysis of 63 mission statements reveals that 91% of the companies mentioned customers; employees and shareholders are present respectively in 67% and 60% of the total sample. In both the studies, the quality of the mission statement is examined in terms of the presence of specific stakeholder groups, such as customers, employees, investors, suppliers, and society (local community, environment).

The second evaluation method of a mission’s statement is related to the attitude of such statement to provide vis-à-vis information about the business “in itself” (i.e. target segments, product, market, philosophy). Pearce and David (1987) consider eight key components of mission statements that have been later extended to nine. An ideal “mission statement” should provide information about a company’s customers or clients, employees, products or services, markets, technology, self-concept, desired public image, philosophy, and strategies for growth and survival (David, 1989, 2007). These nine components serve as a tool for evaluating and writing a good mission statement. Following this idea, other contributions have sought to rename, enlarge, narrow, or redefine these components without changing the main meaning (Amato and Amato, 2002; Bart and Baetz, 1998). Typical words or expressions are mentioned in the mission statements: Dermol (2012), for example, identified the most common words used in the mission statements. The last method for evaluating the quality of mission statements is based on the main goals the mission helps to pursue. Considering the literature on the role of mission statements in the strategic management process, Bartkus et al. (2004; 2006) identify the most cited goals. Mission statements should communicate the firm’s direction to the different groups of stakeholders (David, 2001). Another goal of the mission statement is to provide the correct definition of the structure of the strategic business area and organization (e.g. description of clients, product, technology) in order to prevent managerial actions that are not coherent with these components. Consistently with Drucker (1974), who considers the mission statement as an antecedent of the definition of the entire strategic process (strategic formulation, implementation, evaluation), a third goal is to guide new or non-routine decisions (i.e. new market, new philosophy, new strategy). Moreover, on the basis of Bartkus et al. (2000) who define the mission statement as a communication
tool, mission statements may help to motivate and inspire employees in order to accomplish corporate strategic development. As a minimal attention has been paid to the role of mission statements in the strategic management of tourism companies, and there are not studies focused on the cruise operators, it is useful to explore the extent of the content of the mission statements in such type of companies. The abovementioned three methods will be employed in order to measure the quality of the mission statements of cruise lines companies. Moreover, it could be interesting to observe the differences in the cruise line companies operating in separate market segments

METHODOLOGY AND DATA COLLECTION

The sample was obtained by selecting the most important cruise lines from the Cruise Lines International Association (CLIA), the world’s largest cruise industry trade association, which represents 60 cruise lines. Mission statements were published by 44 cruise companies. Considering that in the cruise industry several cruising markets (bounded geographically and by limitations/substitutability in both supply and demand) coexist (Bull, 1996), the cruise lines belonging to the sample may be classified as: a) standard/ocean market companies (n=15): they offer 7-10 days ocean cruises on large vessels built for mass market cruising and are usually large companies (e.g. Carnival, Royal Caribbean, Costa); b) niche/luxury companies (n=29): they produce river, canal and lake cruises, special interest cruises, such as sailing, education, exploration or luxury cruises, defined as a cruise trip that costs more than $350 per day and serves upper-class travellers (De la Vina and Ford, 2001). The latter market structure is typically fragmented.

Content analysis technique is used to analyze the quality of mission statements expressed by cruise lines. Content analysis is considered a systematic, objective and quantitative technique for obtaining reliable and valid information from narratives (Krippendorff, 1980; Neuendorf 2002). It is a methodology applied by scholars in the study of company disclosure and corporate communication (Boesso and Kumar, 2007). Content analysis is commonly used in order to analyze mission statements (Kemp and Dwyer, 2003; Bartkus et al., 2004; 2006; Stallwowitz Williams, 2008; Dermol, 2012).

The mission statements of each cruise company were obtained by accessing official corporate websites. We identified only 44 companies out of 60 that explicitly enunciate their mission statement in the following sections of their website: “Mission”; “Value”; “About us” “Company philosophy”. In this study, “mission statement” has been broadly defined, including sentences that describe company goals, purpose, products, markets, culture, philosophy and values. Consistent with Bartkus et al. (2004; 2006), mission statement quality has been assessed by three different measures. The first measure (“Stakeholder groups”) is attributed to the main stakeholder groups mentioned by the cruise company. Cruise line stakeholders can be categorized into the following groups: Customers (Cruisers);
Shareholders and Financial community; Employees and Labor Unions and Managers; Society (local community, societal interest groups, environment); Suppliers (i.e. local port agents; port service providers; tour operators: shore excursion providers; ground transportation firms; air transportation/airports; etc.). The second measure (“Components”) derives from the specific components of mission statements defined by Pearce and David (1987): Target/Customers/Segments; Products; Location/Geography; Technology (ships); Concern for Survival; Philosophy; Self Concept; Concern for Public Image; Concern for Employees. The third measure (“Goals”) is consistent with Bartkus et al. (2000) and includes four possible goals pursued by a mission statement: “Sense of direction”; “Control mechanism”; “Non-routine decisions”; “Motivation”. Each mission statement of the selected 44 cruise companies was assessed using the topics inserted in the categories “Stakeholder groups”, “Components” and “Goals”. Three researchers independently recorded whether or not each mission statement is consisting with the topics in the three defined categories. A “1” is assigned if the topic is present, while 0 is assigned if the topic is not present in the mission statement. The results of the content analysis were then compared and doubts were discussed. In order to avoid bias, dictionary meanings and synonyms for the classification of each mission statement were defined “ex ante”. “Customers”, “clients”, “guests”, “cruisers”, “passengers” were employed in order to evaluate the presence of customers in the mission statement. The terms “Employees”, “Crew”, “Members”, “Workforce” determine, instead, the presence of the stakeholder group “Employees”. The operationalization of both the criteria “Components” and “Goals” was more difficult considering that they refer to a broader meaning and can be subjective. In order to avoid bias, for the definition of each topic belonging to “Components”, we closely followed Pearce and David (1987) study. The operationalization of “Goals” followed Bartkus et al. (2004; 2006). In this way, the sense of direction matches the disclosure about the company’s future orientation. When the mission statement pursues the “control mechanism”, it includes at least two of the most significant features of the business area definition (i.e.: industry, customer/segment, geographic scope, technology, distinctive competence). Non-routine decisions concern the definition of values and philosophy, which are useful to meet new strategic objectives. The presence of an evident “competitive or a societal motivational message” could refer to motivation and inspiration for employees.

MAIN RESULTS AND DISCUSSION

The findings of the content analysis are reported in the following tables. Table 1 shows the frequency with which each stakeholder group is mentioned (Measure 1). The total sample (n=44) quotes on average 1.73 stakeholders. For luxury/niche cruise lines the average is slightly higher (1-79).
Table 1. Number of stakeholders included in the mission statement

Table 2 provides, instead, information on the number of mission statements in which each stakeholder group is mentioned. The most cited stakeholders are Customers (84%), followed by Employees (34%) and Society (29%).

</table>
The predominance of customers is consistent with strategic management literature, considering that a major reason for developing a business mission is to attract customers (David, 2001). Some examples are: “We make all efforts to exceed our customers’ expectations” (Royal Caribbean); “Our objective is to be recognized by our customers” (P&O Cruises). Luxury/niche companies are more committed to customers (26 companies out of 29) than the Standard/Ocean companies, because their mission statements reflect the willingness to provide exceptional value for customers: “To put our customers at the heart of everything we do” (The River Cruise Line); “Our objective is to provide unsurpassed luxury and service to our guests” (Paul Gaugin Cruises).

Employees are also frequently mentioned both by Luxury/Niche companies (30%) and by Standard/Ocean companies (42.9%). Different orientation emerged with regard to Society and Suppliers. Society is quoted by 10 of 29 luxury/niche cruise lines (33.3%) and by only 3 of 15 standard/ocean companies (21.4%). Luxury/niche cruise lines tend to operate in unique marine environments (it is the case of exploration cruises) or in river/lake boundaries and offer exclusive destinations (e.g. private island). Thus, the respect for the environment, biodiversity and local community become crucial and this commitment is made explicit in the mission statements. Some examples are: “We strive to make a difference every day and are dedicated to seeking out eco-friendly practices that are environmentally, socially, and economically sustainable” (Paul Gaugin Cruise); “To enable economic, social and environmental advancement in sustainable tourism” (Amadeus Cruises). On the other hand, the results highlight the limited reference to shareholders and the financial community (9.1%). Considering that the Standard/Ocean companies are typically large-sized firms (often listed), they tend to disclose more about shareholders (14.3%). Moreover, suppliers are not mentioned by the vast majority of firms and this result is consistent with previous studies (Bart, 1997; Leuthesser and Kohli, 1997). For the standard/ocean companies, the frequency is higher (28.6%) because the supply chain is more complex considering the high volume of goods and services necessary to the cruise package.

Regarding the number of components included in the mission statements (Measure 2), the total sample show an average of 3.52 of the nine components (Table 3).

Table 3. Number of components included in the mission statement

The majority of cruise lines include two (25%), or three (25%) or four components (20%). None of them disclose all nine components (0%). As seen in Table 4, most cruise lines quote Customers/target (70%) but in their mission statements, the term customers is often vague and “all-inclusive” (e.g. guest).

The typology of “product” contributes to distinguish each company’s style and segments. Moreover, it is relevant for the effectiveness of strategy formulation implementation and evaluation (Kemp and Dweyer, 2003). Despite the relevance of this topic, only 19 cruise companies out of 44 include the definition of their products in their mission statements: Some examples are: “...we create once-in-a-lifetime experiences” (Holland American Line); “This set of behaviour constitutes the “Costa Touch”, a distinctive style which characterizes us and should be applied by all those who have a service relationship with Guests”; “...we provide a wide range of vacation choices that appeal to any taste, interest, lifestyle, or budget” (Carnival Cruise). Regarding the luxury/niche cruise lines, examples are: “...we provide the most authentic and enriching travel experiences, providing unsurpassed luxury” (Paul Gauguin); “we are working to develop and promote the cruise industry” (Cruise Gateway); “AmaWaterways’ mission is to deliver an exceptional vacation experience with everlasting memories onboard their elegant vessel” (AmaWaterways).

The total sample tends to predominantly disclose “philosophy” (68%). Philosophy includes the values, “credo” and ethical principles that express organizational culture. Corporate philosophy is evaluated as crucial in strategic management (Kemp and Dweyer, 2000), especially in the service management approach (Normann, 1984). Moreover, the pressure from Corporate Social Responsibility (CSR) policies holds that social values should be communicated. In the cruise industry, philosophy is connected to values such as excellence, personal services, belief in the importance of people (guests and crew). Some examples are: “Our mission statement is to be recognized and respected” (Regent); “Our objective is to deliver the highest levels of quality and service” (Mariposa); “…to inspire people to explore and care about the planet through expedition travel” (National Geographic); “…we consistently deliver exceptional Seabourn Moments” (Seabourn). For the standard/ocean companies: “Con MSC Crociere il viaggio e la nave sono la vera meta” (MSC); “Through excellence we create once-in-a-lifetime experiences, every time” (Holland American Line). Interestingly, only 20.5% of the cruise lines include “Concern for survival”, i.e the concept of profits,
market growth, economic objectives in their mission statement. This result is consistent with the limited reference to shareholders and the financial community highlighted previously.

Table 5 investigates the quality of mission statements in terms of communicating the four generally recommended objectives (Measure 3).

Table 5. Number of goals included in the mission statement

The mission statements of the cruise lines included in the sample present on average 2.11 goals. The results are similar for the two groups. Only five cruise companies (11%) disclose all four goals.

Regarding the luxury/niche cruise lines, examples are: “…we provide the most authentic and enriching travel experiences, providing unsurpassed luxury” (Paul Gauguin); “we are working to develop and promote the cruise industry” (Cruise Gateway); “AmaWaterways’ mission is to deliver an exceptional vacation experience with everlasting memories onboard their elegant vessel” (AmaWaterways). As reported in Table 6, the results indicate that cruise companies primarily communicate the control mechanism (70%) and the firm’s direction (59.1%). Luxury-Niche companies have a disclosure of the control mechanism higher than average (80%): the elements of the cruise packages and the core competences tend to be defined.
more accurately because they contribute to communicate the differentiation strategy and the segment’s boundaries.

Table 6. Number of mission statements that include each goal

In sum, Figure 1 visualizes the results of the content analysis according to the three methods used to determine the quality of mission statements.

Figure 1. The comparison of the evaluation methods

The number of the total topics disclosed is 7.36. The cruise lines that present the richest cruise mission statements in terms of number of topics mentioned are: Paul Gaugain (N=14); Polar Cruise (N=13); Norwegian Cruise Lines (N=11); Star Cruises (N=11). By contrast, Nicko Cruises (N=2), Ponant and Pullman Tour (N=3), Silversea and The River Cruise Line (N=4) have the lowest scores. To summarise, mission statements may differ a lot in terms of the number of mentioned topics. The two groups do not reveal significant differences in terms of average number of topics. Considering the sum of the three measures, these results show that the studied firms do not meet the criterion for success, considering the low rate of disclosure of the recommended topics.
CONCLUSION

The study presents the results of an explorative analysis carried out on the mission statements of 44 cruise lines operating in the luxury/niche market (group 1) and in the standard/ocean market (group 2). We apply the content analysis method employing three different measures of “quality” derived from the academic literature. The results reveal that cruise lines do not disclose a wide range of topics in their mission statements since the average number of mentioned topics is 7.36 (the highest possible score is 18). No significant differences emerged between the two groups of firms. Empirical evidence suggests that Customers (84%), Employees (34%) and Society (29%) are the most cited stakeholders in the scrutinised mission statements. The mission statements provide also information about Customers/Target/Segments (70%), Product (43%) and Philosophy (68%); cruise lines, therefore, tend to “use” mission statements in order to clarify their strategic business area and their corporate values and “credo”. The scrutinized mission statements perform the task of communicating “control mechanism” (70%) and “firm direction” (59%).

The paper provides insights useful for both scholars and practitioners. As concern academic implications, the manuscript develops extant cruise literature on strategic management. Moreover, from a methodological perspective, the paper carries out a broad content analysis on the mission statements of cruise lines and it helps to identify the most relevant topics in their strategy formulation and in their communication policy toward the stakeholders groups. The study has also several managerial implications since it clarifies the role of mission statements in accomplishing the strategic direction of the cruise lines. Cruise managers, therefore, are invited to exploit these preliminary results for bridging the gap between the “ideal” mission and the designed mission. Despite its contribution to extant cruise literature on mission statement, the manuscript still suffers some inherent limitations. Firstly, the results of the content analysis severely depends upon the judgment expressed by the researchers and they could be vulnerable to subjectivity. Secondly, the adoption of content analysis provides information only on the presence/absence of each topic, without evidencing if the statements include the topic in vague or in specific terms. In order to make findings more relevant, further researches are expected. Further studies should study the impact of the quality of mission statements on cruise lines’ competiveness (e.g. market share) and on financial/organisational performance. Moreover, it should be interesting to evaluate the role of each topic on the strategy formulation. Finally, cultural dimensions and firm size, for example, are expected to be valuable determinants in shaping cruise companies’ attitude towards a high quality of the mission statement and specific topics.

GREEN MARKETING AND ITS PERCEPTION BY YOUNG CONSUMERS
OF THE “GENERATION Y”

Průša, Přemysl; Sadílek, Tomáš

Department of Retailing and Commercial Communication, Faculty of International Relations, University of Economics in Prague, Prague, Czech Republic

ABSTRACT

The aim of this paper is to reveal the perception of Green marketing by young consumers from the “Generation Y”, as this generation has already grown into the level of mature consumers and it is still expecting a very long consumer life. The current “Generation Y” builds potentially the biggest customer base in the long term, therefore it is very interesting to see and understand their attitudes towards the “Green marketing” concept as well as the “CSR” concept. As the main method, a questionnaire survey has been used, and the respondents were mainly the students of the University of Economics in Prague, including the international (exchange) students from the whole world, staying in Prague during the execution of the questionnaire survey. The concept of “Green marketing” as well as the methodology and results of the study are described in the following text. The study has been performed twice in two successive years (namely in 2015 and 2016) to see possible changes in the attitudes of consumers.

Keywords: CSR, Generation Y, Green Marketing.

INTRODUCTION

The global economy is facing severe challenges nowadays. Most of them are even called as “global problems”, such as the increasing number of the whole population, which goes hand in hand with the increasing industrial production, pollution of the environment and the global warming. Various studies suggest that the current economic development as well as the lifestyles of most people living on the earth are not sustainable anymore. Most companies as well as civic societies in the developed countries are already aware of this situation, trying to reverse the impacts of it. Probably the most important concept and initiative which has emerged from this adverse situation is the concept of Corporate Social Responsibility (CSR). An integral part of this concept is the so called Green marketing, which is defined further in this paper.
CSR CONCEPT AND GREEN MARKETING

Green marketing can be perceived as an integral part of Corporate Social Responsibility. The term and concept of CSR (Corporate Social Responsibility) have been discussed and developed since the 70’s of the last century (Průša, 2007). Since that time until now, various definitions of CSR have been created and the CSR concept has become an integral part of most companies operating in the developed countries, as well as in transnational and multinational companies in the whole world. From the plethora definitions of CSR, we can mention the following:

1. CSR is a voluntary integration of social and environmental perspectives into the daily company’s operations and interactions with company’s stakeholders (European union, The green book 2001);
2. CSR is the business philosophy, which complies or goes well beyond the ethical, legal, commercial and social expectations (Non-governmental organization -Business for social responsibility);
3. CSR is a continuous commitment of companies to behave ethically and to contribute to the economic growth and to struggle to increase the life quality of the employees and their families as well as the local community and the entire society at the same time (World business council for Sustainable development, 1997).

Most authors divide the topics, which CSR should cover into three pillars/areas: the economic area, the social area and the environmental area (Trnková, 2004). Some approaches to CSR even add the fourth and fifth area, such as stakeholders and voluntarism (Mokrejšová, 2016).

Green marketing is a part of the concept of CSR (Supeková, 2010). Ecological marketing was introduced as a concept already in 1975 when it held the first seminar organized by the American Marketing Association (AMA) (Supeková, 2015). It is understood as a full orientation of marketing and business concepts to ecological aspects (Nízka, 2007).

According to Castenow (1993) the concept of green marketing should cover mainly the following areas: Care about clean air, soil and water, nature conservancy before devastation, rational use of natural resources with an emphasis on recycling, popularization of ecological orientation and a healthy lifestyle, and realization of the interconnection of the environment, hunger and overpopulation.

“The concept of ecological marketing can be named as environmental marketing, green marketing and sustainable marketing. The aim is to carry out a business activity to prevent environmental pollution, or reduce the load on the environment and to preserve the natural living conditions for people, animals, plants or, at least, change the conditions to improve their lives” (Supeková, 2015).

Zhang (1999) offers two meanings of green marketing – the narrower one is constraint mainly to production of green, ecologically friendly products, whereas to broader meaning is referred to the whole company strategy as to protect the environment and make efficient use of natural resources in
the long term. According to Dubey (2008) green marketing should include all activities aimed at satisfying human needs and desires with minimal impact on the natural environment. According to Supeková (2015) the green marketing concept should be aligned with the whole marketing mix.

AIMS AND METHODOLOGY OF THE STUDY

This study is aimed at identifying the prevalent attitudes and perception of green marketing and green products of the so called generation Y.

The generation Y for our purposes can be defined as all people who were born between the years 1980 and 1995 (Horovitz, 2012), whereas this study concentrates on the population of students at their early 20s, which means the youngest part of the generation Y will be considered.

To find out the attitudes and perception of generation Y towards green marketing a questionnaire survey was used. The sample consisted of 100 students of the University of Economics in Prague, and the survey has been performed twice, in two waves, with the time span of one year, to identify possible changes in the observed attitudes and perception among students. The questionnaire has been firstly completed in December 2015, followed by the second wave in December 2016. To identify possible differences between Czech and international students a special emphasis had been put on the international character of the groups of respondents, which has been enabled by the presence of international exchange students thanks to the Erasmus program. Thus, in the first sample were 53 international students and in the second sample there were 48 international students (out of 100 respondents in total). About the gender division, in the first sample there were 70 women and 30 men, in the second sample there were 53 women out of 100 respondents in total.

The aim of this questionnaire, as already mentioned, was to identify the attitude and perception of young consumers towards green marketing, namely, if young consumers care about ecology, green marketing and green products, as well as if they are ready to implement this concept into their shopping behaviour.

Thus, the following research questions have been set:

(1) Do the respondents care about ecology and environment?

(2) Do respondents care about the approach of companies towards the environment?

(3) Do respondents prefer products produced by eco-friendly companies?
(4) Are respondents willing to tolerate higher price or lower quality of green products?

RESULTS

1. *The care about ecology and environment*

<table>

<td>47%</td>
<td>8%</td>
<td>17%</td>
<td>3%</td>
</tr>
</tbody>
</table>

Table 1. Do the respondents care about ecology and environment?

As it can be seen in the Table 1, most respondents are interested in ecology and environment. In total, 73% of respondents expressed that they are certainly or rather interested in these problems. If we compare the results between the two years, there are almost no differences, only the number of people, who are rather not interested increased from 9% to 17%.

A comparison across genders has been performed, but no significant differences identified. The same has been done for the identification of the differences between Czech students and foreign students. In 2015 the foreign students appeared to be more interested in the problems of ecology and environment (only 3% from the total were not interested), whereas this situation did not appear in 2016, when 26% respondents were not interested in the problems of ecology and environment. As regards the nationalities, the foreign students are mixed from the whole group covering European nationalities as well as American or Asian nationalities. Therefore, it is impossible to identify any straight dependence of nationality and the attitude of the respondent to the problems examined.

Thus, the first research question can be answered: The young consumers from the Generation Y care about ecology and environment.

2. *Do respondents care about the approach of companies towards the environment?*

![Figure 1. Do respondents care about the approach of companies towards the environment?](image-url)
As it can be seen in the Figure 1, in 2015 there was an equal proportion of respondents who do care about companies’ approach towards the environment and who don’t (roughly 40%), in 2016 the percentage of those who do care accounted for 65% and the was nobody who certainly did not care about this issue.

It was also helpful to see the differences across the nationalities and genders. Whereas there were not substantial changes based on the factor “nationality”, important differences can be observed in the case of gender. It is obvious, that women care more about the problem of companies’ behaviour towards the environment, as illustrate the following Figure 2. Nevertheless, even though in 2016 men still tend to care less than woman about the approach of companies towards the environment, the gap between genders got smaller in 2016, when almost 60% of men and nearly 70% of women do care. (In 2015 60% of men did not care about the behaviour of companies, whereas only 30% of women were not interested in this issue).

![Figure 2. How do men care about the approach of companies towards the environment?](image)

![Figure 3. How do women care about the approach of companies towards the environment?](image)

It can thus be summarized, that people already do care about the behaviour of companies towards the environment, even though the attitude appears to be stronger in the case of women.

3. **Shopping behaviour and consumer preference**
In this section, there were two questions used with the aim to find out, if consumers take into consideration “the environmental friendliness” of companies during shopping FMCG/foodstuffs, and if consumers prefer products, produced by environmentally friendly companies.

Results concerning the first question can be observed in the following tables.

<table>
<thead>
<tr>
<th>Year</th>
<th>Quality</th>
<th>Price</th>
<th>Convenience</th>
<th>Brand</th>
<th>Environmental friendliness</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015</td>
<td>93%</td>
<td>83%</td>
<td>36%</td>
<td>34%</td>
<td>19%</td>
<td>3%</td>
</tr>
<tr>
<td>2016</td>
<td>100%</td>
<td>86%</td>
<td>48%</td>
<td>24%</td>
<td>24%</td>
<td>0%</td>
</tr>
</tbody>
</table>

*Table 2. What are your 3 main criteria for shopping of FMCG/foodstuffs?*

It is obvious, that “environmental friendliness” is gaining in importance, if we compare the years 2015 and 2016. Even though it is still not so important for the consumer decisive process as price and quality of products, it has already become a part of consumer criteria for choice, namely for 19% respondents in 2015 and for 24% of respondents in 2016. Thus, this criterion gained even the same importance as the brand.

<table>
<thead>
<tr>
<th>Year</th>
<th>Czech respondents</th>
<th>Foreign respondents</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015</td>

<td>20%</td>
<td>18%</td>
</tr>
<tr>
<td>2016</td>
<td>29%</td>
<td>16%</td>
<td>21%</td>
<td>24%</td>
</tr>
</tbody>
</table>

*Table 3. The importance of Environmental friendliness for shopping across genders and nationalities*

In 2015 the environmental friendliness during shopping of FMCG/foodstuffs was slightly more important for Czech male respondents. On the contrary, foreign respondents showed a below the average level preference of this factor.

Almost the same situation appeared in 2016. Again, the environmental friendliness of companies, as a criterion for purchase of FMCG/foodstuffs was apparently more important for Czech respondents than for the foreign respondents (as we can see in the Table 3), whereas the difference between men and women was rather negligible.

It is rather impossible to explain the fact, why Czechs do put a bigger emphasis on the factor of environmental friendliness, than do the foreign respondents, which also complicated the fact that the foreign respondents represented many nations across the whole world.

Now we can examine the results to the second question – if the respondents prefer products from companies, which behave ecologically friendly. The results are depicted in the Table 4, which also illustrate the comparison of the years 2015 and 2016. It is quite surprising that the trend is declining: In 2015 more than 66% of the total respondents preferred products from ecologically friendly companies, whereas in 2016 only 55% of the total respondents showed this preference. If we look at the figures more in detail, we can see that the preference of products produced by eco-friendly companies is substantially stronger in the case of foreigners as well as women – and this finding can be observed in both years almost equally.
Table 4. Number (%) of respondents who prefer products produced by ecologically friendly companies

<table>

<td>62%</td>
</tr>
</tbody>
</table>

More than 50% of respondents prefer products produced by environmentally friendly companies, thus it appears that consumers from the generation Y already care about the environmental friendliness of company, while shopping FMCG/foodstuffs.

Are consumers ready to tolerate lower quality in case of eco-friendly products?

Figure 4. Are consumers willing to pay more for eco-friendly products/produced by eco-friendly companies?

The Figure 4 shows an evidence, that young consumers from the Generation Y are already environmentally conscious to that extent, that they are ready to pay higher price for eco-friendly products or for products produced by eco-friendly companies. In both years observed there are more than 50% of respondents who are certainly or rather willing to pay more for eco-products. The situation between the years 2015 and 2016 changed only slightly, in 2016 there were less people, who were certainly or rather willing to pay more, whereas more respondents who don’t know. On the other hand, in 2016 there were less people than in 2015, who were not willing to pay more for eco-friendly products (only 13% of the total respondents “rather not” willing to pay more in 2016, nobody “certainly not”, whereas in 2015 there were 14% “rather not” and 1% “certainly not” willing to pay more) (Own research 2015, 2016).

Possible/ eventual differences between Czech respondents and across genders were examined too. It is rather surprising, but no differences have been detected between the answers of foreign and Czech respondents (Own research 2015, 2016). Only minor differences have been identified across the genders. In 2015 65% of women inquired expressed their willingness to pay more for eco-friendly products (10% certainly yes), whereas the same opinion held only 55% of men (15% certainly yes),
men were also more negative in this regard – 25% of men were either not or rather not willing to pay more for eco-friendly products (5% certainly not), at the same time women were less negative – only 12% expressed, that they were rather not willing to pay more for eco-friendly products (Own research 2015, 2016).

The same situation appeared in 2016 – only 42% of men (5% “certainly yes”), but almost 67% of women (10% “certainly yes“) were willing to pay more for eco-friendly products, whereas almost 16% (nobody “certainly not”) of men, but only 10% of women (and nobody “certainly not”) were not willing to pay more for eco-friendly products (Own research 2015, 2016).

![Figure 5. Are consumers ready to tolerate lower quality in case of eco-friendly products?](image)

Figure 5. Are consumers ready to tolerate lower quality in case of eco-friendly products?

It is obvious (Figure 5) that most of the young respondents from the Generation Y are not willing to tolerate lower quality in the case of eco-friendly products. However, there are some exceptions: In 2015 27% of the total respondents could tolerate lower quality (4% “certainly yes” and 23% “rather yes”), in 2016 it was 25% of total respondents (7% “certainly yes” and 18% “rather yes”), whereas the percentage of negative answers (intolerance of worse quality in the case of eco-friendly products) in 2015 was 50% (10% “certainly not”) and in 2016 it was 48% (13% “certainly not”) (Own research 2015, 2016). Thus, it can be said, there are no great changes between the years 2015 and 2016.

<td>21%</td>
</tr>
</tbody>
</table>
If we look at the difference given by the nationality and gender (Tables 5 and 6) we can identify the following tendencies:

1. The relative tolerance ("certainly yes" or "rather yes") is higher in the case of foreign respondents and women.
2. The absolute tolerance ("certainly yes") is also higher in the case of foreign respondents and women.
3. The relative intolerance ("rather not" or "certainly not") is higher in the case of Czech respondents and men.
4. The absolute intolerance ("certainly not") is also higher in the case of Czech respondents and men.
5. In all groups, there is high level of uncertainty in this area, which was higher in 2016 (26% of the total respondents “did not know”) than in 2015 (23% of the total respondents “did not know”).

The last research questions can be answered now: Young consumers from the Generation Y are likely to pay more for environmentally friendly products/produced by environmentally friendly companies, however, they are not very likely to tolerate lower quality of environmentally friendly products.

**CONCLUSION**

Based on the most important findings from the study we can conclude the following:

The young consumers from the Generation Y do care about ecology and environment, and this care has already become an integral part of their lifestyle.

If we look at the shopping behaviour of the Generation Y, we can say that they already care about environmental friendliness of company even during their shopping (FMCG/foodstuffs), as more than 50% of respondents prefer products produced by environmentally friendly companies.

Finally, young consumers are even willing to pay more for environmentally friendly products/produced by environmentally friendly companies, however, they are not very likely to tolerate lower quality of environmentally friendly products.

To conclude, the picture of attitudes of the “Generation Y”, as derived from this study, appears to be rather optimistic, however we must not forget, that this type of research has always its limitations, and it only reveals the attitudes of consumers and not their real actions.

DETERMINANTS OF CREDIT TO SMES - EMPIRICAL EVIDENCE
FROM SUPPLY SIDE PERSPECTIVE IN MUMBAI REGION

Raghu, Kumari P.S; Pankaj, Trivedi

K J SIMSR – Finance Department, Mumbai

ABSTRACT

SME sector has emerged as most important and dynamic sector of Indian Economy. With the latest new initiatives by new government like “Make in India” manufacturing sector has been recognized as the top priority for the development of nation. More than 50 lakh SME units were added from 2006-07 to 2011 period which shows the rapid expansion of SMEs in India. One of the main challenges the sector is facing today is “Lack of financing”. Funds support can be given to SMEs mainly with the support of financial institutions especially by banks along with other sources. Present paper studied the credit granting criteria to SMEs and its impacting factors by applying Binary logit regression model. Research study found that Age of the owner and Net worth are considered to be most important while granting credit to SMEs in the region of Mumbai.

Keywords: Credit granting, Financing, SME credit.

I. INTRODUCTION:

Credit sanctions to small and medium enterprises have two perspectives in decision making: i) human factor model; and ii) credit score model basis (Jain et al. 2011). Credit score approach is system driven and fixed process model whereas human factor model is widely practiced and adopted across the world. Financial institutions appoint dedicated loan officers to scrutinize and assess the loan applications. These loan officers operate based on set of guidelines decided by institutions. Ability of humans to evaluate the worthiness of the loan application is low because of many loopholes in decision making in the form of biasness and psychological factors (Glorfeld and Hardgrave, 1996). In order to remove barriers in this model financial institution should have policy driven credit granting process, proper credit administration, and assessment and reviewing process. Literature available from across the globe indicates the parameters which are emphasized more in SME credit granting. Ayapong et al. (2011) stated that intended purpose of loan, repayment schedule, type of business activity, size of loan, and financial parameters play crucial role in getting SME credit in Ghana. Financial parameters like liquidity, profitability and cash flows are very important in getting credit...
Apart from these owner reputations, firm size, genders were also considered widely (Kouser, 2012). The credit score model requires historical financial data to give the output whereas most of SMEs in India are not having well maintained historical and authenticated financial statements with them which becomes a challenge to loan officer to take the decision on credit issuance (Dietsch and Petey, 2004). According to working committee report of MSME 2015, presently most of the banks insist on audited financial statements for lending up to 20 million INR, whereas banks may not ask for audited financial statements whose turnover is less than 6 Million INR. In the absence of financial statements data human factor approach is the most suitable and widely available method for loan officers.

Present paper focuses on understanding the parameters which are emphasized more when loan officers scrutinize the SME applications in Mumbai with human approach model. The study emphasized on understating factors which influence the outcome of loan application of SMEs in Mumbai.

According to MSME report 2013-14, MSME contributes to 40% of exports and employ nearly 100 million people. Despite their enormous contribution to economy they are facing many challenges in their business. One of the major challenges is “lack of financing” and most of the SMEs in India depend more on debt and equity funding with many of them continuing as family owned enterprises. It is stated in RBI D&B Research report 2012 that SMEs increased from 2001 to 2012 to 40% whereas outstanding credit has just increased only 25%. Credit gap in this sector is a huge opportunity for banking sector in India. The most important factor to ensure that the SME sector grows in India is to provide adequate finance to the sector and induce them to employ better management practices. CRISIL conducted a study in 2011 on the financing pattern of 2000 small and medium enterprises and revealed that there is an opportunity for banks to fund up to 500 Billion INR. The funding opportunity is more for smaller SMEs where turnover is less than 50 Million INR. In the past banks have financed only up to 60% whereas the common banking practice of financing is up to 75 per cent of a firm's working capital requirement. This deficit was funded by the SMEs from their own funds. Present research paper focuses on the need to improve the credit flow to SMEs in India and with this intention a primary survey of
loan officers was conducted in order to find out the most emphasizing factors for banks while lending to SME sectors. Binaly logit regression analysis was conducted to know the important parameters while lending to SMEs in Mumbai. The study helps SME sector immensely as they can focus more on the required parameters to improve credit flow at the right time. Asia SME Finance Monitor Report 2013 says, SME financing policies should be addressed in a holistic manner that goes beyond already established ways. Policy makers should develop a comprehensive policy options that allow SMEs to select diversified financing models which help them doing business in an easy way

The paper is organized as follows. In section II, literature review was presented which will form as the basis for selection of variables and hypothesis. In section III, Research methodology was presented. In section IV, Data analysis, interpretations and managerial implications were presented and in section V, Conclusion was presented.

2. LITERATURE REVIEW

It is evident from history that loan applications were assessed by human approach by using 5Cs (Character, Capacity, Capital, Collateral and Condition), whereas in current scenario credit score models are widely used by loan officers. Several studies were conducted on the issue of what impacts most when it comes to SME loan approval and rejections. Every loan application submitted by SME is carefully scrutinized by loan officers to take the final decision. The success of loan application depends on various important parameters like financials, firm size and creditability of owner. Fatoki and Asah (2011) observed in South Africa that Older SMEs have a better chance in getting credit sanctions compared to SMEs established five years back. It is found in Ghana that form of business is one of the factors crucially considered for granting loans (Abor, 2008). It is observed that location where SMEs are located is also very important factor when it comes obtaining credit from banks in Nigeria and Fiji (Okpara and wynn, 2007; Reddy, 2007). Various parameters contribute to acceptance and rejection of loan applications submitted by SMEs. Number of studies have also focused on the parameters which lead to rejection of loans. Read (1998) states that the main reason attributed for rejection of SME loans are lack of collateral, less turnover, poor cash reserves.
Several research studies argued that Demographic factors and Gender are also playing crucial role in getting credit from banks. The study done by Bexley and Neminger (2012) indicated that loan officers can now easily obtain early indicators of increasing risk by taking a more comprehensive view of the customer’s demographic characteristics. According to Gardener and Mills (2000) demographic profile includes items such as age, gender, level of income, level of education, home ownership, employment status and even location. From the study of Berger and Udell (2006) it is concluded that there is relationship between borrower demographics category and assessing loan repayment performance. Hence borrower’s demographic factors are important aspects that banks can consider when advancing loans to them. According to the study of Giesecke (2004) demographic factors of borrowers are associated with the creditworthiness of borrowers and these factors are also interrelated. Nguyen (2007) study concluded that demographic profiling as a key factor influencing loan advances and the subsequent performance of the loan as it indicates important clues to loan officers with regard to sanctioning of the loan. The study conducted by Berger and Udell (2006) found that banks are likely to consider comparatively more mature clients for loans relative to young clients. It is observed that male customers tend to receive favourable responses from bank compared to female customers. Blanchflower et al. (2003) concluded that women owned business were about twice as likely to be rejected loans even after fulfilling well in all the required parameters. Kantrowitz (2010) study found that the parents education level, having dependents, the marital status of borrower, the borrower’s income have significant relationship with loan performance in banks.

Literature review of many research papers reported differences in the financing patterns of male-owned and female-owned businesses (Coleman, 2000). Women-owned businesses tend to startup with lower levels of overall capitalization (Carter and Rosa, 1998), lower ratios of debt finance (Haines, Orser, and Riding, 1999), and much less likelihood of using private equity or venture capital (Brush et al., 2001). Researchers investigating gender-based differences in debt financing have focused on two related themes. First researchers have tried to find the complex relationship between gender of entrepreneur and bank finance with regard to the volume of finance lent, the terms of loan negotiated, and the perceived attitudes of bank lending officers to female entrepreneurs (Coleman, 2000). Second, researchers have tried to explain whether gender-based differences are a consequence of supply-side discrimination by bank lenders, demand-side aversion to debt or risk by women entrepreneurs, or simply the result of the structural dissimilarities of male-owned and female-owned businesses (Buttner and Rosen, 1989). Overall, the insights of research evidence considering gender, entrepreneurship, and bank lending suggests that while the bank financing profiles of male and female entrepreneurs are distinctly different, much but not all is attributable to structural
dissimilarities. The research proof also suggests that while women entrepreneurs feel that they are
treated differently by bank lending officers (Fabowale et al. 1995), there is almost no evidence of
systematic gender discrimination by banks. Indeed, there is a growing recognition that women
entrepreneurs constitute an important new market for banks, and it is difficult to state that it is within
the banks’ interest to deliberately, much less systematically, exclude this growing market. The debate
has continued largely because of dissatisfaction with existing explanations, coupled with the
methodological difficulties facing researchers in providing clear and unequivocal evidence (Haines et
al. 1999; Mahot, 1997).

Cliff (1998) and Coleman (2000) explained different preferences of female entrepreneurs such as a
tendency to be less likely to use external sources of credit, or to make deliberate choices to limit
growth rates and size of their firms. Though, both studies could not provide evidence of change in
access to financing, but rather that access is affected by choices made about firm characteristics, with
financing being less accessible for smaller businesses than larger ones. It is useful to understand that
the perception of bias towards women continues to exist in spite of lack of evidence for this bias in the
research literature. With reference to debt financing, Fabowale et al. (1995) state that while their
research showed no evidence of differential access to credit between male and female entrepreneurs,
women were far more likely to report feelings of being treated disrespectfully by financial institutions.
While many studies found no differences in loan rates for comparably qualified male and female
applicants, this presses the broader question as to whether women are able to compete equally with
their male counterparts. Lack of reach to debt financing is compounded by women-owned businesses
having lower sales volumes, less capacity, less capital, less collateral and the owners have less
professional experience than male-owned businesses (Fabowale et al., 1995). Research studies focused
on various loan impacting parameters to analyze their role in the final outcome as it helps both the
parties in improving credit flow.

SMEs are very important to low income countries as they make significant contribution to GDP and
employment. SMEs in India contribute to 40% of exports. In spite of SMEs playing crucial role in
Economic development their challenges are similar across the world. One of the main challenge faced
by SMEs across the world and as well in India is “availability of finance” (oy and Haynes, 2006; cook,
2001). At different stage of firm’s growth cycle, different financing support is required (Berger and
Udell, 1998). Present study focuses on determinants of SME credit in Mumbai. Variables used in the
study are carefully selected from the literature available and are tabulated below.

**Hypotheses developed from above literature:**

H1: “Age of the owner” is not significant factor while granting credit to SMEs
H2. “Net worth” is not significant factor while granting credit to SMEs
H3: “Age of the firm” is not significant factor while granting credit to SMEs
H4: “Gender” is not significant factor while granting credit to SMEs
H5: “Geographic location” is not significant factor while granting credit to SMEs

3. RESEARCH METHODOLOGY:

3.1 Sampling Design:
The study focused on Supply side analysis with samples collected from loan officers across Mumbai city. Due to limited availability of these professionals it was decided to approach them through appointments by leveraging the networks in the chosen area. The objective of sampling is to reflect the population by using sample (De vaus, 1996; Miller, 1991; Mies and Huberman, 1984). Convenient sampling technique was used to collect samples from various branches of chosen banks from all corners of Mumbai.

Sample size:
Choosing right sample size is the key in statistical analysis involving inferences on population parameters based on sample parameters. Luck and Rubin (1987) study indicated that large sample size is most preferred when using advanced techniques. Krejcie and Morgan (1970) study indicated that a sample size of unknown population of 384 is good. Gerbing and Anderson (1993) recommended that at least 200 responses are required to obtain variable estimates with reasonable degree of confidence. Thus to achieve a minimum of 200 samples total 234 were collected and scrutinized to get the required results.

Instrumentation
For effective and error less data collection, survey, and interview methods were extensively used. The questionnaire was intricately designed to gather the information on the factors that affect the credit granting decision from loan officer point of view.

Sample Data: Table 1

According to Nunnaly (1978) alpha value above 0.710 is acceptable for data analysis and interpretations.

#### 3.2 Explanatory variables

**Age of the firm:** Rehanakouser et al., (2012) revealed that age of the firm plays crucial role while granting credit to SMEs. David A Schauer (2001) concluded that older firms hold more weightage in getting credit sanctions.

**Age of the owner:** Sinha (1996) study concluded that young age entrepreneurs were relatively more successful. Reynolds et al.(2000) found that entrepreneurs aged between 25-44 years tend to be successful in getting credit. It is found that there exists significant correlation between age of the business owner and business success was emphasized (Kristiansen, Funholt, and Wahid, 2003)

**Gender:** Kolverid (1996) found that male business owners had significantly higher business intentions than female business owners. Mazzarol et al. (1999) found that female business owners show less inclination towards setting of new ventures.

**Net Worth:** One of the most important financial parameter bankers study before granting a loan is Net worth. It is calculated using financial information provided by the borrower. It is observed that net income and net worth are highly preferred calculations in getting credit to SMEs.(Berger and Udell, 2006)

**Geographic location:** Burger et al (2006) and David A Schaurez et al (2006) emphasized that location where SMEs are placed plays crucial role in credit sanctions.

**Nature of financial system:** David A Schaurez et al (2006) found that poor quality of financial statements maintained by SMEs proved to be the biggest barrier in credit sanctions.
Form of ownership: According to Berger and Udell (2006) study, the legal structure of the firm whether it is a sole proprietorship or partnership is having less impact in credit sanctions. This factor is added in current study in order to test whether it is influenced in Mumbai region or not.

4. DATA ANALYSIS

4.2 Binary Logit Regression model

The purpose of research is to provide an exhaustive empirical analysis with respect to the factors which influence the outcome of loan application of SMEs in Mumbai. Logistic regression is a statistical analysis tool models that explains the response of relations between the variables that have two or more categories with one or more independent variables or interval scale category (Hosmer and Lameshow, 2004). Logistic regression models explain the relationship between $X$ and $\pi(\chi)$ which is not linear, abnormal distribution of $Y$, diversity is not constant and cannot be explained by ordinary linear regression model. Data observations has $p$ independent variables $\chi_1, \chi_2, ..., \chi_p$ with the response variable $Y$ which has two possible values of 0 to indicate that the response does not have criteria and a value of 1 to indicate that the response has criteria. 1) Independent variables used in the model do not have normality assumption. 2) Dependent variable consists of continuous variables, discrete, and nominal with dichotomous nature. 3) Distribution of expected response variable nonlinear. Kinds of logistics are divided into binary logistic regression and multinomial logistic regression. In this study, the response is a binary variable that is a loan application accepted or loan application denied, then the incident at the time of granting credit decisions by potential Small Medium Enterprises (SMEs) borrowers recommended or accepted by the influence of a particular variable. The model used in the logistic regression analysis is logit ($pi$) = $\beta_0 + \beta_1 * X$ with logit ($pi$) is the value of the logit transformation to a successful event opportunities, $\beta_0$ is the regression intercept, $\beta_1$ is the slope of the regression line models, and $X$ is the explanatory variables (Nachrowi, 2002: 307):

Thus, the estimation model used in this study is:

$$Li = \ln \left[ \frac{p}{1+p} \right] = \beta_0 + \beta_1 + \beta_2 + \beta_3 + \beta_4 + \beta_5 + \beta_6$$

Descriptions:

$\ln \left[ \frac{p}{1+p} \right] =$ Loan application accepted or rejected

$\beta_0$: Age of the firm

$\beta_1$: Age of the owner

$\beta_2$: Gender

$\beta_3$: Net worth

$\beta_4$: Geographic location
The multivariate statistical analysis technique, Binary Logistic Regression is used to identify the individual and collective roles of the following variables concerning their influence on loan approval/denial rates. From the Literature review it is observed that Charlo et al. (2010) and David A. Schauer et al., (2001) have used binary logistic regression in their research to predict the loan impacting variables.

For the present study “Loan approval status” is considered as Dependent variable and the following were considered as Independent variables and all are recoded into “1” and “0” for the purpose of BLR. Forward likelihood Ratio method was applied in Minitab software for the following variables:

1. Loan approval status coded as approved 1 and not approved as 0
2. Nature of financial system coded as sophisticated 1 and conventional system as 0
3. Legal structure of the firm coded as selected and particular type 1 and other category as 0
4. Size of firm based on turnover coded as Large 1 and small 0
5. Age of the firm coded as Young 1 and old 0
6. Gender of the owner coded as Female 1 and Male as 0
7. Geographic area is coded as selected areas as 1 and other area as 0
8. Type of activity is coded as conventional areas as 1 other and new areas 0
9. Net worth up to 30 Lakhs coded as below average net worth. Above 30 Lakhs coded as above average net worth

<td>0.000</td>
</tr>
<tr>
<td>Hosmer-Lemeshow</td>
<td>8.192</td>
<td>8</td>
<td>0.415</td>
</tr>
</tbody>
</table>

From the above table it is observed that Hosmer-Lemeshow P-value is 0.415 which is above the significant level of 0.05 which means it is insignificant and this model is perfect fit for the data and proved to be a good fit. Pearson P value 0.086 is above the significant level of 0.05 which indicates our model predicts values not significantly different from what it was observed.

Variable “age of the owner “ has got the p value of 0.038 which is below of $\alpha =0.05$, hence reject H0 and accept H1 concluding that “age of the owner” is significant variable while granting loan to SME in Mumbai.

Variable “net worth “has got the p value of 0.000 which is below of $\alpha =0.05$, hence reject H0 and accept H1 concluding that “net worth” is significant variable while granting loan to SME in Mumbai.

Variable “age of the firm “has got the p value of 0.121 which is above of $\alpha =0.05$, hence accept H0, concluding that “age of the firm” is not a significant variable while granting loan to SME in Mumbai.

Variable “gender “has got the p value of 0.087 which is above of $\alpha =0.05$, hence accept H0, concluding that “gender” is not a significant variable while granting loan to SME in Mumbai.

Variable “geographical location “has got the p value of 0.156 which is above of $\alpha =0.05$, hence accept H0, concluding that “geographical location” is not a significant variable while granting loan to SME in Mumbai.

Variable “nature of financial system” has got the p value of 0.836 which is above of $\alpha =0.05$, hence accept H0, concluding that “nature of financial system” is not a significant variable while granting loan to SME in Mumbai.

Variable “form of ownership “has got the p value of 0.153 which is above of $\alpha =0.05$, hence accept H0, concluding that “age of the firm” is not a significant variable while granting loan to SME in Mumbai.

BLR equation for the present study written from the above table is as follows:

**Loan application status = -0.3518 age of the owner + 0.31070 Net worth**
Interpretation: Interpretation of logistic regression models was done using odds ratio from the above table, value of the odds ratio is used to explain the relationship between the dependent variable and the independent variables.

Odds ratio for age of the owner (0.70) of respondents indicate that whose loans are approved belongs to lower age groups than the respondents whose loans are disapproved

Odds ratio for Net worth (1.36) of respondents indicate that one unit change in the Net worth is going to increase the loan acceptance by 1.36 times

Measures of Association:

</tbody>
</table>

These correlations may range from 0 to 1 hence a large value indicates a stronger relationship and thereby indicates the strong predictive validity for the model. In the above model values are ranging from 0.36 to 0.17 which imply a reasonable predictive ability of the model considering the many uncontrolled and subjective parameters controlling the loan acceptance decision in practical scenario

4.3 Managerial Implications

It is observed from study that young age entrepreneurs who are having good net worth are getting credit successfully in Mumbai. This shows that Banks can focus more startup loans and can tap young entrepreneurs who have creative and prospective ideas on business. SME Entrepreneurs should approach for loans early as age increases it becomes difficult to get sanctions and they should focus more on creating net worth by reducing expenses and increasing revenue through various managerial strategies.

5. CONCLUSION

Most small business owners are confused and concerned about the parameters which are considered while granting credit to business firms. Loan applications are evaluated on the basis of parameters defined by Banks. It is important now to make this evaluation criteria uniform across all the banks and create awareness on these criteria parameters to improve the credit flow to SMEs. Present research paper has identified through multiple logistic regression that Form of ownership, Size of Business and Geographic location are the most impacting factors in getting credit from Banks in Mumbai. Further
research using neural networks and artificial intelligence techniques it is possible to enhance the predictability of factors in SME credit.

6. LIMITATIONS

This study relied on primary data which is restricted to Mumbai city-The financial hub of India.

The variables used in this study are taken from literature and no new variables are incorporated in the model chosen.

Limited sample size could influence the results.

Various other parameters which can influence SME loan sanctions like perceptions, credit scores are ignored here.

TEAM PSYCHOLOGICAL SAFETY PREDICTING TEAM CREATIVITY: A CONDITIONAL INDIRECT EFFECT MODEL

Rego, Arménio; Melo, Ana I.; Bluhm, Dustin J.; Pina e Cunha, Miguel

1Católica Porto Business School, Universidade Católica Portuguesa and Instituto Universitário de Lisboa (ISCTE-IUL), Business Research Unit, Portugal
2School of Technology and Management (ESTGA-UA), University of Aveiro, Aveiro, Portugal and Centre for Research in Higher Education Policies (CIPES), Matosinhos, Portugal

ABSTRACT

Through a sample of 79 teams, we test if (a) team psychological safety (PsySafe) predicts team creativity through team learning behaviour, (b) the relationship between team PsySafe and team learning is moderated by the consistency of team PsySafe, and (c) the relationship between team learning behaviour and team creativity is moderated by the consistency of team learning behaviour. The main findings are: (1) team PsySafe predicts team creativity through team learning behaviour; (2) this indirect effect is stronger versus weaker when the consistency of PsySafe and/or team learning behaviour within the team is higher versus lower. The most creative teams are characterized not only by high PsySafe and high team learning behaviour, but also by low within-team variability in the perceptions of team PsySafe and team learning.

Keywords: team psychological safety; team learning behaviour; team creativity; strength of team psychological safety; strength of team learning

INTRODUCTION

A psychologically safe environment is increasingly recognized by scholars and practitioners as crucial for individual, team, and organizational performance (Edmondson & Lei, 2014; Frazier, Fainshmidt, Klinger, Pezeshkan, & Vracheva, 2017). One of the ways that psychological safety contributes to performance is by promoting individual and collective creativity (Frazier et al., 2017). In psychologically safe contexts, individuals are more likely to take advantage of opportunities and experiment with novel solutions to problems. Some companies purposefully foster psychological safety to enhance performance, such as Pixar, whose “formula for creativity” is being a company in which employees are “able to make mistakes without fear” (Garrahan, 2014, p. 10). Another example
is found in marketing guru Tor Myhren, who developed E-Trade’s talking baby and later became Apple’s vice president of marketing communications: “After experiencing his own epic professional stumble, Tor Myhren vowed to foster creativity by banishing fear of failure. (...) He also works hard to make employees feel safe in their creative process because he believes fear of failure kills creative thought” (Moran, 2014).

This paper relies on the Input-Process-Output (IPO) model of team effectiveness (Ilgen, Hollenbeck, Johnson, & Jundt, 2005; Kozlowski, Mak, & Chao, 2016) and the theory of climate strength (González-Romá, Fortes-Ferreira, & Peiró, 2009; González-Romá, Peiró, & Tordera, 2002; Schneider, Salvaggio, & Subirats, 2002) to examine how psychological safety (PsySafe) influences creativity in teams through team learning behavior. The IPO framework conceptualizes team performance as resulting from a system in which the inputs influence team processes, which in turn lead to outcomes. While some consider psychological safety (PsySafe) as a social process (Reiter-Palmon, Wigert, & de Vreede, 2012), we align with scholars (Paulus, Dzindolet, & Kohn, 2012) who conceptualize PsySafe as a team property or as part of the team climate, which is an input in the IPO model that antecedes team related (cognitive, social, and motivational) processes. Team processes are the “members’ interdependent acts that convert inputs to outcomes through cognitive, verbal, and behavioral activities directed toward organizing taskwork to achieve collective goals” (Marks, Mathieu, & Zaccaro, 2001, p. 357). We argue that team learning behavior is a team interaction process linking team PsySafe to team creativity (Drach-Zahavy & Somech, 2001; Paulus et al., 2012). Team creativity represents an effectiveness criterion (Yammarino, Dionne, Schriesheim, & Dansereau, 2008), and we treat it as an output (Paulus et al., 2012).

This research makes several important contributions to the literature on organizational creativity (i.e., “the production of ideas concerning products, practices, services, or procedures that are novel or original and potentially useful to the organization”; Oldham & Baer, 2012, p. 388). First, as Anderson, Potocnik, and Zhou (2014, p. 1309) observed, “research into work group or work team creativity and innovation is particularly valuable as organizations have moved inexorably to more team-based structures and will often be reliant upon teams to develop and implement innovative solutions even where the ideas may have originally been proposed by an individual”. The vast majority of the extant literature on creativity has been focused on individual creativity and on how individual differences (e.g. personality and attitudes) predict creative output (Reiter-Palmon et al., 2012). At the individual level of analysis, the team is viewed as the cognitive, social, emotional and

---

16 Marks et al. (2001) distinguish behavioral processes from emergent states. These are “cognitive, motivational, and affective states of teams, as opposed to the nature of their member interaction” (p. 357). They “do not represent team interaction or team actions that lead toward outcomes. Rather, they are products of team experiences (including team processes) and become new inputs to subsequent processes and outcomes” (p. 388).
behavioral context that facilitates or inhibits individuals’ creativity (Anderson et al., 2014; Hirst, van Knippenberg, & Zhou, 2009). Our research responds to Anderson and colleagues’ call to better understand creativity at the team level of analysis. Team creativity is a different phenomenon from individual creativity, and does not simply equate to the sum of each team member’s creativity (arguments developed below). More research on the antecedents of team creativity is necessary (Reiter-Palmon et al., 2012), especially considering that well-functioning teams can foster team creativity that leads to organizational innovation and performance (Amabile, Conti, Coon, Lazenby, & Herron, 1996; Bechtoldt, De Dreu, & Choi, 2010; Oldham & Cummings, 1996; Reiter-Palmon et al., 2012; Woodman, Sawyer, & Griffin, 1993). Creativity is a “key driver of organizational innovation and success” (Zhou & Hoever, 2014, p. 333), and both creativity (the first step of innovation) and innovation are “increasingly important determinants of organizational performance, success, and longer-term survival” (Anderson et al., 2014, p. 1298).

Second, beyond testing team learning behavior as the mediating mechanism through which PsySafe influences team creativity, we also address the climate strength or consistency within the team (Meyer, Dalal, & Hermida, 2010; Schneider et al., 2002). Specifically, we consider that the I→P and the P→O relationships are moderated by the consistency with which the members of the team perceive team PsySafe and team learning behavior, respectively. In this way, we converge with Ilgen et al. (2005) who defended that the classical IPO is insufficient for fully characterizing teams in a nuanced way. The IPO framework suggests a linear progression: I leads to P leads to O. However, such relationships may be moderated by variables related to inputs, processes, outcomes, or exogenous variables. We hypothesize that (a) the consistency with which team members experience PsySafe (i.e. Input consistency) moderates the I→P relationship, and (b) the consistency with which team members engage in and experience team learning behaviors (i.e., Process consistency) moderates the P→O relationship.

A very limited set of studies have considered the consistency of team PsySafe as a moderator of the relationship between the level of PsySafe climate and the dependent variables (Hirak, Peng, Carmeli, & Schaubroeck, 2012). Surprisingly, the review by Edmondson and Lei (2014) does not include any mention to the consistency with which PsySafe is experienced within the team. For PsySafe “to be a group-level construct (…), team members must hold similar perceptions of it” (Edmondson, 1999, pp. 354-355), which implies that greater similarity in perceptions equates to a more consistently experienced team climate. Moreover, this is the first study to include the consistency of PsySafe and the consistency of team learning behaviors as moderators in the indirect relationship between the level of team PsySafe and creativity. A recent meta-analysis (Frazier et al., 2017) found a relatively weak relationship between PsySafe and both individual and team creativity. We expect that
including consistency of PsySafe and of team learning behaviors as moderators will increase the indirect influence of PsySafe on creativity. Our conceptual model, depicted in Figure 1, therefore suggests a conditional indirect model linking team PsySafe to team creativity. We propose that the I→P and the P→O relationships are stronger versus weaker when the team members perceive PsySafe and team learning behavior in a more versus less consistent way.

![Figure 1. Hypothesized model.](image)

Finally, most research on team or group creativity examines teams in controlled laboratory settings (Paulus et al., 2012). Our research contributes to the creativity literature by examining team creativity in a real-world work environment, providing new insights to both scholars and practitioners. Additionally, our study was carried out in Portugal, an understudied cultural context characterized by relatively high power distance, high uncertainty avoidance, high in-group collectivism, and paternalistic leadership (Hofstede, 1991; House, Hanges, Javidan, Dorfman, & Gupta, 2004; Rego, Marques, Leal, Sousa, & Cunha, 2010). In such a context, where team members are (a) more vulnerable to the unequal power held by supervisors, (b) more susceptible to influences from colleagues, and (c) less likely to challenge the status quo and, specifically, the leader/supervisor views, team PsySafe can be considered particularly important (Anderson et al., 2014; Gong, Cheung, Wang, & Huang, 2012).

The paper is organized as follows. We start by discussing creativity as a team phenomenon and then conceptually support why team PsySafe predicts team creativity through team learning. Later, we explain the hypothesized moderating effects by discussing why the indirect effect is conditional on how consistent the perceptions of team PsySafe and team learning are within the team.

17 The literature is not consistent on differences between teams and groups (Chan, 1998; Paulus et al., 2012; Reiter-Palmon et al., 2012). For example, Biemann et al. (2012) argued that both may be seen as “a clustering of individuals who are interdependent based on a set of common expectations or hierarchical structuring and who interact with one another as if they are a group”. Kozlowski and Bell (2003) made no distinction and used the terms interchangeably. Another approach, which we espouse here, is that groups are “collections of individuals focused on a specific goal or task”, while teams are “groups that typically have a long-term relationship, are embedded in an organization, and work together on some common project or goal” (Reiter-Palmon et al., 2012, p. 328). For simplicity, we use the term “team” throughout the paper and our empirical study focuses on (real) teams in the sense that the teams are embedded in organizations, the team members carry out interdependent tasks, and the team output depends on such interdependence and cooperation.
We present the study, and in the final section we discuss the findings, limitations, and possible paths for future research.

**THEORY AND HYPOTHESES**

**Creativity as a collective phenomenon**

Before presenting arguments supportive of the conceptual model, some points are necessary to clarify regarding how and why creativity emerges as a collective/team phenomenon. Team creativity and individual creativity represent different phenomena and constructs, with research demonstrating that team creativity is not the mere sum of team members’ creativity (Paulus et al., 2012; Rego, Reis Júnior, Cunha, Stallbaum, & Neves, 2014). As teams are made up of individuals, team creativity partially reflects the creativity of the individual members (Paulus et al., 2012; Pirola-Merlo & Mann, 2004; Taggar, 2002), but it is not an additive process. Instead, individual creativity is a building block of team-level creativity that must pass through team member interactions and processes (Yoon, Song, Lim, & Joo, 2010, p. 251). Each team member’s creativity affects and is affected by the other team members’ creativity (Paulus et al., 2012), with the team unit developing a creative dynamic of its own.

Individual creativity may give rise to different levels of team creativity as a result of distinct socioemotional and communicational processes within different teams (Bechtoldt et al., 2010; Pirola-Merlo & Mann, 2004), meaning that highly creative individual solutions do not necessarily turn into a highly creative collective solution. Depending on team processes, the creative contributions of some team members to team creativity may be undervalued (or even discarded) or overvalued, regardless of their effective potential (Bechtoldt et al., 2010; Paulus et al., 2012; Pirola-Merlo and Mann, 2004). For example, in a team characterized by a norm of conformity towards team members with high-power status, a highly (and potentially better) creative solution from a low-power status individual may be neglected in favor of a less (and worse) creative solution from a high-power status individual.

Additionally, hearing a creative idea from another team member has the potential to cognitively stimulate other team members to be more creative, enabling a synergistic effect. However, such a benefit to the team creativity can be severely hampered depending on team processes. If, for example, an individual experiences low PsySafe within the team, he or she would likely avoid sharing a new creative idea or building on a creative idea shared by another team member, especially if he or she perceives his/her contribution as really different or likely to be criticized. Even if the members are all highly creative individuals, in a team with low PsySafe, they may be unable to make effective use of their individual creative resources to benefit the team (Taggar, 2002). In sum, individual creativity contributes to team creativity, but that contribution can be drastically enhanced or diminished by a variety of team processes as well as the team’s climate.
Psychological safety and creativity

Kahn (1990, p. 708) defined PsySafe as the employee’s “sense of being able to show and employ one’s self without fear of negative consequences to self-image, status, or career”. Later, Edmondson (1999) argued that PsySafe may be considered a group-level construct rather than an attribute of individual employees. It is now recognized that the construct can be studied both at the individual, team, and organizational levels (Edmondson & Lei, 2014), although Edmondson (2004) noted that it is “especially relevant at the group level of analysis” (p. 240). Team PsySafe emerges when team members “both trust and respect each other, and it produces a sense of confidence that the group won’t embarrass, reject or punish someone for speaking up” (Edmondson, 2012, p. 119). Consequently, PsySafe involves, but goes beyond, interpersonal trust. Team PsySafe thus reflects the “shared belief” that it is safe for team members to take interpersonal risks within the team (Edmondson, 1999, 2004; Paulus et al., 2012), and team creativity may emerge as a consequence of such a shared belief.

Creativity is an exploratory process (while innovation is about exploitation; Paulus et al., 2012; see also Anderson et al., 2014) that involves considering alternatives and implies the willingness to take risks and even to introduce conflicting opinions (Edmondson & Mogelof, 2005; Paulus et al., 2012). To flourish, team creativity requires a supportive context, which includes an atmosphere of PsySafe in which team members feel free “to engage in some of the risky behaviors involved in creativity” (Paulus et al., 2012, p. 349) and to “propose new ideas and solutions without being judged or criticized” (Anderson et al., 2014, p. 1301). Conversely, when members face psychological threats and experience low psychological safety, they are more likely to develop a defensive orientation and suppress the expression of creativity at work (Paulus et al., 2012; West & Richter, 2008). Individuals may feel especially inhibited, or blocked, to share their most radical or unique ideas, to improve others’ ideas, and to challenge the status quo since other team members and the team leader might react negatively to their efforts and solutions (Camacho & Paulus, 1995; Diehl & Stroebbe, 1987; Edmondson & Lei, 2014; Paulus et al., 2012). As Paulus et al. (2012, p. 337) observed, creativity “implies freedom – freedom to think in new ways. But whenever someone comes up with something different, there is a chance someone else will not like it. (…) Unless there is this sense of psychological safety, individuals will not risk the potential ridicule or negative reactions that may accompany new ideas, especially radical ones”.

In short, teams that experience low psychological safety “are less likely to engage in the behavioral hallmarks of creativity” (Edmondson & Mogelof, 2005, p. 111). Many studies have found empirical support for this relationship (Burningham & West, 1995; Carmeli, Reiter-Palmon, & Ziv, 2010; Carmeli, & Spreitzer, 2009; Edmondson, 2004; Hunter, Bedell, & Mumford, 2007; Kark &
Carmeli, 2009; Paulus et al., 2012; West, Borriill, Dawson, Brodbeck, Shapiro, & Haward, 2003; Yoon et al., 2010), but meta-analyses (Frazier et al., 2017; Hulsheger, Anderson, & Salgado, 2009) found relatively weak relationships between PsySafe and team creativity and innovation. One possible reason for such a weak nexus is that the relationship between team PsySafe and team creativity might be both indirect and conditional.

**Team learning behavior as a mediator**

Paulus et al. (2012) argued that more research is necessary to identify social processes that mediate the relationship between team PsySafe and team creativity. Studying and understanding such processes (the P in the IPO framework) might also be helpful in identifying stronger and clearer relationships between team PsySafe and creativity. In line with literature suggesting that team PsySafe predicts team performance through team learning behavior (Edmondson, 1999; Kostopoulos & Bozionelos, 2011), we propose team learning behavior as a mechanism through which team PsySafe also influences team creativity. Team learning behavior represents the extent to which “team members overtly reflect on the team objectives, strategies, and processes for the purpose of creating a team-level intellectual product that initiates change” (Drach-Zahavy, & Somech, 2001, p. 112). It is a collective and ongoing process characterized by an engagement in seeking information and feedback, addressing differences of opinion, questioning problem-solving assumptions, asking questions, reflecting about decision making process, and discussing failures, unexpected outcomes, and errors (Edmondson, 1999). In line with this definition and description, we treat team learning as a process rather than an outcome (Edmondson, 1999; Edmondson, Dillon, & Roloff, 2007).

Team learning behaviors are encouraged, or facilitated, by a shared feeling that the team is a psychologically safe place. Team PsySafe is “centrally tied to [team] learning behavior” (Edmondson, 2004, p. 239) as it is key to enabling open mindedness as well as healthy skepticism that rejects traditional assumptions (Anderson et al., 2014; Edmondson, 1999, 2004). Within psychologically safe environments, team members, both individually and collectively, are more likely to take time to improve the team’s work processes, to ask for help and advice, to seek information from other team members to make important changes, to speak up to test assumptions about issues under discussion, to invite people from outside the team to present information, to share experiences, and to have discussions about improvement issues (Edmondson, 1999; Edmondson & Lei, 2014). As Baer and Frese (2003, p. 50) suggested, teams and organizations “with a climate for psychological safety will enhance learning behavior as well as the use of employees’ creative potential”. Edmondson and Lei (2014, p. 31) also argued, “a psychologically safe environment... motivates engagement in exploratory and exploitative learning, thereby promoting team performance”.

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516
Team learning contributes to team creativity (Drach-Zahavy, & Somech, 2001; Edmondson & Lei, 2014) because team learning promotes information sharing and the cross-fertilization of ideas within the team, thereby increasing the knowledge and information available to team members, both individually and collectively. This atmosphere allows and encourages the development of domain-relevant skills and creativity-relevant skills, which provide crucial background knowledge and serve as the basis for creativity (Amabile, 1996; Edmondson, 2004; Hirst et al., 2009; Sung & Choi, 2012; Yoon et al., 2010). Through team learning behavior such as feedback seeking and questioning assumptions, creative ideas shared by individuals within the team can be elevated to the team level and experience the team social processes that enhance team creativity. In short, team learning behavior leads to higher team creativity because “a major component of the creative process is the exchange of information or ideas” (Paulus et al., 2012, p. 330). Thus, one potential mechanism through which team PsySafe gives rise to team creativity is team learning (Edmondson, 1999). Hence:

Hypothesis 1: Team PsySafe has a positive indirect effect on team creativity through team learning behavior.

Climate Strength as Moderator

Given the weak meta-analytic correlation between PsySafe and creativity (Frazier et al., 2017; Hulsheger et al., 2009), we anticipate that the I→P→O relationship is insufficient (Ilgen et al., 2005) to understand how team PsySafe predicts team creativity. We propose that the indirect relationship is conditionally based on how consistently the team members within the team experience team PsySafe and team learning behavior. To support our hypotheses, we rely on the theory of climate strength (Schneider et al., 2002). While the climate level represents the average of individual perceptions within the team, climate strength (or consistency, which we use interchangeably) reflects a measure of within-team variability in climate perceptions (Luria, 2008; Schneider, Ehrhart, & Macey, 2013). Two main points are worth mentioning in this regard. First, although team members share in some degree the perceptions about the team climate in which they work, some degree of variability is also expected as individuals process and attribute events differently (Kelley, 1972). Some individuals within a team may also be exposed to certain behaviors or events more than other team members, which should result in variability in their perceptions. The teams with a higher degree of consensus among team members regarding the team climate share a stronger climate than teams with lower consensus (Meyer et al., 2010). Second: although empirical evidence is inconsistent (Schneider et al., 2013), some research suggests that the relationship between the climate level and its outcomes is stronger when the climate strength (i.e., the consistency of perceptions within the team) is high versus low (González-Romá et al., 2009; González-Romá et al., 2002; Schneider et al., 2002). In other words, the impact of
team climate on team outcomes is enhanced in strong climates and attenuated in weak (or inconsistent) climates (Meyer et al., 2010).

Two complementary explanations have been suggested to explain why consistency of climate might moderate the level of the climate variable on outcomes (Schneider et al., 2013). From a measurement perspective, high consensus within a team provides a more reliable mean score (of the climate level) and, as a consequence, greater validity in predicting individual and team outcomes. From a conceptual perspective, a stronger climate equips team members with clearer and more consistent information about the team (Lee & Dalal, 2016; Meyer et al., 2010) and is more likely to lubricate social and cognitive exchanges between team members. For example, knowledge sharing between team members is more likely when all team members experience high PsySafe as opposed to when only some members do. Therefore, as Schneider et al. (2013, p. 368) observed, “the more consistent the experiences of employees, the more likely employees are to behave consistently as a collective such that there should be more positive outcomes on the positive end and more negative outcomes on the low end”.

Empirical evidence on the consistency of team PsySafe and of team learning behavior is almost missing from the literature. However, Hirak et al. (2012) found in supplementary analyses that the unit PsySafe level was more positively associated with subsequent unit performance when the strength of the PsySafe climate was also high. Considering that team PsySafe represents a shared belief that it is safe to take interpersonal risks (Edmondson, 1999; Edmondson & Lei, 2014), it is reasonable that the more widely shared that belief is, the more the benefits of PsySafe should be apparent, as found in the Hirak et al. (2012) study. When all team members experience the team climate as psychologically safe, team members, both individually and collectively, should be more likely to engage in team learning behavior, such as developing efforts to improve the team’s work processes, asking for help and advice from other team members to make important changes, speaking up to test assumptions about relevant topics for the team well-functioning, sharing experiences, and having discussions about improvement issues. Taking these arguments into account, we assert that the consistency of team PsySafe moderates the relationship between the level of team PsySafe and team learning behavior.

**Hypothesis 2:** The consistency (climate strength) of team PsySafe moderates the relationship between the level of team PsySafe and team learning behavior, such that the relationship is stronger when the consistency of team PsySafe is higher versus lower.

Relying on the same arguments presented above regarding climate strength theory, we propose a similar pattern for the relationship between team learning and team creativity. From a measurement perspective, a stronger team learning behavior represents a more reliable mean score on
the level of the team learning behavior, which should strengthen the relationship between team learning and creativity. Conceptually, a more consistent experience of team learning behavior within the team means that the exchange of information or ideas (Paulus et al., 2012) is more likely and that all team members, both individually and collectively, are more likely to share and develop knowledge and creative solutions. Additionally, team learning behavior can result in increases in domain-relevant skills as well as creativity-relevant skills, which provide crucial background knowledge to enhance creativity (Amabile, 1996; Edmondson, 2004; Hirst et al., 2009; Sung & Choi, 2012; Yoon et al., 2010). Combined, these arguments lead to our final hypothesis:

**Hypothesis 3:** The consistency (climate strength) of team learning behavior moderates the relationship between the level of team learning behavior and team creativity, such that the relationship is stronger when the consistency of team learning behavior is higher versus lower.

**METHOD**

**Sample and Procedures**

To test the three hypotheses, we gathered data from a convenience sample drawn from the researchers’ professional nonacademic contacts. A total of 79 team leaders from 27 organizations (in sectors such as clothing, accounting services, retail, and health care) participated in the study. The average team leader in the sample was female (59.5%), 43 years old (SD: 10.16), and had been in a team leader position for 7.24 years (SD: 5.15). The team leaders’ educational backgrounds were as follows: 8.9% of leaders had nine or fewer schooling years, 27.8% had twelve schooling years, 55.7% had a university degree, and 7.6% had a graduate degree.

We delivered a questionnaire to all team members, who anonymously reported perceptions of team PsySafe and team learning behavior and returned their responses to the researchers either directly (in a sealed envelope) or by post. Three hundred and seventeen members participated (75.1% female; mean age: 38.80 years, SD: 10.46; mean tenure in the team: 7.83 years, SD: 7.56), with a minimum of 3 responses per team and an average of 6.28 responses (SD: 3.37). Team members’ educational backgrounds include 19.9% with nine or fewer schooling years, 38.8% with twelve schooling years, 37.9% with a university degree, and 3.5% with a graduate degree.

Before proceeding, two brief notes on data analysis are necessary. First, collecting data about team PsySafe and team learning behavior from the same source (i.e., team members) raised risks of common method bias (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). For this reason, each team was randomly split into two sub-samples, with one sub-sample used to assess team PsySafe and the other to assess team learning behavior. This procedure proved helpful in reducing common-method bias: while the correlation between the two variables is 0.68 ($p \leq 0.001$) when all raters are used to
measure both, the correlation is 0.37 ($p \leq 0.001$) when the subsamples with different-raters were used. Second, we tested the hypothesized model through bias-corrected bootstrap analyses (5000 bootstrap samples) with the PROCESS macros developed by Hayes (2013).

**Measures**

All variables were measured with a 6-point Likert-type scale. Items were translated from English to Portuguese, and then back-translated to ensure appropriate translation. Respondents were requested to report the extent to which different statements applied to the team: (1) “the statement does not apply to this team at all”; (...); (6) “the statement applies completely to this team”. Leaders reported perceived task interdependence within the team (as a control; see below) and reported the dependent variable of team creativity. Team members reported team PsySafe and team learning behavior (individual data aggregated at the leader/team level; see below).

**PsySafe.** Team members assessed the level of PsySafe in the team through seven items (Edmondson, 1999). Sample items are: (1) “It is safe to take a risk on this team”; (2) Members of this team are able to bring up problems and tough issues”. In line with a referent-shift composition model (Chan, 1998), the individual ratings were aggregated to the team level to represent the team PsySafe score (i.e., mean level within the team). The reliability analysis prompted us to remove one item (“No one on this team would deliberately act in a way that undermines my efforts”), resulting in acceptable reliability (Alpha = 0.74).

**Team learning behavior.** Team members described team learning behavior via seven items (Edmondson, 1999). Sample items are: (1) “We regularly take time to figure out ways to improve the team’s work processes”; (2) “People on this team speak up to test assumptions about issues under discussion”. One item was also removed from this measure based on the reliability analysis (“This team tends to handle differences of opinion privately or off-line, rather than addressing them directly as a group”). The individual ratings were aggregated to the team level to represent the team learning behavior score (Alpha = 0.93).

**Team creativity.** Team leaders reported on team creativity with thirteen items from Zhou and George (2001), adapted to the team level. Sample items are: (1) “This team comes up with new and practical ideas to improve performance”; (2) “This team suggests new ways to achieve goals or objectives”. Reliability was acceptable for this measure (Alpha = 0.96).

**Consistency of team PsySafe and team learning behavior.** The standard deviation ($SD$) of individual scores within each team was calculated to measure the consistency of team PsySafe and team learning behavior. We followed LeBreton and Senter (2008), as well as others (e.g., Hirak et al., 2012; Schneider et al., 2002), who suggest that $SD$ is more appropriate than alternative measures (such as $r_{wg}$ or $AD$). The $SD$ score was reversed (by subtracting it from the score representing the team with
the highest SD). The emerging scores were named consistency of team PsySafe, and consistency of team learning behavior. Higher scores represent greater consistency.

Control variables. We included various controls known to influence team processes and/or creativity. We controlled for team size (number of employees), as it can influence both team processes and creativity (e.g., Edmondson, 1999; LePine, Piccolo, Jackson, Mathieu, & Saul, 2008; Paulus et al., 2012; Somech & Drach-Zahavy, 2013; Tierney & Farmer, 2002). Leader education and team members’ education (number of schooling years) were also included as controls because education level might be associated with creativity through task domain expertise (Hirst, van Dick, & van Knippenberg, 2009; Skin, Kim, Lee, & Bian, 2012; Tierney & Farmer, 2002). The tenure of team members within the team was also included as a control because it might influence interactions within the team over time and the capacity of the team to utilize team resources for generating creativity-related ideas and outcomes (Farh, Lee, & Farh, 2010; Martinaityte & Sacramento, 2013). Demographic diversity was included as a control because diversity within teams may affect team processes and team creativity (Milliken, Bartel, & Kurtzberg, 2003; Paulus et al., 2012; Polzer, Milton, & Swann Jr., 2002). To control diversity, we computed a composite indicator of demographic diversity by summing the standard-deviations (after standardizing them, because of differences between the measures) for gender, age, tenure, and education within each team. Perceived task interdependence within the team (as reported by the leader) was also included because it affects interactions, cooperation and the creativity process (Campion, Papper, & Medsker, 1996; Edmondson, 1999; Gully, Incalcattera, Joshi, & Beaubian, 2002; Jaussi & Benson, 2012; Skin et al., 2012; Van der Vegt & Janssen, 2003). This variable was measured through three items adapted from Ramamoorthy and Flood (2004; Alpha = .88). A sample item is: “To carry out their jobs, team members need information and materials from other team members”.

Preliminary analysis

To confirm the appropriateness of aggregating the data, we calculated ICC1, ICC2, and $r_{wg(j)}$ for team PsySafe and team learning behavior. Strictly speaking, aggregation is appropriate when ICC1 is non-zero (Bliese, 2000) and when ICC2 is higher than 0.70 (Kozlowski & Klein, 2000). The ICC1s for team PsySafe and team learning behavior were 0.21 and 0.37, respectively. The ICC2s for team PsySafe and team learning behavior were 0.51 and 0.70, respectively. The $r_{wg(j)}$ values for team PsySafe (mean: 0.89, SD: 0.11) and team learning behavior (mean: 0.86, SD: 0.17) represent “strong” inter-rater agreement (LeBreton & Senter, 2008, p. 836). Although the ICC2 for team PsySafe is below the recommended cutoff, it does not prevent aggregation, as methodologists suggested that it merely reduces statistical power (e.g., Bliese, 2000). We thus proceeded to aggregate our data for the two variables.
Considering the sample size, we followed the recommendation by Little, Cunningham, Shahar, and Widaman (2002) to use parcels when conducting confirmatory factor analyses to test discriminant validity among the constructs. Using the loadings as a guide, we created parcels by using the highest loadings items to anchor the parcels. Then, “the highest loaded item from among the anchor items would be matched with the lowest loaded item (Little et al., 2002; p. 166)”. Three parcels each for team PsySafe and team learning behavior (data from different raters within each team), and four parcels for team creativity were created. Team task interdependence was not parceled given that it only contained three items. This variable was considered in the analysis because, although included just for control, it was measured with data from the same raters who assessed creativity (i.e., team leaders). Results indicated that the four-factor model fits the data well ($\chi^2_{[59]} = 90.70$; RMSEA: 0.08; SRMR = 0.07; NNFI: 0.95; CFI and IFI = .95) and is superior to models in which (1) team PsySafe and team learning behavior were set to load on a single factor ($\Delta \chi^2_{[3]} = 44.58, p \leq .001$), (2) perceived team task interdependence and team creativity were set to load on a single factor ($\Delta \chi^2_{[3]} = 261.13, p \leq .001$), and (3) all variables/parcels were set to load on a single factor ($\Delta \chi^2_{[6]} = 331.96, p \leq .901$). We also tested the four-factor model with data for PsySafe and team learning behavior as collected from the same raters within each team. While RMSEA (0.097) is only marginally satisfactory, the other fit indices suggest that the four-factor model fits the data well ($\chi^2_{[59]} = 102.67$; SRMR = 0.07; NNFI: 0.94; CFI and IFI = .95).

**FINDINGS**

Table 1 presents means, standard deviations and correlations. Team size correlates positively with PsySafe. The consistency of team PsySafe correlates negatively with mean age, mean education, and mean tenure of team members, and the consistency of team learning behavior correlates negatively with mean education of team members. The consistency of team PsySafe correlates positively with both team learning behavior and the consistency of team learning behavior, which means that the more consistent the perceptions of team PsySafe, the more consistent the perceptions of team learning. Finally, team PsySafe correlates positively with team learning behavior, which in turn correlates positively with team creativity.

N = 79.

Notes: (a) 0: female; 1: male. (b) 1: nine or fewer schooling years; 2: twelve schooling years; 3: university degree; 4: graduate degree. (c) Sum of the SD (after standardization them) for gender, age, tenure, and education within each team. (d) Different raters within the team to rate each variable.

*p ≤ 0.05, **p ≤ 0.01, ***p ≤ 0.001.
The hypothesized model was tested through bias-corrected bootstrap analyses with the PROCESS macros developed by Hayes (2013), both with and without the control variables (Becker, Atinc, Breaugh, Carlson, Edwards, & Spector, 2016; Bernerth & Aguinis, 2016). Considering that the findings are very similar for both conditions, we present the findings without the control variables.

We first tested the mediated model without the moderators (Hayes, 2013; template model #4) to assess the indirect effect proposed in H1. The findings presented in Table 2 reflect the following: (a) team PsySafe predicts team learning (effect: 0.51, \( p \leq 0.001 \); Bootstrap SE: 0.13; Bootstrap LLCI: 0.24; Bootstrap ULCI: 0.78), (b) team learning behavior, but not team PsySafe, predicts team creativity (effect: 0.26, \( p \leq 0.05 \); Bootstrap SE: 0.11; Bootstrap LLCI: 0.04; Bootstrap ULCI: 0.48); (c) while the direct effect (effect: 0.13, \( p = 0.36 \)) is not significant (Bootstrap SE: 0.14; Bootstrap LLCI: -0.15; Bootstrap ULCI: 0.41), the indirect effect is (effect: 0.13; Bootstrap SE: 0.08; Bootstrap LLCI: 0.02; Bootstrap ULCI: 0.35). Therefore, H1 is supported.

Next, we tested the moderated mediation model (Hayes, 2013; template model #21). Table 2 suggests that the interaction between team PsySafe and the consistency of team PsySafe predicts team learning behavior, and the interaction between team learning behavior and the consistency of team learning behavior predict team creativity. While the direct effect (0.00, \( p = 0.99 \)) of team PsySafe on team creativity is not significant (Bootstrap SE: 0.15; Bootstrap LLCI: -0.30; Bootstrap ULCI: 0.29), the following conditional indirect effects were found (Table 3): (a) when the consistency of team PsySafe and/or the consistency of team learning behavior are low, no significant effect is found; (b) as the consistency of team PsySafe and/or the consistency of team learning behavior increase, the effect also increases; and (c) the indirect effect is the strongest when both the consistency of team PsySafe and the consistency of team learning behavior are high.

(a) Mean and plus/minus one SD from mean.

**Figure 2.** How the level of team PsySafe interacts with the consistency of team PsySafe to predict team learning behavior.

To develop a more granular understanding of the interaction pattern, we split the sample into three levels (mean and plus/minus one SD from mean) of consistency of team PsySafe and three levels of team learning behavior. Next, we carried out regression analyses for each level. Figure 2 shows that the effect of team PsySafe on team learning behavior is stronger versus weaker when the consistency
of team PsySafe is higher versus lower. Figure 3 indicates that the effect of team learning behavior on team creativity is stronger versus weaker when the consistency of team learning behavior is stronger versus weaker. The highest level of team learning behavior emerges when there is high consensus within the team about the team PsySafe. The highest level of team creativity emerges when there is high consensus within the team regarding the team learning behavior. Findings support H2 and H3.

**Figure 3.** How the level of team learning behavior interacts with the consistency of team learning behavior to predict team creativity.

**DISCUSSION AND CONCLUSION**

**Main Findings and Contributions**

Our study provides empirical support that team PsySafe predicts team creativity through team learning behavior. Findings reinforce the IPO model of team effectiveness (Ilgen et al., 2005), positioning PsySafe as a team climate input, team learning behavior as a process within the team, and team creativity as a team output. It is fairly well established in the literature that teams with high levels of PsySafe are more creative than teams low in PsySafe (e.g., Edmondson & Lei, 2014; Kark & Carmeli, 2009; Paulus et al., 2012), yet researchers studying this relationship clearly state the need for more research that identifies boundary conditions as well as the mechanisms through which the effect takes place (Paulus et al., 2012). In this research, we make a theoretical case for team learning behavior as
one of those mechanisms, with our results indicating a significant indirect effect. PsySafe facilitates team learning processes that allow individual creativity to expand to the team level, ultimately resulting in higher levels of creativity for the team. Considering that team creativity is an indicator of team performance (Yammarino et al., 2008), our results are also consistent with the research showing that team PsySafe predicts team performance via team learning behavior (Edmondson, 1999; Kostopoulos & Bozionelos, 2011).

As noted previously, the IPO model of team effectiveness does not fully account for the relationship between team PsySafe and team creativity, especially considering the weak meta-analytic relationship between the two variables (Frazier et al., 2017; Hulsheger et al., 2009). Our research relied on climate strength theory to expand the IPO model and demonstrate how the relationships are conditional based on consistency of team PsySafe and team learning behavior. Specifically, the relationship between team PsySafe and team learning is stronger when team members rate the team PsySafe more consistently. This can open interesting research opportunities from an LMX perspective (Kozlowski et al., 2016; Liden, Sparrowe, & Wayne, 1997), as well as an attribution perspective (Kelley, 1972) to study how differential interactions produce distinct behavioral patterns and diverse perceptions of PsySafe within the team. The relationship between team learning and team creativity is also stronger when all team members experience team learning in a more consistent way. Research on the climate strength of team PsySafe and team learning is scant in the extant literature, and our empirical evidence helps to fill that gap while addressing the conditional relationship between team PsySafe and team creativity. Our findings also contribute to the climate strength literature (Schneider et al., 2002, 2013), again demonstrating that stronger climates strengthen the relationship between the mean level of the climate and outcome variables (Meyer et al., 2010).

Another relevant finding, although not central for our hypothesized model, is that the consistency of team PsySafe relates positively with the consistency of team learning (Table 1). This finding converges with evidence showing that “strong climates restrict variability in outcomes” (Meyer et al., 2010, p. 129) and suggests that a more consistent team input engenders a more consistent process, which reinforces the indirect effect of the input on the output.

The results of our research are particularly relevant for two additional reasons. First, Anderson et al. (2014) called for more research on work group and work team creativity, as the majority of the creativity research is set at the individual level and fails to consider the social processes that can extend it to a collective construct. Rather than simply viewing the team as the context in which individual creativity takes place, our research conceptually and empirically examines the inputs and processes that take place at the team level that result in greater team creativity. Considering that organizations are increasingly adopting team-based structures, our results yield
important insights for practitioners as well. Second, the majority of creativity research is conducted in controlled laboratory settings (Paulus et al., 2012), which can yield compelling causal relationships but lack generalizability to the workplace. Our research was conducted at 27 organizations with 79 different supervisors, each with his/her own unique perspective on how creativity operates within the team and furthers team performance. By extending creativity research to typical workplace settings, we demonstrate the value of team PsySafe, both at high levels and consistently experienced throughout the team, in advancing real-world team creativity through team learning behavior.

Limitations and Future Studies

This study is not exempt of limitations. First, the sample is small, and some teams were rated by a small number of individuals. Future studies should include a larger sample of teams, ideally with at least six participants. The independent and the mediating variables could then be rated by at least three raters each. Second, the type of teams (Kozlowski & Bell, 2003) was not taken into account. Even though, theoretically, creativity can benefit all teams, different types of teams demand different levels of creativity. Future studies should test if variables related to team complexity (e.g., tasks, goals, roles, process emphasis, performance demands, task environment, internal and external coupling, and workflow interdependence; Edmondson, 2004; Edmondson & Lei, 2014; Edmondson et al., 2007; Kozlowski & Bell, 2003) moderate the indirect relationship studied here. Other moderators, at the individual level, may also intervene. For example, individual learning orientation may moderate the relationship between team learning behavior and team creativity (Hirst et al., 2009), and member’s identification with the team may moderate the relationship between team PsySafe and team learning (Edmondson et al., 2007). Thus, future studies adopting a cross-level analysis should be carried out.

Another limitation of this study is that data were collected at a single time point. Considering that teams are dynamic entities, that PsySafe may fluctuate over time (Frazier et al., 2017), and that the theoretical relationships proposed in this study are causal, future studies should adopt a longitudinal design. Fourth, although the hypothesized model (I→P→O) follows existing theory and intuitively makes sense, other causalities are also plausible. For example, the output (i.e., team creativity) may influence the input (i.e., team PsySafe) (Ilgen et al., 2005; Marks et al., 2001; Paulus et al., 2012), in that team members who operate in creative teams may develop the sense that it is psychologically safe to speak up or share additional ideas. Future research set in a lab can test and confirm the causal nature of the relationships.

For future research, we also recommend the inclusion of antecedents of team PsySafe into a similar model, of which leadership might be particularly important (Anderson et al., 2014; Edmondson, 2004; Frazier et al., 2017; Kozlowski et al., 2016; Paulus et al., 2012). Humble leadership (Owens & Hekman, 2016), authentic leadership (Gardner, Cogliser, Davis, & Dickens, 2011), and
servant leadership (Van Dierendonck, 2011) are all potential antecedents that would add valuable extensions to the present research. We also recommend that future studies include objective measures of team creativity as well as team performance. Finally, it is important to recognize that our study was conducted in a single culture. Considering that cultural variables may affect the entire process of creativity (Anderson et al., 2014), future studies should also collect data in different cultures and test how the cultural context operates as a boundary condition (Edmondson & Lei, 2014). Meta-analytical evidence (Frazier et al., 2017) suggests that high uncertainty avoidance within a culture makes PsySafe more important in affecting work outcomes, and we consider that other contextual/cultural variables may also operate as moderators. For example, in high power-distance cultures, individuals may refrain from engaging in some creative behaviors because of their deference toward the supervisor, even if they feel psychologically safe.

**Concluding Remarks**

Considering that team creativity is crucial for team innovation and effectiveness, our study informs the literature on the antecedents and processes that ultimately lead to team effectiveness. Importantly, this research demonstrates that a high level of team PsySafe is not enough to stimulate team creativity through team learning; it is also necessary that the team members have consistent perceptions of team PsySafe and team learning to fully reap the creativity benefits. As Google’s Project Aristotle revealed (Duhigg, 2016, p. MM20), “psychological safety, more than anything else, [is] critical to making a team work”.

E-COMMERCE STUDIES REVIEW: IMPLICATIONS AND FUTURE AGENDA FOR FIRMS AND CONSUMERS

Resciniti, Riccardo; Matarazzo, Michela; De Vanna, Federica

1University of Sannio, Benevento, Italy
2Marconi University, Rome, Italy

ABSTRACT

In this paper, we present a literature review and classification scheme for electronic commerce research. The former consists of approximately 130 journal articles published in journals that are inherent marketing researches. The results show that an increasing volume of EC research has been conducted for a diverse range of areas. The articles are presented, based on a scheme that consists of a 2x2 matrix: the application area and the trade-off between the results and the gaps.

Keywords: e-commerce; online shopping; internationalization.

INTRODUCTION

Globalization and information technologies (IT) are radically changing the face of business and organization. IT are being adopted and incorporated into nearly all organizations, which have invested heavily in IT infrastructure for the overall success of their business. There is a growing interest in the use of electronic commerce as a means to perform business transactions. For many businesses, it has become a priority and companies are making large investments in e-commerce applications but are pressed to evaluate the success of their e-commerce systems.

The online opportunities have led firms to consider the Internet as both a replacement of other channels and as an integration of pre-existing ones. The major evidences in literature suggest that small and medium sized enterprises (SMEs) use it as a cheap and effective way to enter new markets and reduce the perceived cultural barriers. In literature, the evidences about the e-commerce and the online channel seem already confused. Another part of the studies focuses on the demand side of the market and tries to analyse the characteristics and the variables that affect consumers’ intention to shop online. In particular, researchers want to understand how consumers choose the store where to shop and what affects their decision. These studies combine factors that are found to influence the consumer’s purchasing decision in online and offline stores for apparels. It includes the price...
attractiveness, time saving, perceived risk, enjoyment and excitement, tangibility and high interactivity. All of these factors will contribute to the study of customer's purchasing intention for apparels on both stores which includes online and offline shopping. Online marketers or retailers should be aware of the problems faced by the consumers and their perceived risk to increase their intention to shop in online.

The purpose of this paper is to examine the literature about these themes and gain a full comprehension of the gaps in research about e-commerce. In order to make this review fruitful, a model is developed.

This review will provide a source for anyone interested in EC research and help simulate further interest. The study wants to make a photograph of the state of the art and create an organic framework of the results that are presented in literature, by providing new tracks and questions for researchers.

METHODOLOGY

The studies considered have been chosen according to these criteria:

- They belong to A journals in marketing and management;
- They are published from 2013 to 2017.

After reading the articles, the studies have been classified basing on a scheme that consists of a 2x2 matrix: the application area and the trade-off between the results and the gaps.

CONSUMER RESEARCH

Consumer behaviour

The advent of electronic commerce has revolutionized the way business is done by providing consumers with a plethora of information sources and convenient shopping methods. It has increased business offerings (i.e., goods and services) and has given online shoppers the option and ability to switch effortlessly from one website to another.

Recent industry trends involve reducing customer acquisition costs and increasing customer retention rates. Yet, several companies still suffer from rising e-commerce customer acquisition costs and falling sales and have failed to reduce operating costs and fulfill online customer needs (Bilgihan and Bujisic, 2015). The continued prosperity of e-commerce markets depends on retaining customers who shop online (Huang and Benyoucef, 2013) and converting a potential customer’s initial online encounter into a buying relationship.
Visitors’ evaluation and purchase intentions are determined by the fit between the shopping experiences offered (hedonic vs. utilitarian) and visitors’ regulatory focus (promotion vs. prevention). Furthermore, engagement, perceived usefulness, and perceived ease of use serve as the underlying mechanisms that mediate the effect of regulatory fit on visitors’ attitudes and purchase intentions. When shoppers are task-focused, they visit online stores for the purpose of product acquisition. When shoppers are experiential, they engage in shopping activities for seeking thrills, adventure, disinhibition, new experiences, fantasies, cognitive or sensory stimulation, and escape from boredom. A recent study by Pappas et al. (2016) reports that strongly positive emotions such as pleasure and enjoyment are core conditions for achieving high level of purchase intention. Task-focused shoppers, compared to experiential shoppers, are more likely to tolerate lower quality products when low acquisition costs can compensate for a reduction in quality. Experiential shoppers are more oriented toward the activity itself and derive gratification from affective experiences.

Panda and Swar (2014) identified four factors, namely anxiety, ease of use, usefulness and price, as the determinants of shopper buying behaviour online. Anxiety is the most important factor in online shopping. Price, though an important factor, does not influence shoppers as the other variables. Motwani (2016) explores the factors affecting consumers’ decision to shop online, and how the decision can be affected by product type. Ease of use is an encouraging factor to buy online. It was also found that products such as movies, music and video games are more acceptable items for online shopping. The findings of Safari & Thilenius (2013) analyzed consumers’ perceived uncertainty and trust when purchasing from foreign online retailers that occur from the lack of information about the legal system, specific national customer rights, language difficulties, and from complexity of product returns. Web portals can assume the role of an intermediary of trust. They influence the consumer’s trust in an online shop in a positive way and present themselves as an effective instrument for building trust in the Internet distribution channel. The positive effect of intermediaries of trust can be generalized and applied to other central constructs of purchase behaviour. The use of an intermediary of trust reduces the perceived risk and improves the consumer’s attitude toward the online shop. Similarly, the attitude toward the product and the purchase intention can be significantly increased by the use of an intermediary of trust due to holistic image transfer effects. The stronger the trustworthiness and the brand image of the intermediary, the more positive the effects caused by the existence of the intermediary of trust. The stronger the reputation and trustworthiness of an intermediary of trust, the more positive the transfer effect on the online shop.
Technical aspects: websites

Research extensively examines the relationship between website elements and their influence on usage intentions, online behavior, and overall system satisfaction (Dickinger & Stangl, 2013). In the context of online business, website homepages are arguably the “first contact” points between firms and their potential customers, and they offer varying experiences based on their functionality and appeal. Experiences offered online (e.g., easy product search and evaluation, up-to-date information, visually appealing interface, fun and enjoyable, etc.) are not only the primary asset that customers look for while making decisions, but they also shape their initial impressions of a website and subsequent adoption or exploration. Research has shown that online customers’ (unlike offline customers’) acquisition is dependent, at least in part, on their initial impression of the website homepage (Campbell et al., 2013).

Chiu et al. (2014) discuss the term “web atmospherics” to describe the web design elements that constitute the primary drivers of online behavior. Al-Qeisi et al. (2014) examine the key characteristics of website design quality from the user’s perspective and propose an influence of the website on attitudes and purchase intentions of web consumers. The first component of this model is the technical dimension, which refers to website characteristics such as security, ease of navigation, search facilities, site availability, valid links, personalization or customization, speed of page loading, interactivity, and ease of access. The second component is the general content, which includes characteristics such as content usefulness, completeness, clarity, currency, conciseness, and accuracy. The third component is the specific content, which entails characteristics such as contact information, general company information, product/service details, consumer policies, and customer support. The final component is the appearance, which refers to characteristics such as attractiveness, organization, proper use of fonts, colors, and proper use of multimedia. Attitude toward website (AST) measures a consumer’s predisposition to respond favorably or unfavorably to web content. Important drivers of AST are emotion-based evaluations of website atmospherics, such as entertainment (e.g., fun to browse, exciting) or effectiveness (e.g., convenient, accurate) (Mazaheri et al., 2011). Therefore, higher AST may result from emotions that consumers feel when using a website congruent with their cultural selves. In addition, particularly on the Internet, which lacks physical surroundings or human touch, brands play an important role in the development of site attitudes and trust.

Past researchers have conceptualized websites as hedonic and utilitarian and argued that in order to attract customers e-retailers should incorporate the online shopping entertainment attributes along with functional attributes (Al-Qeisi et al., 2014). E-retailers should use a high level of aesthetic formality when website visitors are pursuing a purchase task, whereas a high aesthetic appeal should be used when website visitors do not have an immediate shopping goal. Websites offering utilitarian
experiences facilitate consumers’ information processing and goal-attainment and are positively associated with the effectiveness of the website (Cyr and Head, 2013), whereas websites offering hedonic experiences furnish sensory gratification and are positively associated with enjoyment (Al-Qeisi et al., 2014). That is, utilitarian websites have been shown to satisfy utilitarian and more pragmatic needs (Chang and Tseng, 2013). In contrast, hedonic websites have been shown to satisfy hedonic and more affective needs. Recently, some scholars have studied the concept of online store image. Chang and Tseng (2013) regarded website image as a collective perception and concluded that website image has a significant influence on consumers’ behavior.

FIRMS’ STUDIES

The benefits of the Internet for firms

Studies show that the Internet has a positive effect on firm information availability and the development of business networks in international markets, as well as an improvement in firm performance. The Internet allows organizations to establish a direct interface with customers and suppliers and provides export marketers with Internet marketing capabilities by strengthening advertising, sales, market research, service, and procurement. The availability of export information and the development of business network relationships are seen to facilitate the development of organizational capabilities, such as marketing research capacity or customer relationship ability. Glavas and Mathews (2014) suggests that the Internet can substantially improve communication with actual and potential international customers, suppliers, and partners. The Internet generates a wealth of information on worldwide market trends and can also be a very powerful promotion and sales tool. The Internet facilitates conducting export business and supports promotion, information delivery, and export revenue growth. Additionally, the Internet can be an efficient tool to reduce entry costs and provide relevant information, which may help to increase relationship development. However, accumulating valuable resources is not enough to achieve a competitive advantage (Lin and Wu, 2014) and investments in information and communication technology may not necessarily benefit firms. Internet technology as a resource is easily imitable and does not necessarily lead to a competitive advantage for firms. Bianchi and Mathews (2016) examine the value of technology resources and find that the Internet’s impact on other complementary firm-level capabilities positively influences firm performance by improving customer retention and satisfaction. Thus, embedding the Internet within organizational processes can generate a competitive advantage, which in turn impacts a firm’s performance.

Typical disadvantages of SMEs such as resource constraints, lack of appropriate strategic planning and difficulties in expanding market share could hence be overcome by the Internet. For instance, by
building different, inter-organizational systems on the Internet to facilitate and support inter-organizational relationships, small businesses can assist each other to access potential markets which would otherwise require expensive market research and communications campaigns. The Internet does not only help SMEs to begin to internationalize but in helping to maintain a strong position in foreign markets through such activities as marketing intelligence, global sales promotion and inter-firm R&D. In fact, because it is a gateway to foreign markets, the Internet enables SMEs to become international whether it was planned or not. The Internet provides such activities the same as marketing intelligence, global sales promotion and communications. Unfortunately, the advantages conferred by Internet seldom meet the high expectations. Relatively few foreign markets can be penetrated by SMEs using the Internet alone. Except for standardized products or commodities, the Internet has not been able to replace the person-to-person contact generally required to build the necessary trust for successful international transactions. For many products the Internet cannot replace physical distribution channels. Moreover the Internet exposes SMEs to global and greater competition, particularly regarding price.

The impact of Internet on internationalization

An increasing number of studies emphasize the importance of the Internet in firms’ international activities (Biamchi and Mathews, 2016). Specifically, the Internet supports the international expansion of exporters, and increases international market growth of firms. Reuber and Fischer (2014) find that firm resources such as Internet technology are pivotal in the pursuit of international marketing opportunities. Other ways in which the Internet can help improve export performance is by finding the right overseas agent, gathering market intelligence to aid export planning, and electronic communication to support networks. The Internet also enables firms to reach potential clients around the world, making the Internet a relatively inexpensive form of marketing. Beck and Rigl (2015) argue that firms use the Internet to generate revenue by selling more to existing customers and by attracting new customers because neither location nor time constrains the Internet.

Therefore, internet technology has become an effective tool in conducting successful business particularly in developed country markets. The firms are benefited from the Internet as it significantly helps in developing communications with new and current importers, suppliers and agents in the value chain. As Frackiewicz and Grzesiuk (2013) suggest, the benefits offered by the Internet to small firms include image improvement, cost cutbacks, increased sales and access to market research, eventually making their entry into international markets quick and cost effective. As suggested the use of the Internet in exporting enables firms to leapfrog the traditional stages of internationalisation as it carries the potential to remove all export impediments such as psychic distance, practical export
problems, resource constraints, trade restrictions and market risks. The Net reduces the export barriers for small firms. Nevertheless, the owner/managers of the firms play a crucial role in determining the extent of the knowledge that supports the international activities of the firm. Sinkovics et al. (2013) also suggest the existence of such virtual export channels with the use of creative web sites which interface with existing channels for exporting.

Small firms in the international business need to understand the culturally diverse population since such awareness of the differences can help small firms to adopt appropriate e-commerce dealings. A number of literature highlights that e-commerce among businesses in the world are also challenged by the different legal support systems available for virtual transactions and certification requirements among different countries. The properties of e-commerce are sometimes described in terms of the ‘death of distance’. However, the reduction in psychic distance due to online interaction also carries the danger of falling into what we call the ‘virtuality trap’, that is a perception by the internationalising firm that the learning generated through virtual interactions obviates the need for learning about the target markets through non-virtual means.

**DISCUSSION**

According to the studies that we have read, we have developed the following framework:

<table>
<thead>
<tr>
<th>Unit of analysis</th>
<th>Object of analysis</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Consumers</strong></td>
<td>Evaluate the mediating role of COO and Country variable in the store choice</td>
</tr>
<tr>
<td><strong>State of the art</strong></td>
<td>Consumers perceive differently products among different retailers (Escobar-Rodriguez and Bonson-Fernandez, 2015; Thakur and Srivastava, 2014)</td>
</tr>
<tr>
<td><strong>Future studies</strong></td>
<td>Study on the different perceived images in various cultures</td>
</tr>
</tbody>
</table>
In this framework we can identify the state of the art in the specific issue and the future studies needed. So, there is obviously a major need for studies that consider cultural variables and that involve more countries.

**CONCLUSIONS**

Globalization and information technologies (IT) are radically changing the face of business and organization. There is a growing interest in the use of electronic commerce as a means to perform business transactions. For many businesses, it has become a priority and companies are making large investments in e-commerce applications but are pressed to evaluate the success of their e-commerce systems. The online opportunities have led firms to consider the Internet as both a replacement of other channels and as an integration of pre-existing ones. However, in literature, the evidences about the e-commerce and the online channel seem already confused. Another part of the studies focuses on the demand side of the market and tries to analyse the characteristics and the variables that affect consumers’ intention to shop online. In particular, researchers want to understand how consumers choose the store where to shop and what affects their decision. These studies combine factors that are found to influence the consumer's purchasing decision in online and offline stores for apparels. It includes the price attractiveness, time saving, perceived risk, enjoyment and excitement, tangibility and high interactivity. All of these factors will contribute to the study of customer's purchasing intention for apparels on both stores which includes online and offline shopping. Online marketers or retailers should be aware of the problems faced by the consumers and their perceived risk to increase their intention to shop in online.

This paper has examined the literature about these themes in order to gain a full comprehension of the gaps in research about e-commerce. In order to make this review fruitful, a model is developed.
This review will provide a source for anyone interested in EC research and help simulate further interest.

VENTURE CAPITALIST’S INTERVENTION AND THE
INTERNATIONALIZATION OF INTERNATIONAL NEW VENTURES
(INVS) – PORTUGUESE CASE STUDY

Ribeiro, Paulo; Meneses, Raquel
Faculty of Economics of Porto, University of Porto, UP, Porto, Portugal

ABSTRACT
The internationalization process is widely believed to be one of the most relevant dimensions in companies across countries. Nevertheless, operate abroad might not be easy for new ventures. This study approached the Venture Capitalists (VC)’s intervention in this kind of firms. It provides empirical data that VCs might take a decisive role, supporting International New Ventures (INVs) in their international path, through their capabilities, resources or international networks. Using a sample of Portuguese VCs, this study’s results suggest that industry knowledge, prior international experience, syndicated investments or “social status” are some examples of the VC’s important characteristics within foreign markets. VC-backing might be especially useful, in terms of the involvement in the new venture’s board, networks and international activities.

Keywords: internationalization; intervention; VCs; INVs; capabilities; resources; networks;

INTRODUCTION
The financing takes an important role in the economic growth. In fact, in order to be more efficient, economies need a solid financing system. This study intends to present a different approach about one type of financial support: the venture capital. The venture capital market is important all over the world. For example, some American companies were founded by venture capital, such as Intel, Oracle or Sun Microsystems. In the opposite side of the world, it happens in the same way. China and Taiwan are very clear examples of that. Quanta, the well-known notebook producer and Asustek, the motherboards maker, were supported by venture capital funds (Kenney et al., 2004). However, this support is not just about money and this study is focused on the interesting relation between venture capitalists (VCs) and International New Ventures (INVs), in the internationalization process. Actually, it aims to analyze and reach pertinent conclusions about the influence of VC’s support in the internationalization of this kind of firms. In other words, it is important to clarify whether that support is effectively relevant and find out which are their main dimensions.
INVs, which are companies developing international activities since their inception (Oviatt and McDougall, 1994), are well-known as “born global” firms because, for them, the internationalization is a short-term plan and is viewed as a priority (Rennie, 1993). Cooper and Daily (1996) stated that “entrepreneurial teams are at the heart of any new venture”. According to this evidence, VCs might take a relevant strategic role in the INV’s management, for example, in terms of their professionalization (Hellmann and Puri, 2002), improving their international competitiveness. However, this study focuses on the “early stage”, when already exists a product, ready to be commercialized. Within this first-stage of financing, the INV starts growing and some expenses are coming up (Bachher and Guild, 1996). However, in their first stage, small firm’s managers are worried about the domestic investment and just after some time they start working abroad. This stepwise growth may be the cause to lose interesting opportunities and develop international activities (Rogers, 2004). The success of operate abroad is strongly associated to the managerial expertise and firm networks (Chandler and Hanks, 1994). Actually, VC’s networks and connections are likely to enlarge over time (Sorenson and Stuart, 2001) and INVs might take very important benefits from the venture capital investment.

Within the early stage, there is a high risk level and the investment necessities are crucial (Howell, 2015). This study’s approach will focus on the venture capital investments including INV and VCs from Portugal. Usually, in Portugal, this process is divided in two types of support: financial and strategic. In fact, VCs may provide both of them, since they might be aware of the INV’s conditions. Further, if the INV are aware of the performance from previous venture capital investments (and their influence within foreign markets), more partnerships will be successfully developed. Hence, being aware of this type of knowledge might be an important step for this type of new ventures, in terms of the internationalization path, and it can turn this international process into an easier one.

**REVIEW AND SYNTHESIS OF LITERATURE**

*Informational intervention:*

VCs might be able to analyze foreign markets in order to minimize the INV’s informational problems. Guler and Guillén (2010b) gave special attention to the legal protection of investor’s rights. According to this evidence, VCs may be able to anticipate any kind of change in the legal systems within foreign markets (such as the property right’s protection) and analyze the foreign market’s political/regulatory stability (Guler and Guillén, 2010b). However, VCs may be an important partner through another point of view: their experience. Sorenson and Stuart (2001) highlight the VC’s prior international investment experience as an important factor reaching new markets, overcoming...
obstacles and enlarge their future international scope. Delineate contract’s characteristics or evaluate business opportunities abroad are some examples of that. Actually, the VC’s international networks increase over time, with the internationalization of the venture capital industry. Additionally, syndicated investments abroad also contribute to a raise of international knowledge, which is significant in order to identify new business opportunities abroad (LiPuma, 2014). However, networks within home country deserve some attention, too. Home country partners may possess some relevant information about the firm, which can be useful for foreign market’s stakeholders (Guler and Guillén, 2010a). Without that support, the firm could face some problems, in terms of signal its reliability (e.g. showing foreign stakeholders that it is trustworthy). It can reduce the venture’s foreignness liabilities. Indeed, the “VC’s social status” is an important characteristic and it can easily influence the stakeholder’s (e.g. customers or suppliers) perceptions about the new venture’s qualities and outputs (Stuart et al., 1999).

According to LiPuma (2014) informational problems are more likely to occur with a greater geographical distance. Thus, if there is a large distance between investors and new ventures, VCs are likely to use more stages of funding with shorter durations between them, in order to develop an efficient monitoring. However, on average, VCs prefer to be near the ventures in which they invest, in order to oversight their activities as well as maintain narrow connections with venture’s founders (Sorenson and Stuart, 2001).

Sorenson and Stuart (2001) also approached the VC’s networks coming from venture capital environments (from participants in this process). These networks might have a decisive role, accessing the international information, which might be important to reach new markets. Connections can be established with another VCs, experts or new entrepreneurs. Those are commonly established within the same industry. Actually, the VC may be investing in the same industry for a long period, which can bring some important connections, from different parts of the globe (Sorenson and Stuart, 2001). Concerning the networks effects, the VC’s type might also be a relevant point, within the internationalization path. According to Schildt et al. (2005), corporate venture capital (CVC) is likely to possess more international networks, for example, in terms of potential foreign customers. However, syndicate investments may be another activity, which can bring some important connections between VCs. This type of venture capital investment might also have some advantages, such as the risk diversification or the second opinion in the decision making process (Gompers and Lerner, 2001). Further, VCs with many syndicated investments are likely to possess important networks and they access to a high amount of information, either in terms of industries or geographic regions (Sorenson and Stuart, 2001). Nevertheless, the existence of a local syndicate partner might increase the likelihood of a successful exit (LiPuma, 2014).
**Functional intervention:**

Functional dimension might be also an essential one. Arthurs and Busenitz (2006) found greater dynamic capabilities in backed ventures, in terms of the product and management development. Additionally, Fried et al. (1998) showed that backed ventures might have an important advantage, since their boards show a greater involvement in the strategy’s development and monitoring, than non-backed ones. Further, Fried et al. (1998) found that the board’s involvement have a positive influence on the backed-firm’s performance.

According to Arthurs and Busenitz (2006), there is a valuable support provided by VCs, in the early stage. At this stage, a competent management team is a crucial necessity. Hellmann and Puri (2002) analyzed this theme and found that VCs develop their activities, in order to “professionalize” the firm, which is likely to be a faster process in venture-backed firms (Hellmann and Puri, 2002). This professionalization might consist in hiring new management teams and some positions may be switched, including the replacement of the CEO (Hellmann and Puri, 2002). However, this changes within the management teams are likely to appear through four main dimensions, which are the recruitment practices, the human resources policies, the stock options planning and the recruitment of vice president of marketing and sales (Hellmann and Puri, 2002). Stock options, “which give the recipient the right to buy a share of stock at a pre-specified exercise price for a pre-specified term” (Hall and Murphy, 2002, p. 1), is an option to manage/retain the human resources and compensate managers. In terms of these stock options, Hellmann and Puri (2002) found a strong relationship between obtaining venture capital and adopting a stock options plan. Actually, backed-firms possess more than twice of the likelihood of having such plan, comparing with non-backed ones. In terms of the vice president of marketing and sales, it happens in the same way: a vice president of marketing and sales is more likely to be appointed with the intervention of VCs. Hellmann and Puri (2002) also found that VCs have a significant role in the human resources planning, defining policies according to their knowledge. Specifically, one dimension was deeper analyzed, which is the recruitment process. Backed-firms are more likely to use (professional) networks, in order to hire some type of human resources, such as the sales, marketing, administrative and managerial personnel. The use of networks within the recruitment process is one indicator about the firm’s level of professionalization, in terms of their relationship with its business environment (Hellmann and Puri, 2002).

Some financial aspects were included in the functional ones, in terms of the VC’s intervention, such as the shortage of working capital to invest. According to Hellmann and Puri (2000), VCs possess business knowledge and they are aware of industry’s conditions, that is why they may be able to choose right firms to invest in, those with high future potential. This evidence brings the idea that VCs
are likely to be aware of the right time to execute the rounds of financing, since they possess expertise not only about venture's features but also about their market.

*Marketing intervention:*

Venture’s marketing needs are related to some factors, such as the product, price or distribution. In terms of the product ones, VCs possess assets that are likely to reduce the time to market, which is considered the “time from the birth of the company to the date of first product sale” (Hellmann and Puri, 2000, p. 15). According to Hellmann and Puri (2000), venture capital is considered as being decisive to accelerate the venture’s product launch. Additionally, adapt the venture’s product might be difficult, in order to reach new markets and meet their specific requirements. In fact, this task might be associated to a high level of uncertainty. Arthurs and Busenitz (2006) approached the venture backing importance for the INV’s product development. It seems that “the market perceives that venture capitalist-backed ventures are better able to address product-related weaknesses and threats” (Arthurs and Busenitz, 2006, p. 207). This product constraint may be minimized through the right choice about the management. Actually, VCs are likely to have close connections with important managerial expertise, assuring the INV’s quality. For example, VCs might convince senior managers with high industry experience to integrate the venture’s project (Arthurs and Busenitz, 2006). This type of “dynamic capabilities” might contribute to explain the reason why the markets value VC-backed ventures, comparing with non-backed ones, when there are high product-related risks (Arthurs and Busenitz, 2006).

The inexistence of economies of scale may be an important constraint within foreign markets. According to Fischer and Varga (2002), inter-firms cooperation/networks might have an important role achieving economies of scale, reaching new markets, or accessing new technologies. Those economies of scale may come up through an alliance with R&D and/or producing institutions. Zeng et al. (2010) approached the relationship between different types of networks and innovation, which requires scale, of small and medium enterprises (SMEs) in China. Their findings point out a high importance of different types of cooperation: inter-firm cooperation, cooperation with intermediary institutions and cooperation with research institutions. These types of organizations are crucial to the small firm’s innovative performance. Furthermore, Zeng et al. (2010) found a higher importance of vertical connections with customers, suppliers or other firms, comparing with the horizontal connections with research institutions. Additionally, the literature’s review also shows the VC’s importance, reaching potential foreign customers and suppliers (Gorman and Sahlman, 1989; Schildt et al., 2005).
METHODOLOGY

Sample and data collection method:

In order to obtain a broader knowledge about the VC’s intervention in backed firms, it was chosen a qualitative methodology. This is an approach, which is likely to explore a single or multiple case, through an in-depth data, based on some specific sources of information and it is likely to achieve case-based themes (Creswell et al., 2007). Usually, data collection methods are questionnaires or interviews and the evidence is qualitative (words). One of the objectives of this type of data collection is to provide a description about the subject (Eisenhardt, 1989) and this study intends to be a descriptive analysis.

In line with Yin (2015), institutional responses may be studied through this type of qualitative data. Actually, the collected data were provided by a group (8) of Portuguese VCs (view Table 1). However, twenty-four VCs were contacted, in order to have the opportunity to collect different and complementary perceptions about VC-backing and its importance for the new venture’s internationalization. The answer rate was 58.3%. However, just eight of them had a positive feedback, in terms of the availability for meetings and all of these ones were interviewed. In these meetings, VC’s members (mainly managing partners and business analysts) were interviewed. The main purpose was to compare the Portuguese VC’s intervention with the literature’s evidence.

Interview’s structure:

Each interview was supported by a script, in order to approach the most important aspects in the literature’s review. Similarly to the literature, the approached aspects, throughout the interviews, were related to the three main dimensions of the venture capital investment: informational, functional and marketing intervention. Specifically, the interview’s questions were divided in 4 main parts: i) study’s presentation; ii) VC’s presentation; iii) VC’s standard intervention in their INVs; iv) VC’s international intervention in their INVs. However, these interviews had an exploratory direction and the interviewed had the total freedom of add some relevant aspects, in order to illustrate its reality supporting their backed firms, operating abroad. Additionally, outcomes from previous interviews were being questioned in the subsequent interviews, in order to find out their relevance for this study.

Outcome’s analysis method:

Seven of the interviews were recorded and transcribed. Then, all of them were organized, through the software NVIVO. Similarly to Creswell et al. (2007), the transcripts from the 7 interviews were analyzed and the most significant statements, sentences or quotes were highlighted. Each of them fitted a specific meaning unit. One of the interviews was analyzed through a note-taking method, but it
was also included in the software NVIVO. Actually, the information was analyzed and classified, according to the aforementioned method (literature’s evidence and interviews additional information).

With the chosen methodology, the researcher is likely to collect data from a variety of sources and aggregate them to illuminate the case (Baxter and Jack, 2008). Thus, it was possible to identify how many VCs (“sources”) mentioned each item and the content of the emerging information about each one of those items (“references”). In fact, through this analysis, it was possible to develop an overview about the most relevant aspects and the existence or inexistence of any relationship with the literature’s aspects.

INTERVIEW’S GENERAL OUTCOMES

Emerging aspects from interviews

The interviews provided some additional information, comparing with the approached aspects in the literature’s review. The interview’s number is available in the Table 1.

The VC’s involvement in the backed firm’s board is one of them. Generally, VCs are likely to appoint 1 or 2 members for the backed firm’s board, developing activities as non-executive directors (NEDs) (4th, 5th, 6th and 8th interview). This aspect was referred in 4 interviews. However, one of the interviews revealed a different approach about the backed firm’s control, which is the CEO’s
appointment for just one year (6th interview). Additionally, most of the VCs usually take minor positions, in terms of the share capital (pointed out in 4 interviews – 3rd, 4th, 5th and 6th interview).

Another emerging aspect from interviews was the services provided by VCs. In fact, they are likely to improve the internal information/reporting systems, in order to make the backed firm’s communication easier and more efficient between their members (1st and 5th interview). However, the definition of pricing models to reach any specific type of foreign customers was another service, which may be provided by VCs (8th interview).

VC’s networks are also an important aspect in terms of the venture capital investment. In the interviews, some VCs are likely to recruit venture’s members, based on their networks. One of the referred activities were the introduction of industry experts to the backed firms and this members may take a position in the board (8th interview).

According to the interviews’ information, VCs are likely to invest in industries related to the academic background or professional experience of their members. In fact, according to this aspect, industry knowledge might be strengthen by VC-backing (3rd interview).

VCs might also have an important role searching for investors to support the backed firm’s project (4th and 8th interview). New investors can improve the foreign market’s approach. National VCs may syndicate investments with foreign VCs from foreign markets, which can bring some advantages in the international path. With this kind of activities, VCs are able to bring not only international funds, but also international knowledge and local important networks (e.g. connections with customers, suppliers, distributors…) (4th interview).

Additionally, VCs might find other institutions to syndicate investments, such as banks or private investors (5th and 6th interview), which might bring several advantages such as the board’s heterogeneity or compliance mechanisms, in order to oversight the activities related to the backed firm.

Foreign markets analysis is another activity, in which VCs can be very important. For example, VCs are likely to develop some international activities, such as the international visits to know the main local stakeholders (2nd interview) or they might search for the most valuable groups of foreign customers in the market (1st interview). However, VC’s international experience might turn the international path into an easier one. Actually, prior investments within foreign markets might benefit future investments in the same countries (2nd, 3rd, 7th and 8th interview).

Finally, VCs are likely to examine some opportunities to acquire firms, in the national market or abroad. This activity might be a relevant one, since international firms can provide some industry or market knowledge to the backed firm (2nd interview).

*Literature’s aspects supported through the interviews*
Some of the literature’s aspects were supported in the empirical data. According to the interview’s outcomes, VC’s geographic reach is likely to enlarge with syndicated investments (6th interview). Sorenson and Stuart (2001) considered the same aspect through a different perspective, which is that VCs are able to enlarge their social and geographic reach, due to the effects of successive investments. For example, they might establish connections with some actors in the venture capital market (entrepreneurs, other VCs, experts…), from different countries.

Industry knowledge from the ongoing investments in the same industry was also pointed out by the literature’s review (Sorenson and Stuart, 2001) and supported by VCs (1st interview). Indeed, both sources considered this kind of investments as an important mean to establish some valuable ties within the industry (e.g. suppliers or customers).

In terms of the local connections, it is important to highlight the existence of a local syndicate partner. Although its advantages were recognized by the interviewed VCs (2nd interview) and LiPuma (2014), the empirical data deepened this aspect, exploring the usefulness of these local partners.

Concerning the foreign market’s analysis, regulatory aspects might be relevant and they were approached either in the literature or the empirical data. Actually, according to Guler and Guillén (2010b), VC’s may be able to anticipate any kind of regulatory change within foreign markets, such as the property right’s protection. Thus, this kind of foreign market’s study might be useful, in terms of its analysis. In the empirical data, the same trend was supported. According to the 3rd interview, some industries and markets have stronger regulatory conditions and VCs might be able to analyze it, for example, through a comparison with other backed firms operating within the same markets.

Regarding the board’s involvement in the backed firm’s strategy and monitoring, there is also a correspondence between empirical data and literature. In fact, Fried et al. (1998) considered that boards from backed firms are likely to present greater involvement in the strategy’s development and monitoring. The interviews (4th, 5th, 6th and 8th interview) are likely to corroborate this theory, since most of the VCs might appoint 1or 2 members for the backed firm’s board (as NEDs), in order to support the development of the backed firm’s strategy as well as its monitoring.

The backed firm’s teams are likely to change with the venture capital intervention. This evidence was brought from the literature (Hellmann and Puri, 2002), with the appointment of new management teams. Actually, this evidence was supported by empirical data (2nd, 5th and 6th interview), since there is the possibility of switching the management teams, especially, in “C-level positions” (CEO or CFO, mainly).

Human resources policies were also referred previously in the literature (Hellmann and Puri, 2002) through two main examples: the adoption of a stock options plan or the recruitment process, based on VC’s networks. In the empirical data, this evidence was corroborated, since VCs might be
important either in the recruitment process (1st interview) or in the implementation of some human resources policies, illustrated with an adoption of a stock options plan (8th interview).

The recruitment process and changes of management teams deserve some attention, too. In the literature, Arthurs and Busenitz (2006) approached the possibility of VCs bring senior experienced managers (experts) to the venture’s board. Actually, this fact was referred in the interviews (8th) and it might give some expertise to the venture’s board, in terms of the industry knowledge.

Syndicated investments with another VC might also represent a relevant aspect, in terms of the advantages in the decision making process. In fact, firstly, Gompers and Lerner (2001) referred the importance of having a second opinion in the decision making. In reality, the empirical data (6th interview) took a position in the same direction and revealed that the information sharing between investors might be important in the backed firm’s success.

Interviews’ most referred aspects

Some aspects assumed a higher importance, since they were mentioned more times than the others. Although these points have not been mentioned in the same way, they are likely to present complementary ideas, concerning the same subject. For example, in terms of the backed firm’s control and board’s involvement, it was possible to conclude that most of the VCs are likely to take a minor position in the share capital (3rd, 4th, 5th and 6th interview) and appoint 1 or 2 members for the backed firm’s board, as NEDs (4th, 5th, 6th and 8th interview).

Prior international investments were considered as an important characteristic in the literature. However, the interviews went further and they considered that prior investments within foreign markets are likely to benefit future investments in the same markets (2nd, 3rd, 7th and 8th interview).

VC’s networks (personal and professional) were deeply analyzed in the interviews, through some different perspectives. Mainly, these connections were approached through 3 main dimensions, which are their usefulness: i) to appoint some industry experts for the backed firm’s board, as NEDs (1st interview); ii) to support another firms in the same industry (7th interview); iii) to reach foreign VCs, in order to syndicate investments with them (4th interview). However, VC’s personal connections were also one of the most referred points (1st, 4th and 7th interview). Actually, these personal connections are likely to benefit backed firms abroad, essentially, reaching foreign stakeholders.

VCs might be likely to develop activities within foreign markets and they might assume a high importance, with many purposes. For example, VCs are likely to visit foreign markets, in order to explore their opportunities and have a better perspective about the main local stakeholders (2nd interview). Additionally, VCs might go along with the management of the backed firms, in order to support them in international meetings (3rd and 7th interview).
Literature’s non-referred aspects (in the interviews)

One of the non-referred aspects was the influence of Corporate Venture Capitalists (CVCs) in the internationalization of their backed firms. According to Schildt et al. (2005), CVCs are likely to possess more international networks (for example, in terms of potential foreign customers) than IVCs. Nevertheless, CVCs were just approached once in the empirical data (8th interview). This interview just approached the CVC’s industry-related knowledge, since CVCs are likely to support backed firms within the same industry.

In line with the literature, home country partners might have a high importance in the backed firm’s international path, since they may possess relevant information about the backed firm and it can be useful for stakeholders within foreign markets (Guler and Guillén, 2010a). Actually, according to this evidence, home country partners may facilitate the backed firm’s international approach through the minimization of informational lacks, but this trend was not referred in the empirical data.

Sorenson and Stuart (2001) considered that VCs are likely to be near the backed firms to oversee their decisions and maintain close connections with their founders, but this point was not supported by the empirical data, since international VCs might be involved in the investments (4th interview).

Product development was not deeply approached by empirical data. According to Hellmann and Puri (2000), VCs are likely to reduce the backed firm’s time to market, since they might possess assets which can make the product launch faster. Nevertheless, this aspect was not approached in the interviews. In fact, most of the VCs highlighted their influence on strategy-related aspects, instead of product-related aspects.

In the literature’s review, the achievement of economies of scale was one of the identified small firm’s constraints operating abroad. Zeng et al. (2010) referred that inter-firms might give easier access to the economies of scale, which might come from an alliance with R&D and/or producing institutions. Thus, this type of actions could be taken by VCs but this point was not approached in the empirical data.

CONCLUSIONS AND DISCUSSION

Concerning the interview’s outcomes, VCs are likely to develop some important activities, supporting their backed firms within foreign markets, through some transversal backed firm’s dimensions, such as the VC’s connections, their international activities or their involvement in the venture’s board. In fact, board’s involvement was considered a relevant point by this study. Actually, Fried et al. (1998) highlight this subject and this investigation’s outcomes point out the same direction.
According to Fried et al. (1998), backed firm’s boards are likely to present a greater involvement in the strategy’s development and monitoring than non-backed firms. In terms of the approached VCs, although most of them take a minor position in the share capital, they are likely to appoint 1 or 2 members for the backed firm’s board, as NEDs. In line with Hellmann and Puri (2002), with the VC’s intervention, the venture’s management teams may be switched. This evidence was supported, not only through the appointment of NEDs, but also through the VC’s influence (in some cases), appointing some of the “C-level positions” in the backed firm’s board (CEO or CFO, mainly).

Prior international investments were another point with an important relevance in this study’s results. In the literature, prior international investments are likely to enlarge the VC’s networks and scope. Actually, some obstacles may be easier to overcome in foreign markets, such as the negotiation constraints (Sorenson and Stuart, 2001) and the informational lacks may be reduced. Although the empirical data have agreed with this evidence, it went further. Prior investments within foreign markets are likely to benefit future projects in the same markets.

VC’s professional and personal networks were also approached through the empirical data in three main dimensions, which were their usefulness: i) supporting firms in the same industry; ii) appointing some industry experts for the backed firm’s board, as NEDs; iii) reaching foreign VCs, in order to syndicate investments with them. Arthurs and Busenitz (2006) considered that VCs might be able to bring senior experienced managers to collaborate in the venture’s project and these members may be recruited, through the VC’s partners networks (personal connections). In fact, according to the 1st interview, VC’s connections may be useful through this way and they can make the venture’s board more valuable, in terms of the industry knowledge. Additionally, industry knowledge might also be improved by VC’s backed firms in the same industry. This interaction with other backed firms might be important, in order to share experiences or obstacles and the international path may be easier for new ventures. Syndicated investments were also approached in this study. Actually, the international syndicated investments were highlighted as another example, in which VC’s networks may be important, either in terms of industry knowledge or market knowledge. Czinkota and Ronkainen (2001) considered that backed firms must be aware of cultural assumptions within foreign markets, such as the necessity of formal or informal procedures within each stage of negotiation. Indeed, syndicate investments with foreign VCs may be a useful method (coming from VC’s networks), in order to be aware of this specificities of foreign markets. Nevertheless, VC’s personal connections might also be important through more points of view, such as reaching foreign stakeholders (e.g. customers or suppliers).

With the purpose of reaching a better understanding about foreign market’s characteristics, VCs can develop some activities, within those markets, where their backed firms will operate. In the
literature, VCs present a high importance reaching foreign potential customers and suppliers (Gorman and Sahlman, 1989; Schildt et al., 2005). Indeed, the empirical data brought some relevant information, concerning this internationalization process of new ventures. VCs are likely to visit foreign markets, with the purpose of exploring their business opportunities and know the main local stakeholders. Additionally, VCs might be with the management team in international meetings.

In short, VCs are likely to have an important role in the international path of their backed firms, mainly, in terms of the involvement in the new venture’s board, networks and international activities. In reality, new ventures might have some important advantages with VC-backing, operating internationally.

This study presents some limitations, which may be referred, in order to obtain a better understanding about the venture capital market, analyzed throughout the study. Actually, the sample (interviewed VCs) was not perfectly homogeneous. Some of these Portuguese VCs have a different scope, in terms of their backed firm’s profile. Some of those firms were not within their first stage of development. However, all of the VC’s information might be valuable, since the VC’s intervention may be useful in different occasions with different backed firms. Additionally, the VCs had different purposes, since their portfolios had different characteristics between each other. In other words, the VCs were likely to invest in different sectors and different type of support may be provided. Indeed, this aspect may be relevant since the sample might be considered as a non-homogeneous one through this way and the VC’s intervention and knowledge might be biased by the backed firm’s sector. Another limitation is the origin of the VC’s funds. Some of them might come from different proveniences and the VC can be “obliged” to develop some specific type of activities, according to the will of those resource providers. In these situations, the VC’s intervention (for example, in terms of the international activities) and their decisions may be shared with different players or investors.

CONCEPTUALIZING PUBLIC VALUE DESTRUCTION

Ricci, Paolo; Esposito, Paolo

University of Sannio, Italy

ABSTRACT

The research aims to map the different types, configurations and 'constellations' within the Italian galaxy (De Graaf, Nabatchi, Van Der Wal, 2012) or universe (Jorgensen, Bozeman, 2007: 359; Johnson, 2012) of public (dis)value, trying to develop a conceptual model based on the notion of public value (PV) and on the processes that allow its generation and 'visualization' (Guthrie, Farnsworth, 2008). PV is a variously definable abstract quantity, and not a measure quantity such as income (Onida, 1968: 558), which is used in its various stages of creation, transformation and destruction to help define public governance features (Sòstero, 2003) when assessing the sustainability of public policies (Moore, 1995, 2002; Stoker, 2003; Benington, Moore, 2011; Guthrie, et al., 2014).

The capital that generates or compromises PV is not abstract, though: it is the political capital, a specific component or sub-configuration of social capital that is behind political action (Birney, 2010) and can be seen as a complex and ever-changing combination of cultural paradigms, ideologies, skills, relations and ligatures (Dahrendorf, 1994: 42.193).

Not much attention has been devoted in literature, particularly by Italian business science, to public (dis)value issues (abstaining from voting, corruption, tax evasion, (ab)use of power, (ab)use of law, State capture), to the difficulties in composing the frictions and tensions existing between apparatuses and people, between bureau-cracies and demo-cracies (Aucoin, 1991, 2012; Blaug, 2006) and to the increasing risk of silent autarkic, anarchist, revolutionary tendencies or worse, all potentially subversive of democratic representation.

Further goals of the present work are:

i) to draw logical and conceptual cognitive maps able to identify and codify the distinctive elements that mark most situations of public (dis)value (Rutgers, 2008; Nabatchi, 2011), visualizing changes in value (either increasing or decreasing), evaluations and (re)evaluations (Masini, 1955). Such mapping process would also highlight hidden reserves resulting from the re-evaluation through co-generation and/or re-generation of new public value within an initially compromised context/situation (Borgonovi 2007: 606), for example by 'freeing' and converting properties confiscated from the Mafia in public goods available to the community (Plus-Value);

ii) to verify the nature of any relationship existing between the degree of accountability that a...
The research aims to map the different types, configurations and 'constellations' within the Italian galaxy (De Graaf, Nabatchi, Van Der Wal, 2012) or universe (Jorgensen, Bozeman, 2007: 359; Johnson, 2012) of public (dis)value, trying to develop a conceptual model based on the notion of public value (PV) and on the processes that allow its generation and 'visualization' (Guthrie, Farnsworth, 2008). PV is a variously definable abstract quantity, and not a measure quantity such as income (Onida, 1968: 558), which is used in its various stages of creation, transformation and destruction to help define public governance features (Sòstero, 2003) when assessing the sustainability of public policies (Moore, 1995, 2002; Stoker, 2003; Benington, Moore, 2011; Guthrie et al., 2014).

The capital that generates or compromises PV is not abstract, though: it is the political capital, a specific component or sub-configuration of social capital that is behind political action (Birney, 2010) and can be seen as a complex and ever-changing combination of ideologies, skills, relations and ligatures (Dahrendorf, 1994: 42.193).

Not much attention has been devoted in literature, particularly by Italian business science, to public (dis)value issues (abstaining from voting, corruption, tax evasion, (ab)use of power, (ab)use of law, State capture), to the difficulties in composing the frictions and tensions existing between apparatuses and people, between buro-cracies and demo-cracies (Aucoin, 1991, 2012; Blaug, 2006) and to the increasing risk of silent autarkic, anarchist, revolutionary tendencies or worse, all potentially subversive of democratic representation.
Further goals of the present work are:
i) to draw logical and conceptual cognitive maps able to identify and codify the distinctive elements that mark most situations of public (dis)value (Rutgers, 2008; Nabatchi, 2011; Esposito, Ricci, 2014, 2015, 2016, 2017), visualizing changes in value (either increasing or decreasing), evaluations and (re)evaluations (Masini, 1955). Such mapping process would also highlight hidden reserves resulting from the re-evaluation through co-generation and/or re-generation of new public value within an initially compromised context/situation (Borgonovi 2007: 606), for example by ‘freeing’ and converting properties confiscated from the Mafia in public goods available to the community (Plus-Value);
ii) to verify the nature of any relationship existing between the degree of accountability that a public administration can implement and consolidate (Anessi Pessini, Borgonovi, 2000; Ricci, 2005, 2010; Lapsley, Ezzamel, Hyndman, Johensen, 2009; Parker, Guthrie, 2010; Anessi Pessina, Nasi, Steccolini, 2010), and the increasingly frequent depletion phenomena occurring within the Public Administration with relation to value (either tangible or intangible), finance, property and reputation (Birney, 2010: 4,5);
iii) to analyze through a case study an example of the pathological situations compromising public value and integrity that increasingly often occur in the management of public bodies (Bianchi, 2012), and showing how the pursuit of individual happiness is detrimental to the degree of happiness referable to the community as a whole.

2. RELEVANCE OF THE RESEARCH TOPIC IN THE ITALIAN CONTEXT

The relevance of the research topic for the scientific community in question is provided by different data processed and presented by different national (Corte dei Conti, Istat, Banca d'Italia, CNEL, Alto Commissariato per la prevenzione della corruzione, AVLP) and international (World Bank, OECD, IMF, Asian Development Bank, Transparency International) institutions on the public (dis)value generated by phenomena of corruption, tax evasion, abuse of law and State capture (Edwards, 2010).

As to phenomena of corruption in local public administrations and Italian problems of economic development and growth, the focus on them by national research institutes such as CNEL and Istat and international organizations such as OECD and World Bank is strong.

CNEL in particular, through its socio-economic Observatory on crime, has focused since the mid-90s on the obstinacy of corruption phenomena in public management (1996), also highlighting the risk of infiltration by organized crime in EU funding processes (Law 488/1992), in large public works and also in several local bodies in northern Italy, in what looks like a silent conquest of entire chunks of legal economy. Investigative bodies and DIA have been recently strengthened, also by stipulating...
inter-institutional agreements with CNEL and Alto Commissariato per la prevenzione della corruzione (the latter watchdog was subsequently suppressed); clear guidelines have also been provided by organizations such as Confindustria, by expelling those businessmen and industrialists who do not report bribing phenomena, this way fueling the culture of lawlessness and the silence of illegality. Also growing is the production by the national legislator of standards and measures for the prevention, law enforcement and fight against corruption (Anti-Corruption Bill), and to ensure free market standards in procurement procedures and public tenders through the establishment of a legality rating (Law 18/05/2012 n.62; also the regulation issued by Autorità garante della concorrenza e del mercato on 14th November 2012), in order to define a white list of companies able to take part to public procurement procedures.

3. SOME EMPIRICAL EVIDENCE OF PUBLIC DIS-VALUE

Below is some empirical evidence that can help visualize the economic and social amount of public dis-value:

Corruption

Recent data from Corte dei Conti (2012) show that phenomena of 'informal economy' (in the absence of price, tariffs and/or measurement units of the exchange utility) that are erosive of public value, amount in Italy to about € 60 billion a year with regard to corruption, and to € 120 billion a year as a result of tax evasion (Bank of Italy, 2011), thus siphoning off crucial resources which could otherwise be employed to support education, health and social policies.

It should be added that less than 60 million euros - out of the annual 60 billion dis-value, which are recovered each year by Corte dei Conti (Vannucci, 2012).

Tax evasion

Delays in terms of tax revenue assessment and collection policies compared to other OECD countries (Locarno, Staderini, 2007), have affected the cultural and financial dimension of tax evasion in Italy.

Figure 1
Recent data from *Corte dei Conti* (2012) show that the erosion of ‘public value’ by tax evasion amounts to about € 120 billion a year in the Italian economy (Bank of Italy, 2011). Below are 2011 data from *Agenzia delle Entrate*, broken on regional and provincial basis.

*Figure 2: Tax Evasion*

Debt due to tax evasion  
Debt without tax evasion

Source: *(Agenzia delle Entrate, 2011)*
Even more alarming are 2012 *Istat* data regarding tax evasion, whose size is measured in about 275 billion Euros. Italy holds in fact the top position in Europe for the size of its hidden economy and, consequently, for tax evasion. The unpaid amount in taxes amounts to about five annual budgets, almost one third of the total State revenue.

**Eco-Mafia**

In Italy, the financial dimension of the disposal of waste generated by eco-mafia and the consequent costs sustained to restore the healthiness of the areas involved are remarkable (*Legambiente*, 2012).

*Figures related to environmental lawlessness in Italy grew significantly also in 2011. Reported offences were 33,817, 9.7% more than in 2010, a year when the same figure was already 7.8% up compared to 2009. This means that in two years reported crimes against the environment established by the police, by the Coast Guard*
and by provincial police forces went up by 17.5%. The number of crimes committed every day exceeded 92, an average of 3.8 offences per hour. Up were also the figures related to reported offenders (27,969, a 7.8% increase compared to 2010) and especially of those subsequently arrested: 305, 100 more than in the previous Ecomafia report, with a 48.8% increase. The number of seizures was on the other hand stable: 8765, against 8771 operated in 2010 (Legambiente, 2012).

Archeo-Mafia

Theft of cultural and archaeological treasures has grown steadily in Italy: 1,112 offences were recorded in 2011, with a 13.1% increase on the previous year. A significant police activity brought to report 1,302 offenders and to the arrest of 53 of them. The amount of the related business estimated by the police is also on the rise at more than € 316 million in 2011, almost a million a day, exactly 100 more than in 2010. Campania is the region with the highest number of thefts (169, 15.2% of the national total) knocking Lazio off the top of the ranking of the most affected areas, now in second place with 150 thefts; third is Lombardy (143), fourth Tuscany (95), and fifth comes Sicily (83). (Legambiente, 2012).

Again, most thieving is concentrated in churches, museums and public libraries. It is the theft of public value (dis-value) related to the national cultural heritage, either artistic (objects and works of art) or regarding manuscript and print (archeo-mafia).

It is the archival and library system to suffer the most serious attacks with as many as 9,886 items stolen in a single year, that constitute public goods and value removed from the community. The theft of books, old documents and archival heritage perpetrated to the detriment of institutions, agencies and libraries, either public or private, is indeed a pressing issue (Legambiente, 2012). In most cases the shortfalls are ignored by the institutions themselves, due to incomplete and ineffective cataloguing procedures, or the extreme ease of transportation, concealment and fragmentation of the assets stolen.

These figures are even more alarming for current and future communities, in view of the growing scale of the crisis and consequent shortage of financial resources that, apart from causing additional effects on the taxation of individuals and businesses, also produce further financial, social and existential inequality.
4. RESEARCH METHOD

This study aims to achieve its research goals through the adoption of an inductive/deductive method (Yin, 1984, 1995). It is the approach followed by Bozeman and Jorgensen in 2007, also the starting point to highlight some obstacles in the advancement of studies and future investigations on PV (De Graaf, Nabatchi, Van Der Wal, 2012; Taylor, Pierce, Blackmar, 2012), using the ‘constellation-based’ reference model, which nevertheless displays both advantages and disadvantages (Jorgensen, Bozeman, 2007). The advantages are represented in our study by the empirical evidence of re-acquisition of assets seized to the mafia and of ethical re-generation of new public value from previous forms of dis-value by returning freed goods to the reference community. As to the disadvantages, we can mention the ‘visualization’ and identification of public value by denying the notion of value itself, that is by determining its conceptual inversion: the (dis)value. In other words, the model in question does not measure value or, better, its determination produced by public actions and policies, through the quantitative measurement of value changes brought by such actions (Corte dei Conti, 2010, 2011, 2012).

In the first part of the work, after a thorough analysis of the available literature, we shall try to answer the following research questions (RQs): RQ1: Is it possible to define or display public value through the measurement of public disvalue? RQ2: What is the empirical evidence of public disvalue in Italy? What are its main causes? RQ3: What tools can we reasonably use to fight the causes of public disvalue?

In the second part of the paper, we shall analyze the case of re-generation of public value and political capital through the liberation, the conversion and subsequent management of assets seized from the mafia and returned to the community of reference.

5. THE METAMORPHOSIS OF PUBLIC VALUE: A CONCEPTUAL PREMISE

Speaking of public value is not easy. Before trying to define it, we are supposed to tackle fundamental philosophical issues relating to its existence, its nature and the conditions necessary to individuate this aspect of human action. Through their social action, in fact, men more or less consciously create or destroy value for themselves or for others. Also, such value should not be exclusively considered in terms of economic utility. It: 1) exists, as it constitutes one of the main purposes of human action; 2) has a hybrid nature, as it can be observed for different aims and from different points of view; 3) changes and can be measured, albeit in a complex way, with relation to social, cultural, environmental and anthropological factors affecting its very origin.
Let us proceed with more order. First of all, we can say that public value can be pursued by each individual, either considered on his/her own or organized with other individuals. It is quite clear that, if each individual is able to pursue it, such value should only be considered public if the effects of human choice or action involve other individuals, under any (social, economic, psychological, etc.) profile. It is worth pointing out, however, that it is very difficult to think about individual choices that are not able to affect, in one way or another, other people's lives. Bearing this in mind, we could get one day to a full and comprehensive assessment regarding the relevance and significance of all individual choices, taking into account the fact that a social person is always a political person, i.e. someone called to participate in and contribute to the life of any form of human association (Tronti, 2010).

The present study aims to address the issue of individual political action and of the political capital consequently produced in favour of the community. More in detail, it will examine the actions taken by an individual who has been specifically appointed to run public affairs, that is to choose priorities, lead towards certain targets, implement plans, control the action, produce or take part to the production of a public service that could benefit the reference community (welfare community). Even the exercise of voting rights is a necessary condition for good political governance and as such it is of crucial importance to the community (Brennan, 2011), but this is a topic we shall not be addressing here.

Value is created and destroyed whenever an individual is called upon to perform any of these activities in relation to a public service (Denhardt J. and Denhardt R., 2003; Kelly, Mulgan and Meurs, 2002). In theory, these actions produce disvalue when their actual target becomes different from the one they were supposed to reach when they originated. This means we are able to understand whether a certain behaviour - or an omission - by a politician are such as not to create or even destroy value, when we are able first to measure and then evaluate the effects of such variance. It is therefore paramount to understand what the good pursued by political action is, what originates and motivates political action, that ultimately is any action carried out in the society and for the society. In order to better understand the significance of this statement, it seems extremely useful referring to Aristotle (Natali, 2003; Laurenti, 2009) and going back to over 2300 years ago. The great philosopher addresses the question as follows: "(...) all knowledge and every pursuit aims at some good, what it is that we say political science aims at and what is the highest of all goods achievable by action. Verbally there is very general agreement: (...) it is happiness" (Nicomachean Ethics, Book 1). Happiness should therefore be the good to be pursued through politics. From what is considered happiness depends therefore whether and how public value is created or destroyed after meeting an ever changing (Dahrendorf, 1981, 1995) social desirability (Dahrendorf, 1994: 30). Everything seems to balance if we
stay away from the relevant moral and religious considerations which we are not going to address here. However, it is almost impossible to reach a univocal definition of happiness: philosophical inquiry is as wide as uncertain and complex, and above all endless. Many questions come to one’s mind, including: is happiness the same for everyone? Is it accessible to all? Does it coincide with the material well-being of all or at least most of the individuals belonging to a community? Again, can it be taught or become a habit? “(...) For if what was said in the Ethics is true, that the happy life is the life according to virtue lived without impediment, and that virtue is a mean, then the life which is in a mean, and in a mean attainable by every one, must be the best” (Aristotle, Politics, Book 4). But how can Aristotelian happiness, either individual or collective (of the polis) actually be found? How can it be achieved? These are truly complex questions. This paper therefore only aims at studying the metamorphoses of public value, trying to understand what kind of political action public sector companies should take in order not to overlook the general end, creating the conditions necessary for each individual to gain in terms of current benefits or future opportunities, either directly or indirectly. Following this approach, public sector companies and administrations are the means by which a community solves practical problems regarding political action, which aims to make community members ‘happy’ (simplifying, today we would just say satisfied). By replicating Bozeman and Jorgensen’s model (Bozeman, Jorgensen, 2007: 361) of ‘visualization’ of logical-cognitive ‘constellations’ and conceptual maps of the public value universe, we can say that:

1. each individual, as a member of his/her community, is a political person;
2. human action, and particularly political action, affects other people’s lives;
3. political action also involves the government of public affairs;
4. the good pursued by political action is individual and collective happiness;
5. happiness implies the satisfaction of material and immaterial needs;
6. some material and immaterial needs can be met through the government of public affairs;
7. public value is one of the expressions of collective happiness;
8. public value can increase or decrease as a result of political action;
9. metamorphoses of happiness result from changes of complex and different (sociological, institutional, political, etc.) nature;
10. metamorphoses of happiness involve metamorphoses of public value.

It seems therefore totally impossible to talk about public value and especially to consider its whole multidimensional nature without tackling, at least in part, some issues about its meaning. What concerns us here is to show how political action can create disvalue whenever it moves away from the common good, that is whenever collective happiness is jeopardized, as we can reasonably associate the latter with the common good and the general interest: essential rights, development of personal
skills, recognition of human dignity. What makes a family or a worker happy with relation to the conduct of a public administration? What does one expect and what gives satisfaction to a patient with relation to public healthcare? What are the effects of widespread corruption among public officials? What public policies tend to maximize the pathological behaviour of officials and politicians? The ‘strategic triangle’ approach to public value by Moore (1995), despite being an important tool for the study of public action success, does not thoroughly cover the issues regarding how to visualize and determine value, and how to prevent harmful behaviour. Experience from the world of professional consulting (Accenture, 2004), however useful to understand the empirical relevance of public value, does not seem to account for all the different notions of it and for its metamorphoses (Cole, Parston, 2006). On the one hand, theoretical approaches tend to confine research on public value within a paradigmatic debate, or one which is too often about the abstract identification of conditions at the basis of public administration activities (NPM), while on the other hand more practical approaches risk to restrain the notion of public value within economic and financial determinations that are often too narrow. The real challenge of the coming years will be entirely about intellectual capital, in its most important form: the political capital. It is the set of ideologies, relations, skills and combinations of those, expressed by public sector companies and the relevant ruling class, either political or managerial, that contributes to the creation of public value. Such capital can combine and coordinate appropriate levels of equality and collective utility (Borgonovi, 2004: 344).

The political capital can be visualized in terms of trust or reliability the community ascribes to public entities. Such attributes are based on different parameters: detail and incisiveness of rules, transparency of information, degree of corruption and of technological innovation, state of the culture etc. (Morin, 2012). They also change as the notion of public value changes. Following this approach, public value should not be calculated as a mere difference between the value of the utility produced for the community and the value of the costs borne by the latter to reach it. Such differential factor would be very difficult if not impossible to determine, as utility produced is not always measurable being it of cultural, historical, legal or social nature. Even if it was, it would still be of no real significance, as its relationship with time is not univocal. Public value may be, however, identified in a set of factors that constitute both the goal and the mean of political activity, and still express human action potential that can lead to good administration and collective happiness.

Overcoming some long-established ideological positions, or in some cases their exclusive strengthening, do not imply – respectively – that those positions no longer exist or instead that they are paramount in the process of creation of public value, which should be eventually seen – with Aristotle – as the decisive factor in the removal of all obstacles to the expression of human virtues. Public value is created when the community promotes and enables the realization of all human
capabilities (Nussbaum, 2011), while the same is destroyed when the community is prevented from doing so.

There is a further issue, though, one which is not at all secondary: how does public value, as generated by political capital, change following the apparent cultural and anthropological transformation of happiness?

In other words how does a better quality of life, in terms of material and immaterial well-being, affect both the creation and destruction of public value? Are changes of political action, determined in turn by a transformation of the factors that shape a community (religious sense, education, value system, but also skills and sense of civic duty), able to affect public value or not?

6. PUBLIC VALUE (PV) AND PUBLIC VALUES (PVS).

The theme of public value has long been the subject of attention in academic community. In recent years it has become also known among a non-specialist audience, this way becoming part of what we can call a new ‘management frenzy’ (Abrahamson, 1991, 1996). From a theoretical point of view, the research work was inspired by the debate that, according to some authoritative authors, began in 1995 with Moore, who was at that time dealing with the subject of quality in PA (Jorgensen, Bozeman, 2007: 361). Through further elaboration, clarification and contextualization, it has then developed into a model that features the theory of public value as a new paradigm – integrative or even alternative to NPM – that was named Public Value Management (Stoker, 2006; O’Flynn, 2007; Alford and O’Flynn, 2009). The rationale behind our research lies therefore in the multidimensionality of the notion of public value and in its obvious implications for public governance, following a path that has led us to focus, both theoretically and empirically, on the study of public value measuring methods and on their application to the case of Italian public administration.

TRENDS

During the 80s and the 90s the scientific debate on public sector reforms was marked by theories, notions and values then constituting the framework of the new public management (NPM), an approach that undoubtedly broke with the traditional bureaucratic paradigm of public administration. Within the rich literature on NPM we find key notions and ideas such as the transition to a professional management, the use of standards and performance indicators, the emphasis placed on the control system, organizational decentralization, the establishment of competitive procedures and processes, the adoption of management styles typically used in the private sector, a more effective and efficient use of resources, the equalization of the citizen to the customer (Savas, 1982; Hood, 1991; Broadbent and Guthrie, 1992; Osborne and Gaebler, 1993; Kelly, 1998; Pollitt and Bouckaert, 2004). By
the mid-90s the NPM approach, seen as a synthesis of managerial innovation experiences carried out in the public administrations of the most advanced countries, but also as the philosophy behind the role of the public administration as a key player in the quasi-market, started to be reviewed and reconsidered. Scholars have gradually become aware of the fact that certain principles stated by NPM cannot support the need of the community for a government able to ensure the creation of public value that, by its very nature, is radically different from any value generated by companies operating within the free market (Moore, 1995; cfr. Bozeman, 2002; Blaug et al, 2006; Spano, 2009). The basic idea is that the creation of public value (Rebora, 1999; Valotti, 2000; Borgonovi, 2007) should be paramount not only in policy makers' choices, but also in public managers' actions, in exactly the same way private value is crucial to private managers' decisions (Moore, 1995; Stoker, 2006; Flynn 2007).

CHALLENGES

Scientific literature has shown how public managers are given a much more demanding task, which is to combine purely political issues with those of a more technical nature, in order to ensure the creation of public value (Hefetz and Warner, 2004). This re-assessment of changes occurring in public administrations had the effect of reducing the expectations towards the NPM model of a public sector based on free market mechanisms while - perhaps not without critics - has the merit of sorting, at least partially, the logic according to which the public sector works from free market logic, bringing the focus back to values typical of the former. The approach to public value was born at the beginning of the '90s, independently from NPM studies, and it has gradually become an important part of their development and revision, first by highlighting and then by filling and amending their gaps and inconsistencies, respectively. This has led in some cases to significant changes of direction in the process of modernization of public administration compared to originary NPM issues. It has been restored, in particular, the notion that policy makers should take into account multiple goals. According to this relatively new approach, the citizen is not seen as a customer, but rather as someone who contributes to shape decisions and public policies that are ultimately taken by managers operating with transparency and providing quality public services, so as to increase not only the effectiveness and efficiency of the action itself, but also the legitimacy and trust placed in politics and institutions (Osborne, 2006, 2010). The theory of public value is based on the need to assess public services and to achieve higher levels of efficiency and effectiveness. This would in turn facilitate the establishment of an accountability culture where the public management should be held responsible as much towards citizens as they are towards politicians, overcoming a static approach based on top-down models where public managers try to reach targets set at central level following performance management criteria. It was argued (Blaug et al., 2006) that the public value model tries to compose the tension between bureaucracy and democracy. The assumption at the basis of the public value
theory is the acknowledgement of needs and preferences of the citizens, who are the recipients of public services, in order to avoid that any decision regarding quantity and quality to be delivered stays only in the hands of politicians, public managers or of the private companies in charge of providing the services in question. Public value should therefore be seen as a key factor in the design and implementation of political decisions and strategies regarding the services to be provided and should involve the entire decision-making process, right up to the final stage when the service is offered/provided to citizens (Lapsley, 1999; Sevic, 2001; Marcon and Russo, 2008). The design of the public value of a service begins therefore from the moment the service is planned according to what is expected by the community and its potential users.

7. CONFUSION REGARDING THE DEFINING PERIMETER OF ITALIAN PV and PVs

In recent years there has been in Italy a perception and ‘visualization’ of public value almost on a molecular scale, and at the same time we have witnessed conceptual contradictions originated by growing confusion (De Graaf, Nabatchi, Van Der Wal, 2012), perhaps due to terminological and definitional ambiguity of the following terms (Jorgensen, Bozeman, 2007: 355):

Public Value
Public Values

not acknowledging the importance and influence that public values, defined according to different hierarchical taxonomies (Jorgensen, Bozeman, 2007) and expressed by constitutionally guaranteed rights (Bozeman, 2007; Borgonovi, 2001, 2008), have in determining and affecting the perception, ‘visualization’ and generation of public value.

CONTRADICTIONS

In a State where rights, responsibilities, freedoms and democratic boundaries change rapidly over time, where the different dimensions of public value become growingly central to the government of citizens and the life of communities, there may be the risk to confuse cause and effect, returns and investments, ends with means. It is possible to find in scientific literature several definitional and conceptual perimeters regarding the notion of public value, which consider citizens either direct beneficiaries (Dicke, 2006), or direct generators through the manifestation of their preferences (Moore, 1995; Kelly, 2002: 4; Borgonovi, 2004, 2005: 47; Brennan, 2011). We can talk about public value when there is a community of individuals who benefits from such value (De Bruijn, Dicke, 2006: 719). The inadequacy of political capital, caused by poor combinations of ideologies (now diluted), relations, skills, ligatures (Dahrendorf, 1994) generates transformation, dispersion and destruction of public value (dis-value), compromising the quality of administrative decisions, and of political and social choices, with harmful effects brought over time by their financial and economic manifestations.
Our PV is the effect of an investment in a political capital that is at boiling temperature and whose state has been constantly changing. Such metamorphoses have led it to ideological liquefaction and to a confused and chaotic dispersion of ethical behaviour (Brennan, 2011), of ideological orientations, skills and social ligatures in constant contradiction, and to conflictualism (Dahrendorf, 1981) between happiness of the individual and happiness of the community, or between the happiness of a State and the happiness of more States in order to preserve the specific happiness of other single States and interest groups (e.g., Greece and the EU). The public values that can affect and shape a different perception and visualization of happiness, i.e., of the capacity of the Italian Public Administration to detect and meet the needs of our community, are in turn affected by the specific cultural and ideological background (secular and Catholic) where public value originates and grows. In Italy, more than in other countries, dominant religious values have affected the political capital and thus the production of public value being created and/or destroyed, and sometimes regenerated again (plus-value) (Pollitt, 2010). It is precisely due to the strong presence of some dominant religious and cultural values (Catholic Church), such as the centrality of the family with its distortions (Banfield, 1954) that in Italy we can find, still contaminated by other ideological and cultural factors, different public values within which it is possible to visualize PV (Guthrie, Farneti, 2008; Spicer, 2012).

8. PV AND P(DIS)V

The Constellation Theory: Public Universe (Value, disValue, PlusValue) The research aims at visualizing the public (dis)value, an abstract quantity in public administration government systems, according to the model describing the ‘constellations of the public disvalue universe’, proposed by Bozeman with relation to public value (Bozeman, Jorgensen, 2007). It is a conceptual framework based on the abstract character of the public value universe, that mirrors constellation patterns we identify within an observable radius (Galileo, 1609; Kepler, 1599).

Figure 7 - The constellations of the PV universe
Literature analysis takes into account corruption phenomena within public institutions that led to social, institutional and financial weakness also within part of the private, free-market system (Borgonovi, Fattori, Longo, 2008), which represents a failure of part of the reform process and in general of the reformitis trend (Ricci, 2012) that has affected the Italian Public Administration for the past twenty years, also causing:

a) the failure of NPM implementation in Italy (through the emphasis placed on good governance and on PV measurement);

b) an identity and financial crisis affecting the whole country;

c) a weak sense of belonging to the community displayed by citizens, and unwillingness to change/progress on the part of public managers;

d) an unbalanced system of creation and preservation of electoral support and of political capital (essential prerequisite for the production or destruction of value).

From the literature analysis (attached), it is possible to see a whole universe of public dis-value and the different constellations that form the reticular connective tissue between the structural determinants of corruption and the creation of political support and capital; autonomy, dependability (loyalty), governance (Reichard and Wegener, 1988; Frey and Benz, 2004; Kooiman and Van Vliet 1993; Cassese, 2002, 2004), social forms of self-organization (Kickert 1995; Meneguzzo, 1996), accountability (Jones, Schedler, Mussari, 2004; Metcalfe, 2000; Jordan, 2005; Osborne, 1995; Pezzani, 2003; Ricci, 2010), all forming a conceptual perimeter where corruption can only represent an acute symptom of the Country's democratic and institutional weakness and probably of the inadequacy of the culture behind the control systems and the management techniques adopted (Von Maravic, 2007). Our approach led us to identify three constellations. The first two are the political capital and its generation of dis-value, or degeneration (destruction) of value. The third constellation is described in the final part of the case study. In this constellation, accountability (part of the sixth constellation in Jorgensen, Bozeman, 2007: 368) and its various manifestations are useful tools to tackle or prevent the destruction of value (dis-value), and the transformation and re-generation of new value. The figure below shows the reticular pattern according to which political capital, a component of social capital (Putnam, 1993), can be weakened and compromised by the different factors that together are able to destroy public value, as they can either satisfy social desirability or cause (un)happiness in the Aristotelian sense of the word among the whole community.

T1 = the determinants of political capital = f (Ab-use of power, ideological dilution, poor regulation, low competence of representation, lobbying, nepotism, corruption, tax evasion, control, transparency)
T2 = individual and existential damage
T3 = weakening of the State
T4 = weakening of the market
T5 = weakening of control
T6 = reputational damage
T7 = damage to public integrity
T8 = damage to public integrity over time - future generations
T9 = dependability and lack of autonomy

In literature, given the already mentioned limitations regarding the use of economic goods compared to the collective needs to be met (such discrepancy determines in fact the condition otherwise known as scarcity of resources), corruption within the public administration contributes to distort reality and
public policies in Italy \((RQ1, RQ2)\), where the public disvalue, i.e., the destruction of value, is caused and created by the loss of political capital (through the different determinants involved, and their possible combinations). They can be summarized here as follows:

- electoral abstention, renunciation to voting and to adequate levels of democratic representation;
- disruption of the financial balance of public finances (tax evasion);
- diminished capacity of affecting reality by planning and control systems, now mere bureaucratic tools set by the respective internal stability pacts;
- inequality of taxation with relation to citizens living in areas with a lower fiscal capacity per inhabitant, due to the implementation of an incomplete and confused federal system (\((ab)\ use of power\);
- unpopular tax planning decisions (\(tax\ amnesty\)) with increased levels of local, regional and national taxation sometimes unjustified if compared to the services provided;
- public budget rigidity and financial losses arising from off-balance-sheet management and off-balance-sheet debt (lack of financial coverage);
- existence of asymmetric information between guidance and control activities operated by local authorities.

**Fig. 9:**

*(Constellations of the public dis-value universe)*

T1 = lack of revenue to fund public policies for citizens

T2 = individual and existential damage

T3 = weakening of the State

T4 = weakening of the market
Scarce political capital resources invested in different representative and democratic processes cause therefore destruction of value, (dis)value, that prevents a sustainable and transparent development of public policies and is marked by persistent decision-making discretion, arbitrariness and abuse of political power, all erosive of public value and of the connective fabric between the systems and the ethical infrastructures of a community on the one hand, and the sense of belonging to it manifested by its citizens on the other (Moore, 1995, 2002; Stoker, 2003; Benington and Moore, 2011). One might wonder where this opportunistic and perverse behaviour (RQ2) comes from. The answer to this phenomenon is rather complex: control of the territory can be seen as competing with the state authority up to the point of defining it as a parallel authority that is organized and operates using the same tools of traditional PA, i.e., legitimacy, public resources and authority over all those people who have been co-opted into the vicious circle of corruption. The ‘grey area’ between the two authorities has grown dramatically in recent years, as testified by the growing number of corruption and bribery offences. It is the mismanagement of public affairs that prepares the ground for corruption. Corruption ‘is a malignant tumor that surrounds the most vital and active ganglia in the country and does not seem to go away’ (Corte dei Conti, 2010).

This phenomenon is not even affected by the current financial crisis, as it is exactly this kind of situation that usually boosts the value of assets belonging to criminal organizations. Instability causes a fast and significant wear of the political-institutional system and ‘plows the ground’ for the growth of groups, lobbies, special interests, either lawful or, in many cases, unlawful (Cavaliere, 2004). Examples of this are healthcare mismanagement, illegitimate appointments, a frequent use of negotiated procedures, an opaque system of public procurement, EU fraud schemes and scams related to local tax collection, appointments related to the performance and delivery of local public services, which have been since the ‘70s perhaps the most striking case of ‘cost of democracy’.

The companies involved, in most cases publicly owned and sponsored by politicians, were plagued by financial scandals and very poor industrial strategies (Gallino, 2005) as their unwritten goal was that of ensuring administrative continuity through the establishment of durable electoral pacts (Ricci, Esposito, Landi, 2010; Esposito, 2010). It is possible to represent this form of corruption as follows (Figure no. 10):
The cases examined by the Italian accounting judiciary (Corte dei Conti) are examples of low public and political responsibility, or of social irresponsibility (Gallino, 2005), while social responsibility should be one of the most important features required to run public affairs (Borgonovi, 2002, 2005). The growing importance of the system of political parties (electoral laws), leading to the pathological situations described above (public procurement procedures, public service management) has no justification whatsoever in art. 49 of the Italian Constitution which states that all citizens have the right to freely associate in political parties to contribute, within a democratic process, to determine national politics. The constitutional right regarding freedom of association in political parties is the result of a protective idea of the Constitutional legislator aimed at overcoming the objective impossibility for the individual citizen (user/voter) to make him/herself heard (Ricci, 2010). There are currently different studies, drawn especially by general economists, regarding the determinants of corruption which consider it as dependent on the quality of governments and institutions and on the degree of openness to trade of a Country (Broadman, Recanatini, 2001; Cepiku, 2002, 2004; Mussari, Jones, Schedler, 2007; Von Maravic, 2007).
Formula on corruption

\[
\text{Corruption} = f (\text{quality of governance, quality of political institutions, openness to trade}) = B_1 + B_2 \\
\quad (\text{institutional indicators}) + B_3 (\text{democracy index}) + B_4 (\text{trademarks, designs and index systems})
\]

(Source: Broadman and Recanatini, 2001)

International organizations have been trying to monitor and prevent corruption phenomena and the generation of public disvalue. Transparency International\(^9\) presents each year the world ranking according to the corruption perception index (CPI) referred to 180 States, thanks to the work of institutions (World Bank, UN, Asian Development Bank) that systematically carry out investigations regarding corruption levels in certain States or geographical areas. Given the importance of statistical data and indicators of perceived corruption, it would be appropriate for such figures to be supported by independent scientific assessments. To give an idea of how corruption is currently widespread in Italy, we report the 2011 ranking below (table no. 1)\(^9\):

Table 1 – CPI (Corruption Perceptions Index) classification, 2011

(Transparency International, 2011)

\(^{9}\)Non-governmental, non-profit organization founded in 1993 with the specific aim of fighting international corruption by working with international institutions, States and businesses.

\(^{9}\)For the full table of the index regarding the perception of corruption in the world, see also www.transparency.org/policy_research/surveys_indices/cpi/2009/cpi_2009_table
Some Italian research institutes such as CNEL and ISTAT have been focusing their attention on corruption phenomena in local public administration and problems regarding development and economic growth in our country. CNEL, in particular, through its observatory on socio-economic crime, has been studying since the mid-90s the pervicacity of corruption in public management, which places Italy after developing countries such as Botswana and Namibia in terms of perceived corruption.

The case study chosen takes only into account the process of re-generation of new value through the management and restoration to the community of real estate property confiscated from the Mafia (White, 2012), because data referring to businesses seized from organized crime and then re-converted are only available for the past two years and, however interesting, the time frame they refer to is not deemed significant enough to draw conclusive indications on the phenomenon in question. According to data released by the 'Report on the management of assets confiscated from organized crime', presented by the Director of the State Property Agency to the Parliamentary Anti-Mafia Commission, out of 6556 assets seized from the mafia from 1983 to 2005, only 2962 were later restored. Patrimonial prevention measures (L. 31 May 1965 n. 575 and subsequent amendments and additions) aim to ensure not only the seizure of assets from organized crime, but also their return to lawful economic channels, entrusting Agenzia del Demanio with the management of those assets after the final seizure in view of their subsequent use. Between 2007 and 2008, 84% of confiscated property was located in Sicily, Calabria, Campania and Puglia. Sicily is the region with the highest number of seized property, with more than 50% of the total. 89% of confiscated property was transferred to the municipalities for institutional or social purposes, while the rest was given to the central State for justice, public order and civil protection purposes.

Despite the simplification of administrative procedures and the expectation of shorter times for the allocation of goods, problems related to the application of complex administrative procedures led first to the creation of a permanent observatory on confiscated property, then to the appointment of a Government Special Commissioner. Corte dei Conti, with resolution no. 17/2005/G issued on 1/7/2005 (Implementation of the provisions on the re-use of assets confiscated from organized crime - L. 109/1996), examined the activities carried out by Agenzia del Demanio from 1/1/2001 (when it officially assumes the relevant powers) to 31/12/2003 (when the Agency officially becomes an economic public body). While we can say there have been initiatives aimed at streamlining procedures and at monitoring seized goods even before the final judicial seizure, the report showed the long time needed to issue the destination decree (far too long compared to the limits set by law) and in many cases the non-use of the goods in question, due to technicalities pertaining to the judicial phase, or to difficulties in managing the assets (because of the existence, for example, of third-party rights on the assets themselves), or simply because properties had not been physically delivered.

The conclusions reached by Corte dei Conti were as follows:
- absence of management planning
- lack of coordination with other inter-institutional bodies
– little use of productivity and profitability criteria
– need for inspection controls on peripheral branches of Agenzia del Demanio

Agenzia del Demanio keeps track of the 7,875 confiscated properties and their destination.

Figure 12: Percentage of delivered goods

Source: Agenzia del Demanio (State Property Agency)

47.30% of the properties seized was allocated to local authorities. According to the analysis carried out by the former Special Commissioner through consultation with local authorities acting as temporary administrators of the properties waiting to be re-converted, some mayors have specifically mentioned the lack of a specific fund to be used for potential transactions. The same source also shows the non-use of 40% of the properties seized due to foreclosures operated by banks as a result of mortgage provision.

The vicious circle of underdevelopment triggered by criminal alliances and joint ventures increases the costs necessary to buy properties, renovate, maintain and re-convert them. Financial needs by local administrations also trigger a rapacious profit-maximizing behavior on the part of lenders, as they often grant – in the pre-seizure phase – easy credit to untrustworthy individuals (in many cases without requiring the antimafia certificate issued by the local Chamber of Commerce), while they sell – post-seizure – financial products and services to local administrations to be used for the conversion of such facilities (sometimes in blatant conflict of interests – banks are often financial advisors to the same administrations), finding such local bodies captured and unprepared with relation to the following activities: - ex ante financial assessment; - financial planning of activities; - operating management, either direct or through proxy; - control and supervision; and in the difficult task of
finding possible solutions in a context of persistent lack of financial resources and at the same time of high demand by the communities involved of policies aimed at restoring legality.

The survey also examined the time span going from the moment the goods are assigned to their actual use. Data provided by Agenzia del Demanio show that some goods destined to local authorities in 1989 are today still unused.

Source: Agenzia del Demanio (State Property Agency)

In order to simplify the relevant procedures, local councils have been arguing that they should not only take part in technical workshops in which to determine guidelines and goals of the whole process, but also make sure that all critical issues are not transferred to local authorities which often have to face abnormal problems and challenges, well beyond ordinary local government standards. Local authorities in the South, acting as carers of the properties seized, do not usually have the economic resources necessary to restore them, and therefore try to assign them 'as they are' i.e., in the same condition in which they received them. On the other hand, economically disadvantaged community members who are given use of the good are often not able to access it, as they might not have enough resources to invest on a property they do not fully own. In fact the confiscated property, part of the council's inalienable estate, is assigned to the cooperative or association under a free loan agreement. This means that the property cannot constitute a guarantee for banks wishing to lend money to whoever wants to take care of it, even more so if one considers the 'weakness' of a free loan agreement.
Figure 13 - Real estate confiscated from organized crime

Source: Agenzia del Demanio (State Property Agency)

Data shown highlight the weight of companies and assets seized in northern Italy. Lombardy, for example, turns out to be the fifth in terms of number of confiscated properties. Tables placed above show the subtraction and liberation of the assets confiscated from the mafia, and their return for social purposes to the reference community, through an important process of metamorphosis, transformation and re-generation of new ethical value (from dis-value to value), which we could define plus-value. Public managers and their organizations play a leading role in creating public value, not only by producing – efficiently and effectively – goods and services that can add value to the reference community, but also by pursuing goals and targets that are of a purely social and ethical nature. The public subject must be the guarantor and the custodian of the public interest, putting its citizens/users/customers’ welfare before any personal interest. However, in the current system of Italian Public Administration, the management of the administrative machine is anything but inspired by principles of equity, sociality and ethics (Borgonovi, Giavazzi, 1994; Cavalieri, 2002). Alterations and distortions of political action, transformations, metamorphoses and destruction within the constellations of the public (dis)value universe (Jorgensen, Bozeman, 2007: 355) have arisen due to a lack of political capital, caused by an unbalanced and inadequate combination of factors, by ongoing tensions and frictions between the devolvement of greater autonomy and power to local authorities, and the consequent allocation of responsibilities in the management of public resources. Such imbalances have produced in recent years deep lacerations up to the point of seriously compromising planning, administration, management and control processes at any level within the Public Administration. The most common effect of this failure of Public Administration management is
corruption, which takes place whenever there is contempt for the common good and some people transform public affairs in private business and public organizations in personal property (from public value to public (dis)value). Any information requirement and the citizens' right to interact with the Public Administration whenever it is called to account for its activities, comes from the general principle regarding the social responsibility of public sector companies, in which accountability can play a significant role in qualitative terms, in addition to standard economic, financial or otherwise quantitative informational channels. The recent trend about seeking greater levels of accountability and transparency (Weihe, 2008; Van Der Wal, 2008; Jorgensen, Sorensen, 2010) in the decisions and actions taken, that affects not only public sector companies but also private businesses, can be related to several factors (Ricci, 2010):

- the different meaning given in recent years to accountability, which is no longer based on mere compliance to rules and regulations but it is now seen as an important tool to facilitate the participation of citizens to administrative action and to inform them about the achievement of targets, thus highlighting areas of responsibility (with relation to managers and politicians) in the measurement of results;

- a clearer definition of models regarding performance measurement and autonomy determination, in order to properly sort areas of activity between different government levels (internal governance and accountability);

1. the creation of representation models aimed at increasing the citizens' knowledge of administrative activities, this way sharing the results achieved (external governance and accountability);

2. the improvement of the quality of public services through the definition of qualitative and quantitative standards for an easier and more immediate assessment of satisfaction levels, as expressed by citizens (customer satisfaction);

3. the improvement of internal and external control systems in order to facilitate an independent evaluation of the performance realized and the results achieved.

It is important to emphasize here the autonomy gained by local administrations (from programming to management and control stages), the responsibility that comes with it and above all the capability to explain what has been achieved (accountability), in order to measure the public value created and to prevent distortions within an adequate system of public governance.
Accountability, as described above, makes therefore possible to prevent, cope with and limit corruption phenomena (Banerjee, 1997; Lederman, Loyala, Soares, 2004, 2005; Ricci, Esposito, Landi, 2010). It also allows the measurement of the public value produced for the whole community by monitoring performance (seen not only as the value of the benefits produced for users and recipients of public activity, but also as the activity carried out to achieve a specific target). There are seven key variables that help to identify a proper accountability system (Ricci, 2010):

- a thorough and clear planning process;
- a clear definition of internal and external responsibilities;
- an effective accounting and extra-accounting detection system;
- an effective internal system for control and evaluation;
- periodic PR campaigns regarding the activities carried out;
- a significant benchmarking activity;
- a proper use of technology with relation to communication processes.

The presence of these factors should facilitate a clearer definition of responsibilities and the implementation of a better assessment process.

Figure 14:

(Use of accountability for bringing to light and tackling the determinants of public dis-value)
T1 = a thorough and clear planning process
T2 = a clear definition of internal and external responsibilities
T3 = an effective accounting and extra-accounting detection system
T4 = an effective internal system for control and evaluation
T5 = periodic PR campaigns regarding the activities carried out
T6 = a significant benchmarking activity
T7 = a proper use of technology with relation to communication processes

Figure 15:
(Use of accountability for bringing to light and tackling the determinants of public dis-value)

T1 = inadequacy of political capital
T2 = individual and existential damage
T3 = weakening of the State
T4 = weakening of the market
T5 = weakening of control
T6 = reputational damage
T7 = damage to public integrity
T8 = damage to public integrity over time - future generations
T9 = dependability and lack of autonomy

The accountability process (RQ3) put in place by our National Agency with relation to properties confiscated from the Mafia and then released, returned and re-converted in social activities for the community (nurseries, legality laboratories, land to be used for organic food production), has therefore highlighted how political capital can transform public (dis)value (given by Mafia infiltration of
vital business and political ganglia within local authorities, in order to take possession of common goods and resources. Such (dis)value, through a different and better combination of the factors constituting the political capital, undergoes a positive (leading to higher value) metamorphosis, through the re-generation of new ethical, reputational, economic values (plus-value) to be re-assigned (Onida, 1958) to the whole community.

ENERGY MANAGEMENT IN ITALIAN MUNICIPAL PUBLIC ADMINISTRATIONS: AN ORGANIZATIONAL CULTURAL PERSPECTIVE

Rizzi, Francesco1; Annunziata, Eleonora2

1University of Perugia, Department of Economics, and Scuola Superiore Sant’Anna, Institute of Management
2Scuola Superiore Sant’Anna, Institute of Management

ABSTRACT

Public administrations play a fundamental role for sustainable development. They do not only set and facilitate the implementation of relevant policies in the field, but also influence markets leveraging on green public procurement and being first in adopting behaviours that are expected to have a positive social and cultural impact on local communities. Despite that, unfortunately, the lack of human and financial resources, combined with the struggle between different planning priorities, is often reported as the main reason for public administration achieving poor environmental performances. In this framework, a strong fit between employees and their organization might help enabling those extra role performances that might help mitigating this shortage of resources. This paper draws from the literature on person-organization fit to adapt and test the hypothesis that organizational dimensions are strong predictors of managerial and technical energy performance. Data from 729 valid questionnaires responses from environmental managers of Italian Municipalities show that energy managers might alternatively act as task managers or business partners. The main results indicate that formalization, team orientation, innovation, centralization and reward system are the key elements to control energy performance. Causal relations are discussed and presented along with theoretical and policy implications.

Keywords: Environmental performance, Organizational fit, Reward system, Green human resource management, Energy manager

1. INTRODUCTION

Since sustainable development discourses have pointed a spotlight on resource efficiency, energy efficiency (EE) has attracted a strong interest from public and private industries. If compared with other resource efficiency initiatives, EE is often easy to delineate, measure, communicate and replicate (IEA, 2014). EE is thus seldom neglected when pursuing sustainability. Energy service companies,
energy managers, energy audits, guidelines for EE, sustainable energy action plans, renewables and energy savings to carbon emissions converters are among the recurring elements in policies and policy tools that reflect the legitimacy and desirability of EE among sustainable performances.

To the date, research in field technical sciences has much more increased together with the relevance for business of EE than research in the organizational and managerial dimensions (Martin, Muuls, de Preux & Wagner, 2012). Despite that, the latter is far from being irrelevant. In fact, in times of scarcity of economic and financial resources, organizational resources determine competitive advantage (Carmeli & Tishler, 2004). Pertinent examples come from large multinational corporations, which pursue EE by re-designing their organizations for open innovation, as well as from smaller enterprises, which increasingly recognize energy managers as new professionals that operate as business partners across traditional functions (i.e. in primis, supply chain, procurement and R&D).

Organizational determinants of EE are a novel but still largely unexplored research field (Schulze, Nehler, Ottosson, & Thollander, 2016). The black box that mediates organizational dimensions ranging from internal culture to person-organization fit (P-O fit) and EE is a promising field of studies (Chai & Yeo, 2012). A major difficulty in investigating these relations because of the high heterogeneity of boundary conditions that might affect the observed relations, which means difficulties in isolating causal relations between variables among different cases. In such framework, this work attempts to provide a first investigation on the links between organizational dimensions and EE performances by analysing a highly regulated setting, which allows the assumption of reduced heterogeneity of boundary conditions, namely public administrations. These actors are highly committed toward EE not just because they cover a multifunctional role as regulators, building owners, tenants and developers and, lastly, boosters for market suppliers of energy-efficient products and services (Annunziata, Rizzi, & Frey, 2014), but also because of their need to adsorb best managerial practices from the private sector to cope with budget constraints (Carmeli & Tishler, 2004).

In the reminder of the paper, we present a grounded-in-theory conceptual model that links organizational dimensions and EE. The method section provides a theoretical justification of Italian municipalities as a meaningful research setting as well as details on the research design, data collection and measurement models. Results from ordered logic regressions are then discussed to distil theoretical and managerial implications that shed light on the relevance that such organizational elements as vision, goals, trust, social networking, centralization, formalization, rewards, openness to innovation, attention to detail, outcome orientation, team orientation and corporate social responsibility have on EE performance.
2. THEORETICAL BACKGROUND

2.1 Internal factors influencing energy efficiency

EE is a key resource to achieve economic growth and social development, competitiveness and environmental sustainability (IEA, 2014). Unfortunately, cost-effective EE potential remains untapped due to the existence of “energy efficiency gap” in all sectors of society (Jaffe & Stavins, 1994). Energy management is widely recognized as a primary means to achieve EE targets within organizations. Indeed, literature has shown the effectiveness of both energy management practices and investments in energy-efficient technologies (Thollander, Backlund, Trianni & Cagno, 2013). Accordingly, organizations aiming to improve their EE performance by implementing energy management practices need qualified staff dealing with energy issues (Sucic, Lah & Petelin Visocnik, 2017). In particular, the role of energy manager is crucial for successfully integrating energy management practices into the daily operations of organizations (ISO, 2011).

Martin, Muuls, de Preux & Wagner (2012) show that energy managers are likely to affect differently EE management practices and performance depending on their degree of power and authority, but also their competences that come with their position within organization. Indeed, energy managers who are at the lower level of management hierarchy contribute to EE practices by implementing technical measures at operational level, whereas energy managers being at the top of hierarchy can develop a vision of future energy strategy within their organizations (Martin, Muuls, de Preux & Wagner, 2012; Sucic, Lah & Petelin Visocnik, 2017). Moreover, energy managers can work in isolation or cooperate with other departments/function within organization (Martin, Muuls, de Preux & Wagner, 2012). Therefore, energy managers as key actors in the implementation of EE practices within organizations should be involved in the investigation to explore the relationship between organizational dimension and EE performance.

2.2 Energy efficiency and organizational environment

Thollander, Backlund, Trianni & Cagno (2013) recognize organizational elements as a fundamental dimension for implementing EE practices and improving related performance within organizations. Therefore, the identification of organizational elements associated with EE performance becomes a priority for organizations pursuing EE targets (Martin, Muuls, de Preux & Wagner, 2012). Previous research has identified organizational structure as influencing factor in the improvement of EE (DeCanio & Watkins, 1998; DeCanio, Dibble & Amir-Atefi, 2000). In particular, scholars have identified the effectiveness of connectedness and communication cost, and hierarchy of functions as components of organizational structure (DeCanio & Watkins, 1998; Martin, Muuls, de Preux & Wagner, 2012), but...
have neglected other components of organizational structure such as performance-based reward systems that foster the sharing of best practices within organizations (Szulanski, 1996).

Another aspect representing the deep framework of organizations is the organizational culture. Organizational culture is rooted in the values, beliefs and assumptions shared by organizational members (Denison, 1996). This organizational dimension plays an important role in organizations because it produces a collective identity of organization’s members (Hofstede, 1998), prescribes norms of behavior (Schein, 1990), helps employees to cooperate and communicate (Schneider & Bowen, 1995), and provides structure and control without relying on an authoritative management (O’Reilly & Chatman, 1996).

Since all abovementioned organizational elements are strictly connected to organizational members such as employees, the process of identification of organizational elements affecting EE performance can be supported by P-O fit concept that can be defined as “the congruence between the norms and values of organizations and the values of persons” (Chatman, 1989). Santos and Domenico (2015) recognize the multidimensionality and several organizational elements characterizing P-O fit. These organizational elements can include cultural aspects (i.e. organizational vision and goals, trust, social networks, innovation, attention to details, outcome orientation, etc.) (Tepeci, 2001; O’Reilly, Chatman & Caldwell, 1991; Kim & Lee, 2006) and structural ones (i.e. formalization, centralization performance-based reward systems, etc.) (Kim & Lee, 2006; Martin, Muuls, de Preux & Wagner, 2012). Therefore, P-O fit can provide organizational elements which energy managers as organizational members are able to perceive as crucial for improving EE performance within organizations.

### 2.3 Hypothesis and research question

Pursuing the improvement of EE performance is a challenge that requires relevant efforts within organizations. Therefore, it is necessary to identify organizational elements affecting EE performance. EE performance can be split into two: managerial and technical. Managerial performance identifies all practices that address EE from an overall organizational perspective to the level of business groups, functional area and facility through formalization of responsibilities and controls (Schulze, Nehler, Ottosson & Thollander, 2016). Technical performance regards the implementation energy-saving technologies and technical measures that reduce energy consumptions and related costs (Abdelaziz, Saidur & Mekhilef, 2011). Therefore, the following hypotheses will take into account the relationship between organizational elements and (managerial and technical) EE performance. Figure 1 shows the conceptual model to be tested.
2.3.1 Vision and goals
Kanter, Stein and Jock (1992) state that organizational vision determines clear organizational purpose supporting the achievement of goal. Moreover, clear organizational vision and goals engage employees in contributing to organizational goals and activities (Davenport, Javenpaa & Beers, 1996). Therefore, a clear organizational vision and goal have a positive impact on managerial and technical EE performance.

H1a: Clear organizational vision and goals exert a positive effect on managerial EE performance.
H1b: Clear organizational vision and goals exert a positive effect on technical EE performance.

2.3.2 Trust
Organizational trust is functional in achieving goals, because contexts promoting trust create a clear and predictable environment in which employees take risks and involve themselves in organizational goals (Kahn, 1990). Moreover, loyalty and trusting relationships avoid deception and the tendency to blame others for organizational failure (Nonaka, 1990). Another study finds that high levels of trust within organizations facilitate knowledge sharing, shared goals and lower transaction costs (Andrews & Delahaye, 2000). Therefore, EE as specific organizational goal can be positively influenced by the presence of trust within organizations.

H2a: Organizational trust within organizations exerts a positive effect on managerial EE performance.
H2b: Organizational trust within organizations exerts a positive effect on technical EE performance.

2.3.3 Social networks
Social networks consisting in communication, dialogue, individual or group interactions can support and foster knowledge-related organizational members activities (Leonard & Sensiper, 1998). O’Dell and Grayson (1998) show that both formal and informal relationships between employees are important for sharing vision and knowledge within organizations. In particular, organizational members very often prefer informal networks for communication (Stevenson & Gilly, 1991) and practices communities as knowledge-sharing networks (Constant, Sproull & Kiesler, 1996). Hence, EE performance can be supported and strengthened sharing knowledge and practices through informal and formal network within organization.

H3a: Effective social networks within organizations exert a positive effect on managerial EE performance.
H3b: Effective social networks within organizations exert a positive effect on technical EE performance.
2.3.4 Centralization

Some studies recognize the importance of hierarchical structure for sharing knowledge and goals within organizations (Creed, Douglas & Miles, 1996). In particular, the centralization of power and authority at higher level can reduce the inclination to exchange knowledge within organization (Tsai, 2002). Accordingly, some scholars claim that organizational structure should be developed to foster collaboration and sharing within and outside organizations (O’Dell and Grayson, 1998). Martin, Muuls, de Preux & Wagner (2012) highlight the importance of organizational structure in the implementation of EE. In some cases the effect of organizational structure and in particular the degree of centralization produces controversial effects depending on the kind of investigated performance (Zeng, Zhang, Matsui & Zhao, 2017). Then, a decentralization within organizations hinders EE performance.

**H4a:** The decentralization is negatively associated with managerial EE performance.

**H4b:** The decentralization is negatively associated with technical EE performance.

2.3.5 Formalization

Formalization consisting in the use of procedures, roles and regulations within organizations is controversial (Hempel, Zang & Han, 2012). Indeed, it is often viewed as a “red tape” limiting the ability to exercise authority and operate effectively (Tata & Prasad, 2004), but it can be also considered as a mechanism to provide strategic direction (Segars, Grover & Teng, 1998) and goal clarity (Organ & Greene, 1981). These contradictory interpretations can be solved if we analyze how formalization is applied. Indeed, formalization is positive if it clarifies goals, procedures, and areas of responsibility and enables employees to excise their mastery (Blanchard, Carlos, & Randolph, 1996). Accordingly, formalization clarifying roles, procedures and responsibilities fosters the implementation of EE.

**H5a:** The good formalization is positively associated with managerial EE performance.

**H5b:** The good formalization is positively associated with technical EE performance.

2.3.6 Performance-based reward systems

Reward and compensation systems aim to motivate and increase the performance of individuals and groups within organizations. These systems are based on the achievement of congruence between their goals and activities and those of the organization (Bonner and Sprinkle, 2002). Reward systems that foster employees to pursue the sustainability strategy through the improvement of organization’s social and environmental impacts are difficult to design and often fail to align with organization’s mission and strategy (Virtanena, Tuomaala & Pentti, 2013). Since some jobs (e.g. energy managers)
require multiple tasks and decisions based on several factors, the implementation of reward systems focused on narrow and specific performance measures will motivate behavior toward excelling in those particular measures. Accordingly, these systems incentivize performance that is incomplete or conflicting with the organization’s overall strategy (Epstein, 2009). Hence, incomplete performance-based reward systems hinder EE performance belonging to organization’s overall strategy. 

H6a: An incomplete performance-based reward system is negatively associated with managerial EE performance.  
H6b: An incomplete performance-based reward system is negatively associated with technical EE performance.

2.3.7 Innovation

Several studies highlight the importance of innovation for organizational effectiveness (Janssen, Van De Vliert, & West, 2004; Van de Ven, 1986; Woodman, Sawyer, & Griffin, 1993). Therefore, some organizations put efforts to create an innovation-oriented culture. Indeed, an innovation-oriented culture pursues both the will to be innovative and the development of supportive context for innovation (Dobni, 1998; Laegreid, Roness & Verhoest, 2011). Accordingly, innovative behavior consists in the identification and implementation of new and useful ideas, process, products, services and procedures (Farr & Ford, 1990). Some studies show that innovation-oriented culture supports organizations moving from its current state to a desired future state by fostering organizational change (Goh, 2002; Huang, Wu, Lu & Lin, 2015). Hence, innovative organizations are more likely to implement EE.  

H7a: Innovation-oriented culture within organizations is positively associated with managerial EE performance.  
H7b: Innovation-oriented culture within organizations is positively associated with technical EE performance.

2.3.8 Attention to detail

Organizations more and more have implemented quality improvement initiatives consisting of management practices intended to provide better quality products and services (Dean and Bowen 1994). The success of these initiatives relies on several reasons, but particularly on organizational culture (Naveh &Erez, 2004). O’Reilly, Chatman & Caldwell (1991) identified that attention to detail defined in terms of precision and accuracy as one of values that comprise the organizational culture. The literature presents a variety of perspectives regarding the integration of attention to detail within quality improvement initiatives. Some scholars claim that attention to detail hinders quality initiatives...
as part of the improvement of products, services, and processes and the development of novel values for the organization’s stakeholders (Baldrige 2001). Another stream of research argues that the importance of attention to detail reinforces new forms of behavior emphasizing conformity to rules and procedures, precision, and accuracy, which are crucial for quality improvement (Naveh & Erez, 2004). These controversial results foster the investigation of the influence of attention to detail in EE practices. In particular, attention to detail support the implementation of EE within organizations.

**H8a:** The importance of attention to detail within organizations is positively associated with managerial EE performance.

**H8b:** The importance of attention to detail within organizations is positively associated with technical EE performance.

2.3.9 Outcome orientation

O’Reilly, Chatman & Caldwell (1991) proposed that outcome orientation defined in terms of the achievement of results as one of values that comprise the organizational culture. The link between outcome-oriented culture and culture and performance has mostly been studied, but empirical evidence on this relationship is limited (Wilderom, Glunk & Maslowski, 2000). Garnett Marlowe & Pandey (2008) find a positive mediated relation between an outcome-oriented culture and organizational performance. Verbeeten & Speklé (2015) show that results orientation is positively associated with organizational performance. Accordingly, it is worth investigating the if specific subsets of organizational performances, such as EE performances, are still positively influenced by outcome-oriented culture. Hence, organizations with an outcome orientation are likely to implement EE.

**H9a:** Outcome-oriented culture within organizations is positively associated with managerial EE performance.

**H9b:** Outcome-oriented culture within organizations is positively associated with technical EE performance.

2.3.10 Team orientation

The literature identifies team orientation as a crucial component of organizational culture (O’Reilly, Chatman & Caldwell, 1991; Dean & Bowen, 1994). Team orientation consists in shared behaviors, attitudes and cognitions that are necessary to accomplish organizational goals (Morgan, Salas, & Glickman, 1994). This value results form a melding process that acknowledges similarities among team members (Earley & Mosakowski, 2000) without forgetting their peculiarities (Mannix & Neale,
Thus, any degree of team orientation facilitates the interactions within organizational members (Salas, Shuffler, Thayer, Bedwell & Lazzara, 2015). Therefore, some scholars find a relationship between team orientation and organizational performance, but this relationship depends on how team orientation and performance are measured (Beal, Cohen, Burke & McLendon, 2003). In this context, team orientation affects positively EE performance within organizations.

**H10a:** Team orientation culture within organizations is positively associated with managerial EE performance.

**H10b:** Team orientation culture within organizations is positively associated with technical EE performance.

Figure 1. Conceptual model

### 2.3.11 Corporate social responsibility

Corporate social responsibility (CSR) practices and programs are more and more common in organizations and are addressed to various stakeholders (e.g. consumers, communities, or employees). Even though Pohl (1996) state that CSR is not the content, but is the tool to implement the values, beliefs, attitudes and norms, namely the organizational culture, various publics consider CSR as one ethical behavior from corporations or organizations that can reflect organizational culture and values (Kim & Park, 2011). Therefore, CSR represents another crucial component of organizational culture. Although many studies have tried to answer if CSR has an effect on organizational performance (Orlitzky et al., 2003; Wu, 2006; Fifka, 2013), the results found have not been totally conclusive. Therefore, the implementation of EE provides another interesting field to test the effect of
CSR on organizational culture. Since Miras-Rodriguez, Carrasco-Gallego & Escobar-Pérezs (2015) find that CSR practices are carried out because organizations looking for performance rewards (e.g. profits or cost savings), CSR culture can foster organizations to pursue EE performance.

**H11a:** CSR culture within organizations is positively associated with managerial EE performance.

**H11b:** CSR culture within organizations is positively associated with technical EE performance.

### 3. METHOD

#### 3.1 Experimental design

Public administrations are suitable to identify organizational elements influencing EE performance due to the following motivations. First, public administration are affected by constant pressures to become more market and performance-oriented organizations (Swan, 2016). Therefore, these organizations put managerial practices in place to deal with private sector’s typical concerns and in particular budget constraints (Carmeli & Tishler, 2004). Another crucial aspect is the multifunctional role covered by public administrations, as regulators, but also as boosters for market suppliers of energy-efficient products and services (Annunziata, Rizzi & Frey, 2014; Testa, Annunziata, Iraldo & Frey, 2016). Moreover, public administrations allow to focus on organizational elements, because they traditionally operate in standardized contexts with rigid rules and strict hierarchy (Swan, 2016).

Here we choose to investigate Italian municipalities because Italian government has given a strong authority in local energy planning to municipalities and because Italy is the first European country for number of signatory municipalities within Covenant of Mayors initiative\(^20\) that aims to foster actions and policies for the implementation of sustainable energy at local level.

Since there were no previous data available on organizational dimensions and EE performance of municipal administrations, we used primary data from a questionnaire survey conducted among the Italian municipalities. The data were collected by an online questionnaire, from November 2015 to February 2016. The respondents were assisted in filling-in the questionnaire by phone. The questionnaire and the cover letters were sent to 4500 municipalities by e-mail. In order to reduce potential response bias, we used some procedural remedies. First, the questionnaire has been tested and validated by ten municipal energy managers already involved in energy efficiency projects. Second, we guaranteed complete anonymity of respondents and then we committed to providing an executive summary containing the main findings of the study after completion. Third, we avoided use of ambiguous or unfamiliar terms, vague concepts or complicated syntax in order to make simple,\(^{20}\) 3180 out of 6400 are Italian municipalities (03/02/2016). See: http://www.covenantofmayors.eu/about/signatories_en.html?q=Search+for+a+Signatory...&country_search=it&population=&date_of_adhesion=&status=

Global and national business theories and practice: bridging the past with the future

ISSN: 2547-8516

specific, and concise questions. Moreover, we avoided bipolar numerical scale values (e.g. -3 to 3) providing verbal labels for the midpoints of scales. The survey collected 729 responses with a response rate of 16.2%. The respondents were municipal environmental and energy managers.

3.2 Estimation model and measures
The organizational elements influencing managerial and technical EE performance were analysed by means of an ordinal logistic econometric model using STATA 12. To test our hypotheses, we proposed the following equations:

Managerial EE performance = α0 + βVision&Goals + βTrust + βSocial networks + βCentralization + βFormalization + βPerformance-based-reward-systems + βAttention-to-detail + βInnovation + βOutcome orientation + βTeam orientation + βCorporate social responsibility + ε

(1)

Technical EE performance = α0 + βVision&Goals + βTrust + βSocial networks + βCentralization + βFormalization + βPerformance-based-reward-systems + βAttention-to-detail + βInnovation + βOutcome orientation + βTeam orientation + βCorporate social responsibility + ε

(2)

Dependent variables
Managerial EE performance was measured by a categorical variable considering the integration of following managerial practices within municipality: presence of an energy manager and periodic monitoring of energy consumption for support decision-making process (Schulze, Nehler, Ottosson & Thollander, 2016).

Technical EE performance was measured by a categorical variable considering the integration of the following technical energy-saving technologies and technical measures: installation of smart meter in municipal buildings, implementation of EE measures in municipal buildings, installation of renewable energy source plants, installation of smart public lighting systems and implementation of electric mobility solutions (Abdelaziz, Saidur & Mekhilef, 2011).

Independent variables
We have adapted most of the selected constructs from scales used by other scholars. All items were measured on a seven-point Likert scale ranging from 1 (“not important”) to 7 (“the most important”). Vision and goals were measured by four items gauging the extent of which an organization is able to support the development of clear organizational vision, the presentation of a clear organizational vision by top management leaders, a clear transposition of vision into goals and a clear communication of goals (Davenport, Javenpaa & Beers, 1996; Kim & Lee, 2006).
Trust was measured by three items gauging the extent to which an organization is able to promote full confidence in the skills of coworkers, empathy among employees and collaboration among employees (Andrews & Delahaye, 2000; Kim & Lee, 2006).

Social networks were measured by four items gauging the extent to which an organization is able to facilitate external collaboration, external sharing of information, informal communication networks among employees and participation in communities of practice (Constant, Sproull & Kiesler, 1996; O’Dell and Grayson, 1998; Kim & Lee, 2006).

Centralization was measured by three items gauging the extent to which an organization is able to promote organizational member’s initiatives, decision autonomy at operational level and strict monitoring of operational decision (O’Dell and Grayson, 1998; Tepeci, 2001; Kim & Lee, 2006).

Formalization was measured by three items gauging the extent to which an organization is able to facilitate the implementation of clear roles and procedures, strict surveillance of internal commitment and high internal compliance (Blanchard, Carlos, & Randolph, 1996; Kim & Lee, 2006; Hempel, Zang & Han, 2012).

Performance-based reward systems were measured by four items gauging the extent of which an organization is able to promote opportunities for advancement, rewards based on performance, fair amount of pay, promotion based on competencies and performance (Bonner and Sprinkle, 2002; Kim & Lee, 2006; Virtanena, Tuomaala & Pentti, 2013).

Innovation was measured by three items gauging the extent of which an organization is able to facilitate innovation, willingness to experiment and creativity (Tepeci, 2001; Laegreid, Roness & Verhoest, 2011)

Attention to detail was measured by three items gauging the extent of which an organization is able to promote attention to quality service, precision and accuracy (O’Reilly, Chatman & Caldwell, 1991; Dean and Bowen 1994; Tepeci, 2001).

Outcome orientation was measured by four items gauging the extent of which an organization is able to promote attention to citizen’s expectation, outcome orientation, success orientation and actual achievement of operational objectives (O’Reilly, Chatman & Caldwell, 1991; Tecepi, 2001; Garnett Marlowe & Pandey; 2008).

Team orientation was measured by three items gauging the extent of which an organization is able to promote attention to employees, team orientation and concentration (O’Reilly, Chatman & Caldwell, 1991; Tecepi, 2001; Salas, Shuffler, Thayer, Bedwell & Lazzara, 2015).

Corporate social responsibility was measured by three items gauging the extent of which an organization is able to encourage respect for individual rights, ethical integrity and honesty (Kim & Park, 2011; Carrasco-Gallego & Escobar-Pérezs, 2015).
The descriptive statistics and correlation matrix of variables analyzed in the study are shown in Table 1. Cronbach’s α values for the constructs ranged from 0.78-0.95, suggesting high levels of measurement reliability. With respect to the quality of the measurement model, the loadings (λ) of all items of the eleven constructs listed in Table 2 are significant.

4. RESULTS AND DISCUSSION

The results of our model provide new and valuable information on how organizational dimensions determine EE performance. In Table 3, higher values of the response variables, i.e. managerial and technical performance, indicate respectively higher levels of formalization of responsibilities and controls on EE and higher levels of adoption of technical solutions for EE. Performance is treated as ordinal under the assumption that it has a natural ordering (low to high), but the distances between adjacent levels are unknown.

In both the estimations, the number of observations used in the ordered logistic regression (729) is lower than the number of respondents because of missing values for some variables in the equation, which are thus described only by observed data.

The probability to accept the error of incorrectly rejecting the null hypothesis (i.e. all of the regression coefficients in the model are equal to zero) is in both cases lower that a 0.001 level of willingness to accept it.

The ordered log-odds regression coefficients highlight the significance of formalization and team orientation as predictors of managerial performance, and of centralization and innovation as predictors of technical performance. Notably, performance based reward is an excellent predictor of both the performance.

A clear distribution of roles and responsibilities for EE and periodic control on direct EE performance are achieved in organizations that are broadly inclined to clearly define roles, rules and surveillance processes. In fact, for one unit of increase of perceived formalization, respondents report a 0.34 increase of EE managerial performance given the other variables are held constant in the model. The probability for organizations with a perceived formalization to have EE managerial practices is 1.41 times higher than the probability to have unclear roles, responsibilities and surveillance practices for EE.

Similar evidence emerges also for team orientation. Having a higher attention towards employees, working in a more team-oriented environment and keeping high the concentration on shared goals have a 0.49 positive relation with EE managerial performance. The probability for organizations with a strong team orientation to have poor EE managerial performance is 0.61 times lower (i.e. 1/1.64) than the probability of having clear roles, responsibilities and surveillance practices for EE.
Both formalization and team orientation do not have a statistically significant influence on EE technical performance, which instead is influenced by innovation and centralization.

EE monitoring systems, EE measures, renewable energy technologies, high-efficiency public street lighting and electric mobility are more largely implemented in organizations that are more open to innovation and high in creativity and willingness to experiment. In fact, for one unit of increase of perceived innovation in the organization, respondents report a 0.51 increase of EE technical performance given the other variables are held constant in the model.

</tbody>
</table>
The probability for organizations with a perceived innovation to implement EE technical solutions is 1.67 times higher than the probability to fall short in translating EE objectives into hard interventions on their assets. 

Interesting evidence emerges also for centralization. Having a higher autonomy in decisions and taking more initiative without losing the control from organization hierarchies have a 0.25 negative relation with EE technical performance. This means that the more organizations implement EE solutions, the more energy managers are the task managers and direct responsible for the achievement of EE. The probability for organizations with strict tasks and responsibilities directly assigned to energy managers to implement EE monitoring systems, EE measures, renewable energy technologies, high-efficiency public street lighting and electric mobility is 1.29 times higher (i.e. 1/0.77) than the probability of allocating competencies to other activities than the development of technical investments.

A combined interpretation of these findings brings new insights on what drives the implementation of hard and soft initiatives for EE in budget-constrained organizations. Sharing of competencies in highly formalized environments comes with procedures that easily cover soft aspects related to EE like the identification of the energy manager and the circulation of information from periodical reporting. This allows organizations to pick some low hanging fruits from different areas of the organization that do...
not necessarily refer to hard interventions. The latter, in contrast, require EE process owners to have a certain degree of autonomy in planning the implementation of innovative solutions. This suggests that budget-constrained organizations typically implement either soft or hard EE measures, and that organizational dimensions related to the autonomy of EE managers serve as discriminants between the two.

Particularly relevant is the relation that meritocracy has on the achievement of both the above mentioned managerial and technical performance.

In details, organizations that are perceived by their energy managers as workplaces offering high opportunities for carrier and having fair and satisfactory reward systems score low in both managerial and technical performance. These findings, that are apparently in contradiction with current literature on the relationships between reward systems and organizational performance, have a straightforward interpretation that has been supported in the follow-up of the study with a selection of respondents. In details, for one unit of increase of perceived meritocracy and effectiveness of the reward system, respondents report a 0.50 and 0.49 decrease respectively of EE managerial performance and EE technical performance given the other variables are held constant in the model. The probability for organizations with a valuable performance-based reward system to have EE managerial practices is 1.66 (i.e. 1/0.60) times lower than the probability to have unclear roles, responsibilities and surveillance practices for EE. Similarly, the same organizations have a probability to implement EE technical solutions 1.64 (i.e. 1/0.61) times lower than the probability to fall short in translating EE objectives in hard interventions on their assets. This means that current organizations with effective and meritocratic reward systems do not explicitly encompass EE among the key dimensions of performance management. In such organization, the elements of the performance-based reward system that are addressed are thus not aligned with the corporate strategies on EE. This has two typical impacts on energy managers. Energy managers who help their organizations achieving high managerial and technical performance, e.g. those who strive for identifying adequate suppliers, to monitor and review energy consumption, to promote structural and infrastructural projects to improve EE, perceive their role as the one of “alone heroes” and do not feel that current reward systems ensure adequate recognition and appreciation of their efforts. On the contrary, energy managers that interpret such role as a secondary assignment focus their attention to other core objectives of the organization, i.e. those that are clearly addressed in the performance-based reward system, and –thus– do not push for mainstreaming EE performance within the organization. Such interpretation is supported by the words of two energy managers engaged in follow-up of the study. EM#3, who works for a municipal administration that has invested in both high-efficiency public lighting and a biomass fuelled trigeneration plant, reported “I am proud of my work, given that we are a
small mountain municipality. Sadly, being mentioned in newspaper is the higher satisfaction that I can have from it. […] Cost pressures have limited or stopped pay increases. […] Several new jobs are much more specific than our performance indicators, which have a macro perspective on the wealth of the organization”. EM#6, who works in a bigger municipality, reported “Since the Mayor decided to sign for the Covenant of Mayors, I have coordinated the collection of information from other colleagues who have responsibilities on projects that have some aspects of relevance for energy efficiency. […] This task cumulates with my other duties. […] Despite these difficulties, I am happy because up to now I have never failed achieving a positive evaluation from my director”.

Finally, it is worth noting that six of the eleven organizational dimensions that we have investigated, namely vision and goals, trust, social networks, attention to details, outcome orientation and CSR, have not statistically significant relations with managerial or technical EE performance. This means that our data just show a high heterogeneity of links between these independent variables and the dependent variables of the models, with hybrids that depend on local circumstances that might be explored in future research.

5. CONCLUSIONS

The trade-off between resource efficiency and financial crisis is of great concern for both private and public organizations. On the one hand, resource efficiency might mitigate the shortage of financial resource but, on the other hand, it might require high managerial and technical investments. The capability to benefit from resource efficiency thus reasonably depends on the organizational dimensions that drive organizational performance. Our study present, to the extent of our knowledge, the first empirical attempt to shed light on the relations between organizational dimensions and EE among budget-constrained organization. In particular, based on a unique dataset of responses from 729 energy managers of Italian municipal administrations, we have adapted from current literature measurement models of organizational dimensions that are relevant person-organization fit to measure organizational traits and better understand the drivers of the managerial and technical EE performance. Our research design thus allowed leveraging on current literature on performance management at employee level to explore understudied forms of control on performance at organizational level that reside in management decisions of relevance for EE professionals.

Theoretical and managerial implications

The theoretical contributions of this paper are twofold. First, since separate groups of organizational dimensions adapted from person-organization fit drive respectively EE managerial and technical performance, it is possible to draw two dominant pathways to align the role of energy managers with strategic goals: task managers in bureaucratic environments
and business partners in value creating environments. The former role comes with EE duties on top of those that are functional to wider strategic objectives, which results in working in teams with shared (broader) goals and being subject to strict hierarchical and non-EE-specific surveillance. The latter comes with a centralized definition of clear strategic goals for each peripheral team, including the one that is specifically focused on EE, with high support for the empowerment of specialized personnel aimed at lowering the hierarchical control during the implementation phases. These pathways are mutually exclusive; thus, hybrid pathways are expected to lead to inconsistent and unpredictable performance.

Second, reward systems are the only organizational element that produces the same effect on EE managerial and technical performance. This means that an explicit inclusion of EE performance among the criteria of meritocracy for EE professionals would be fundamental to mobilize and valorise internal skills and competencies on EE. Such finding helps also identifying some potentially critical aspects in the management of such internal resources. In fact, specificity and relevance of meritocracy criteria might have a potential trade-off with uniformity of judgment among different process owners. This might occur, as an example, if specific criteria that are applied in some areas of the organization make it more easy to achieve the expected rewards than in other areas. In this case, therefore, there is need for highly-skilled top managers who have the ability to mitigate the threats of the creation of a divisive working environment, which might occur when one performance might be rewarded more than others.

**Limitations and needs for further research**

Despite the originality of the above-mentioned results, the study is not free from limitations. First, we have collected data from only one setting, i.e. energy managers of municipal administrations in Italy. Thus, extending the study to other settings might be useful to further support the external validity and of our findings. Second, our work puts in the spotlight formalization, team orientation, centralization and innovation. We demonstrate that these organizational dimensions influence EE performance, but the deep nature of such influence is still largely unknown. Therefore, future explorative (qualitative) researches might help opening the black box to disentangle causal mechanisms and enrich our theoretical model. Finally, future researches might usefully analyse the effects of different reward systems that explicitly encompass EE on EE performance to gain further understanding of what determines effective relationships.

HORIZONTAL ORGANIZATION AND LEADERSHIP: A GENERATIVE APPROACH FOR AN ETHIC DEVELOPMENT IN COMPLEX SYSTEMS

Rizziato, Erica
Italian National Research Council, Research Institute for Economic Sustainable growth IRCRES, Rome Italy and IMO Foundation, Frank van Borselenlaan Neatherland (www.het-imo.net)

ABSTRACT
The growing complexity of our time urgently demands management culture to be innovated, as more and more effective solutions to organization problems are not found at the top, with the traditional managerial culture, characterized by systems, procedure and control. Research shows that 80% of change projects fail or do not reach the expected results and that the main obstacle is the lack of motivation. This depends on a rationalistic, reductive vision of people and organization, considered as two independent realities. The paper shows a new way the organization and workers have to be considered, as two realities that keep evolving with synergy, in an evolutionary systemic-complex vision. On the basis of this, an approach is proposed for organizational and people development which create spaces for trasversal connections and within them generate new processes and competences towards a horizontal, client oriented organization, where people can also find a place of self-development, thereby strengthening their responsibility and motivation. It is an action research and action learning approach developed within a CNR and IMO Foundation research project. It integrates a method to create a space for connections to generate horizontal processes and of a IMO methodology for leadership, which permits to generate new more responsible and aware behaviors, adding to the vertical dimension a horizontal one as well, characterized by dialogue, interactions and connections between the inner and outer world. This approach creates a new path for a responsible, ethic and sustainable development: the horizontal organizational and leadership path.

Keywords: leadership, management, ethics, competences, organization development, social responsibility, complexity, action research, action learning.

INTRODUCTION
The paper proposes some findings of a CNR (Ircres Institute) research project (started in 2001) proposing to identify effective approaches to organization development and people motivation. The
project involved a large group of international stakeholders in focus groups, case studies, literature analysis, interviews, experimentation of innovations, for around 10 years (Rizziato, 2010a, b, 2007, a,b; Rizziato, Nemmo, 2013, Bekman, 2004, 2010). Among other main partners of the project, particularly relevant were Prof. Francesco Novara, in-charge of the Olivetti company psychology center and Prof. Adrian Bekman, in-charge of the Dutch foundation NPI created by the psychiatrist B.C.J. Lievegoed in 1954 for his research work in teaching Social Pedagogy at Erasmus University. NPI in 2005 was developed in the international Foundation IMO, which became the main partner of the project.

The results of a first phase of the project, focused on reflections about critical aspects of the traditional change programs, highlight the need to rethink the human person and organizational vision and to change the traditional planned change programs towards generative approaches of both competences and processes. Interesting innovations for the challenges the researcher evidenced in that field were then found. Among which, we can see the necessity to involve people in the definition of change processes and to improve the quality of interactions (Pasmore in Reason, Bradbury, 2001) and specifically the quality of dialogue (Argyrys, 2010; Beer, 2011). Moreover, Bradbury, Mirvis, Neilsen, Pasmore, (2008) sustain that many companies concerned with sustainability have not created the conditions for a sustainable culture and that changing behavior is rarely easy, that launching initiatives and maintaining momentum is a great challenge. They identified the largest challenge to the next industrial revolution in three main points: 1. system thinking, working with the whole system, 2. relational know how, engaging people collectively and fully, 3. generativity, defining ourselves through what we wish to create for the future. They evidenced the “deficit assumptions” about human nature and the necessity to involve people beyond mere conceptualization of action. Also Pardo Del Val (2012) suggest that participation of stakeholders show the way to commitment, and commitment keeps away from resistance. Moreover, the proposed approach by the CNR-IMO project is an innovation to overcome what H. Bradbury (2015) calls the “Cartesian Catastrophe”, which separates mind and heart, reflection from action, self from the others which led, for example, to conventional healthcare research that excluded patients, and conventional education research that exclude students. Furthermore, the project proposal is answering to the questions posed at the end of the work of Hazy and Bien (2014) about the Complex System Leadership Theory: “what role do identities play in storing, sharing and evolving rules of interaction? How do ethics play into this question?”. The project also contributes to the reflections on transformational leadership and creativity (Alrawi et al 2015) which focus on the necessity for leaders to improve the ability to empowering employees and inspires them to induce a great influence in the organization. The first paragraph of the paper reflects on the critical elements of the traditional approaches to organization development, found in the project, mainly based on rationalistic and reductive image of man and organization. The second explains a way the
organization and workers are to be considered to improve change programs, which are two realities that keep evolving with synergy, with an evolutionary systemic-complex vision, oriented by their “identity”. The third describes the innovative approach of organizational development, which combine a new method to create a space of connections for horizontal processes, that is client oriented (Rizziato 2010b), integrated with a new methodology for leadership, which creates a link between the inner and outer world, the methodology of evidential (Bekman 2004, 2010, 2014).

REFLECTIONS ON CRITICAL ELEMENTS OF THE TRADITIONAL APPROACHES TO ORGANIZATION DEVELOPMENT

The literature analysis on effectiveness of change methodologies (J.J.Boonstra, L. Caluwè 2004, Novara, 2003, Pardo Del Val 2003) have shown that commonly used interventions have led to poor results or have come to a stop. This depends on a reductive vision, where the individual and organization are considered as two independent realities (Hosking, Morley,1991). Organization behavioral interventions and Human Resources focused on the individual, considering the organization as an independent context. Also organization theories focused on designing internal functions and processes without taking into account the peculiarities of human nature within the working environment, thus making rationalistic reductions. In both cases, the result is a negative impact on motivation which becomes the major obstacle to the expected change. The project experts focus groups, literature analysis and several interviews with managers (Rizziato 2010 a) highlighted that, assuming an adequate remuneration, workers’ motivation is based on two main elements: to be able to perceive the social utility of the work and to be able to give a personal contribution to organization development, by holding specific responsibilities in transforming the working reality. Moreover, it emerged that the organization’s dysfunctions cannot be solved only from within, but also need to reconnect people to their social identity, in contributing to the life of the community through products or services (Novara, 2003). Therefore, it is important to connect these elements to activate effective change processes, so that they can bring added value to the core components of the organization such as clients and people, via an efficient economic process. The expert focus group also analyzed the anthropological and organizational models that today inspire the prevailing interventions in the market. The vision of homo oeconomicus, as elementary mechanism triggered by the impulse to economic turnover, interested in achieving maximum pleasure with the least effort, is still widespread. Man is seen as “rational” in the sense of maximizing his own well-being. Hence it has been observed that the pyramidal and functional image of the organization prevails, despite attempts to change it with the matrix or project organizations, that have shown many limits over the medium and long term. The idea is that those at the top know more than the ones lying at the bottom and so
the decision-making process is handled from the top in a vertical logic of control of the decisions taken. Attempts to change this reality led, notably in Europe, to unsatisfactory results (Novara in Rizziato 2010a, Bekman 2010), as management’s claims of the bottom’s empowerment, such as the quality circles, were prevailed by logical and reductive vision of work motivation, which is widely dependent on profit. Even the interesting ideas of lean thinking of Womack and Jones, suggesting the client’s process as the center of change, have fallen into technical logic without the involvement of people, thus bringing often unsatisfactory results. Also the vision of the organization as a collective learning community, the learning organization of Senge, which has been transposed into a classical management mentality and applied in the field of work-related training, led to the same unsatisfactory outcome (Bekman, 2010). The expert project focus group observed that lot of new impulses to the life of the organization has not brought the so hoped changes, because it was considered within reductive managerial visions, lacking vital links for effective change. These reflections focused on the necessity to rethink cultural references necessary to promote effective forms of development. The group focused on a systemic-complex vision as also theorized by Moraine (1993) who underlined, like Drucker (1993), that an organization exists to “do”, to carry out the task for which it was built, and that gives it its own identity (i.e. enterprise, hospital, public body etc.). In Olivetti the system complex approach was applied by Novara and evidenced that we can only generate the change with a multidisciplinary vision and with an experimental approach, people and client oriented. This was also Lievegoed’s proposal, moreover, he saw the organization’s relationship with the client and the leadership in an evolutionary perspective. The group then deepened his vision and practical application with studies case from Bekman. Lievegoed introduced the concept and model of development in the organization reality, connected to the development of individuals (Lievegoed, 1973, 1979). His evolutionary vision allows an important cultural breakthrough, considered essential to promote a new level of “organizational culture” and was taken as the basis of the new approach to development, result of CNR-IMO project. Most of the focus was on how to create new spaces of interaction and the type of leadership which could help such “systemic transformations”.

THE EVOLUTIONARY IMAGE OF ORGANIZATION AND MAN AT WORK

Lievegoed (1973) highlight the necessity for who manage organizations to learn how to work from a model of development. For him this necessarily comes from two premisses: the comprehension of ways to develop social structures and the comprehension of human development processes, to include the human being as a relevant player, for organization development. Therefore, Lievegoed recalls the foundations of Kenneth Boulding’s general theory of systems (1956), who distinguishes
a hierarchy of 9 levels of systems, where each higher level integrates all the lower ones, adding a new dimension that was not present at the previous level, larger for differentiation and complexity. To sum up, the 9 levels are briefly described.

1. The first level is that of the static structure. It might be called the level of frameworks. This is the geography and anatomy of the universe, for example, the patterns of electrons around a nucleus.

2. The second level is that of the simple dynamic system with predetermined, necessary motions. This might be called the level of clockworks. The solar system itself is of course the great clock of the universe from man's point of view, simple machines such as the lever, even quite complicated machines like steam engines and dynamos.

3. The next level is that of the control mechanism or cybernetic system, which might be called the level of the thermostat. This differs from the simple stable equilibrium system mainly because the transmission and interpretation of information is an essential part of the system.

4. The fourth level is that of the "open system," or self-maintaining structure. This is the level at which life begins to differentiate itself from not life, it was called the level of the cell.

5. The fifth level was called the genetic-societal level. The plant typifies it, and it dominates the empirical world of the botanist.

6. The next is the "animal" level, characterized by increased mobility and self-awareness. Here we have the development of specialized 'information receptors (eyes, ears, etc.) leading to an enormous increase in the intake of information.

7. The next level is the "human" level, that is of the individual human being considered as a system. In addition to the characteristics of animal systems man possesses self-consciousness, which is something different from mere awareness, we can see a self-reflexive quality - he not only knows, but knows that he knows and he can develop himself in a space of freedom.

8. Then we have the social organizations. The unit of such systems is not the person but the "role": social system, as a set of roles tied together with channels of communication. At this level we must concern ourselves with the content and meaning of messages, the nature and dimensions of value systems, the transcription of images into a historical record, the subtle symbolization of art, music, and poetry, and the complex gamut of human emotion. The empirical universe here is human life and society in all its complexity and richness.

9. The last level is that of transcendental systems, which also exhibit systematic structure and relationship. It is a space where to ask questions that do not have any answers.

Lievegoed wonders if it is legitimate to transfer the concept of biological evolution to social system development and growth, according to Boulding’s classification. He thinks that the biological object evolves from the simplest shape to the final predetermined one, the adult shape of the species, that is
present as information from the beginning. He states that you can see a social organization as a
natural biological organism, if you don’t forget the difference: members of social organizations are
autonomous social individuals and not the cells of a biological organism. What is at stake in modern
social and political conflicts in our human organizations is the so called “adult” shape of the
organization. In a biological object the final goal of the evolution is the adult shape of the species, in a
social organization the adult shape is the most suitable way to reach a goal outside the system. This
goal is what we call the “client process”, i.e. the global experience that a client lives from the first
moment he gets in touch with the organization. A social organism can evolve into a predetermined
goal, if this goal is perceived and pursued by individuals, who, in that social organism, take
autonomous initiative to buy in the whole group. Lievegoed believes in an “adult” shape of social
organization, as a result of the effort of all its members, who work together to define that shape,
regardless of significant differences in personal judgments and ideas. The “adult” shape of social
organization can realize what is unique and special in the 8th level according to Boulding, only if
adult individuals want to realize a specific goal, self-consciousness, described in the 7th level. This is
the challenge of the modern working community, the creation of a connection between human and
social system development. Growth and ripeness can be used to describe a biological organism, change
and development are suitable for people. Lievegoed (1973) presents the co-evolution of man and
organization, focusing the self-consciousness of the individual in connection with the changing
environment. His evolutionary view holds that development is a discontinuous, one-way process. It
goes from a starting model, to differentiation, to a final integration in a more complex model.
Organizational development follows a three-phase model: the pioneering phase, the differentiation
phase and the integration phase. These phases pivot around the client, that is outside the organization
and can give sense and meaning to all ongoing relationships in the organization. The “client process”
is the on-progress identity of the organization and it is the “client process” that unifies, steers, makes
sense in organizations. Let’s walk through these three phases, and see how leadership, relationship
with clients and internal relationships change. Later, we will see his human being development vision,
also in a wider framework, and its connections with organization development.

The development phase of an organization

The pioneering phase.

It is the initial phase, when the entrepreneur establishes the opportunity to solve practical problems
and offers his solutions to other people. By doing so, he generates an economic flow. In this phase
everything is connected with him, processes quickly flow and communication is direct, “everyone
knows everything”. The organization has the shape of a not-well-differentiated pyramid, governance
is authoritarian, leadership style is hierarchical and deeply concerned with the pioneer-entrepreneur.
Functions are roughly formalized, internal responsibility is not officially confirmed, communication among people is informal and direct, working approach is toward improvisation and the organization can react very well to turbulence in an external context. People can shift from several roles and functions, work is considered a “large family”, people are willing to do service, commitment is strong and every worker shares company objectives that are clear and simple.

![Pioneering phase](image)

*Fig 1 The first phase of an organization (Rizziato, 2010)*

In the market, pioneering companies build strong ties with their clients. Mainly the entrepreneur has personal contacts with clients and can solve any critical aspect quickly, there is a sense of “community” based on trust in the pioneer.

**The differentiation phase.**

When business starts growing, the organization cannot work anymore on the basis of naiveté, dysfunctions with clients and not efficient use of resources start to emerge. A step of development need in a different, more differentiated organization. Typically, pyramidal hierarchical organization are created, with separate functions, clear rules and vertical top-down decision processes. For a first period this helps to increase efficiency in a chaotic pioneering situation almost out of control. But in the time, previous vital and smooth interpersonal relationships begin to loosen, fading away into anonymous functions, managers don’t have the pulse of the client anymore and the organization undergoes malfunctioning due to difficulty in feeling the organization as a whole. Often it is the case that managers go one way, following an abstract idea of service leaving their clients alone. Symptoms of organizational crisis are: distance from company values and individual values, carelessness, communication problems, less flexibility, process control problems, lack of motivation.
These symptoms of crisis ask for a severe re-modeling of the organization and lead to another phase of development. The weakness of this second phase is that the social sub-system of the organization is not taken into consideration, while economic and technical sub-systems thrive notwithstanding a falling motivation.

The integration phase.

In the next phase, social, technical and economic systems have to start intertwine. From a competence and function based organization, where focus is on internal processes, to a process based organization, where focus is on the client and workers are proactive. To start this transformation, need a horizontal and shared vision of the client experience, which is traversal to all functions and levels of the organization. A horizontal space has to be created next to the vertical one. Each worker has to be moved by an entrepreneurial spirit to serve the organization, that in this third phase Lievegoed calls “cloverleaf organization” (see Fig.3, how the author re-writes it). Each person in this organization is allowed to act proactively in order to define and reach common objectives. As well as technical and economic sub-systems have strict rules, that worked to permit social progress, social sub-system calls for a road-map to twine together the three sub-systems.
Lievegoed underlines the necessity to work for a new leadership style to permit the passage to the third phase. The new leadership has to stimulate individual initiative and entrepreneurial spirit in order to enhance social and organizational awareness.

An evolutionary vision of man in the organization

Since the Homo Oeconomicus concept and the models drawn from it have failed to describe a man able to embrace all the nuances of complexity and continuous change, we need a new paradigm and a new concept. Stanford Research Institute (Campell et al 1982) and humanistic psychologist like Maslow (1971) define interesting and useful concepts as “individual health”, “self-realization”, full development of talents. Assaggioli’s Psicosintesi is in this framework and integrates different schools and approaches and designs four basic human dimensions: physical, emotional, mental and spiritual (the last being the unifying concept). This model accepts a personal I and a trans personal Self, towards which the I tends to realize himself. Lievegoed’s (1979) evolutionary image of man, derived from Steiner and the personalist stream, is close to this model and presumes the possibility of the I to evolve. Reality is lived considering three levels of the psyche (thinking, feeling, willing) and the I has an ordering function. It is the I that defines the path of development which can be realized in a process of responsible action and reflection and realize what Assaggioli (1977) calls “la meta oltre la porta”, the goal beyond the door and what Lievegoed calls Leitmotiv, that is the biographical direction. In the CNR-IMO project we considered that giving people at work the opportunities to be proactive, able to take decisions about improving their work process is a path toward the realization of the personal I, following their Leitmotiv, and is a very essential issue, an ethic one. On this principle we defined the concept of “ethics of development”. This not only out of respect for the people but also for the enormous value of it can have for the organization, because it can liberate creativity and make people proactive and motivated. This emerged very clearly by analyzing several experiences in the case studies of the CNR-IMO project. It becomes also evident that this type of ethic is effective. As a result,
the following evolutionary image of human being was chosen, in order to connect it to organization development. An evolutionary, constructivist, systemic, action research and action learning, generative approach was also chosen to connect people and organization development, as will be illustrated in the next paragraph.

In the constructivist approach the “reality” depends on how we approach, observe, know, and communicate it, comes out from relational processes and from meanings generated by our experience, as the reflexive approach tells us (Weik, 1997). The I is the element who can unify and give sense to the different experience; it has to be considered in the framework of the “leit motiv”, the biographical orientation (Lievegoed 1973). It is important that HR policies consider these factors and make effort to create a suitable environment to enable each worker to pursue self-realization in accord with organizational challenges. The identity of the organization, given by the client service and the individual identity, can be the result of a motivating and evolutionary synergy. Francesco Novara (1996) brilliantly stated: “the “ideal of the organization” picks up the “ideal of the I” and the goals of the organization become the goals of the “ideal I”…”.

THE APPROACH DEVELOPED: A SPACE OF GENERATIVE CONNECTIONS FOR HORIZONTAL PROCESSES AND LEADERSHIP

As result of CNR-IMO project, a new approach is presented for an efficace and sustainable organization development, based on a method which creates spaces of generative connections for horizontal processes (Training Development in Rizziato 2010b), integrated with a methodology to create a new type of leadership, the horizontal leadership, with the methodology of evidential (Bekman 2004, 2010, 2014). This methodology stimulate changes in behavior, adding to the vertical dimension a horizontal one as well, characterized by dialogue, interactions and connections between the inner and outer world. It considers leadership as a dialogic process, where each individual appeal to the other as a person, not as a role, to explore the possible development step. Horizontal leadership do not guide people, but processes, where people can act responsibly toward a common goal, so strengthening personal motivation. The approach takes as foundation, the individual and organization evolutionary vision explained in the previous paragraph and is characterized by the generation of new processes and behaviors step by step, in a path of action and reflection, with a specific rhythm, depending on the needs of the organization. The proposed approach considers that we move in a systemic complex evolutionary environment and analytical and planning methodologies are of no use. We focused on connections between people and organization, guided by the development of both “identities” in explorative and experimental way. The development of the organization follows the client process
improvement, in connection with the steps workers can take toward this goal. In doing so, they can reflect on their development areas and sense making for their I development, in a generative path. The client has to return to being central to the organization strategy and this means rethinking the processes design.

Fig 5 From the second to the third phase of the organization development (Rizziato 2017)

The theoretical basis of the approach is constructivism, action research, action learning, adult learning, neuroscience, humanistic psychology, social psychology, evolutionary theories of man and organization.

Create a horizontal space of connections for horizontal processes

To start with, it is important that directors can share a horizontal and evolutionary vision and strategy, connected to the client process improvement, as the identity of the organization and ordinator element of the complexity. They also have to share the view that workers are synthesis elements of complexity, not “human resource to manage” and the importance to identify a selected group of workers, to start a generative process of sustainable change, which will involve, step by step, all the working community. The community of directors will then choose a group of “developers”, activating and connecting them with the horizontal development strategy. The developers will involve the colleagues in the change with a dialogical, explorative and experimental path, using the methodology for horizontal leadership. Directors, working as a community, will sustain the cultural change from the steering principle of vertical working process, that is how to rationalize processes to the steering principle of the horizontal working process, that is how to create added value for the client.
To create fruitful connections for development, a new “development infra-structure” (DIS) will be created, which will represent the space of a new organizational leadership where the issues about change needs, will be shared and oriented in a generative path. A horizontal dimension is added to the vertical one.

Create an action-reflection, generative, cyclic development and learning path

The two communities will follow a cyclic development path of action research and action learning. For the directors community it will be a path of defining a horizontal strategy and acquiring horizontal leadership competencies. For the developers it will be a more practical way to explore the questions of change, sharing it with the wider community and collecting ideas, to experiment with new possible ways to change the process, even more horizontally, in order to give added value to the client, while growing in their personal competences. Both the groups will follow an Exploration Macro phase to identify the real issues, share them, collect ideas for improvement and to experiment them. The two groups will meet regularly in DIS, as a space where they can share the exploration and experimentation results, and decide the successive steps, considering the added value for clients, people and capital. Every new process will be issued only after experimentation and “validation” by the whole community.
In the cyclic development path the two communities work in a generative way: exploring and experimenting the change before renew all the processes.

They will alternate 3 moments in a rhythmic way:
- meetings moments, where each time a next step is planned
- experiential moments, where the steps are realized
- reflection moments, for the sense making process and the plan of next step

Transversely to the two macro phases, the two communities will reach new competences as horizontal leaders, thanks to the action-reflection paths they will do. It is essential the definition of the next step, which permits to explore the reality behind the abstract ideas people have and then reflect on the findings, both for the processes and for the opportunities for personal change. This synergic way of working is well described in the path called Development Leminscate of image 9. The start will be the thinking on the critical element for the client and focusing on the steering principle behind it, which will be renewed with the focus on the added value for the client. In the cycle of the Lemniscate, people explore the real chances of change as “acting agents”. They will reorient vertical process into horizontal one step by step, identifying the steering principle lying under processes not effective for the clients, defying the new one and sharing it with the working community, projecting the new step in an explorative way and doing it. In reflecting on the critical aspects of the steps done they can see their behavioral “steering principles” and change them, if need as, with the same approach.

Fig. 8 The cyclic development path (Rizziato 2017)
After each step and reflection, people acquire new perspective to observe the processes and can generate new and better aware steps. They also gain new “developing competences”, becoming step by step horizontal leaders, (Rizziato, Nemmo, 2017, Bekman, 2010).

We already have a good record of successes following this methodology in different type of organizations: profit, nonprofit, public. The proposed approach is a way for the creation of modern communities in the working place, as places of sense.

ABSTRACT

Globalization and innovative development have led to the profound changes in the global industry structure. The rapid character of the industrialization process in developing countries leads to the spatial regrouping in the world. This article analyzes the changes in the spatial organization of the global manufacturing industry.

We define the position of countries and regions in the manufacturing industry and reveal changes in the share of the countries and regions in the world industry in 1999–2014. Under the influence of a complex of factors there is a radical change in proportions between the territories of the "old" and "new" wave of industrial development. The findings prove that there is spatial redistribution of industrial production between the major regions of the world in favor of Asia.

In the recent two – three decades the role and importance of Asian countries has been steadily growing in the world economic development. Nowadays we are facing clearly expressed Asian vector of economic and industrial development. The comparative analysis of NAFTA, the EU and BRICS countries positions in the various types of high-tech manufacturing industries captures the growing importance of the BRICS in the global industry. Quite logical that Asia is the leading region and its share has risen from 32.6 to 45.5% of the world high-tech manufacturing industries over the last 15 years, primarily due to the China’s share increase (from 3 to 27%). It is shown that China is already the world leader in the manufacturing of most types of industrial products.

Keywords: world manufacturing industry, structure, high-tech manufacturing, industrial development.

INTRODUCTION

A lot of regional and global leaders of the world economy have appeared in recent years. Many developing countries have become significantly integrated into the transnational chains of value added
production. In addition, these countries ensure the growth of competition level in almost all of the
global markets. The TOP-10 countries ranked by GDP purchasing power parity of currencies are now
headed by China (19.7 trillion dollars, 2015) that is ahead of the United States (18.0 trillion dollars).
They are followed by India (8.0 trillion dollars), Japan (4.8 trillion dollars), Germany (3.9 trillion
dollars), Russia (3.7 trillion dollars), Brazil (3.2 trillion dollars), Indonesia, the UK and France (Science
and Engineering Indicators 2016).
The positioning of different economic groupings (EU, NAFTA and others), especially a relatively new
one – BRICS (Brazil, Russia, India, China and South Africa), in the world economy and the global
industry is at the heart of numerous discussions (Lo and Hiscock 2014, Rodionova et al 2015 and
others). The BRICS countries have the largest resource potential, huge domestic markets and laborforce;
accumulate over 10% of global investment and approximately 20% of the world trade (Heifetz 2015).
According to the OECD report, by 2020, the total GDP of the BRICS countries can reach the 1/3 of the
global GDP (for comparison: the share of the EU is about 17%, NAFTA – 19%). No doubt, in the next
20-30 years these countries will have a significant impact on the international community processes.
During the years of cooperation, BRICS countries took a huge effort and signed a number of
agreements, including those aimed at developing and strengthening financial relations among the
member countries as well as at establishing proper financial institutions. At the BRICS summit in
Fortaleza (Brazil) in July 2014 the representatives of the member countries signed the Agreement on the
New Development Bank and the Cooperation Agreement on Innovation (this agreement means BRICS
countries and Development banks’ cooperation on co-financing initiatives). The 2016 BRICS summit
was the eighth annual BRICS summit (October 2016, Goa, India).
Nowadays BRICS countries have an obvious appeal among scholars. The researchers all over the world
examine modernization processes in these countries, study different aspects of their development and
cooperation, analyze the importance of internal growth, contribution to the global economy, the
expansion of the financial markets and the growing scale of the BRICS countries’ interaction with other
The relations between the BRICS and leading industrialized states are investigated by Jonathan
Luckhurst (2013) who analyzes the former’s mutual relations, focusing on how the ideational construct
presented by Jim O’Neill in his “BRIC hypothesis” became formalized as a leader-level diplomatic
group at the summit in Yekaterinburg, Russia, in 2009. Jonathan Luckhurst evaluates how the BRICS
have influenced international issues and takes an effort to identify whether “cooperation” or “conflict”
characterizes their relations with the key industrialized states, concluding that there has been a greater
multilateral cooperation since 2008, especially through world forums. The author underlines that the
BRICS is one of the unparalleled significant partnerships in the international economic relations.
especially due to China. This has had important consequences as the Chinese government has prioritized economic cooperation with leading industrialized states.

Speaking about China it is worth mentioning the report published by the World Bank (Shahid 2012), which points out that by raising the capital/labor ratio and rapidly assimilating technologies across a wide range of activities, China has increased factor productivity manifold since 1980 and joined the ranks of middle income countries and nowadays China has set its sights on becoming a global innovative powerhouse by 2020. By 2030, China is expected to have pulled abreast of the most advanced countries technologically and increasingly its growth will be paced by innovation which pushes outwards the technology frontier in the areas of an acquired comparative advantage. It is innovation that today has actually emerged as one of the most popular economic terms. And the innovativeness and technological performance strongly depends on close interaction between them (Soete 2007; Samburova E.N. (2014)).

The global Information and Communications Technologies industry has experienced a rapid, radical reorganization of the industry leaders (Kenji 2015). Moreover, in recent years, the literature has increasingly articulated the links between information and communications technologies and socio-economic development (Avgerou 2000, Mansell 1998).

The proponents of the ICT for development agenda have claimed that these technologies create new opportunities for economic and social development for developing countries (Shahid 2012, Castello 2013, Kovalyov 2015, Sharova 2015).

This theory is proved by many scientists including the Russian ones. For example, after the VII BRICS summit in 2015 (Ufa, Russia) the group of Russian scientists published a special report “Perspectives and strategic priorities of the BRICS ascendancy”. Their report contains the authors’ assessment of the BRICS as a civilizational unification of the new format, as well as a comparative analysis and forecast for BRICS and G-7. Nowadays the role of scientific research recently published in Russia is growing due to its characteristics of national innovation systems of BRICS, development of information and communication technologies and technological cooperation of the BRICS countries (Soukup 2013).

**METHODS OF RESEARCH**

The objectives of the paper are:

to define the main shifts in the territorial structure of the global manufacturing industry;

to define the BRICS countries’ position in the global manufacturing industry, (including high-tech industries as the driving force of the economic growth and the development of countries in the post-industrial era);
to analyze the dynamics of BRICS in comparison with NAFTA and the EU indicators of manufacturing industry.

The analysis methodology builds on the principles of the system approach and the method of comparative analysis. The calculations are based on National Science Foundation (USA) statistical database (Science and Engineering Indicators – 2016) in the dynamics of the period 1999-2014. This paper also relies on the authoritative international organizations reports, including: Industrial Development Report (UNIDO); International Yearbook of Industrial Statistics (UNIDO); UNESCO Science Report; Towards 2030; 2014 Global R&D Funding Forecast; World Investment Report; INDSTAT 4 – 2016 and others.

The dynamics of industrial development over the period of 1999-2014 was very significant for BRICS countries. Based on the comparative analysis of statistical data we have repeatedly carried out research into the volumes of this or that industrial production in the countries and regions of the world over the past 60 decades, taking into account the indicators and structural changes of the coefficients (Rodionova 2014, Rodionova et al 2015 and others).

We calculated the proportion of countries and regions in the world manufacturing industry and presented the calculations in the tables highlighting their dynamics for the period 1999-2014. However, it is important to recall that the BRICS is the forum of the five fastest growing countries: Brazil, Russia, India, China, South Africa. Jim O’Neill proposed the term acronym (BRIC) to refer to the four economies in the world with the fastest growing GDP - Brazil, Russia, India and China in 2001. This practical cooperation within BRIC began in September 2006 on the initiative of Russian President Vladimir Putin. South Africa acceded to the BRIC in December 2010, and the group began to be known as BRICS. Therefore, in this article the tables covering the period from 1999 to 2006 we present the arithmetic sum of indicators for the countries belonging to the present time in the BRICS. This was done to facilitate the study of dynamical processes in the global industry with the help of comparative analysis.

TRANSFORMATIONAL SHIFTS IN THE WORLD ECONOMY

Globalization and innovative development have led to profound changes in the branch (sectoral) structure of the world economy because of the increasing role of the service sector. Currently the share of the service sector (tertiary sector) in global GDP amounts to 62.6% (the share of industry is 30.4%, agriculture – 6.4%, 2015). It should be noted that despite the dominance of the service sector in the world’s GDP and employment, the main source and measure of civilization progress is the improvement of forms and methods of the industrial production. Deindustrialization as the reduction of employment in the global industry, does not mean "uselessness" character of industrial sector in the
world economy. The development of industrial sector is still crucial to achieve high performance and efficiency of the entire economic mechanism.

However, at least two important aspects should be noted. Firstly, in most developing countries (particularly in China, India, Brazil, etc.) the employment in the secondary (industrial) sector of the economy has been growing quite rapidly since the beginning of the twenty-first century (Sluka 2015, Rodionova 2013, Rodionova 2014). For example, in China it has already exceeded 30% of the economically active population, in India and Brazil – 20%. It should be emphasized that the labor force in China is 800 million people, in India – 500 million people, in Brazil – approximately 110 million people. Secondly, it is significant that the leading countries have already carried out or intend to "let" their strategies on the tracks of reindustrialization after the global financial and economic crisis of 2008-2009. Strategy of reindustrialization means taking measures to revive the role of industrial production, although reindustrialization in the developed countries will happen on the wave of new technology (Gorkin 2012). It will be the high-tech industry of the post-industrial era. Developed countries are less competitive in the traditional industries in comparison with the developing countries. Nevertheless, developed countries are still leading in these industries according to their output.

The manufacturing industry is a powerful driver of the world economic development. Many of its innovations and technologies are successfully used in different industries. The output in the manufacturing industry is growing much faster than in the other sectors of the economy (mining, agriculture, services) due to the wide introduction of information technologies, new materials, and the employees’ professional development.

However, the industrial structure development trend has varied greatly in the recent decades. This kind of process is affected by the distribution of production capacity of the largest TNCs that mostly influenced the industrial structure of Asian countries of export-oriented economies. In the most backward countries of the world, significant changes in the industry structure have not been marked in the last decades. Many of them are still at the initial stage of the industrialization process (Rodionova 2011, Rodionova 2014).

**TRANSFORMATIONS OF THE WORLD R&D**

Research and development (R&D) is defined as the process of creating new products, processes and technologies that can be used and marketed for mankind’s benefit in the future (R&D Magazine. 2016). R&D investments continue to grow. The spatial unevenness of socio-economic development of the countries has led to the polarization of R&D and has formed a contemporary world scientific landscape (Table 1).
Nowadays the share of R&D expenditure in the structure of the world GDP amounts to about 2%. At the same time, this indicator is different for developed and developing countries at least in two times. In this case, a high concentration of R&D expenses should be noted, especially in the developed countries – 60%. There are three main R&D areas: North American, European and East Asian. However, there are some changes in the world scientific landscape. Nowadays the R&D three-dimensional space (US – EU – Japan) transforms to a four-dimensional one (US – EU – China – Japan) (Antipova, Rodionova 2014).

Asian economies continue to grow faster than other parts of the world, and their investments in R&D are often at rates several times that of American and European countries. It should be noted that the USA and Europe are still leading, but the most significant world scientific transformations occur in the Asian region. It is a result of growing importance of R&D activities there. The share of China in R&D activities is growing steadily (Table 1).

The USA is ranked the first – 26% of global R&D expenditure. For 2015 and 2016, R&D investments in the U.S. continue a series of trends started over the past five years. These include restrictions on total federal government spending on R&D, the resultant decline in federal government support of academic R&D investments (and their struggles to compensate), and the slow increase in industrial R&D spending (and its share of the total R&D “pie”). (R&D Magazine. 2016).

China reached the second position – 20% of global R&D. They are followed by the EU (19%) and Japan (appr. 10%) (UNESCO Science report 2015; R&D Magazine. 2016.). The R&D expenditure in the BRICS countries (over 30% of global R&D expenditure) is growing especially in China. As for R&D expenses per capita, China is still very far behind the leading countries (2014: China – $243, Japan – $1260, South Korea – $1399, USA – $1428), whereas R&D expenses per capita in Russia are not too high as well as in the other BRICS countries (UNESCO Science report 2015).

Table 1. Share of total global R&D spending (%)
VALUE ADDED OF ALL MANUFACTURING INDUSTRIES: POSITIONS OF REGIONS AND COUNTRIES

Different tempos and vectors of development influence the transformation of the global industry spatial configuration. This transformation could be easily fixed by quantitative and qualitative statistical methods when assessing the output in different industries. Nevertheless, at the global level all of the economic disparities remain on the north-south divide (developed – developing countries). This transformation could be reflected by the indicator of value added production in the manufacturing industry, including per capita indicator. According to the UNIDO data analysis there is a gap between the average per capita industrial indicators in developed and developing countries. Nowadays, this gap is characterized as 10:1 and has not reduced yet. However, the role and importance of developing countries (primarily the leading ones: China, Brazil, India, Indonesia, Mexico, Republic of Korea, etc.) in the manufacture and export of industrial products is steadily growing. Moreover, the reduction of the gap in economic (including industrial) development between the Centre and Periphery, on the one hand, is becoming a prerequisite for further development of the Centre. On the other hand, this reduction is the basis for the deepening globalization process (INDSTAT4 2016, Rodionova 2014).

Table 12. Table 2. Leading manufacturing economies share in world MVA (at constant 2010 prices)

*Generated according to: World Leading MVA

As for the regional level, there are tangible shifts in the manufacturing industry outputs. In general, these shifts are directed from West to East – to Asia. Meanwhile ex-leading regions (North America and
Europe) are losing their positions. Thus, in 1999–2014 the share of North America declined from 31.9 to 21.6%, the European share declined from 30 to 24% (including the EU's share decrease from 28 to 20%). Nowadays according to the world rating, the largest industrial regions are located in Asia. Its share in the structure of the world manufacturing industry increased from 32 to 46.6% in the analyzed period. Undoubtedly, such progress arises from the Chinese economic phenomenon. In 2014, China ranked first in the world manufacturing industry, increasing its share from 6% (1999) to 25.6% (2014). At the same time, it left behind all the industrial giants like the USA (18.3 %), Japan (7.2 %) and Germany (6.1 %) (Generated according to: Science and Engineering Indicators 2016).

Originality of the industrial development process and the changes in the global leadership of key producing countries logically affect the balance of power within the largest economic groupings in the world hierarchy. This means the significant character of transformations happening nowadays. In 1999 the share of NAFTA amounted to 32% of the world manufacturing output, the EU – 27.8% and BRICS – only 10.1 % in comparison with the 2014 indicators: 21.6%, 20.1% and 33.8% respectively (Table 3).

Table 3. NAFTA, the EU and BRICS share of the value added of all manufacturing industries, 1999–2014, %*  
*Generated according to: Science and Engineering Indicators 2016

In other words, under the influence of a complex of factors there is a radical change in proportions between the territories of the "old" and "new" wave of industrial development. Moreover, we can witness the revolutionary changes of the spatial structure of the global industry.

THE RAPID GROWTH OF HIGH-TECH MANUFACTURING INDUSTRIES IS A KEY TREND IN THE DEVELOPMENT AND TRANSFORMATION OF THE SPATIAL STRUCTURE OF THE WORLD MANUFACTURING INDUSTRY IN THE XXI CENTURY

The value of net material product in that sector has doubled from $862 billion to $ 1781 billion over the last 15 years. Such kind of dynamics distinguishes the manufacturing industry as the superior sector of the global economy. However, the development tempos of this sector differ in the regional and country context. On the one hand, there is "extremely negative" pole represented by Japan where value added of HT manufacturing industries fell by one half from 185 billion to $ 91 billion in 2000–2014.
The EU positions deteriorated noticeably as a result of the global financial and economic crisis of 2008–2009. In general, in 2008 the EU cost indicators amounted to $325.8 billion (of current dollars), in 2009 fell to $274.9 billion. In 2014 these indicators amounted to $303 billion that is $9.6 billion less than in 2014. During the crisis the most noticeable decrease in production happened in Germany, France, Italy, Finland, etc. At the same time high-tech product output increased significantly in Slovakia, the Czech Republic, Romania, Poland, Bulgaria over the last 15 years. It can be explained by the fact that many developed countries of Europe transferred their TNC’s branches to these countries. All the mentioned above led to the manufacturing indicator increase in the EU by half.

North America is one of the global centers of high-tech industry. The region increased its value added of HT manufacturing industries from $349 billion to $550 billion in 1999–2014 and production from $349 billion to $550 billion in 1999–2014. Meanwhile the output in high-tech industry in the USA increased from $320 billion to $511 billion. So the USA is a core of high-tech production in this region (Science and Engineering Indicators 2016).

On the other hand, there is an “extremely positive” pole of high-tech manufacturing created by the other regions. However, double or triple growth of indicators in Africa, Central and South America, Australia and Pacific Islands should be regarded in a certain sense as the effect of “zero-base”. In Asia the value added of high-tech manufacturing industries increased in 1999-2014 (from $281 billion to $810 billion), although Japanese output in high-tech manufacturing industries declined. Over the last 15 years the highest growth rates of total worth of products in current prices have been typical of Vietnam (42 times growth, the highest growth recorded in recent years), China (16 times growth), Indonesia (6 times growth), India (4 times growth), Singapore, Taiwan and Bangladesh (Generated according to: Science and Engineering Indicators 2016).

Quite logical that Asia is the leading region and its share has risen from 32.6 to 45.5% of the world high-tech manufacturing industries over the last 15 years, primarily due to the China’s share increase (from 3 to 27%). The share of the BRICS countries increased from 14% (2006) to 31% (2014). The NAFTA ranked second, decreasing the share of the global value added of high-tech manufacturing industries from 40% (1999) to 35% (2006) and to 31% (2014). The EU ranked third reducing from 22% to 17% (Table 4).

Table 4. Share NAFTA, the EU and BRICS of the value added of high-tech manufacturing industries, 1999–2014, %*
COMPARATIVE ANALYSIS OF NAFTA, THE EU AND BRICS POSITIONS IN THE VARIOUS TYPES OF HT MANUFACTURING INDUSTRIES

Consequently, the share of NAFTA in the global output in high-tech manufacturing decreased over the analyzed period from 40% to 31% and the EU share fell from 22% to 17%. Meanwhile the BRICS countries denoted a rapid growth from 6% to 31% (Tab 4).

It should be noted that the giant countries and leading economic groupings constantly enhance the control over the world high-tech industry market. Nowadays the main vector in this sphere is a growing tendency of monopolization. In 1999–2014 the share of three major economic groupings (NAFTA, the EU and BRICS) in the world high-tech manufacturing increased from 2/3 to 4/5. Some high-tech industries easily reveal a partial limitation of global markets and a lack of competitiveness of other participants of the new international labor division in the field of hi-tech technologies.

Another recent direction of transformations is reformatting shares within the group of high-tech manufacturing leaders. The analysis demonstrates good opportunities for “young” and “aggressive” in pioneering areas and directions of high-tech industries (Table 5).

</table>
BRICS IS LEADING BY DYNAMICS AND SCALE:

- The share of the BRICS countries in the world output of computers and office machinery increased from 3% (1999) to 50% (2014). At the same time the share of NAFTA decreased from 46 (1999) to 23% (2014), and the share of the EU has fallen from 18 to 12%.

- The share of the BRICS countries in the world communications industry increased from 9% (1999) to 24% (2006) and to 47% (2014). Meanwhile the share of NAFTA reduced from 34% (1999) to 18% (2014), and the share of the EU fallen from 14% (1999) to 7% (2014).

- The share of the BRICS countries in the world semiconductor industry also increased from 13% (2006) to 36% (2014). At the same time the share of NAFTA fell from 25.3 to 24.8%, the EU decreased from 14 to 8%.

- The share of the BRICS countries in the world pharmaceuticals industry increased from 13% (2006) to 33% (2014). Meanwhile, the share of NAFTA and the EU declined in 2014 by 24% and 23%, respectively.

BRICS – EXPERIENCE DYNAMIC DEVELOPMENT IN CLAUSES OF THE STIFF EXTERNAL COMPETITION

In this high-tech industry category the share of NAFTA amounted to 44% (2014), while the share of the USA was still very high – 42%. The share of the EU amounted to 23%. The share of the BRICS countries increased from 3% (1999) to 16% (2014) of the world testing, measuring, and control instruments...
industry. The main leading countries in this high-tech industry category are primarily developed: the USA, China, Germany, Switzerland, Japan, Italy, the UK, South Korea, France and Russia.

**BRICS – EXPERIENCING LOW ACTIVITY IN CLAUSES OF THE HIGHLY COMPETITIVE FIELD**

This situation could be illustrated by the world aircraft and spacecraft manufacturing. It should be noted that the lowest share in the world aerospace products and parts manufacturing was revealed in 2000 – 1.5%. The total share of NAFTA (56%) and the EU (23%) now accounts for almost 80% of this high-tech industry category (in the early 2000s, almost 90%). The share of the BRICS countries amounts only to 13% (2014), due to the rapid increase in the share of China from 0.6% (1999) to 7% (2014) and Brazil (Generated according to: Science and Engineering Indicators 2016).

**CONCLUSION**

The role of the international component in all mechanisms of social reproduction and economic relations is growing in the globalization of the world economy. The priority goal of development for many countries of the world is the development of a national innovation strategy now. Globalization and innovative development have led to the profound changes in the branch structure and spatial organization of the global industry. The rapid character of the industrialization process in developing countries leads to the spatial regrouping in the world.

In the recent two – three decades the role and importance of Asian countries has been steadily growing in the world economic development. Nowadays we are facing clearly expressed Asian vector of economic and industrial development. At the same time, such leading regions as North America and Europe are losing ground.

China, India, Russia and Brazil are already among the TOP-10 leading countries in the world economy. All of the BRICS countries have set themselves ambitious plans to improve the economy structure and to pursue a transition to the innovative way of development. All said above could be especially noticeable when analyzing the dynamics of production of high-tech industries.

The comparative analysis of NAFTA, the EU and BRICS countries positions in the various types of high-tech manufacturing industries captures the growing importance of the BRICS in the global industry. It is noted that in 1999–2014 the share of BRICS countries in the value added of HT manufacturing industries increased from 6 to 31%. At the same time, the share of NAFTA and the share of the EU decreased.
This paper was financially supported by the Ministry of Education and Science of the Russian Federation on the program to improve the competitiveness of Peoples’ Friendship University of Russia (RUDN University) among the world’s leading research and education centers in the 2016-2020.

ANTECEDENTS TO BRAND HATE AMONG GENERATION Y: A CONSUMER CROSS-CULTURAL STUDY

Rodrigues, Clarinda1; Rodrigues, Paula2

1School of Business and Economics, Linnaeus University, Kalmar, Sweden
2School of Economic and Management, Lusíada University North, Porto, Portugal

ABSTRACT

Previous research highlights that brand experiences impact on how consumers relate emotionally to brands. Nevertheless, research on negative brand experiences is scarce, particularly in the field of brand hate. In order to fulfill the identified research gap, this paper aims to investigate the negative aspects of brand relationships by focusing on the antecedents of brand hate among Generation Y. Moreover, it explores weak innovativeness, perceived quality, brand social responsibility and brand personality impact on brand hate. More precisely, it attends to the mediating effect of brand experience on brand hate. A survey with Apple and Samsung was conducted among Swedish and Portuguese consumers. The model has been tested using SEM. Our findings show that the effects of the antecedents of brand hate in general vary for both brands and countries.

Keywords: Brand Hate, Brand Experience, Generation Y, Brand Innovativeness, Brand Perceived Quality, Brand Social Responsibility, Brand Personality, SEM

INTRODUCTION

Consumer-brand relationships have been a focus of branding theory over the last two decades (Fetscherin & Heinrich, 2015). The need to connect with consumers emotionally and develop close and long-term relationships has prompted both marketing practitioners and academics to seek innovative ways to create compelling brand experiences. In fact, Generation Y consumers may consider brands as a relationship partner (Fournier, 1998) that brings meaning to their daily life when they are searching for or buying products and services (Brakus, Schmitt, and Zarantonello, 2009). The broad and long-term relationship, which is characterized by multiple interrelated cognitive, affective and behavioral elements (Batra, Ahuvia, and Bagozzi, 2012) will determine the nature of consumer feelings towards the brand. Hence, it can be claimed that brands that do bad may generate negative feelings among Generation Y consumers such as brand hate.
Hate is conceptualized, both in psychology and marketing literature, as an intense and negative feeling (Grégoire, Tripp, and Legoux, 2009; Johnson, Matear, and Thomson, 2011; Alba & Lutz, 2013; Romani, Grappi, and Dalli, 2012; Bryson, Atwal, and Hultén, 2013). Most recently, Zarantonello, Romani, and Grappi (2016) conceptualized brand hate as a constellation of negative feelings and demonstrated that brand hate is associated to different types of negative behavioral outcomes such as “attack-like” (negative WOM), “avoidance-like” (patronage reduction/cessation) and “approach-like” strategies (consumer complaining and protest behaviors). Another stream of research shows that negative-brand relationships are influenced by poor quality of products, association to undesirable social groups, inconsistency of brand image, moral or values of those consumers (Park, Eisengerich, and Park, 2013).

Despite the anti-consumption research raised the importance of brand hate as an emerging branding concept, there is a growing call to extend the theory on the dark side of brands in order to obtain a more balanced and holistic understanding of negative consumer-brand relationships (Fournier & Alvarez, 2013). Furthermore, little is known about how Generation Y, a generational group that is well-educated, technological adept and knowledgeable about brands (Noble, Haytko and Phillips, 2009), reacts to negative brand experiences as a result of brand failures to deliver the desired functional and experiential values. Hence, the question remains in relation to which antecedents can generate brand hate among Generation Y consumers? And if those effects vary among different cultures?

CONCEPTUAL BACKGROUND AND HYPOTHESES

According to Brakus et al. (1999), brand experience consists of five dimensions, namely sensory, affective, cognitive, behavioral and relational, which all provides consumers with memorable experiences along the consumption process. Hence, any time Generation Y consumers interact directly or indirectly with a brand, evaluative judgments are made in relation to the overall functional and experiential values provided by a branded product or service (Delgado-Ballester & Sabiote, 2015). Moreover, branding literature suggests that consumer perceptions of brands are deeply anchored on brand associations that arise from the direct brand experiences (Brakus et al., 1999). If Generation Y consumers are exposed to brand misconducts, they will react negatively to those brands and might manifest feelings of hate, either “active brand hate” (contempt/disgust and anger) or “passive brand hate” (fear, disappointment, shame and dehumanization) (Zarantonello et al., 2016). According to Bryson et al. (2013), country of origin of the brand, customer dissatisfaction with the product, corporate social performance and negative stereotypes of users of the brand are predictors of brand hate. The research on brand hate antecedents is however scarce and does not take into account the
significance of the overall brand experience. For that reason, the authors departure from marketing and branding literature to identify five antecedents to brand hate, i.e. brand perceived quality, brand innovativeness, brand social responsibility and brand personality. All these branding constructs account together for the sensory, affective, cognitive, behavioral and relational dimensions of brand experience.

Previous research shows that consumer-brand relationships might be influenced by brands failures to meet consumer sensory or intellectual expectations in relation to quality (Park et al., 2013), when they are searching for or buying branded products or services. As a result, consumers may start manifesting hate feelings towards brands that are no longer able to comply with high standards of quality, especially when quality is perceived by consumers as a key kernel brand value (Kapferer, 2015). Hence, the authors hypothesize:

**H1: Brand perceived quality, mediated by brand experience, has a positive and direct relationship with brand hate.**

Brand innovativeness refers to the degree a consumer perceives a brand to be innovative and serves as a heurist signal to consumers (Pappu & Quest, 2016) for technology, products and services. Hence, innovative brand experiences have a profound meaning for consumers (Lin, 2015) and if it fails to meet Generation Y consumer expectations it could result in strong negative feelings towards a brand. Hence, it is hypothesized that:

**H2: Brand innovativeness, mediated by brand experience, has a positive and direct relationship with brand hate.**

Brand social responsibility is defined as “consumers’ holistic (or gestalt-like) impressions regarding a brand’s social responsibility” (Grohmann & Bodur, 2014). Moreover, studies show that brand social responsibility’s perceptions are influenced by both products and marketing activities (ibid) and might be a predictor of brand hate (Bryson et al., 2013). Moreover, there is a growing concern about environmental and social issues among Generation Y consumers, which increases consumer attention towards brands that might start behaving badly. Thus, we suggest that consumers tend to manifest hate feelings towards brands that misbehave and are no longer able to address the Generation Y aspirational needs of contributing to a better world. Therefore, the authors hypothesize that:

**H3: Brand social responsibility, mediated by brand experience, has a positive and direct relationship with brand hate.**

Brand personality is defined as “the set of human characteristics associated with a brand” (Aaker, 1997, p. 347). Research in the dynamic construal of brand personality demonstrates that the relationship with brands could result either in signs of reinvigoration or brand suffer in the wake of transgressions (Aaker, Fournier, and Brasel, 2004). Given the importance of relating to brands which
are the usually the reflection of the individual’s self-concept (Beck, 1988), we believe that Generation Y consumers are more prompt to manifest extreme and negative feelings towards brands whose personality is not aligned with their self. Hence, it is hypothesized that:

H4: Brand personality, mediated by brand experience, has a positive and direct relationship with brand hate

METHODOLOGY

In order to examine the postulated hypotheses, an empirical study was conducted in Sweden and Portugal from September to October 2016. A survey on universally known brands – Apple and Samsung – was carried out among Generation Y consumers using a convenient sample. In total, 362 participants aged 18 - 25 years completed the questionnaire (156 in Sweden and 206 in Portugal). Gender is distributed almost equally in both countries: in Sweden 69.2 per cent of the participants are female and 30.1 per cent are male, whereas in Portugal 54.4 per cent of the participants are female and 45.6 per cent are male. A set of validated scales from marketing and branding literature were used and followed the evaluation of the psychometric properties of the scales proposed by Churchill (1979) and Bollen (1989), in order to guarantee that the proposed scales are reliable, have validity and are one-dimensional. All indicators, at the exception of brand-relationship construct, are formulated as to serve a five-point Likert scale ranging from 1 “Not at all” to “Very much”. To measure brand innovativeness (BI) we used four items from Pappu and Quester’s (2016) scale, brand experience (BE) was measured with four items from Brakus et al.’s (2009) scale, brand social responsibility (BSR) was measured with eleven items from Grohmann and Bodur’s scale (2015), we measured brand personality (BP) with ten items from Geuens, Weijters and Wulf’s (2009) scale, and finally brand quality perceived (BQP) was measured with three items from Yoo, Naveen, and Sungho’s (2000) scale. To operationalize brand hate, we asked the respondents to evaluate their relationship with both brands using a five-point Likert scale. In order to test our hypotheses, we examined our model using structural equation modelling. Moreover, we followed the assumption of Anderson and Gerbing (1982) that the modelling of structural equations must be done through two conceptual distinct models: confirmatory factor analysis and structural model for both countries and for two brands (Apple and Samsung). Finally, we tested our model and our proposed hypotheses by estimating the paths between the constructs and determining their significance.
MAJOR RESULTS

In total, 206 questionnaires were validated in Portugal and 156 questionnaires in Sweden for both Apple and Samsung. The confirmatory factorial analysis shows a high internal consistency of the constructs for both countries and both brands. Fit indices and scale reliabilities reveal a good overall model fit. In each case, the Cronbach’s alphas exceed 0.7 as Nunnally and Bernstein (1994) recommend. The composite reliability of each factor is greater than 0.6 and the average variance extracted (AVE) exceeds 0.5 (Bagozzi & Yi, 1988). As evidence of convergent validity, the CFA results indicate that all relations of the items to their hypothesized factor are significant (p < 0.001) and that all standardized loadings are greater than 0.6 (Bagozzi & Yi, 1988). Moreover, results provide support for discriminant validity (Fornell & Larcker, 1981). In particular, for each pair of variables, the squared correlation was always lower than the average variances extracted of each of the two constructs. In order to purify the scales used, some items from brand personality and brand social responsibility were removed. Hence, in Portugal the social brand responsibility scale was reduced to seven items and brand personality to five items. The same procedure was applied in Sweden, resulting in three items for social brand responsibility and six items for brand personality. After the stabilisation of the model of measurement and the analysis of the quality of the adjustment, we verified whether the hypotheses of research were confirmed or not. In the case of the model proposed, estimation was carried by the method of the maximum likelihood (ML), so that the objective of developing and testing the hypotheses could be met. Consequently, results of the estimated models are presented and discussed below (Fig. 1 and Fig. 2).

Overall, the postulated model performs well and most of the paths are significant accounting for the robust effects of the constructs. For Apple, and for Portuguese case, findings show that brand innovativeness (BI) (γ_{11} = 0.505, p = 0.000), brand perceived quality (BPR) (γ_{12} = 0.165, p = 0.000) and brand personality (BP) (γ_{13} = 0.275, p = 0.000) indirectly affects brand hate, through the moderating effect of brand experience (BE). On the other hand, in Sweden BPR (brand perceived quality) is not statically significant to affect brand experience. Instead, brand personality (BP) (γ_{13} = 0.149, p = 0.000) and brand innovativeness (BI) (γ_{11} = 0.498, p = 0.000) directly affects brand experience (BE) in a positive manner. Nevertheless, the path between brand experience and brand hate (β_{21} = 0.078, p = 0.368) is insignificant for Sweden.
Regarding Samsung, findings demonstrate that both in Portugal and Sweden brand innovativeness (BI) has a positive and direct effect on brand experience (BE). Furthermore, for Portugal it is demonstrated that brand social responsibility (BSR) also has a positive and direct effect on Brand Experience (BE), whereas in Sweden is brand personality (BP) (γ₁₂ = 0.274, p = 0.000). Interestingly, the path between brand experience (BE) and brand hate (BH) (β₂₁ = 0.181, p = 0.000) is significant only for Portugal.
CONCLUSIONS

Research on brand hate remains in its infancy and has offered limited insights into its antecedents and moderators. Our results account for the multidimensionality of brand hate, demonstrating the importance of brand perceived quality, brand innovativeness, brand social responsibility and brand personality for developing brand hate towards brands. The impact of these four constructs on brand hate have been not investigated previously in the marketing and branding literature, though they often appear associated to consumer-brand relationships literature in general. In line with previous studies (Park et al., 2013; Bryson et al., 2013; Aaker et al., 2004) we confirm the importance of all the four constructs in affective relationships with brands by showing how brand misbehaves can generate intense negative feelings towards the brands (Zaratonello et al., 2016) among Generation Y. Nevertheless, our findings demonstrate significant cross-cultural differences regarding antecedents to brand hate for Apple and Samsung brands. In particular, the lack of brand innovativeness drives brand hate for both brands. This could be explained by the fact that Apple and Samsung are technological based and Generation Y consumers might expect those brands to offer them continuous innovation. On the other hand, results show for both countries that brand perceived quality and brand personality are antecedents to brand hate for Apple, whereas antecedents to brand hate for Samsung are different in both countries. In fact, brand hate is positively influenced by brand innovativeness in both countries, but brand social responsibility has a greater influence on brand hate in Portugal and brand personality in Sweden. The antecedents to brand hate of the two brands could be explained at the light of the importance of quality and personality traits associated with premium brands such as Apple, while brand social responsibility might be related to the perception of Asian brands (ex: Samsung) as non-social and environmental responsible.

As another contribution, we demonstrate the relevance of brand experiences as a moderator of brand hate. Collectively, our results account for significant differences between the two countries in relation to how Generation Y consumers tend to manifest extreme negative feelings towards brands, which are not able to create meaningful and compelling brand experiences. As discussed by Fournier (1998) consumers may consider brands as a relationship partner that brings meaning to their lives when they are searching products and services (Brakus et al., 2009). If brands fail to deliver cognitive, affective and behavioural elements within their broad and long-term relationship with Generation Y consumers, it may influence negatively how they relate to those particular brands. Interestingly, however, our findings demonstrate that in Portugal there is a direct and positive relationship between brand experiences and brand hate. This could be explained by the fact that Portuguese consumers are more emotionally driven towards brands than Swedish consumers and, therefore, more prompt to manifest hate feelings towards brands that they consider as bad relationship partners. In fact,
Generation Y consumers might feel deceived if those brands fail to meet their expectations along the overall brand experience. On the other hand, Swedish Generation Y consumers seem to be more tolerant if brands fail to deliver the desired functional and experiential values and therefore do not tend to manifest extreme negative feelings towards brands.

**IMPLICATIONS**

From a theoretical perspective, this paper expands on research about negative consumer-brand relationships by proposing brand innovativeness, brand perceived quality, brand social responsibility and brand personality as new antecedents to brand hate. Additionally, it stresses the relevance of brand experiences as a moderator to brand hate. Finally, it explores for the first time how Generation Y consumers reacts upon brand failures when delivering experiences and which are the effects on brand hate. From a managerial perspective, this study sheds light on the importance of understanding the reasons behind brand hate. By identifying them, brand managers could prevent from engaging in misleading behaviors, which are negatively perceived by consumers. In particular, brands should continuously innovate, enhance its product and quality standards, implement adequate brand social responsibility policies and be selective in the manner they shape their brand personality.

**LIMITATIONS AND FUTURE RESEARCH**

One of the limitations of this study relates to the non-probabilistic sample since the surveys were only conducted in two universities. Secondly, being a cross-cultural study it is recommended to include other countries in the data collection. Thirdly, brand experience was used as the only moderator and it could be interesting to explore the mediating effects of other branding constructs. Finally, a future avenue of research relates to the outcomes of brand hate among Generation Y.

**INTRODUCTION**

Consumer preferences are driven not only by functional elements, but also by various specific brand-related stimuli, resulting in a comprehensive experience (Ding and Tseng, 2015). In particular, sensory stimuli impact both cognitive and emotional reactions, which influence consumers’ perceptions of products and brands (Krishna, 2012). Previous research has investigated the role of senses in stimulating purchase, retail patronizing and brand preferences (e.g., Chebat et al., 2001; Mattila and Wirtz, 2001). Sensory stimuli have been shown to create positive associations and perceptions in consumers, resulting in positive overall experiences, with these elicited emotions, thoughts and sensations contributing to a positive brand attachment (Brakus et al., 2009). However, only recently studies (e.g., Biswas et al., 2014; Spence, 2012, 2015) are combining more than one sense to understand their combined effect on consumer experience (Schifferstein and Spence, 2008).

Wine consumption provides a valid and interesting context to understand the combination of the senses involved in consumer experience, given that wine is an experience good whose quality cannot be truly assessed until the product has actually been consumed (Jaeger et al., 2009). Therefore, the sensory aspects are seen as an integral part of the consumer’s total product experience when consumption takes place (Bruwer et al., 2011; Lee and Lee, 2008). Consumers are also driven by other factors such as product attributes, use situation, product experience and knowledge (Hollebeek et al., 2007; MacDonald et al., 2013). The influence of these factors varies in intensity, according to consumer expertise (Perrouty et al., 2006).

Most of previous wine marketing research (e.g., Camillo, 2012; Martinez et al., 2006) has focused on the importance of intrinsic and extrinsic attributes. The former are those related to physical attributes that cannot be altered in the final product and which cease to exist when it has been consumed (Olson and Jacoby, 1972) such as color, flavor and grape variety (e.g., Jover et al., 2004). The latter are related to the product, but are not physically part of it (Olson, 1977), such as brand, price, label, bottle form and color, and purchase occasion (e.g., Mueller and Szolnoki, 2010).
These studies, however, did not really predict which combinations of factors actually motivate consumer preferences. A few sensory consumer studies (Enneking et al., 2007; Raz et al., 2008) have separated the relative effects of extrinsic and intrinsic attributes on consumer choice through a conjoint analysis approach. However, these studies used only one single intrinsic attribute (i.e., sweetness or aroma) to prevent possible conflict caused by the usage of multiple sensory cues. On the other hand, several studies (e.g., Lockshin et al., 2006; MacDonald et al., 2013) have measured the relative importance of various extrinsic attributes in regards to product choice, without integrating any sensory characteristic into their research design.

Studies that take into account cognitive, emotional and sensory aspects are therefore needed, since these factors contribute to creating a whole experience. The experiential responses stored in a consumer’s memory involve cognitive, affective and sensorial systems (Brakus et al., 2009). It is through these interactive experiences that consumers build their preferences and purchasing decisions.

This paper seeks to understand the effect of the combination of more than one sense (sight, olfaction and taste) and of the brand on wine experience. Therefore, wine experience has been defined as a combination of sensations, feelings, cognitions, and behavioral responses stimulated by extrinsic and intrinsic attributes. This depends on when and where consumers experience a specific wine, which have cognitive and emotional aspects. The main idea is that consumers choose wine not only for the experience they get through the sense of taste, but also through other senses that help enhance and reshape the informational role of the intrinsic attributes, shifting wine consumption into a hedonic experience (Chrea et al., 2011). The attention is focused on the unique multisensory aspects of taste perception, thus exploring whether other senses can have an impact on taste perceptions. Taste is a curiously unique sensation as it is composed not only of one sensory input (i.e., from the tongue) but is also created by incorporating multiple sensory inputs (Elder and Krishna, 2010).

One of the main focal points of this article is to explore the interaction of cognition and sensory perception, particularly taste, given that, in addition to a reliance on intrinsic cues from the food itself, taste is susceptible to extrinsic cues such as brand. Moreover, since insights into consumers’ perception of the importance of these elements, under specific contextual conditions (i.e., purchase and/or consumption situations), are still rather limited (Martinez et al., 2006), this study examines two main occasions for consumption: self-consumption and gift.

The remainder of this paper is organized as follows: the theoretical background is discussed, followed by hypotheses, as well as an overview of research methods. Results are then presented and discussed, ending with a look at practical implications and a short conclusion.
THEORETICAL BACKGROUND

Consumers assign their preferences to products according to the relative benefits they obtain from them. The experiential enjoyment is related to the product’s sensorial aspects, which encourage a greater brand affect, while practical functionality derives from tangible aspects that generate high levels of brand trust (Babin et al., 1994).

Literature has found intrinsic cues to be more important in assessing quality, since they have greater predictive value than extrinsic cues (Zeithaml, 1988). Therefore, intrinsic cues are particularly important at the time of purchase and upon consumption. However, in the absence of previous experience with a product, consumers often tend to assess its quality on the basis of extrinsic cues (Veale and Quester, 2008). Since in most purchase situations consumers do not have the opportunity to taste a particular wine before buying, extrinsic attributes (i.e., what is outside the bottle) are used to evaluate intrinsic ones (i.e., what is inside the bottle) (Menichelli et al., 2012).

Studies on food consumer behavior have mainly analyzed the processes before the purchase such as information search, exposure to and processing of purchase related cues, which do not involve tasting, while sensory affective studies that involve tasting mainly deal with processes that occur after the purchase (Grunert, 2003).

Intrinsic and extrinsic attributes in wine experience

Consumers form opinions about wine through the evaluation of intrinsic and extrinsic product attributes (Veale and Quester, 2008). Given the high number of factors that influence consumers’ decision to purchase wine (Bruwer et al., 2011) and the difficulty in accurately evaluating both extrinsic and intrinsic attributes due to lack of product knowledge or situational circumstances (Martinez et al., 2006), consumers look for proxy indicators to make their decision (e.g., price, brand name, region of origin, winemaker, grape variety, label, awards and recommendations).

Although consumers give more credence to intrinsic attributes than to extrinsic ones (Veale and Quester, 2008), extrinsic attributes play an important role when perceived intrinsic cues are insufficiently predictive or consumers are unable to accurately assess their influence on quality (Srinivasan et al., 2004). Moreover, situational influences, such as the absence of intrinsic cues or the purchase associated with self-image or status (i.e., gift-giving), can increase the reliance on extrinsic cues (Kardes et al., 2004). However, previous research has not clarified the combined effect of these factors on consumer experience.

Consumers select, from a range of products/brands, the one they feel may be suitable for a particular situation (Yang et al., 2002). The purchase situation (Ritchie, 2007) and purchase purpose (Olsen et al., 2007) have been found to strongly influence consumers’ motivation to buy and their wine experience.
Two main purchase occasions have been identified (Fennell, 1978; Thach, 2002): the interest opportunity, or self-consumption, in which functional cues are more important, and the sensory pleasure opportunity, exemplified in convivial and gift occasions, in which experiential cues are more important.

In particular, consumers prove to be more cautious when shopping for gift-giving, since they seek to avoid the social cost of an inaccurate delivery and inadequate product quality (Baskin et al., 2014; Gino and Flynn, 2011; Steffel and LeBoeuf, 2014). Previous research (Garcia-Retamero and Gaiesic, 2012; Laran, 2010; Polman and Emich, 2011) has found that, in the domain of gift-giving, givers are much more aware of the inputs into their gifts than are recipients. This perspective difference can lead givers to invest resources into gifts that fail to have the intended effect on recipients. Indeed, gift givers experience different levels of shopping involvement, which depend on the relationship with the recipient and the gift-giving occasion (Beatty et al., 1991). In fact, if the occasion and the recipient are high task involvement, the gift giver will more likely select a gift that is high in involvement as well.

Gift selection is therefore a more involving task than buying for personal use (Melo et al., 2010). Specifically, wine consumption can be explicitly related to the situation and context (Bruwer et al., 2002) and its social aspect is important as a rite of passage or to promote social interaction (Ritchie, 2007). Therefore, it has been hypothesized that:

H1a: Intrinsic attributes influence wine experience more positively than extrinsic attributes in sensory pleasure occasion than in interest opportunity occasion.

The use of intrinsic or extrinsic cues varies depending on the level of a consumer’s wine expertise, which derives from the meanings that consumers learn about, and associate with, the wine and its brand (Hussain et al., 2007). These meanings include functional, symbolic and sensory associations (Bruwer and Buller, 2012). The level of expertise plays an important role when a purchase takes place, and has a different effect on sensory evaluation (Fröst and Noble, 2002). Since taste pleasantness cannot usually be experienced during the decision moment, only an experienced consumer can undertake a more reasoned decision (MacDonald et al., 2013). Less experienced consumers tend instead to rely on ratings from experts or medals/awards, thus showing a simple like or dislike for a particular wine (Schiefer and Fischer, 2008). Previous studies have found that, when making their purchase decision, consumers with high level of knowledge rely more frequently on intrinsic cues compared to consumers with lower level (Phau and Suntrornnond, 2006).

As different types of product-related experiences lead to different levels of expertise (Erdem et al., 1999), which, in turn, have various effects on product evaluation and choice behavior, it is hypothesized that:
H1b: Greater expertise is related more to intrinsic attributes than extrinsic ones.

The effect of senses on wine experience

Sensory stimuli affect consumers’ perception of products and brands, as they impact both cognitive and emotional reactions (Krishna, 2012). However, extrinsic cues can be powerful enough to overcome sensory perceptions (Garber et al., 2000), since sensory perceptions are not always accurate and are influenced by expectations and beliefs (Priilaid, 2006). This means that intrinsic attributes can be weighted and interpreted more accurately when evaluated by consumers, even if the evaluation is through sensory means (Spence, 2012).

Wine is a product for which the evaluation of intrinsic sensory characteristics is strongly affected by extrinsic attributes (Mueller et al., 2010b). In particular, taste is not physiologically made up of sensations from taste buds only; it also relies heavily on input from the other senses (Spence, 2015). It derives first from sight and then odor. Each sense has some role in generating taste (Rolls, 2005). Sight works cognitively to inform and identify the product, and affectively to differentiate and stimulate emotions; visual clues are also significant in consumer quality evaluations (Garber et al., 2000; Hoegg and Alba, 2007). Experiments in meat consumption (Bredahl, 2003; Hurling and Sheperd, 2003) showed that consumers prefer the appearance of very lean and red steak, which contributes to a better tasting product.

Olfaction, instead, is the truly emotional sense, and naturally hedonic, evoking a primary reaction of either liking or disliking. It produces an experience that involves at least some degree of self-reference, thus having an effect on affective processes and hedonic values (Fitzgerald Bone and Jantrania, 1992; Small and Prescott, 2005). Finally, taste drives choice and experience, thus creating an attachment with the wine chosen. It is both cognitive and affective (Veale and Quester, 2008).

It is thus evident from physiology and neuroscience literature (e.g., Spence, 2015; Spence and Piqueras-Fiszman, 2014) that taste is derived from multiple intrinsic sensory components, including smell and sight. However, the automaticity of these inputs is largely unexplored, leaving the question as to whether or not marketing actions incorporating these cues will have an impact on taste perceptions. This question addresses also the general impact of extrinsic cues on taste perceptions. The olfactory experience, which can also take place independently, always accompanies the tasting one together with the visual aspect, which can influence flavor perceptions (Deroy, Crisinell and Spence, 2013; Doty, 2015). However, food and drink consumption is not only a physical experience that involves smell, taste and sight, but also a cognitive and affective experience. The sensorial experience of tasting therefore can be described more easily from a cognitive point of view, notwithstanding its strong emotional component (Ferrarini et al., 2010). Therefore, it is hypothesized that:
H2: The combination of senses (sight, olfaction and taste) positively impacts wine experience

The mediating role of brand attachment
Wine has been found to be a product for which the evaluation of intrinsic sensory characteristics is strongly influenced by extrinsic attributes (Lange, Issanchou and Combris, 2000; Mueller et al., 2010b; Priilaid, 2006; Siegrist and Cousin, 2009). Consumers almost always are conscious of the extrinsic characteristics when actually consuming wine; that is they are informed about the wine’s brand, origin, price and packaging (Mueller et al., 2010b). It is well acknowledged that consumers are heterogeneous in their liking of sensory cues (Carbonell et al., 2008; Semenou, 2007) and also differ in their reaction to extrinsic cues (Gracia, Loureiro and Nayga, 2009; Jaeger and Rose, 2008). Brands facilitate the decision-making process, especially in the case of wine that is often regarded as complex and/or having a high level of associated risk (Lockshin et al., 2006). The addition of salient intrinsic attributes to a product or consumer experience enhances the quality and value perceived by consumers, and will increase the positioning strength of the brand (Batra and Ahtola, 1991). While some physical/functional attributes of the wine (e.g., producer information, label and bottle) are linked to the brand in its basic function of guarantee, risk reduction and trust building, the sensorial cues (e.g., color, bouquet) characterize the uniqueness of the offer and contribute to the brand attachment through symbolic meanings related to self-concept and social identity. An emotional utility is therefore reflected in the expression of the self and the brand experience (Keller, 1993).

Marketing literature has investigated the effect of senses on brands (e.g., Krishna, 2010), thus highlighting the sensory branding concept (Lindstrom, 2005). Senses, in particular, recall brand image and reputation (Brakus et al., 2009). The sensorial responses from a consumer’s exposure to a brand precede affective responses (Zajonc and Markus, 1982) and the hedonic experience of senses (sight, odor, taste) contributes to the formation of mechanisms like brand attachment, which mediate all feelings with a pleasant experience (Park et al., 2008).

While a number of studies has proven and measured the combined effect of several extrinsic cues on product evaluation (e.g., Combris et al., 2009; Stefani et al., 2006), they did not disentangle their relative impact (Mueller and Szolnoki, 2010). Also unexplored is the degree to which consumers differ in their relative responsiveness to extrinsic cues. Moreover, only some brand elements, such as label and brand name, have been examined. Recently, Hoegg and Alba (2007) show the impact of several extrinsic cues for orange juice, including brand name, price, and region of origin, on taste discrimination and taste preference. Their findings include a national brand receiving better taste evaluations than a store brand and differences in the color of orange juice leading to greater differences in perceived taste than in brand labels. Therefore, it is hypothesized that:
H3: Brand attachment mediates the effect of senses on wine experience

This study tests the following conceptual framework (see figure 1), in which sensorial cues affect wine experience through the mediation of brand attachment. This framework is studied in 2x2 design; gift-giving vs. self-consumption and low vs. high expertise.

Figure 1: Conceptual framework

METHODOLOGY

This paper aims to investigate the effect of the combination of sight, olfaction and taste on wine experience. A questionnaire was developed, in which all variables were measured on seven-point Likert scales (1 = not important, 7 = very important) using multiple items, in an effort to overcome the limitations of previous studies that used single-item rating scales (Cohen, 2009). The scales, whether used in full or partially (adjusting to the study objectives), were drawn from relevant literature. Respondents were asked to answer the questions in relation to the last bottle of their favorite wine they purchased. This approach particularly derives from the definition of wine experience, considering also that wine is a product with strong sensory fatigue due to its alcohol content (Mueller, Francis and Lockshin, 2009). In fact, Mueller et al. (2009) showed that in a blind condition consumers were not able to discriminate between wines due to the sensory interaction and carryover effects of stimuli in a choice set. Moreover, we were interested in memorable, attention capturing and easy to process perceptually experiences (Spence, 2012). Grunert (2003) found that, if a consumer has previously consumed a product, then the memory of the beliefs formed due to the previous taste experience will influence his later repurchase and not the original taste experience itself. Zandstra...
(2006) showed that the memory of a taste can be quite different from the actual taste impression. If one analyses products that exist in the market, then some consumers are likely to have previously tasted the product. Accordingly, the fuzzy memory of the taste experience and extrinsic cues will likely influence their purchase decision. Therefore, we believe that the experience of the favorite brand of wine is easy to recall, since perception relies on an interpretative ability to recognize and compare with previous sensory experiences, which, in turn, depend on social practices and an individual’s personal history.

Ferrarini et al. (2010) have demonstrated that people are capable of identifying a circumscribed range of terms within the broader emotional lexicon that describe the emotional aspects elicited by wine. Therefore, since we measured the emotional attachment the respondents have to a wine brand, we asked them to evaluate all variables in relation to their favorite brand instead of giving them some brands. In fact, Mueller et al. (2010b), analyzing market shares and choices, have confirmed that extrinsic characteristics and product memories from previous consumption are very strong drivers for consumers’ wine purchase.

First, respondents were asked to rate their wine expertise through a 15 item, seven-point scale (Kleiser and Mantel, 1994). Respondents were then asked to indicate the importance level of extrinsic and intrinsic attributes derived from the literature (Lockshin et al., 2006; MacDonald et al., 2013; Mueller and Szolnoki, 2010). The extrinsic attributes were brand, area of production, price, point of purchase (shop staff, atmosphere), bottle, label, medals, certifications, the producer and, finally, the producer’s marketing actions (leaflets and/or brochures). The intrinsic attributes referred to the three senses: taste, sight and olfaction. In particular, the dimensions used were:

- **sight**: color intensity, color brightness and color shade;
- **olfaction**: frankness, intensity, delicacy, harmony balance;
- **taste**: body, aromatic persistency, aftertaste, acidity, mouth thickness, astringency.

The three senses were measured through self-reported questions covering different aspects in relation to the wine the respondent preferred.

Respondents were then asked to rate their emotional attachment to the brand of wine they usually purchase by using 7 seven-point scale items from Thomson et al. (2005). Lastly, they rated their wine experience in terms of familiarity, memorability and affection by using 3 seven-point scale items adapted from Murray (1991).

Finally, socio-demographic variables such as age, gender, income and nationality were also included to explain certain behaviors, along with respondents’ preferences in terms of the type of wine (red, white, rosé) and their favorite brand of wine.
The questionnaire was submitted to a sample of specialized students enrolled in a Master degree program in tourism and wine marketing in Switzerland and a sommelier course in the South of Italy. For the Italian sample, items were translated into Italian using an iterative approach (Douglas and Craig, 2007). Participants in the survey were highly involved wine consumers, having either high or low expertise. According to the literature (Coulter and Coulter, 2003), these consumers have a high level of preference insight, which means that they choose a product evaluating all its elements properly. Since they are able to accurately weigh the sensory enjoyment of wine tasting, they carefully evaluate, and are less driven by, extrinsic cues such as brands and promotions. Therefore, the type of respondents allowed us to be fairly confident on their recall of all the dimensions analyzed. A total of 748 respondents were asked to participate after being intercepted at the end of the classes. They were randomly assigned to the 2 purchase occasions, namely self-consumption and gift-giving. A total of 698 questionnaires were ultimately deemed usable since 50 of them had missing responses. Due to the locations where the interviews were conducted, the achieved sample is somewhat skewed in favor of younger people (64% of respondents being under 35), and somewhat balanced in terms of gender (M = 335, F = 363). In the section related to brand attachment, as the respondents were asked to think of their favorite brand of wine, they highlighted different brands, varying in brand reputation that goes from very well-known brands to unknown brands. The wines chosen covered a wide range of chemical and sensory properties (fruit intensity, oak flavor, astringency, sweetness, alcohol levels, etc.) and a wide range of extrinsic (non-sensory) characteristics, such as price points, label type, different vintages, brands and regions from all over Italy and France.

In terms of preferences, 65% of the respondents prefer red wine (28% primitivo, 33% negramaro, 22% aglianico, 17% merlot wine variety), 25% prefer white wine (38% pinot, 12% gewurtztraminer, 25% sauvignon blanc, 25% falanghina wine variety) and 10% rosé wine. In terms of price the wines chosen range from 9 Euros to 30 Euros, thus reducing the impact of price on their preferences. Six brands emerged as most preferred mainly from Italy and France.

The extrinsic factors that consumers consider when choosing wine have been factor analyzed with a Varimax rotation (see Table 1). The analysis highlighted 2 components: (1) ‘Functionality’, which groups elements related to the tangible and functional aspects of the wine, highlighting the importance of cognitive information that constitutes wine expertise; and (2) ‘Point-Of-Purchase (POP)’, which groups extrinsic attributes that highlight both the informational function of the point of purchase (i.e., through the shop staff,) and the experiential function (i.e., the atmosphere).

**Table 1. The Factor analysis results**
The two components reflect the brand literature (e.g., Keller, 1993), which considers products as a bundle of product-related attributes. They are essentially defined as the components of the core product function sought by consumers, along with non-product-related ones, which are external to the function or process of the product offering.

To assess the effect of the product attributes and senses in relation to the two purchase occasions (gift-giving vs. self-consumption) and level of wine expertise (high vs. low), a two-way ANOVA was carried out. To test the effect of senses on wine experience, a structural equation model was run (see figure 2).

**RESULTS**

To test H1a and H1b, a two-way ANOVA was carried out with wine experience as a dependent variable. All sensorial variables and wine experience were computed by calculating the mean of the items measured for each variable.

In both the purchase occasions, all variables were found to significantly affect wine experience: sight (F (1, 698) = 174.54, p < 0.001), olfaction (F (1, 698) = 149.21, p < 0.001), taste (F (1, 698) = 204.98, p < 0.001), functionality (F (1, 698) = 216.69, p < 0.001) and POP (F (1, 698) = 160.23, p < 0.001).

The gift condition, in particular, shows that all variables have higher means than in self-consumption scenario (see Table 2), which confirms the gift function in self-expression that requires both cognitive and sensory dimensions. The former are activated in order to avoid the risks of a wrong choice that could negatively impact the image, and the latter reinforce the psychological and emotional meaning of a gift.
The sensory dimensions affect wine experience rather than the extrinsic ones, confirming H1a.

Moreover, the interaction between the occasion and the expertise confirms the sensoriality of the wine experience. In fact, all variables were significant: sight (F (2, 698) = 30.84, p < 0.001), olfaction (F (2, 698) = 36.40, p < 0.001) and POP (F (2, 698) = 32.78, p < 0.001) – except for Functionality (F (2, 698) = 2.59, p = .108). High-expertise consumers show higher means in both the occasions, except for Sight in the self-consumption occasion, confirming that it is through the senses that these consumers experience wine, while the functional aspects basically provide cues that cognitively reinforce the choice (Table 4).

To test H2 and H3, a structural equation model (LISREL 8.80) has been run with the three senses (sight, olfaction and taste) as independent variables, wine experience as a dependent variable and brand attachment as a mediator (see Figure 2 and Table 5). In regards to the senses, it is assumed here that sight and olfaction are antecedents of taste. As for brand attached, 4 factors resulted significant.
The model has a good fit ($\chi^2(164) = 260.44$, $p < .001$; CFI = .98; NNFI = .94; RMR = .104; GFI = .964; AGFI = .954; PGFI = .753; RMSEA = .029) and shows that the sensory effect is mostly driven by Taste, which had a direct effect on Wine experience ($\beta = .65$ $p < 0.001$). Sight ($\beta = .25$ $p = .792$) and Olfaction ($\beta = .71$ $p = .460$) are not found to have a significant effect on Taste. Therefore, H2 is confirmed.

Further, it is maintained that sensorial perceptions have an effect on extrinsic cues such as the brand that in turn acts as a mediator of the relationship with the wine experience. In fact, brand attachment turned out to be a mediator ($\beta = .269$ $p < 0.001$), reinforcing emotionally the sensory features. Instead, cognitively the function of a brand, represented by elements such as the name of the producer and the region of origin, is displayed in the label.

Brand attachment is also affected by the purchase occasion ($F (1, 698) = 516.79$, $p < 0.001$), with a higher mean in gift purchases ($M = 5.4$; $SD = .82$) than in self-consumption ($M = 3.64$; $SD = 1.18$). This highlights the role of the brand in affecting the social aspect of wine. Therefore, H3 is confirmed.

**DISCUSSION**

The study shows that wine is a multisensory experience and that the combination of extrinsic and intrinsic cues contributes to wine experience. Consistently with a growing body of sensory consumer research (e.g., Biswas et al., 2014; Krishna and Schwarz, 2014; Meiselman, 2013; Spence, 2015), this paper highlighted that extrinsic product cues, such as branding, influence how consumers experience food and beverage products, in this case wine. This finding confirms the complexity and variety of factors that influence wine consumption (e.g., Hollebeek et al., 2007; MacDonald et al., 2013; Martinez et al., 2006; Siegrist and Cousin, 2009), thus highlighting the importance of simultaneous processing of extrinsic and intrinsic cues. In fact, despite the differences in the country of origin and demographics...
of wine consumers, taste is not the only factor that can influence consumer experience and needs to be supported and combined with other factors, whether or not sensory.

First, the findings demonstrate that the purchase situation affects wine experience. Congruent with the gift-giving literature, the social situations and the consequent use of wine affect how consumers proactively reinforce their self-perception when gift-giving, especially for the non-expert general public. This confirms the experiential nature of wine and its appeal to senses, also given by the respondents’ preference for full body wine with a strong smell and strong taste (red wine from primitivo or aglianico vine variety), which encapsulate the pleasure of senses. The non-sensory components serve to reinforce the sensory nature of wine, cognitively supporting the experiential features.

Secondly, wine expertise helps in appreciating the wine in a sensory way, thus confirming previous studies on knowledge (Schaefer, 1997). A higher level of wine knowledge helps the consumer weigh relatively sophisticated product cues such as region, vintage or estate, while low-knowledge consumers predominantly rely on peripheral product cues such as medals and awards that may act as substitutes for product knowledge (Charters, 2004). Experts develop, through successive wine tasting, a somewhat different set of sensory concepts that do not include the personal idea of “liking” a wine. Experts’ assessment tends to be based on a number of specialist parameters and criteria that are part of a collection of standards widely accepted in the reference community.

Moreover, the higher mean for the point of purchase in case of high expertise respondents can reflect a certain level of wine knowledge. Consumers might choose stores perceived as more functional by nature (e.g., supermarkets or grocery stores) to purchase wine for everyday consumption (i.e., self-consumption), while specialty stores might be more common for premium wines, a product considered to be more symbolic and/or hedonic (e.g., in case of gift).

Lastly, the findings demonstrate that brand is an important element in wine experience, representing a premium when consumers value their own preferences, especially in a gift-giving context. In fact, through brand attachment, sensory cues have a positive effect on wine experience, thus confirming the experiential nature of wine (Benfratello et al., 2009; Spence, 2012). Brand attachment summarizes the cognitive characteristics to the emotional features of wine. The combination of sensorial cues together with cognitive cues such as information on the bottle’s label and design factors (i.e., imagery, color and layout), contribute to developing the attachment (Elliot and Barth, 2012). Since a wine brand is a layered or hierarchical concept, in which layers of brand elements interact (e.g., vintage, grape variety, region and country of origin), it represents a unique bundle of characteristics that only one, or very few, producers are able to combine to differentiate and create a distinctive experience. The importance of these elements also varies in relation to consumer knowledge and situational factors.
This paper also contributes to the growing sensory marketing literature by examining the effect of multiple senses on experience, demonstrating that senses act through the brand even for products that need to be consumed in order to fully appreciate their qualities.

This paper is a first understanding of sensory branding in wine, analyzing how senses through brand attachment affect consumer experience. We are aware of the limitations of the approach chosen, which aims at obtaining an overall evaluation of wine experience in different aspects including brand attachment and sensory factors. Future research could therefore combine self-referential measurements of senses and experimental real settings involving taste. This approach would help to better understand the impact of remembered taste versus taste impression in a taste test on consumer purchase behavior. It should be also investigated whether differences in terms of expertise are more attributable to an acquired taste or to an innate ability. In addition, other measurements of brand effects (e.g., brand loyalty) and behavioral responses (e.g., purchase intention, willingness to pay a premium price) should be considered in the model. The wine quality could be included as a mediator of the relation between the cues and the brand. The findings could also be further validated by replication in other countries.

Further research on sensory branding could consider whether more specific aspects of the brand are differentially effective based on the recipient and a different type of product (e.g., a search product, which, being more utilitarian, would show a different experience outcome especially in gift giving situations).

**CONCLUSION**

This paper looks at the role of functional and sensory cues in consumers’ wine purchasing decisions. The relatively high complexity and perceived risk of a wine purchase give rise to a need for selecting an optimal mix of wine elements when creating marketing communications. These communication efforts should take both low- and high knowledge consumers into account.

The wine industry is facing major changes, shifting from a production-oriented industry to a more marketing-oriented industry, while its agricultural roots and emphasis on product source remain unpredictable factors. From a managerial point of view, this study reinforces the necessity of a sound marketing strategy. It is important for practitioners to understand the interplay of sensory and non-sensory attributes as both dimensions have to be optimized for a product to be successful in the marketplace. The wine business needs to combine price competitiveness with experiential and sensorial strategies. Wine as a product is an experience of the brand, the lifestyle connotations that are associated with it and the region where the wine comes from. For wine brand trust or brand relationship factors are not sufficient for consumer repurchase. Consumers do not expect the wine to
be branded per se as a tool of engagement, but rather to engage them in cultural and geographical storytelling, using elements such as heritage and terroir, which convey a sense of authenticity. As consumers become increasingly exposed to a wider range of wines in retail outlets, wine producers need to build strategies to strengthen consumer loyalty for their brands. The appeal to senses must be matched to all components of a wine brand in order to connect with consumers and, ultimately, increase sales.

A SOUTH AFRICAN INDUSTRY PERCEPTIVE ON MODERN TRANSIT ADVERTISING MEDIA OPPORTUNITIES

Roux, Thérèse

Department of Marketing, Logistics and Sport Management, TUT, Pretoria, South Africa

ABSTRACT

The evolution of the transportation systems in South Arica offers a whole range of novel advertising opportunities; however, practitioners’ perspectives on planning this Out-of-home advertising platform remain unknown. This study is one of the first to explore practitioners’ perspective on transit advertising media in an emerging context and contributes to the limited theory on OOH advertising and media planning. Using qualitative interviews, this study detailed themes concerning media professionals’ evaluation of transit advertising media in a developing context. The feedback of these experts was used to ascertain the key strengths and limitations of transit advertising media. The practical as well as academic implications of findings were also presented.

Keywords: media planning, out-of-home advertising, transit advertising media, South Africa

INTRODUCTION

Gustavo Petro, the mayor of Bogota, Columbia, is well known for his contribution to transportation systems in developing countries and the quote: “A developed country is not a place where the poor have cars. It’s where the rich use public transportation.” Consider for a moment, some of the finest cities across the globe - London, Paris, New York, Dubai, Singapore, and Mumbai. The majority of the populations in these cities travel via massive first-world public transport networks of trains, trams and buses. This trend has only lately expanded to some developed countries (Subramania, 2016). In South Africa, recent infrastructural developments, such as the new transportation hubs, new airports, taxi-rank upgrading, SARCC (the South African Rail Commuter Corporation) integration, the new upmarket Gautrain, the Bus Rapid Transport (BRT) system, resulted in a far wider range of Out-of-home (OOH) advertising media opportunities (Du Preez, 2015).

OOH advertising in South Africa can be classified in four major platforms based on their reach in different environments: outdoor advertising aimed at vehicular traffic; transit advertising aimed at commuters; street-and-retail furniture advertising for pedestrians and shoppers; and alternative OOH advertising targeting exact audience profiles where particular groups congregate for a specific purpose.
This article offers an industry perspective on planning one of these OOH advertising platforms; transit advertising media. OOH and transit advertising media are expanding across the globe. The global OOH advertising expenditure of $7.6 billion is driven primarily by digital OOH in the transit environments (GIA, 2015). Globally transit advertising is the fastest growing OOH platform at 7% (Magna Global, 2016). It is also expanding in African markets due to the formalization of transit environments (Du Preez, 2015). Most commuters in these markets are reliant on the minibus taxi- and bus industry for their daily travel. This in turn generates a captive audience for brands to effectively reach these economically active consumers. It is evident that there are prospects for small and large businesses to use transit advertising to engage and reinforce their advertising messages – and even to entertain commuters in this new media landscape.

THE PROBLEM INVESTIGATED

No empirical study on how media practitioners evaluate modern transit advertising media platforms in a developing context could be found. Research in developed markets predominantly concentrated on consumers’ responses to traditional outdoor advertising boards (Donthu et al., 1993; Wilson & Till, 2011; Wilson et al., 2015), as well as digital advertising signage (Roggeveen, et al. 2016). Consumers’ contact with outdoor advertising messages for potential harmful foods or alcoholic beverages are often the focus in developing countries (De Bruijin, et al. 2014). However very limited studies on transit advertising have been conducted; with the exception of a few such as commuters in Hong Kong perceptions on exterior-bus advertising (Prendergast & Hang, 1999) and subway advertising (Chan & Fung, 2013); airport advertising in New York (Wilson & Till, 2008) and taxi-cab advertising in Scotland, UK (Veloutsou & O’Donnell, 2005). There still remains a serious paucity of academic literature on the practices of transit advertising media sector, even more so in an emerging market context, such as South Africa.

In the light of this insufficiency, the objective of this article to explore how experienced media experts evaluate transit advertising media when planning campaigns within South Africa. The contribution of this study is practical as well as academic. From a practical perspective, the findings can assist marketers and businesses in understanding transit advertising, in order to make use of this innovative OOH advertising media platform effectively for their advertising purposes. Despite the growing potential and opportunities there is still a lack of understanding of the value of this platform for businesses. The planning of advertising media followed by the nature and scope of transit advertising media will be reviewed in the following sections. This will be followed by the research methods and insight obtained from the in-depth interviews with advertising media professionals. Finally, the managerial implications and suggestions for future research are presented.
ADVERTISING MEDIA PLANNING

Advertising media planning is the most crucial function to achieve the advertising objective of reaching the target market (Koekemoer; 2010). Numerous academic sources acknowledge the complexity and significance of advertising media planning within the overall marketing strategy (Barker, 2014; Lane et al., 2011). It is a critical area of research because companies invest millions on advertising and promotional campaigns to persuade and engage; driving participation, facilitation, and conversation to build relationships. Furthermore, the digitization of media channels, proliferation of media options and increase in customer touch points has driven a intense fragmentation of target audiences, and continues to complicate the advertising media planning process of setting the media strategy and selecting the media options through which to deliver effective communications (Barker, 2014).

The current article is focused on advertising media planning, a specialist subset within marketing communication based around the selection of communication platforms used to transfer the organisations’ marketing messaging to their desired audience (Barker, 2014). Advertising media planning refers to the decision made to deliver advertising messages to the appropriate people, the right number of times, in the right environment at minimum cost to achieve the advertised brand’s marketing communication objectives (Koekemoer, 2010). A media plan refers to the complete analysis and execution of the media component of an advertising plan (Lane et al. 2011). No two media plans would be exactly the same, since it depends on the advertiser or the product, the objective to be achieved and the media planner or agency. At the crux of advertising media planning is the selection or evaluation of the best medium or combination of media to obtain the marketing communication-and-media objectives. The focus of the current study is on the evaluation of transit advertising media by experienced media experts in South Africa.

When selecting advertising media, the following factors should be considered: The ability of the media to communicate the brand or product the most effectively, the media objective (such as the reach and frequency required and the cost involved); the size, type and media habits of the target audience; the unique characteristics of each medium, and the nature of the product or service to be advertised (Sissors & Baron 2010; Lane et al. 2011) An important principle in media selection is “Media Neutral Planning” (MNP), where each medium is treated as potentially appropriate, depending on the specific marketing objectives. This requires the “consideration of, and expertise in all media channels”, including transit advertising (Tapp, 2005). Media neutral planning, therefore, requires an in-depth understanding of all the available transit advertising media types and their unique characteristics.

Advertising media can be evaluated based on objective criteria and subjective media values when planning campaigns. Objective media considerations such as the level of media exposure, frequencies and cost indicate the ability of the different media options to reach a target audience at the right time,
Quantitative media considerations such as the level of media exposure, frequencies and cost indicate the ability of the different media options to reach a target audience at the right time, place and cost. The media exposure and frequency delivered in an OOH campaign depends on the location and features of media types as well as the creative message (Donthu et al., 1993; Wilson & Till; 2008). Subjective media values refer to how and which subjective media-context variables influence the effects of the advertisements embedded in that context (Bronner & Neijens 2006; Belch & Belch, 2015). The qualitative values of OOH advertising media have only recently been explored in empirical research, despite the fact that global companies are increasingly relying on these values to promote the image of their brands in international as well as developed countries (Wilson & Till, 2011; World Outdoor Advertising News, 2012; Ju & Chung, 2016).

TRANSIT ADVERTISING MEDIA
The Outdoor Association of America (OAAA) defines transit advertising as “advertising displays affixed to moving vehicles or positioned in the common areas of transit stations, terminals and airports” (OAAA, 2015). Transit advertising thus consists of moving transit advertising media affixed to the outside or inside of moving vehicles as well as static advertising boards located in the common areas of train stations, taxi ranks, bus terminals and airports.

Some scholars examined commuters’ responses to moving transit advertising media affixed to moving vehicles (Chan & Fung, 2013; Veloutsou & O’Donnell, 2005), while others studied the noting and recall of static transit advertising (Wilson & Till, 2008). Veloutsou and O’Donnell (2005) conducted exploratory research in three areas in Scotland, on the overall attitudes and feelings towards advertising, outdoor advertising and taxi advertising from the perspective of the taxi commuters. They warned that there is more to the effectiveness of an advertising medium than the respondent’s ability to recall the advertisement – and the subsequent short-term sales increase. Therefore, target audiences’ attitudes and perceptions towards the medium and advertising also need to be taken into consideration when determining the effectiveness of an advertising medium. They found significant differences in exposure to taxi cab advertising between the different groups surveyed. For example higher exposure was measured for those from living in the city compare to those living in smaller towns, where taxi advertising is relatively new or not used as often. This suggests that specific types of transit advertising can be very successful for geographic selectivity to target different audience groups, however not all types might be equally effective or available across geographical areas.

Other studies also confirmed the ability of certain transit advertising types to target narrowly defined audiences. Wilson and Till (2008) suggest that airport advertising media are effective for narrowly defined customers audiences that coincide with airport passengers’ profiles such as businessmen. The
findings also showed that the size and shapes of the advertising medium, the themes used in the messages, as well the number of words in the copy, influenced the recall and recognition levels. The findings iterated the importance of the “less is more” principle of using a simple message with fewer words, rather than longer and more complex copy for effective advertising messages in the transit environment. This creative limitation in terms of the design is a potential disadvantage (Belch & Belch, 2015). The findings also suggest that placing advertisements on unusual or unique media vehicles and the use of context-related themes (such as destinations, or airport-related themes for airport media) in the message increase the level of processing of information by a audience in transit.

Prendergast and Hang (2008) examined the recall of exterior bus advertising in Hong Kong. They found that the exposure to and recall of exterior bus advertisements is relatively high due to long time spend by commuters waiting for busses in this geographical area. This type of public transit advertising is thus able to deliver reach to a wide captive audience. However message wear-out was also reported due to repetitive exposure. It was also found Hong Kong consumers are generally less opposed to tobacco and liquor advertising on the exterior of buses compared to developing countries. Exterior bus advertising was found to be more effective if consumers were highly involved with the products/services being advertised, and if consumers had positive attitudes towards advertising in general.

The nature of public transit in South Africa is fairly different in comparison to that in the Western developed countries. South Africans spend on daily far more time commuting to work, compared developed countries (World Bank in PMG, 2014). Public transport users in South Africans earn less than those in developed countries (StatsSa, 2013). Minibus taxis, are used as transport by the majority of the South African population (18 million people); and it accounts for 69% of public transport in the country (StatsSA, 2013). The commuters are typically lower income workers (26,5%); and key decision-makers in household purchases (OMD South Africa, 2013). Commuters using taxicabs in developed markets are part of the higher-income segment of the market; and they are transporting only a few passengers at a time (Veloutsou & O’Donnell, 2005; Wilson & Till, 2008).

**STUDY DESIGN AND PROCEDURE**

In-depth interviews with 16 transit advertising media specialists in South Africa were conducted to understand how they apply objective criteria and subjective values when planning transit advertising media in a South African context. Qualitative research was deemed to be appropriate as it allows for the in-depth understanding of participants’ perspectives in their own words (Patton, 2005). Purposive sampling was applied to select specialists in prominent media agencies and transit media providers across South Africa. The membership lists of Advertising Media Association of South Africa (AMASA)
and Out of Home Media South Africa (OHMSA) were used to identify organizations that met the following criteria: 20 or more employees, 10 million rand (764,619 USD) or more in revenue, experienced in transit advertising media, and within reasonable distance from the researcher. The size and distance prerequisites allowed the researcher to conduct in-depth interviews with these specialists in their own space, which facilitated the building of rapport. Twenty-two organizations met these criteria. The highest-ranking manager at each organization was contacted and briefed on the purpose of this research. They advised the researched on the most suitable person in their company to participate in the study. Of these, ten participants with extensive experience in transit advertising media were interviewed for this study.

The interviews moved from general to specific questions to provide context for each participants’ answers and allow the conversation to develop based on the point of view of the participants (Morrison et al. 2011). To develop a rapport, participants were first asked about their experience in the media industry. They were then asked some general questions about how they employ quantitative criteria and qualitative values when planning transit advertising media campaigns. Each question used laddering to further probe perceptions and media practices (Reynolds & Gutman 1988). Participants were also requested whether they had any additional ideas on the topic to share before the interview was concluded.

The framework approach was used to analyze the data (Gale, 2013; Ritchie & Spencer, 2002). Firstly, all the interviews were digitally recorded and transcribed verbatim. This was followed by familiarization with the data and construction of a thematic framework drawing upon priori literature- and emerging issues from the data. Then indexing by applying the thematic framework and abstraction to synthesize were conducted.

The last phase of data analysis involved finding of thematic patterns and interpretation of the data as a whole to address the research purpose. Guba’s four criteria to ensure trustworthiness (Lincoln & Guba, 1985) were considered for this study. The strategies as suggested by Shenton (2004) were implemented to meet these criteria. Sufficient understanding and thorough review of the literature to conceptualize and frame the findings ensured credibility or validity of the findings and conclusions. Transferability is concerned with the applicability of the findings to all relevant contexts. Detailed descriptions of the research design and methodology, as well as rich and solid descriptions of the data analysis were provided to satisfy the concerns for transferability. Confirmability or neutrality of the findings was ensured by discussions between the researcher and key experts to reduce potential bias. An accurate and detailed record on how the study was approached and conducted, including how the data were collected and analysed also contributed in this regard.
FINDINGS

Several potential approaches can be followed to structure or report on qualitative findings, including chronology, life-history, themes, composites, critical events, zoom lens and portraits (Patton, 2005). For this article, the conceptual networks with meaningful themes that emerged from the data analyses were used to report the findings. A schematic overview of the related themes that encapsulate the overall findings of this study can be seen in Figure 1.

Figure 5. Major themes and related themes

In the following sections, the discussion of the insights obtained from the qualitative analysis of the interviews will be done, according to three themes: Target audience exposure; Frequency and reach, and relative cost. Verbatim quotations of participants are indicated with quotation marks and identified by the number of the participant. For example P1 means participant 1, and P2 refers to participant 2. In the case where words were added to the verbatim quotations to enhance the understanding, it was indicated by putting the inserted words in parenthesis: (...).

Theme 1: Target audience exposure

The participants revealed that there are various types of transit advertising options that can be employed in an campaign, to target different commuter profiles with different levels of disposable income, who typically make use of different modes of public transport in South Africa: “These offer the opportunity to be seen by high volumes of people of specific demographic and/or income groups.” (P3). Consumers in low-income and middle-income groups are typically reached by advertising on buses, minibus taxis and metro-trains: “Transit is usually when you are talking to your mass market, then you brand an entire taxi or brand a taxi rank or buses. It is great because so many people are using this transport... So typically you would use your transit for the low and medium LSM groups” (P6).

Transmit media opportunities catering for high income groups are expanding. Until recently advertising at airports was the only option for businesses targeting high-income travellers. As one participant noted: “airport media is the class of transit media that reach higher income and business people” (P4). However, it seems that there has been a shift from the past, where transit media were mainly suitable to reach the mass market by minibus taxis or metro train advertising to targeting higher LSM
groups. As one participant noted: “the improvements in the public transport lead to new opportunities”; and confirmed that “you will get more people (advertisers) involved in the transit media” (P1). A number of recently introduced upmarket transit advertising opportunities for businesses to reach higher-income commuters using media options were highlighted by the specialists, such as: “… opportunities for branding of metered cabs, not only on the outside, but inside as well” (P9); “the light boxes, Gauframes and digital platforms at all the Gautrain stations,” (P5); “Bus networks like Cape Town’s MyCiti and Rea Vaya in the Johannesburg” (P8).

Private car branding was another innovative opportunity revealed, where car owners’ lifestyles are matched with the target market of the product or service being advertised. The participants gave several examples illustrating highly targeted campaigns. “You give them your details and then the marketer will say he’s trying to reach people at gyms; so, therefore they will go into the database and see who are the active healthy type and goes to which gym” (P6). “Branding of selected fleets of private vehicles based on your target market criteria is also an option. We can combine it with brand ambassadors to distribute samples or flyers.” (P13)

**Theme 2: Frequency and reach**

Major strengths of transit advertising media identified in the findings are the ability to deliver exceptionally high levels of frequency, together with specific reach, because of the commuters’ habitual travel, as well as the specific routes of the transport modes in the area. A number of the participants corroborated this. One explained that “it’s a good format for frequency and reach; since, because of the mobile nature of that, it is specifically handy in areas where billboard availability is limited” (P10). Others explained, “this flexible medium is good to target hard-to-reach target areas.” (P7) “Each vehicle is chosen for routes within the advertiser’s market; Locally or regionally or nationally within South Africa” (P11). Public transit advertising and minibus taxi advertising media are usually employed to reach the mass market travelling back and forth to major metropolitan areas on a daily basis. The participants believed that this offers businesses the opportunity to expose a captive audience to their message several times during the course of a day. One participant explicated, “transit is usually when you are talking to your mass market, then you brand an entire taxi or brand, a taxi rank, or buses. It is great, because so many people are using this transport” (P6). Another reiterated the potential of mobile transit media to deliver high and repetitive audience reach and exposure. “Busses are like moving billboards with the ability to penetrate areas where other forms of OOH media are restricted. They offer advertisers frequency, reach, and high visibility within exactly targeted geographic zones” (P 3).

Some of the public transport vehicles used for advertising, such as buses and trains follow pre-determined and scheduled routes in specific geographic areas, while the routes of other vehicles, such as minibus taxis and upmarket cabs are more flexible, stopping at a large number of different locations.
within an area. This influences the way different transit advertising formats are employed in campaigns. The participants differentiated between broad nationally and narrow geographically target campaigns. “This message is going to be relayed, and re-impacted to your broad target audience going on this route, every day, every morning to work and back. Or, we can be targeted, for example, if you just want to target taxis that run next to school routes and you target school kids” (P1). Another explained how the levels of frequency and reach could be maximized using mobile media options and repetitive message placement. “For regional reach, branding of taxis or your bus advertising... so if you want to carry a message or a product demonstration or a brand activation – or just getting your message out there for a specific product - you can use the mobile media, and you can take it into Gugulethu (township close to Cape Town) the one day and the next day, Khayalitsha (township in Western Cape), and the next day, off to Durban, the next week you can do Umlazi (township on the east coast of KwaZulu-Natal), KwaMashu (township close to Durban), Claremont up to Jo’burg, wherever you need to be” (P5). The transit advertising media attributes should thus be taken into account, when planning such a campaign, since this influence the actual reach and frequency of the media plan, as well as the potential demographics of the commuters in the spaces being exposed to the advertising.

**Theme 3: Cost**

When comparing the cost efficiency of the different formats of transit advertising media, minibus taxis are regarded to be able to deliver a message to a large number of commuters at a reasonable low unit cost. “Taxis get around. You know they work for twelve hours a day, and cover more than 300km each day. In a month a taxi will transport almost 5000 passengers and cover almost 10 000 kilometres” (P14). “Taxi advertising is a cost-effective way to reach the commuters’ market that is active in the economy, so they have spendable income” (P7). Advertising on upmarket transit advertising media, such as the Gautrain station, or at airports is perceived to be far more expensive. One participant explained, “If you are looking for the fancy high class cabs you are looking for high expense, and if you are looking for minibus taxis, you are looking at low expense. However, the cost of new transit, such as the Gautrain, is very high” (P 3). Another confirmed that formats reaching higher income commuters are expensive. “Airport media are very expensive. For example, a gantry exiting OR Tambo, costs almost R400 000 (30 585 USD) per month” (P5).

A number of the participants were of the opinion that airport media do not offer adequate value for their clients’ budget any more, due to the extremely high media cost and the loss of exclusivity. They believe that this is due to low-cost airlines expanding air travel to a wider market, which in the past was only possible for the really affluent. “The cheap airlines operating over the past few years have resulted in air travelling having become far more accessible to a lot more people. One cannot claim that same exclusiveness with regard to the audience at the airports anymore, due to lower incomes; people are also using that mode of transport. So, I think the traditional argument that the airports are the highest concentration of wealthy viewers is
less valid now than it was 15 years ago” (P10). Others confirmed the high expenses associated with airport media. “The set-up cost is can require an enormous investment, so a brand must determine if it will offer long-term pay-off” (P15).

**DISCUSSIONS**

The findings in theme 1 revealed that transit media advertising offers targeted audience exposure. This is in line with the findings of previous study reporting on the ability of specific types of transit advertising to target narrowly defined audience segments such as taxi commuters of frequent flyers (Veloutsou & O'Donnell; 2005; Wilson & Till; 2008). However some novel insights were also revealed in the developing context of the current study. Airport media no longer offer exclusivity to advertisers aiming at high-income consumers and business travellers due to cheaper airlines making air travel affordable for the lower-income mass market.

When selecting specific transit advertising media options, it is thus critical to consider the demographic profile of the travellers advertisers are hoping to reach versus who they will actually be reaching. People travelling with airlines no longer just include affluent business people or international travellers. Voluminous middle-income families, local and international arriving or departing from South Africa also utilise this type of transportation.

Advertisers can choose from a variety of interior airport displays (located throughout the terminals in the arrival and departure areas, ticketing areas, baggage-claim areas, gate-hold rooms, concourses, entrances/exits, retail shops and VIP lounges) or exterior airport displays (along airport and terminal roadways in the form of billboards, spectaculars or overhead signs) to match the demographics of the targeted travellers leaving or entering this environment. For instance, those advertising car rental, accommodation or attractions aimed at tourist might consider baggage-claim areas, while those aiming at wealthy business travellers might consider VIP lounges or duty free shops.

The findings in theme 2 with regards to the frequency and reach highlighted some strengths as well limitations of transit advertising media. It confirmed the potential to deliver high and continuous levels of frequency and reach due to commuters’ mobility and repetitive exposure to the same message daily or weekly. This collaborates with research results on the geographic selectivity offered by different transit advertising media (Veloutsou & O'Donnell, 2005). While an advantage of transit advertising is the ability to provide high levels of exposure and frequency to a large number of people, this overly repetitive exposure to messages can result in message wear-out so that commuters just ignore them. Advertising wear-out occurs when, at some level of repetition, the audience affective response is either no longer positive or shows a significant decline. Advertising wear-out is the result of excessive
frequency causing viewers to perceive there is nothing new to be gained from processing the advertisement, thereby withdrawing attention.

Distracting stimuli in a cluttered and crowded transit environment can also make it difficult for advertisers to engage with captive commuters, because they can be tired, bored or too absorbed in their thoughts to even notice a message. Controversial messages may contribute to this less than positive feeling. Limited availability in certain areas is another limitation. For example, in rural or suburban areas, mass transit is limited or non-existent, so the medium is not very effective for reaching these people.

The surroundings may detract from advertisers' messages. A mud-splashed bus, a graffiti-sprayed subway car or a decaying subway entrance wall may not be ideal to showcase prestigious brands. Also, rushing through an airport may create apprehensions that limit the effectiveness of the advertisements placed there.

Advertisers could use creative techniques to minimize wearing-out over repeated exposures. To avoid wear-out they must offer ample variations in advertising executions. They can for example develop and rotate a pool of advertisements that employ different executions but convey the same basic message. These executions can share a number of common features, such as brand name, logo and tag line while other features such as headline, copy and graphic elements are changed. They could also include context-related themes such as destinations, or airport-related themes for airport media in the message to increase the level of processing of information by the audience. This use of context-related themes draws on consumers associations and relevant knowledge, which, in turn, facilitates learning and the recall of information or messages. They can also utilize original media strategies such as placing advertisements on unusual or unique sizes and shapes that are custom-designed to gain maximum attention through special eye-catching effects, such as cut-outs, three-dimensional sculpted features and digital-interactive screens. The effectiveness of the message can be improved – not only by using simple short messages, but also by using one that is relevant to the context or the environment, and placing it in unique advertising formats, such as an unusual shape.

The findings in theme 3 confirmed that mass public transit advertising is able to deliver reach to a wide captive audience at relative low unit cost. This is a common cited and empirically proven advantage of transit advertising (Prendergast & Hang, 2008). However the study furthermore reported on the high prices of up-market transit media such as airport media. This is because a captive audience is valuable for advertisers, and the transit media providers and agencies know and exploited it.
CONCLUSION AND RECOMMENDATIONS

Academic literature focuses predominately on freestanding outdoor advertising signs or billboards with limited studies on transport advertising. None of these offer insights on the value and challenges of those responsible for transit advertising strategies in a developing context. For that reason, insight was obtained purposefully selected specialists in the South African industry. This was reported in thematic format and compared with existing transit advertising media literature.

This study is not without limitations. Only media specialists in South Africa were interviewed, a valuable future research agenda could therefore be to compare the media tactics to target particular audiences identified in this study with those applied in other developed or developing countries. Specialists might not truly comprehend consumers’ perspective. Hence, one could add value by examining consumers’ exposure to and attitudes towards different transit advertising formats. It would especially be interesting and worthwhile to conduct empirical research on the qualitative values of media – such as the image and potential impact of the different media types, the context in which they are placed and the fit between the brand/product image and the context where it is advertised in light of the findings of the study that specialists are relying on these values to promote the image of advertisers’ brands.

UNDERVALUED AND DISORGANIZED? CLASSIFICATION AND APPRAISAL OF CONTEMPORARY OUT-OF-HOME ADVERTISING IN SOUTH AFRICA

Roux, Thérèse; Babst, Melanie; de Jager, Johan

Department of Marketing, Logistics and Sport Management, TUT, Pretoria, South Africa

ABSTRACT

Systematic reviewing of prominent marketing communication journals and online industry sources offered some insight on the effectiveness of contemporary OOH advertising media types, but it presents no comprehensive classification thereof. This article therefore proposes an audience-centred matrix to plan and classify out-of-home advertising media options, according to the different environments in which audiences are exposed to them. Marketers are advised to focus on audience’s mode of mobility and their opportunity to process brand information, rather than the media features typically emphasised in the literature. This article contributes to the current theory for this type of advertising by synthesising discordant theory and practitioner sources on this type of advertising. Clear directions for future research were offered in particular, consumers’ process ability and mobility patterns in different environments, and the value of OOH advertising from a user- and consumer perspective.

Keywords: Outdoor advertising, Transit advertising, Street furniture advertising, Mall and point-of-purchase advertising.

INTRODUCTION

Out-of-home (OOH) advertising has always been somewhat unappreciated in academic literature. It remains of the least researched mediums - probably due to high costs involved with enacting field experiments or the large national surveys typically required to study this medium (Donthu and Bhargava, 1999). Some researchers have focused on the effectiveness of outdoor advertising boards (Bhargava et al., 1994; Donthu et al., 1993; Ju and Chung, 2016; Klerkx and Van Meurs, 2006; Taylor and Franke, 2003; Taylor et al., 2006), while a few others considered contemporary OOH advertising types (Veloutsou and O’Donnell, 2005; Wilson and Till, 2008). However they don’t offer a comprehensive logical taxonomy to apprehend the whole range of contemporary OOH advertising media possibilities. The practitioner’s perspective - as represented by OOH advertising media associations across the globe - recognises an increasing wide variety of options, but don’t concur on exactly what constitutes

THE PROBLEM INVESTIGATED

There seem to be a lack of a proper comprehensive OOH advertising media matrix or taxonomy for the whole range of media options. Without such a classification matrix or taxonomy there is no systematic, integrated basis to define, study or measure this persuasive advertising medium, neither is there a thorough understanding of the wide range of contemporary OOH advertising media options. For example according to Nielsen Media Research (NMR), OOH advertising media in South Africa accounted for R1,6 billion or 4,3% of the total of advertising media investment (OMD, 2013). However other reputable industry sources (such as Gordon Muller as Chairperson of the Advertising Media Forum and the Advertising Media Association of South Africa and Price Waterhouse Coopers) indicate that it was at least R4 billion or closer to 11.8% of total advertising investment in the country in the same year (Muller, 2013; PwC South Africa, 2013). The significant difference between these figures can be attributed to a number of factors. Firstly, the Nielsen figure only considered traditional OOH advertising media types such as roadside billboards, while disregarding the wide range of contemporary OOH advertising opportunities (OHMSA, 2017). Secondly, unlike other reported media formats the OOH advertising investment does not include agency commission, resulting in a 16.5% under-representation (PwC South Africa, 2013). Thirdly, a significant number of the OOH media companies, do not report their advertising revenue figures to Nielsen (Muller, 2013).

In order to address this shortcoming, the purpose of this article is to develop an audience-centred matrix to plan and classify the wide range of contemporary OOH advertising media options. It is necessary to approach conventional and contemporary alternatives OOH advertising with a holistic and audience-centred perspective in order to recognize and emphasize common elements (e.g., out-of-home placement and a mobile audience). This can guide marketers to better integrate and coordinate their efforts by increasing effective and efficient allocation of their advertising budget, recognizing the potential of the environmental urban context as a persuasive advertising medium beyond traditional and expensive mass media and exploiting all possible synergies among the potential environmental touch-points with commuters, pedestrians and shoppers. In the light of this discussion, the objectives of this article are twofold: i) To propose a contemporary OOH advertising media matrix; ii) To review the value of the major OOH advertising media platforms
This next section firstly outlines the methods used to design the study; and it then presents the results of the systematic review. Thereafter, a contemporary OOH advertising media matrix is proposed – derived, as it is - from this systematic review. Finally, the article provides conclusions, summarises the limitations, and recommends some areas for future research.

**RESEARCH METHOD**

Systematic reviewing is a methodological approach that systematically maps out the available evidence, critically appraises the evidence, and synthesises the results (Petticrew and Roberts, 2008). Systematic reviews allow for the objective appraisal of evidence, in order to address a specific research question, the synthesis of the results in an explicit way, as well as an identification of those areas where research is insufficient and further investigations are required (Kitchenham, 2004). A key element of a systematic review is the research protocol, which describes the research question; the search process; the inclusion and exclusion criteria; and methods for synthesising the studies, according to the type of data available (Petticrew and Roberts, 2008). In this article, the research question deals with exploring what constitutes contemporary OOH advertising media. The search process entails searching for classifications of OOH advertising media types by screening recent journals in advertising and marketing communication, as well as perusing the websites of global OOH advertising media associations. These online sources were considered, because there is only a very limited amount of scholarly articles available on the whole range of OOH advertising media types and even less so in the developing context (Roux and Van der Waldt, 2016).

Specific inclusion and exclusion criteria for journals were applied. To search for relevant journal articles the keywords "out-of-home advertising", "outdoor advertising" and "billboard advertising" were entered in the search functions nine prominent international journals in the advertising, communication and marketing disciplines. These international journals (Journal of Advertising, Journal of Advertising Research, Journal of Current Issues and Research in Advertising, Journal of Marketing, Journal of Marketing Research, Journal of Consumer Research, Communication Research, Journal of Marketing Communications) are widely accepted as the top journals in the respective disciplines. They are also similar to those used in previous studies to examine scholarly literature on advertising and media within these discipline (Khang *et al.*, 2016). No classifications of the major OOH advertising media types were found when examining the abstracts of the identified articles. However they offered valuable insight on the effectiveness of different OOH advertising types. This was integrated in assessment of the features of the major OOH advertising media platforms.

Websites of OOH advertising media companies, which are part of FEPE, the international industry association of OOH advertising media) with English on their webpage were also considered to review
practitioners’ perspective. These media companies represent the majority of industry revenues in the respective countries, as well as globally (FEPE International, 2017). A summary of OOH advertising media classifications found in on the websites of official OOH advertising media associations is depicted in Table 1.

Table 1: A comparison of OOH advertising media taxonomies presented in practitioner sources

The progression of industry is illustrated by the wide variety of unique media options offered to advertisers, such as sport-stadium advertising, promotional activities at shopping malls, and transit environments, various digital OOH advertising types, floating and flying advertising on boats and balloons, place-based advertising at medical clinics and restaurants. Furthermore different criteria are used to categorise the numerous types. Some base their classification mainly on the media format, irrespective of the environments and those audiences, which will be exposed to the medium. This means that an advertising board aimed at drivers on the highway, and one placed at a transport hub, and even one located inside a shopping mall, would be classified as outdoor advertising – irrespective of the environment in which it is located, or the type of audience exposed to it. While this method of categorisation is simple, it does not capture the environmental complexity of locations in which out-of-home advertising messages are delivered. Other associations classify the OOH advertising media types on the basis of the environment in which it is placed, or the key audience reached by the medium while they are involved in specific activities. The implication is that a billboard aimed at drivers on the highway would be classified as a roadside medium; but when it is located at a transport hub, it would be classified as transit advertising; and if inside a shopping mall, it would be regarded as retail a medium. Following an audience-centred approach like this is arguably more prudent, than merely focusing on the physical features of the medium. Ultimately, the target audience should be the main focus of any advertising campaign and the focal point around which all communication decisions are made.
There are also some differences of opinions on the inclusion or exclusion of cinema advertising as part of the OOH advertising media class. Some sources regard cinema advertising as part of alternative OOH advertising media; while most exclude it. The nature of cinema advertising differs from OOH advertising media in that the audience has to give its explicit consent to being exposed to the messages. Advertisements on OOH media are just advertisements; the brand messages are not embedded in a medium consisting of editorial or programme content (Muller, 2013). Consequently, cinema advertising will, therefore, be excluded from the OOH advertising media class in this article.

The systematic reviewed revealed that academic literature classifying OOH advertising is insufficient. It also showed that the industry present a variety of options but don’t agree on the major types of OOH advertising media. The aim of this article is thus to overcome this by proposing a contemporary OOH advertising media matrix and then present the value of the major OOH advertising media platforms.

**A CONTEMPORARY OOHADVERTISING MEDIA MATRIX**

The proposed OOH advertising media matrix in Figure 1 contains five major OOH advertising media platforms and OOH environments to incorporate the wide assortment of contemporary media recognized by global OOH advertising media associations. The major platforms are classified, according to two dimensions, namely: the audiences’ mode of mobility and their opportunity to process the information presented in an advertisement. The audience is at the centre of this planning matrix. In the context of integrated marketing communication, this is known as an outside-in planning approach, or a customer/audience-centred planning (Kliatchko, 2008). This approach is critical for media planning; since advertising without value or relevance to an audience, or which are not delivered via relevant media, would be filtered out, or ignored by the potential consumers (Wilson et al., 2015). Therefore, a audience’s perspective should be followed in deciding which media would be most effective in reaching a specific target audience or audiences by delivering relevant messages via the most-preferred media. This is achieved when the information needs, motives, lifestyle, frame-of-mind, and behaviour of the target audience(s) are used as a basis to select the most suitable OOH advertising media touchpoints, as opposed to focusing on the media characteristics. For example by placing contextually relevant messages on airport media in appropriate locations with longer dwelling times, would improve the level of processing of information by the travellers (Wilson and Till, 2008).
Mode of mobility of audience

Opportunity to process information

Figure 1: Contemporary OOH advertising media matrix

Mode of mobility of audience

Analysing the mobility patterns of a population is the basis of precise OOH advertising media planning (Bloom, 2000). The mobility of audiences reached differs considerably across the OOH media platforms, and should be considered when designing media plans and advertisements. Outdoor advertising is mainly aimed at moving traffic such as drivers or commuters. With mobile consumers moving in one direction and the advertisements possibly in another direction, the time of the exposure to the message is usually very brief and the likelihood of taking notice of a message is relatively low (Van Meurs and Aristoff, 2009). However this type of advertising has the ability to expose members of a target market to a message numerous times in a relatively short period of time (Donthu et al., 1993). Based on understanding where people are travelling from and to and for what purpose, the relevant target groups can be addressed with greater precision and less wastage (Bloom, 2000). The OOH mobility patterns of pedestrians and shoppers impact how they interact with advertising media. Advertising is more likely to be noticed when consumers are alone compared to when being in a group; and when being placed at specific locations such as close to a store or POP, but away from security checkpoints or gate-waiting areas (Wilson and Till, 2008).

The design can also influence the effectiveness of advertisements aimed at a mobile audience. The recognition of brands and products can be improved by using easily identifiable branding (logos/packaging/brand colours) and strong contrasting colours but limiting distracting content and informative information cues (images or words); (Donthu et al., 1993; Van Meurs and Aristoff, 2009). Design can even enhance the experience and influence the buying behaviour of shoppers by including humorous components, sounds and contextual relevant information to assists them in making their purchase decisions more rapidly (Dennis et al., 2012, Newman et al., 2010).
Opportunity to process information

A unique feature of OOH advertising compared to other media is the relatively low level of control and involvement of the audience when processing messages (Donthu et al., 1993; Wilson and Till, 2008). The situation in each of the OOH environments differs considerably; and therefore, this provides distinctive opportunities for audiences to process brand messages. The potential viewing- and dwelling-time of the target audience depends on the OOH environments in which they are exposed to the message (Wilson and Till, 2008). Advertisements viewed by a mobile vehicular audience are more difficult to process; because their appearance is often fleeting – and consumers have limited time to attend to them. Consequently, they do not usually lead to a high level of involvement in message processing (Donthu et al., 1993). Using simple short messages that are relevant to the context or the environment, and placing these on unique advertising formats, such as an unusual shape or form, can be used to increase the level of information processing (Dennis et al., 2012). Vehicular traffic is typically exposed to the advertisement very briefly. Environments with longer dwelling time, such as travellers waiting an airport or people waiting at doctors’ rooms typically result in more time being available for people to notice the message (Wilson and Till, 2008). The opportunity for interaction and engagement from the audience is better in environments with longer potential dwelling times than those with limited exposure times, such as at waiting areas at airports and kiosks in shopping malls displaying advertising on video screens (Gambetti, 2010). The disposition of consumers in the retail environment might be more composed; since they have already reached their shopping destination. Consequently, they are in shopping mode, and likely to be most receptive to information that could assist them in making purchase decisions (Burke, 2009). Thus, the opportunity to process information is typically low in both the outdoor- and urban environment, while the transit- and retail environment provide audiences with more opportunities to process such information.

OOH ADVERTISING MEDIA PLATFORMS

Outdoor advertising in the roadside environment

Outdoor advertising media are usually placed in the roadside environment, targeting fast-moving vehicular traffic on highways and other major roads, and are viewed from a distance. Consequently, an important condition for the effectiveness of outdoor advertising media is visibility from the side of a road (Taylor et al., 2006). This inherently requires readable and concise messages, remarkable sizes and prominent locations for messages to be noticed by motorists and passengers (Donthu et al., 1993). In
the roadside environment, boards that are larger in size are more conspicuous and therefore have a
greater likelihood of being seen (Wilson et al., 2015). Research has shown that brand and/or company
recall levels are positively related to high levels of repetitive message exposure on outdoor-advertising
media (Bhargava et al., 1994). Its round-the-clock presence offers advertisers a broader reach at high
frequency levels in both national and local markets (Taylor et al., 2006). By placing outdoor advertising
on specific highways and other major routes, advertisers can target a defined geographic market (Belch
and Belch, 2015). Local companies often use this platform rather than traditional broadcasting and print
media, because it exposes a broad mass market to their messages at a lower price (Taylor and Franke,
2003). The high impact of messages on these pervasive and massive canvases produces high awareness
levels that could improve the brand image (Ju and Chung, 2016) and package identification (Klerkx and
Van Meurs, 2000). Advertisements on these large formats are potentially more attractive and
noticeable (Katz, 2014); and they can be used to portray the advertised organisation as an important
and respected company or brand (Ju and Chung, 2016).

Nevertheless, outdoor advertising media have some limitations. Some countries have banned or
limited the placement of outdoor advertising, and extreme environmentalists regard this medium as
visual pollution (Iveson, 2012). For example Baro and Iqani (2017) criticised the massive scale outdoor
billboards that cover the entire facades of city buildings in Johannesburg and believe that they are at
the expense of citizens’ visibility and their opinion. Outdoor advertising delivers messages to a broad
mass market with limited information on demographic variables for target audience selection, such as
age, gender, occupation, income and family size (Lane et al., 2011). Another limitation is the limited
copy/text supported by such a brief exposure to the message – due to audiences often passing by at
high speeds. However, short, simple and legible messages tend to be recognised by consumers in split
seconds; and they allow for more rapid brand and company identification (Klerkx and Van Meurs,
2000).

Transit advertising media in the commuter environment

Transit advertising is another major platform of OOH advertising media; and it has also been in
existence for quite some time. In the early nineteenth century, messages, brand names and company
names attached to or pasted on carriages, buses and vans were carried through the streets by means of
horses (Bernstein, 2005). However, it has evolved considerably since then to now encompass a wide
variety of new advertising opportunities on moving transit media, such as on and/or inside buses, taxis,
trains and planes, or on trailers and trucks as well as on static transit media, such as airport terminals,
taxi ranks, bus stations and train stations (Veloutsou and O’Donnell, 2005). Advertising on transit
media provides widespread reach and repetitive exposure of messages to citizens working in major metropolitan areas (Veloutsou and O’Donnell, 2005). The majority of commuters travel the same route to work every day, using the same mode of transport, and spending approximately an hour each day travelling to work (Advantage, 2012). This allows for prolonged and repetitive exposure to brand messages on various transit advertising media formats.

The surrounding stimuli in this active environment and the preoccupied minds of passengers introduce some challenges to the advertisers (Wilson and Till, 2008). As the OOH advertising media class grows in terms of appeal and available formats, the use thereof increases, along with the advertising clutter. In addition, commuters may be engaged in other activities or media, such as newspapers, magazines or mobile devices, which may prevent contact with transit-advertising messages. This emphasizes the importance of a striking message that could hold the attention and interest of the target audience (Bhargava et al., 1994). Although advertising on moving vehicles can be quite a challenge, this form of transit media offers substantial creative opportunities, especially if used as a support medium in conjunction with other media such as radio and television (Veloutsou and O’Donnell, 2005).

*Street-furniture advertising in the urban environment*

While transit advertising delivers message to commuters, advertising on street-furniture provides a means to reach audiences somewhat closer to the point of purchase. Street-furniture advertising refers to those messages affixed to structures/furniture found in the streets of urban, suburban and metropolitan areas, such as bus shelters, park or street benches, kiosks, litterbins, bicycle racks, street poles and other structures erected for the purpose of advertising (OHMSA, 2017). Consequently, it can reach pedestrians, shoppers, and even drivers or passengers in slow-moving vehicles. This OOH media format offers exposure to a highly defined, motivated consumer market that commutes to, gathers at, or resides in specific areas (Lane et al., 2011). Urban furniture is not a primary advertising medium; but it rather facilitates and exploits the infrastructure provided for public use. Part of the income obtained from renting the advertising space on this furniture goes to the municipal bodies and local government, which, in turn, can use it to maintain or improve the infrastructure (OHMSA, 2017).

Street-furniture advertising is an economical option to deliver repetitive brand exposure to a specific geographically defined market on a 24-hour basis (Blakeman, 2011). It can also be used in residential areas of high-income households and public places, such as parks, where other larger types of OOH advertising are typically not allowed (OHMSA, 2017). Apart from the information feature of commuter shelters as advertising vehicles; they offer bus-users, and often taxi-users, other features, such as shelter, comfort and convenience (Bernstein, 2005).
**POP advertising in the retail environment**

POP advertising is found inside and outside shopping malls, convenient stores and other central gathering points (OHMSA, 2017). The wide variety of size and types is ideal for delivering advertising messages – wherever and whenever prospective customers make actual purchase decisions (Burke, 2009). Furniture and fixtures found inside the retail environment, such as elevators, escalators, information booths/kiosks, banners, benches, phone booths, restrooms and shopping trolleys, can also be used for advertising aimed at potential shoppers. Structures outside the retail location, for example, bicycle-racks, car parks, parking booms, parking tickets, and even the outer walls of shopping centres, can also be employed (OHMSA, 2015). The effectiveness of advertising in this environment can be maximised by ensuring that shoppers remember the brand, when they enter this setting.

A consumer exposed to advertising via traditional print or broadcast media at their homes, often cannot recall what they have seen or heard, once they leave their homes (Gambetti, 2010). A brand is, therefore, best advertised close to the POP (such as on retail furniture or in malls), in order to maintain brand awareness and remind consumers of the advertising theme used for the traditional media, the closer the consumer comes to purchasing (Burke, 2009).

**Alternative advertising media**

Ambient or alternative OOH advertising media involve the use of almost any structure or format imaginable to reach specific audiences in unexpected and unusual places and manners (Jurca and Madlberger, 2015). The alternative media are positioned in the centre of the four OOH environments in this matrix, because they can be located in the outdoor-, transit-, urban- and retail environments. Alternative advertising media is the most diverse of all the OOH advertising media formats (Saucet, 2015) and can seen on goods used by the public, such as shopping trolleys, shopping bags, soap dispensers, cups, fruits, vegetables, bus seats and petrol pumps; or goods exposed to the public, such as sidewalks, walls, structures, floors, ceilings and even people (Gambetti, 2010). A major difference between alternative OOH advertising and other OOH advertising media formats is that the audience is typically exposed to the brand message – when and where the message is most relevant to the particular product or service (Saucet, 2015). Advertisers and advertising agencies therefore have to scan the environment, in order to determine through which platform the advertising messages would be most relevant to, not just the product and context, but also a specific and often narrow target audience (Gambetti, 2010).
Ambient OOH advertising media offer organisations a cost-effective way to reach consumers (Jurca and Madlberger, 2015). This medium is characterised as being a low investment in terms of time, resources and money; and it is ideal for breaking through the cluttered advertising environment – by enhancing the consumers’ advertising and brand experience (Gambetti, 2010). A common objective of using ambient OOH advertising is to reach consumers in their daily live, surprising and getting noticed do that they would want to share their experience with their network via electronic word-of-mouth (WOM) (Saucet, 2015). Using the relevant media and messages can enhance the value that consumers receive from positive experiences. The ambient OOH advertising media is ideal when used as part of an advertising campaign to support the messages delivered via traditional media and/or other OOH media platforms (Gambetti, 2010). This medium should, therefore, be strategically integrated into the advertising campaign, in order to guarantee a collaborated advertising effect that would strengthen a similar theme delivered via other media vehicles.

CONCLUSION AND RECOMMENDATIONS

This article proposed an original conceptualisation matrix of contemporary OOH media platforms. This matrix suggest that the audience’s mobility and opportunity to process information should form the basis of contemporary OOH advertising media planning, rather the physical features of the media platforms. The proposed matrix is one of the first to offer a holistic and audience-centred perspective on the contemporary OOH advertising in a developing context to guide advertisers, marketers and media planners when evaluating and selecting different media options. The application value of the OOH advertising media matrix a developing context could change global views on the ad hoc and often hap hazardous use of these media platforms.

This article has important implications for both academics and practitioners. From an academic viewpoint, the results of this study offer insight into the diverse nature of the OOH advertising media class and the various opportunities offered across environments. This matrix can be form the basis to compare, measure or focus scholarly research on this topic. The research contributes to the literature by providing a more inclusive classification of OOH advertising media – with a particular emphasis on the different environments in which audiences are exposed to brand messages. Practitioners, such as advertisers and media planners face numerous challenges in effectively reaching the evading consumers of today. Consequently, they need to consider the wide range of alternative media options placed in the OOH environment, where its powers of intrusion do not require the explicit consent of the consumer, in order to make an impact.

This article offers several opportunities for future research. It would be worthwhile to launch an empirical study on consumers’ frame-of-mind and ability to process messages in the respective OOH
environments. Consumers’ mobility patterns in different environments could also be analysed and monitored, in order to determine the impact of mobility on the cognitive resources available to process messages. Another possibility is to conduct empirical research to appraise the unique strengths and weaknesses of the major OOH advertising media platforms in the proposed matrix from an advertiser and consumer perspective.

EMPLOYEE LEARNING IN INTERCULTURAL INTERACTIONS -
GROUNDED THEORY
Rozkwitalska, Malgorzata
Faculty of Finance and Management, WSB University in Gdansk, WSB, Gdansk, Poland

ABSTRACT
Owing to the presence of multinational corporations (MNCs) worldwide and the global mobility of workforce, working in multicultural environments is a daily reality for a growing number of people. Such a workplace introduces unique challenges to employees, yet it is also abundant in learning opportunities. The aim of the paper is to depict employee learning in intercultural interactions in MNCs. The in-depth interviews with 38 informants were conducted to explore learning in intercultural interactions in 2 MNCs’ subsidiaries. The grounded theory approach was applied to collect and analyze the data, which were further interpreted with regard to the existing theoretical concepts. The emerged theory states that employees in intercultural interactions face specific job demands that evoke their stress (cognitive dissonance). If they believe that they can handle with them, then they classify them as challenges, mobilize their resources and learn in interactions. Job resources offered by MNCs that facilitate cooperation in a multicultural environment are of vital importance too. The paper supports the positive view in the literature on cultural diversity in organizations, thus it contributes to the research conducted with the Positive Organizational Scholarship lens. Yet the study is limited due to application of the qualitative methodology, which does not allow for a generalization of the findings.

The study indicates that managers need to invest in the development of organizational and individual resources to foster learning in intercultural interactions. Moreover, they should recruit employees whose need for growth is well-developed since those individuals can benefit more from such work settings.

Keywords: intercultural interactions, learning, multinational corporations, grounded theory, Positive Organizational Scholarship
INTRODUCTION

The work landscape is constantly changing due to the worldwide presence of multinational corporations (MNCs) in host economies, the global mobility of workforce, the unprecedented flow of immigrants, a growing need of companies to search for a more diverse staff with a broader knowledge base or the short supply of professionals for certain key positions in organizations (Collings et al., 2007; Harvey et al., 2004; Nolan, 2012; Samnani et al., 2012; van Veen et al., 2014). As a result, national diversity in organizations and states is rising, leading to a growing number of people working with culturally diverse others. Hence, intercultural interactions, here understood as contacts between individuals from a home country and other countries, are becoming and will be more and more significant in today business (Abdul Malek and Budhwar, 2013; Groeppel-Klein et al., 2010).

The work context in MNCs is different than in other types of organizations mainly due to cultural and language diversity which impacts on the interactions of MNCs’ employees (Lauring, 2009; Tanova and Nadiri, 2010) and lead to norm complexity or discrepancy. Individuals in intercultural interactions can notice their face threat, an identity conflict or performance ambiguity. In addition, cultural diversity may lead to a different perception of an appropriate behavior with its negative influence on intercultural interactions (Lauring, 2009; Molinsky, 2007; Tanova and Nadiri, 2010). However, Davidson and James (2009) claim that when culturally different people interact with one another and are “faced with the novel worldview-perspective, a thought process, values – that the other person presents” (p. 139), learning takes place. It, in turn, affects the quality of interactions and may trigger an organizational change (Antonacopoulou and Gabriel, 2006; Carmeli et al., 2009; Minbaeva et al., 2003). Learning is, therefore, a vital aspect of individual and organizational functioning. Employee learning behaviors are essential antecedents of organizational learning (Engelhard and Nägele, 2003) since they enables the workforce to adapt to their environment, to grow, build and maintain their competitive advantage (Carmeli et al., 2009).

Scholars emphasize the importance of social contacts as facilitators of a learning process, yet there is still insufficient knowledge of the phenomenon, especially in a cross-cultural context (Carmeli et al., 2009; Engelhard and Nägele, 2003). Carmeli et al. (2009) argue that the nature and quality of social interactions may be substantial enablers of or obstacles to learning in organizations. Considering intercultural interactions, in view of prior research, they bring “double-edged sword” outcomes (Stahl and Tung, 2014). Thus, the aim of the paper is to depict employee learning in intercultural interactions in MNCs. Employee learning is defined in a holistic manner and as such “is the combination of processes throughout a lifetime whereby the whole person”, i.e. his/her body and mind, “experiences
social situations” that are transformed “and integrated into the individual person’s biography, resulting in a continuously changing (or more experienced) person” (Jarvis, 2009, p. 25).

To actualize the aim, the paper first presents the literature review concerning learning in intercultural interactions and in MNCs. Then it shows methodology and the empirical findings, i.e. the grounded theory that reflects the research problem, with discussion. Conclusions, contributions, practical implications and directions for future research close the discourse.

LITERATURE REVIEW

First and foremost, the literature on organizational learning and knowledge sharing in MNCs provides evidence that cultural barriers impede the learning process (e.g. Engelhard and Nägele, 2003; Kohlbacher and Kra, 2007). Although individual learning does not equate with organizational learning (Boateng, 2011), it may suggest that employee learning in MNCs encounter difficulties due to linguistic and cultural boundaries which create potential friction and different behavioral norms as well as communication codes, which make interactions troublesome (Mäkelä et al., 2012). On the other hand, MNCs are also seen as “a knowledge integrating institution (...), whose productive knowledge defines a competitive advantage” (Ambos et al., 2006, p. 295). Moreover, there are studies which demonstrate that MNCs’ internal environment and multicultural teams are abundant in learning opportunities (Basinska, 2017; Puck et al., 2008; Rozkwitalska and Basinska, 2015; Stahl et al., 2010).

The positive impact of intercultural interactions on employee learning is also highlighted in the studies on global careerists. Those people frequently admit that international assignments and dealing with cultural diversity contribute to their learning and growth as well as satisfy their need for adventure and curiosity (Stahl et al., 2010; Suutari and Mäkelä, 2007). Likewise, in the research on intercultural learning it is emphasized that interactions with foreigners are necessary for this type of learning which further fosters development of a person’s cultural competence or intelligence (Bartel-Radic, 2006; Gertsen and Söderberg, 2010).

The studies on cultural adaptation of expatriates or intercultural interactions of students expose the role of cognitive dissonance that individuals may face in contacts with other country nationals. It may motivate to reflective thinking, taking a stand on encountered unexpected and, as a result, learning that helps to reduce cognitive dissonance (Bowman and Brandenberger, 2012; Maertz et al., 2009).
METHODOLOGY

The research method

The paper presents the results of an explorative, qualitative study carried out in the year 2014. It was aimed at exploring intercultural interactions in subsidiaries of MNCs. It investigated both the outcomes of intercultural interactions and facilitators of successful interactions. Due to the study’s aim, the grounded theory approach was applied to analyze the data (Corbin and Strauss, 2008; Goulding, 1998). Therefore, the theory emerging process started with no previous hypotheses or propositions to test (Hassi et al., 2011; Randall and Mello, 2012). Afterward, the empirical findings were interpreted, as accepted by the grounded theory approach (Goulding, 1998), with regard to existing theories to better explain what was found.

Following the grounded theory approach, the research started with semi-structured, in-depth individual interviews with a rather loose structure of open-ended questions (Glaser and Strauss, 1999). The design of the interview assumed four sections, yet with necessary flexibility concerning the order of the questions asked (Dearnley, 2005). The first section tackled an issue of the interviewee’s job position and his/her intercultural interactions at the workplace. The second part was built around the positive and negative outcomes of his/her intercultural interactions, while the third one referred to conditions for fruitful intercultural contacts. The last section comprised the participants’ particulars, who were both managers and specialists employed in subsidiaries of the MNCs and involved in intercultural interactions. There were about 39 hours of the interviews with an average time of 63 minutes.

The interviews were transcribed, manually coded, analyzed and constantly compared with one another. The analytic procedure was based on the three-step procedure of analysis to meet the requirements of the grounded theory approach (Hassi et al., 2011). The first phase, i.e. the open coding, concentrated on common themes (keywords, phrases) emerging from the interviews (Randall and Mello, 2012) such as e.g. broader perspectives or diverse viewpoints. In the axial coding phase, those categories were labeled with the higher-level concepts, i.e.: 1) problems encountered in intercultural interactions; 2) positive outcomes of intercultural contacts; 3) enabling factors of successful interactions. In the selecting coding step, the categories were integrated and refined. As a result, a theoretical scheme emerged with respect to: 1) specific job demands and resources in MNCs; 2) learning as an outcome of intercultural interactions; 3) personal and acquired resources as facilitators of intercultural contacts.
Moreover, the study entailed additional interviews with the representatives of the board of directors in the subsidiaries, non-participant observations of managers and document analysis to contextualize the data and to ensure methodological and data triangulation (Maxwell, 2005).

**The companies and participants**

The sample consisted of subsidiaries of two MNCs (Table 1), which could “inform the research questions being investigated” (Zhang and Wildemuth, 2009, p. 309). They were selected purposively as the method is usually applied in research with qualitative content analysis (Zhang and Wildemuth, 2009). Following the study’s aim, only subsidiaries of MNCs in which intercultural interactions at work are a daily reality for their staff were appropriate for the investigation and the subsidiaries A and B met this initial criterion.

Table 13. A brief profile of the subsidiaries in the sample

In terms of the number of participants the sample consisted of 38 individuals - 20 subjects in subsidiary A and the remaining 18 interviewees in subsidiary B. They were mainly specialists and middle-level managers (42.1% and 26.3% of the sample respectively). 60.5% of the participants were men, including 3 foreigners (from Denmark, the United States and Ukraine). The majority of the individuals (65.8%) were in their twenties and thirties. The respondents have had some international experience since 71.1% of them have worked and lived abroad, while 47.4% individuals have professional experience gained in other MNCs. In terms of job tenure, 55.3% of the informants have worked in the present MNCs for less than five years. Operation departments (18.4%), HR/administration (15.8%) or board of directors (15.8%), and R+D unit (13.2%) were the most represented organizational units in the sample.
LEARNING IN INTERCULTURAL INTERACTIONS IN MNCS – GROUNDED THEORY

Results

The content analysis of the data revealed the first category of the emerging theory, namely specific job demands and job resources that stimulate or facilitate the participants’ learning at work (Table 2). The vast majority of them categorized those job demands, such as necessity to speak foreign language, to manage the difference of attitudes, perspectives, views, habits, etc. and to adjust to cultural diversity, as challenges rather than barriers. The following quotation mirrors the perception: “The difficulties you face [in a multicultural team] are not a problem but a challenge. It is interesting, not annoying. It requires more effort, though I also learn more.” [interviewee 1, subsidiary B]

<table>

<tbody>
<tr>
<td>Communication in common language</td>
<td>“I like communication in a foreign language. (…) Before the contact you never know if a person has a good command of language. I had problems with a Dutch accent. (…) You need to adjust your communication style to your interlocutor, e.g. if someone doesn’t speak fluently, you should use simple vocabulary.” [interviewee 5]</td>
<td>“There are plenty of benefits, developmental, personal ones, an occasion of working in another language, so we boost our linguistic competence.” [interviewee 3]</td>
</tr>
<tr>
<td>Managing cultural differences</td>
<td>“While working with foreigners I have observed that they obey the rules and that’s it… We look for solutions, how to bypass the rules, we see such opportunities.” [interviewee 6]</td>
<td>“I’m fascinated with the differences and cooperation with other people. Understanding otherness is quite developmental for me. I become more flexible, see things from other perspectives. I become more tolerant.” [interviewee 3]</td>
</tr>
<tr>
<td>Cultural adaptation</td>
<td>“…it is not any problem to provide our services here in our country or in any place in the world. Since we work on the European scale, or even occasionally on the global one, they are very operative, open and versatile, they easily adapt to a local organization as well.” [interviewee 2]</td>
<td>“We learn from people whose worldview and business approach differ. I learn humility while noticing that others may not think the same way I do…. The world is colorful… My organization develops since people who were raised in various cultures are the repository of diverse ideas which are brought to the work process.” [interviewee 1]</td>
</tr>
</tbody>
</table>

Table 14. Job demands and learning in intercultural interactions

According to the participants of the study, while job demands activate employee learning, job resources offered in MNCs (such as language and cross-cultural trainings, communication technology for dispersed teams, knowledge databases, core values, special initiatives, relocation, etc.) facilitate intercultural interactions. Likewise, the latter could be obstacles if they are insufficient (e.g. a lack of face-to-face contacts due to limited resources allocated for business trips for virtual teams). The belief is the best depicted in the research quotation: “It helps a lot when people can meet informally to see peers from virtual teams or other sites. Then communication and cooperation go better. Yet, it is all about money – it
should be more videoconferences (teleconferences are more common nowadays) – the direct contact is the key.”  
[interviewee 9, subsidiary B]

The interviewees highlighted benefits of intercultural interactions, nevertheless they also noted barriers or challenges, e.g. various emotional states (like stress, anxiety, frustration, impatience, curiosity, excitation, enthusiasm, pleasure, surprise, joy, etc.) that accompany such contacts. As far as this research is concerned, it has occurred evident that learning, including personal growth, was the most frequently mentioned outcome of intercultural contacts in both subsidiaries, i.e. 100% and 55.6% of the respondents in subsidiary A and 68.4% and 84.2% of the interviewees in subsidiary B directly referred to either learning or personal growth respectively. The following quotations demonstrate this finding (Table 3):

<table>
<thead>
<tr>
<th>Subsidiary A</th>
<th>Subsidiary B</th>
</tr>
</thead>
<tbody>
<tr>
<td>“The contacts always teach you something and bring something. If they are with a foreigner, then you very often learn about the other country’s culture and it is somewhat enrichment. The contacts with other countries broaden your horizons... The contacts with foreigners let you observe how they work and you learn it.” [interviewee 1]</td>
<td>“You may learn a lot... The whole world is not homogenous. Other nations introduce an element of stimulating anxiety. A person becomes vigilant, keeps acute senses. I personally prefer such an unstructured environment, when my impact on future results is significant, the creative excitement of working with teams that you cannot fully rely on. On the one hand, you feel nervous; on the other hand, it increases your curiosity concerning the outcomes.” [interviewee 5]</td>
</tr>
<tr>
<td>“You gain personal development and cultural exchange owing to a contact with foreigners.” [interviewee 6]</td>
<td>“I personally appreciate the chance to learn from people from other places. It is a kind of reward to observe others, their talents and how they come up with a solution.” [interviewee 17]</td>
</tr>
</tbody>
</table>

Table 15. Learning as an outcome of intercultural interactions

In view of the interviewees’ opinions, certain personal or acquired resources may enable positive intercultural interactions, i.e. interactions that bring about more benefits, such as e.g. learning, than barriers. These are personality traits (e.g. being open, flexible), a positive attitude, skills (social, technical, linguistic) and international experience (Table 4).

<table>
<thead>
<tr>
<th>Subsidiary A</th>
<th>Subsidiary B</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Previous experience, personality, an attitude, if we want to achieve something – if there is a problem, you have to solve it, this way or another; an approach to life, upbringing, inherited traits.” [interviewee 6]</td>
<td>“You should have a positive attitude toward others, be flexible and expect the unexpected, be ready for unconventional approaches to problems, and be open.” [interviewee 5]</td>
</tr>
<tr>
<td>“If you do your job well, it doesn’t matter if you are a Pole or a foreigner – you have to do your job well in this sector. Your experience in working with foreigners, each contact, contributes to better cooperation in the future.”</td>
<td>“You need patience to reach a common set of vocabulary, emotional maturity, tolerance, willingness to tune oneself, intercultural openness” [interviewee 18]</td>
</tr>
</tbody>
</table>

Table 16. Personal and acquired resources as facilitators of positive intercultural interactions

Discussion
The aim of the research was to depict employee learning in intercultural interactions in MNCs. The emerged grounded theory revealed that specific job demands in MNCs that are the consequences of cultural and language diversity trigger employee learning, while organizational and personal resources, including the acquired ones, help to forge positive intercultural interactions and enhance the learning process. The observation emerging from the study that learning is a relational process which results from social interactions is congruent with previous research (Carmeli et al., 2009; Rozkwitalska and Basinska, 2015, 2016) and theories.

The study demonstrates that although MNCs’ job demands put effort into the work process, they can be evaluated by employees more as challenges than hindrances (barriers). This approach can be interpreted with regard to the cognitive appraisal, the key term used in the transactional stress theory (Lazarus, 1991; Lazarus and Folkman, 1984). Cognitive primary appraisal determines whether a specific situation (e.g. a job demand) is perceived as a challenge or a hindrance. Despite the fact that challenge stressors require personal effort and induce strain, individuals can anticipate that they have necessary skills to deal with them, which, in consequence, makes challenges positively related to work performance (in this study to learning). In contrast, hindrance stressors produce an adverse effect because individuals do not have a sufficient ability to deal with the barriers (LePine et al., 2005).

The notion that intercultural interactions introduce “stimulating anxiety”, as stated in one interview, can be referred to cognitive dissonance theory and Piaget’s theory of cognitive development. These theories posit that novel and/or discrepant with one’s worldviews experiences provide the chance of cognitive growth or lead to actions aimed at reducing discrepancy (Maertz et al., 2009). In such a case, people “must either find a way to reconcile this novel interaction with their current beliefs and conceptions, or they must change their views to incorporate this new information” (Bowman and Brandenberger, 2012, p. 181). Thus, people who are in a state of cognitive dissonance may change their beliefs to fit with their new experiences, which includes learning.

The fact that the participants were aware of the impact of organizational and personal resources on their ability to manage differences can be further interpreted in accordance with social cognitive theory (Bandura, 2001). It states that personal agency functions within a broad network of social interactions. The agentic transactions involve individuals as producers and products of social systems. They are compelled to be agents and learn in intercultural interactions since they are more demanding than common social interactions.

Figure 1 presents the grounded theory that emerged from the field data of this study with its connections to the existing theories.
CONCLUSIONS

The study extends the literature on employee learning and cultural diversity since it revealed that specific job demands in MNCs, such as the necessity to use functional language, to manage the differences and to adjust to them, can be acknowledged as the antecedents of employee learning, whereas organizational, personal and acquired resources can support the process as they impact on intercultural interactions. The paper emphasizes a positive approach to cultural diversity in organizations via documenting such a positive outcome as learning. It augments the knowledge of the role of intercultural interactions, as a peculiar type of social interactions, in a learning process.

The study allows for formulating some practical implications. Namely, the findings indicate that, owing to learning potential embedded in multicultural work settings, managers need to invest in development of organizational and individual resources (personal and acquired ones) to foster learning in intercultural interactions. Moreover, managers of MNCs should recruit employees whose need for growth is well-developed since those individuals can benefit more from multicultural work settings.

The study shortcomings are as follows. First and foremost, the applied qualitative methodology does not enable a generalization of the findings. Although the sample size was sufficient for the grounded

![Diagram](image-url)
theory approach, it was limited in terms of proposing any general theory of employee learning in intercultural interactions. Nonetheless, the study indicates certain directions for future research. For instance, the obtained results could be further tested on a larger sample in quantitative studies. Moreover, a focus on job resources in future research might help to explain the role of organization in fostering individual learning in intercultural contacts. Finally, employee learning in social interactions in other types of organizations could be separately explored in future studies to deepen the understanding of social aspects of learning and to compare the results with the current research.

To sum up, the organizational antecedents such as job demands and job resources, and the individual antecedents, such as personal and acquired resources, can foster learning in MNCs that is triggered by cognitive dissonance experienced while interacting with culturally diverse others. The research posits that due to learning embedded in MNCs' settings these companies can be an attractive workplace for people seeking to grow.

THE MEDIATING EFFECT OF INNOVATION ON THE RELATIONSHIP BETWEEN INTANGIBLE RESOURCES AND EXPORT PERFORMANCE

Rua, Orlando Lima¹; França, Alexandra²

¹Applied Management Research Unit (UNIAG); Polytechnic of Porto/ISCAP/CEOS.PP, Porto, Portugal
²School of Economics and Management, University of Minho, Braga, Portugal

ABSTRACT

This paper develops a framework to test the relationship between intangible resources and export performance, considering the mediating effect of innovation.

Based on survey data from Portuguese small and medium-sized enterprises (SMEs) exporting footwear findings suggest that: (1) innovation has a direct and positive influence on export performance; and (2) innovation does have a mediating effect on the relationship between intangible resources and export performance.

This study deepens our understanding and provides novel insights into strategic management literature, since it combines multiple factors and has obtained the importance of each construct in SMEs business growth.

Keywords: intangible resources, export performance, absorptive capacities, innovation, PLS-SEM.

INTRODUCTION

As the importance of internationalization grows for many firms around the globe, there is an increasing interest in the strategic determinants that predict export performance. Consequently, research on export performance has developed exponentially. This increase interest of the academia is due to the various macro and micro-level benefits associated with export development. At the macro-level, superior export performance is a cost-effective vehicle for economic growth, employment creation and a general improvement in living standards. There are countless benefits at firm-level that includes opportunities for growth, worldwide market share, better margins and risk diversification (Kahiya and Dean, 2014).

Strategic management has focused on firms’ intangible resources and this has attracted considerable interest among academics and practitioners (Barney, 1991). Particularly, scholars have focused a great deal of attention on a subclass of intangible assets that is called “social approval assets”, because they develop their value from favorable collective perceptions (Pfarrer, Pollock, & Rindova, 2010).
Innovation, as a process of generating new ideas, will prevent firms’ stagnation and give their products and services competitive advantage by allowing to define direction and business strategy to adopt (Abrar et al., 2009). Moreover, innovation can support a strategic posture and the willingness and ability to question (or leave) existing circumstances, thus creating space for creativity, new ideas and experiences (Frank, Kessler, & Fink, 2010). Regardless of the sort of innovation adopted, the most innovative firms tend to overcome unstable situations, and is thus considered the most important dimension in the context of entrepreneurial orientation, as it determines the means by which organizations can achieve competitive advantage and promote its growth (Dess & Lumpkin, 2005).

SMEs are increasingly confronted by challenges and opportunities in international markets. Together with large corporations, smaller firms are among the key players in international trade. Smaller firms that belong to traditional (low-tech and labor-intensive) industries can find here opportunity for growth or challenge their survival. In fact, they are particularly vulnerable to global competition, particularly from players located in low-labor-cost economies. In order to achieve competitiveness in this context, smaller firms need to develop unique, firm-specific assets (Zucchella and Siano, 2014).

Literature on export performance is extensive but arguably it has not yet achieved the consensus required to prescribe exporting strategies to small firms (Casey and Hamilton, 2014). Moreover, factors that set off SME growth (including exporting) are still in need of research (Stouraitis, Harris, Harun and Kyritsis, 2017). So, the purpose of this paper is to broaden the boundaries of strategic management literature and test the following general hypotheses — does intangible resources positively influence small business export performance? Additionally does innovation mediate this relationship?

THEORETICAL FRAMEWORK

Intangible resources

Resources and capabilities are a set of tangible and intangible assets that can be used by firms to help choose and implement strategies (Barney, Ketchen, & Wright, 2011). There is a consensus in the literature that the sources of competitive advantage are more associated to intangible resources than with the tangible ones. In addition, the tangible assets tend to depreciate over the time, while intangible assets may accumulate value over time (Porter, 1991).

Scholars argue that resources form the basis of firm strategies (Barney, 1991). Therefore, firm resources and strategy cooperate to create positive returns. Firms employ both tangible resources (such as physical infrastructures and financial resources) and intangible resources (like knowledge and brand equity) in the development and implementation of strategies. However, intangible resources are more
likely than tangible resources to produce a competitive advantage, since they are often rare and socially complex, thereby making them difficult to imitate (Hitt, Bierman, Shimizu and Kochhar, 2001). Thus, intangible resources are considered strategic resources (Amit and Schoemaker, 1993).

Intangibles resources have three intrinsic characteristics that distinguish them from tangible resources (Molloy, Chadwick, Ployhart and Golden, 2011). First, intangibles do not deteriorate with use, since these resources are expected to confer benefits for an indeterminate period of time (Cohen, 2005). Secondly, multiple managers can use the intangibles resources simultaneously, for example, the use of a brand is available for all managers. Finally, the intangibles resources are immaterial, making them difficult to exchange, as they often cannot be separated from its’ owner (Marr and Roos, 2005).

The existing literature suggests six types of resources that are particularly important sources of export venture competitive advantage: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and, informational resources (Morgan, Vorhies and Schlegelmilch, 2006).

Innovation

Innovation refers to the support and encouragement to new ideas, experimentation and creativity that will lead to new products, services and processes. Any form of innovation involves a series of efforts, such as: technological innovation involves a research and engineering effort, focused on the development of new products and processes; product innovation includes market research, design, and the focus on advertising and promotion; administrative innovation refers to the development of management systems, control techniques and organizational structure. Thus, innovation reflects the trend that an organization has to participate and support new ideas, innovations, processes, experimental and creative, which may result in new products, services or processes (Lumpkin & Dess, 1996). Thus, innovation reflete a tendência que uma organização tem para participar e apoiar novas ideias, novidades, processos experimentais e criativos que possam resultar em novos produtos, serviços ou processos (Lumpkin & Dess, 1996), being that the adoption of new innovations can generate competitive advantage and can promote a greater source of growth (Dess & Lumpkin, 2005).

Innovation can occur throughout a long process, a new product line, a new announcement or a new technological advance (Lumpkin & Dess, 1996). On one hand, there are several ways to identify the degree of innovation of companies, such as the quantity of financial resources invested in innovation, human resources devoted to innovation activities, number of new products or services launched on the market or frequency of change in product lines or services. On the other hand, the financial resources invested in innovation and the level of commitment of human resources with the innovative activities will dictate the degree of innovation in an organization (Covin and Slevin, 1989).
While it is true that all types of innovations involve a lot of efforts, be it in technology, management, products or markets, the most innovative firms tend to overcome unstable situations and, in this way, there is a consensus that this dimension is the most important in the context of entrepreneurial orientation, as it determines the means by which firms achieve competitive advantage and growth (Dess & Lumpkin, 2005).

Export performance

The use of efficient worldwide communications technology and transportation, the decrease in governments’ protectionist policies, and the decrease of geographically protected markets have made it possible, and necessary, for many firms to view their operating domains as global (Gil-Pechuan, Exposito-Langa and Tomas-Miquel, 2013). Moreover, small countries with constricted domestic markets depend on the success of small firms who can export successfully and grow to a scale beyond that which their home market could support (Casey and Hamilton, 2014).

Exporting is an early phase in the internationalisation model established by Johanson and Vahlne (1977, 2009), grounded on the assumption that new exporters can gradually engage with foreign markets, depending their exploitation strategy on knowledge and other resources. This export research, however, was not pertinent for small exporters (Casey and Hamilton, 2014), since its unit of analysis was large firms.

In a fairly recent literature review, Sousa, Martínez-López and Coelho (2008) conclude that, along with internal capabilities and competencies, the main determinants of export performance are firm size and international experience. Actually, internationalization processes have mainly been studied with reference to multinational corporations and less for SMEs, because smallness is usually considered a problem, as these firms often have a disadvantage in resource access (Musso and Francioni, 2014). This, however, does not support small firm managers in search of a growth strategy through exporting.

Conversely, the number of small firms operating in international markets has increased and represents the majority of firms in most countries, and therefore, they play an important role in the economic growth of their countries. As a consequence, the internationalization process of SMEs has become a topic of academic and governmental attention (Musso and Francioni, 2014).

Hence, the development of exports is of great importance, both at macro and micro levels. Exporting contributes to economic and social development of nations, helps the industry progress, increases productivity and creates jobs. At firms’ level, through market diversification, exports provide an opportunity for them to become less dependent on the domestic market, gaining new customers,
exploiting economies of scale and achieving lower production costs while producing more efficiently (Okpara, 2009).

Exports is a more attractive way to enter international markets, especially for SMEs, in comparison with other alternatives, such as joint ventures, which involve spending a large number of resources (Dhanaraj and Beamish, 2003; Fuchs and Köstner, 2016; Piercy, Kaleka and Katsikeas, 1998), does not create high risk and commitment and allows greater flexibility in adjusting the volume of goods to different export markets (Lu and Beamish, 2002).

On one hand, export activity fulfils certain business goals, which may be economic (such as increasing profits and sales) and / or strategic (such as diversification of markets, gaining market share and increasing brand reputation) (Cavusgil and Zou, 1994).

On the other hand, export motivation may result from proactive or reactive actions. For example, proactive actions are advantage of profit, introduction of a single product, technological advantage, exclusive information, commitment of management, tax benefits and economies of scale. Reactive motivations are identifying competitive pressures, excess production capacity, sales decrease or saturation in the domestic market and proximity of customers and landing ports (Stouraitis et al., 2017; Wood & Robertson, 1997).

**Hypotheses Derivation**

The literature suggests that resources and capabilities are related to each other (Dhanaraj & Beamish, 2003; Morgan, Kaleka, & Katsikeas, 2004). Integration, reconfiguration and learning resources only become significant when resources are abundant (Wu & Wang, 2007), thus improving firms’ dynamic capabilities. Moreover, innovation is an ability that can attract the necessary resources to exploit opportunities (Alvarez & Busenitz, 2001). These resources can thus promote, support and facilitate innovation, allowing firms to innovate and prosper, contributing to the construction of healthy and enduring business (Miller, Wright, Le Breton-Miller, & Scholes, 2015). The benefits of innovation may result in the development of products and processes that occur in multiple stages (multi-stage process), requiring a complete set of resources for an innovative firm (Teece et al., 1997). Barney (1991) highlights resources as assets, capabilities, organizational processes, firm attributes, information and knowledge, which, according to this author, are valuable, rare, imperfectly imitable and non-substitutable (VRIN).

The resource-based perspective conceptualizes innovation as a complex and dynamic process (Zhang et al., 2016) through which firms consistently develop innovation capabilities by exploring new
resources or new combinations of resources (e.g. Galunic and Rodan, 1998; Mahoney and Pandian, 1992; Teece et al., 1997).

**H1: Intangible resources influence positively innovation.**

The RBV posits that variations in firms’ performance result from the possession of heterogeneous resources. This heterogeneity of resources and capabilities leads to performance imbalances and affects firms’ ability to design and implement competitive strategies (Barney, 1991; Peteraf, 1993). Thus, this theory suggests that heterogeneous resources and capabilities have a direct effect on firms’ performance (Makadok, 2001; Teece et al., 1997). Thus, we tested the following hypothesis:

**H2: Intangible resources influence positively export performance.**

Zahra and Garvis (2000) believe that innovation is important for organizational success both to local and foreign markets. According to these authors, success in the global market requires creativity and risk-taking. Literature suggests that innovation has a positive influence in business performance (Wiklund and Shepherd, 2005), since it increases firms’ engagement to, for example, create new products and services, seek new opportunities and new markets (Lumpkin and Dess, 1996; Miller, 1983). In this sense, innovative firms have an extraordinary performance and can even be seen as a country’s engine of economic growth (Schumpeter, 1934). Thus, these firms can control markets by mastering distribution channels and building brand recognition. Hence, we intended to confirm this relationship and test the following working hypothesis:

**H3. Innovation influences positively export performance.**

Innovation is the ability to simultaneously pursue both exploration and exploitation, efficiency and flexibility, or alignment and adaptability (De Clercq, Thongpapanl, & Dimov, 2013). Innovation requires different strategic orientations, technological resources and processes. Innovation provides a mechanism to effectively manage change by repeatedly pursue and achieve both disruptive and incremental innovation (Andriopoulos & Lewis, 2009; Jansen et al., 2009).

This research posits one hypothesis regarding the mediating effect of innovation in the relationship between intangible resources and export performance. The significance of the mediating effect of the variables was assessed by Aroian test (Baron & Kenny, 1986). This test is used to determine whether the indirect effect of the independent variable on the dependent variable via the mediator is significantly different from zero (Aroian, 1947). Thus we propose:

**H4. Innovation mediates the relationship between intangible resources and export performance.**
METHODOLOGY

Setting and data collection

To test the hypothesis a sample of Portuguese SMEs exporting footwear was used, that meet the following criteria: companies in which at least 50% of income comes from exports of goods, or companies in which at least 10% of income comes from exports of goods and the export value is higher than 150,000 Euros (INE, 2011).

The population of this empirical study has been drawn from Portuguese footwear industry firms. Questionnaires were used as primary data sources and were carried out over the period of April 22 to July 22, 2014. The identification of companies was done through the Portuguese Footwear, Components and Leather Goods Association (APICCAPS) database. To reduce misunderstandings, the questionnaire was validated by the research department of APICCAPS. So, in this study we use a non-probabilistic and convenient sampling.

A total of 42 complete and validated questionnaires accounting for 25% per cent of the population were obtained. This response rate is considered quite satisfactory, given that the average of top management survey response rates are in the range of 15%-20% (Menon and Bharadwaj, 1999).

Measures

This study uses well-validated scales from previous studies to operationalize the key constructs and adapted them to the particular context of our empirical setting.

Independent variables – Following Morgan et al. (2006), in the intangible resources construct we included six dimensions: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and informational (knowledge) resources.

Mediators - To assess Innovation we adopted Covin and Slevin’s (1989) measurements.

Dependent variable - Performance is a construct that is difficult to operationalize holistically, since it may refer to different aspects of the organizational effectiveness (Gil-Pechuan et al., 2013). The decision-makers were asked to assess the relative position of their firm vis-à-vis their competitors. All constructs were assessed on a five-point Likert scale.

RESULTS

The structural equation model is a multiple regression analysis, with reflective indicators that are presented as an image of the unobserved theoretical construct, representing observed variables or measures, with the objective of strengthening the relationship of influence between the constructs (Marôco, 2011). The simple correlation between these indicators with their construct must have a
value equal to or higher than 0.707 so that the shared variance between the construct and their indicators is higher than the error variance (Carmines and Zeller, 1979).

Partial Least Squares (PLS) is a technique that best fits predictive applications (exploratory analysis) and theory development when it is not soundly established (Cepeda and Roldán, 2014). This technique, on one hand, maximize the explained variance of the dependent variables (latent or observed, or both) and estimate structural models with small samples (Chin and Newsted, 1999; Reinartz, Haenlein and Henseler, 2009). On the other hand, it estimates reflective and formative measurement models without identification problems (Chin, 2010). PLS appear to be a preferable option for researchers with samples below 250 observations (42 in this study) (Reinartz et al., 2009).

In order to verify the reliability of overall variables we estimated the stability and internal consistency through Cronbach’s alpha (α). Generally, an instrument or test is classified with appropriate reliability when α is higher or equal to 0.70 (Nunnally, 1978; Chin, 2010). The result of 0.958 achieved for all variables is considered excellent, confirming the sample’s internal consistency (Pestana and Gageiro, 2008). Table 1 show all constructs largely achieved the required level.

Table 1 - Cronbach’s alpha

<td>.000</td>
</tr>
</tbody>
</table>

We also use the composite reliability coefficient to assess construct validity (Chin, 1998). This coefficient reflects construct adequacy for a level higher than 0.6 using confirmatory factor analysis (Gefen and Straub, 2005), as in our case. Table 2 illustrates that the studied constructs (all multidimensional) highly exceeded the minimum required for a good fit.

<td>.000</td>
</tr>
</tbody>
</table>

For validity assessment, two subtypes are usually examined: convergent and discriminant validity. Convergent validity implies that a set of indicators represents one and the same underlying construct (Henseler et al., 2009). Fornell and Larcker (1981) suggest using the Average Variance Extracted (AVE) criterion and that an AVE value of at least 0.5 indicates sufficient convergent validity. Next table demonstrates that only absorptive capacity is slightly below the minimum required.

Table 3 - Convergent validity

<table>
<thead>
<tr>
<th>Construct</th>
<th>AVE</th>

</thead>
<tbody>
<tr>
<td>IR</td>
<td>.563</td>
<td>.000</td>
</tr>
<tr>
<td>INOV</td>
<td>.739</td>
<td>.000</td>
</tr>
</tbody>
</table>
Discriminant validity is the degree to which any single construct is different from the other constructs in the model. To have discriminant validity a construct must exhibit weak correlations with other latent variables that measure different phenomena. There are two measures of discriminant validity in PLS. The Fornell–Larcker criterion (1981) recommends that the AVE should be greater than the variance between a given construct and the other with which it shares the model. The second criterion suggests that the loading of each indicator is expected to be greater than all of its cross-loadings (Henseler et al., 2009).

We can observe the explanatory power of each variable in the model. Entrepreneurial orientation is the only purely explanatory variable and reputational resources and absorptive capacity of knowledge exploitation the explained variables. Chin (1998) distinguishes the explanatory power from moderate to substantial. Table 4 expresses the good results in terms of discriminant validity of the research model, confirming that constructs do differ significantly.

Table 4 - Discriminant validity

<td>.750</td>
</tr>
</tbody>
</table>

In order to determine the significance of the studied relationships and the confidence intervals of the path coefficients, we used bootstrapping technique. The weighted coefficients indicate the relative strength of each exogenous construct. According to Chin (1998), relationships between constructs, with structural coefficients higher than 0.2, are considered robust. From table 5, we thus conclude that the original model does not present non-significant paths.

Table 5 – Effects

| Path          | Original Sample (O) | Sample Mean (M) | Standard Error (STERR) | T Statistics (|O/STERR|) | p values |
|---------------|---------------------|-----------------|------------------------|-----------------|----------|

The significance of structural coefficients and the magnitude of the total effects enabled us to test the research hypotheses, having registered the following results:

*H1. IR --> INOV – Not supported;*

*H2. IR --> EP – Not supported;*

**DISCUSSION AND CONCLUSIONS**

This study allowed us to conclude that innovation has a mediating effect on the relation between intangible resources and export performance. Our findings confirm that indeed resources and capabilities are related to each other, supporting the studies of Dhanaraj and Beamish (2013) and Morgan et al. (2004). Conversely, results do not support Teece et al. (1997) and Teece (2007), since these authors claim that innovation requires not only the property of intangible resources, but also its exploration.

Success in the global market requires creativity, ingenuity and risk taking, both in domestic markets and in foreign ventures (Zahra and Garvis, 2000). The literature suggests that innovation has a positive and direct influence in business performance (Damanpour, Szabat, & Evan, 1989; Han, Kim and Srivastava, 1998). Our findings support this statement. Indeed, innovative firms have an extraordinary performance and can even be seen as a country’s engine of economic growth (Schumpeter, 1934).

**Theoretical and practical implications**

Theoretically, this study contributes to the literature of intangible resources that leverage firm performance, when mediated by innovation (e.g. Cabral et al., 2015; Damanpour et al., 1989; Han et al., 1998). We also highlight the contribution of this study to the theory of strategic management. It is known that strategy includes deliberate and emergent initiatives adopted by management, comprising resource and capabilities used to improve business performance (Nag, Hambrick and Chen, 2007). In order to remain competitive, firms must assess which strategic determinants give them an advantage over their competitors. The findings are a contribution to clarify the influence of innovation, intangible resources and absorptive capabilities in small firms export performance.

In addition, the results provide guidance to business practitioners; since they indicate intangible resources and innovation as predictors for export performance. Firms are a bundle of resources and
capabilities (Peteraf, 1993), it is essential to understand and identify which resources are relevant to gain competitive advantage and superior performance. Business managers must be able to systematically analyse the changes that arise in their target market(s) and to identify the present and future needs and market trends, anticipate changes in demand and seek new business opportunities.

Research limitations

While this research provides valuable insights into SMEs in the footwear industry, the study is not without its limitations. First, the main limitation of this study is related to the sample size, since it was difficult to find companies with the willingness to collaborate in this type of research. Second, it would have been interesting to control our analysis. The fact that the research does not consider the effect of control variables such as age, location and target market of the respondents can be seen as a limitation. Third we used an online study to collect our data. While electronic data collection methods are becoming more common, strategies to encourage a greater response rate are lacking compared to other survey implementation methods. Finally, the fact that the sampling is non probabilistic and convenience is a limitation. Therefore we advise prudence in the generalization of results.

Future lines of research

Firstly, in future work, we suggest that the model is used in a sample with a higher number of observations to confirm these results. Second, this study has been based on a mature sector, as is the footwear sector in Portugal. The results obtained should be understood in this context. For this reason, new research could be done in more modern industries to test again the proposed relations. Third, given the irregular nature of business growth, a snapshot survey may not be able to capture strategy and performance variations over long periods of time. As such, further studies with a longitudinal perspective would be of added value to investigate why these differences persist. In other words, to find how and why some small exporters become highly successful while others, in the same industry, struggle to raise their export strengths. Finally, the moderating effect of other variables (e.g. competitive advantage, dynamic capabilities, environment hostility) should be studied.

THE ROLE OF HUMAN RESOURCES FOR INBOUND OPEN INNOVATION: IMPLICATIONS FOR HIGH-TECH FIRMS.

Santoro, Gabriele
Dipartimento di Management, Università degli Studi di Torino, Italia

ABSTRACT

With the increasing proclivity in engaging in open innovation, firms likely to face some tensions and opportunity given by the management of human resources. This starts from the assumptions that the knowledge base of the firms reside in the people who works for the firms and that some human resource management factors can influence innovation within firms. Despite this, there is a lack of studies investigating the link between human resource management and open innovation. This paper intends to fill this gap and nurture future research directions by assessing whether some human resource management elements help in engaging in open innovation and whether these elements are mediated by open innovation in enhancing innovation.

The paper uses structural equation modelling to test the aforementioned relationship on a sample of Italian firms in high-tech sectors, to provide theoretical and managerial implications.

Keywords: inbound open innovation, human resource management, high-tech, innovation.

INTRODUCTION

Early studies in the business management field suggest that knowledge is the most important resource for firms to compete and create unique advantages (Nonaka, 1994; Grant, 1996). So far, there has been an arduous debate on whether firms create knowledge internally or acquire externally. Anyhow, no doubt exists that firms have to create and leveraging dispersed knowledge to increase competitiveness (von Krogh 1998; Argote and Ingram, 2000; Alavi and Leidner, 2001), to respond to changes of the competitive and technological environment (Teece, 2007). Consequently, firms increasingly have to heighten internal knowledge management capacity in order to manage inward and outward flows of knowledge exploiting and exploring external opportunities (Lichtenthaler and Lichtenthaler, 2009).
According to the open innovation paradigm, firms can and should acquire dispersed knowledge from external actors to integrate it with knowledge developed internally and possessed by firm employees (Chesbrough, 2003). Most importantly, people inside the organization are called to search for external knowledge and integrate it with the internal one to improve processes and products (West and Bogers, 2014). For this reason, it is reasonable to infer that certain HRM practices could affect the capacity of managing knowledge properly. In fact, studies within the HRM domain found that certain practices help knowledge acquisition, knowledge creation, and innovation (Ichniowski et al., 1997; Laursen and Foss, 2003; Michie and Sheehan, 2003; du Chatenier et al., 2007, 2010). In addition to this, acquiring or sourcing external knowledge may provoke many internal tensions requiring cultural and HRM efforts and practices. Despite this, there has been scarce interest in the intra-organisational aspects of open innovation so far (van de Vrande et al., 2010; Petroni et al., 2012; Vanhaverbeke et al., 2014; Bogers et al., 2016).

Therefore, with this paper aims to contribute to literature addressing the research gap aforementioned by shedding more light on the issue concerning the human aspect of open innovation.

To reach this goal, this paper follows a quantitative methodology approach through hierarchical regression model technique to test several hypotheses developed under the open innovation and HRM lens. Finally, theoretical and managerial implications are provided.

THEORETICAL BACKGROUND

Open innovation

The value creation for a firm depends on intangible and knowledge-based resources (Grant, 1996), which can be acquired externally or developed internally by employees and R&D departments. In fact, an integrative perspective which considers both internal and external sources of knowledge is relatively new in management studies (Grant and Baden-Fuller, 2004; Chesbrough, 2006; Teece, 2007; Del Giudice and Maggioni, 2014).

From a dynamic capabilities perspective, Teece (2007) claims that firms could combine internal and external knowledge in order to cope with the dynamic environment and to exploit technological and commercial opportunities. The open innovation theory describes this combination suggesting that “...firms can and should use external as well as internal ideas, and internal and external paths to market, as they look to advance their technology” (Chesbrough, 2004; p. 1). Thus, an alternative
innovation model suggests new forms of interactions and collaborations that foster innovativeness within firms.

Therefore, firms develop competitive advantages through knowledge exploitation and exploration both within and outside the firm’s boundaries (Vrontis et al., 2016). From one hand, internal departments and employees are pushed to find new solutions close to customers’ need to develop new products. From the other hand, internal departments and employees struggle to find knowledge externally provided by the customers through customer engagement techniques, from other market-based sources such as suppliers and distributors, but also from scientific partners such as universities for more radical innovations development (Fabrizio, 2007).

Several studies suggest that, despite no firm can be considered totally open to innovation, some firms tend to establish more external relationships, while other concentrate their effort with one or two intense ties (Laursen and Salter, 2006; Naqshbandi and Naqshbandi, 2016).

A part from the level of openness to innovation, employees cover an important role in recognising and integrating sources of knowledge within the innovation process (West and Bogers, 2014). Despite this, there have been few attempts to describe the human and intra-organisational aspects of open innovation in literature. This is striking given that acquiring or sourcing external knowledge may provoke many internal tensions requiring cultural and HRM efforts and practices (Vanhaverbeke et al., 2014).

**HRM and innovation**

HRM regards to all the decisions made by management of a firm that affect the relationship between the firm and its employees (Beer et al., 1984). Literature usually distinguishes a number of relevant areas of policies and practices within the broad field of HRM. In particular, HRM regards (De Leede and Looise, 2005): a) the design of organizations and tasks; b) the staffing of the organization by managing the in-, through- and out-flow of personnel; c) the measurement of performance and the reward of employees; d) the channels for communication and participation in work and decision-making.

To date, there has been an increasing interest in understanding the strategic role of HRM and the benefit for the firm performance.

Accordingly, there is evidence of positive effects of recruitment and selection, training, HR planning, rewards system and employees participation activities on higher productivity (Koch and McGrath,
1996; Lazear, 1996); market performance (Delaney and Huselid, 1996; Hartog and Verburg, 2004), overall performance (Pfeffer, 1998; Fey et al., 2000), and innovativeness (Hoque, 1999; Andries and Czarnitzki, 2014). With regard to innovation, the following part will develop hypotheses on HRM and innovation under the open innovation lens.

THE HUMAN AND INTER-ORGANISATIONAL ASPECTS OF OPEN INNOVATION: HYPOTHESES DEVELOPMENT

An open approach to innovation involves the engagement between two actors though formal or informal ties (West and Lakhani, 2008). This means that, at organizational level, employees and teams are essential in managing inter-organizational innovation process, in particular for what concern (du Chatenier et al., 2007, 2010): a) the management of collaboration processes; b) the management of the whole innovation process; c) the creation of knowledge in a collaborative manner; d) the importance of boundary-spanning, novelty-generating, negotiating and learning competences for employees.

Therefore, I believe that:

Hp. 1: the greater the use of team works within a firm, the higher the proclivity of engaging in inbound open innovation

Hp. 2: the greater the use of team works within a firm, the higher the likelihood of benefiting from inbound open innovation

Global talent management is about systematically utilizing HRM activities to attract, develop, and retain individuals with high levels of human capital (e.g., competency, personality, motivation) consistent with the strategic directions of the firm in a dynamic, highly competitive, and global environment (Tarique and Schuler 2010). Despite the fact that most of useful knowledge is outside the firm’s boundaries (Chesbrough, 2003), our belief is that the ability of recognising useful external knowledge reside in the employees’ capabilities and talent (Lewis and Heckman, 2006), given that talent plays a key role in the relationships a firm has with its external stakeholders (Zhang et al., 2015). Therefore, the employees’ retention is reasonable expected to be positively associated with commitment and trust with the firm, and it is also likely to foster knowledge specialization and fortification (Muffatto, 1998). In fact, short-term contracts and low level of commitment have been found counterproductive to firm’s innovativeness (Michie and Sheehan, 2003), and OI strategies potentially lead to higher levels of professional commitment of employees (Bogers et al., 2016). Through higher level of commitment and retention, it is reasonable to infer that employees are more
willing to consider the open innovation strategy and approach of the firm, understanding the need to integrate the knowledge developed internally and externally. Moreover, with the retention of the employees, the knowledge base of the firm increase, and therefore firm augments the likelihood of benefiting from inbound open innovation, because employees’ retention is important to acquire knowledge and for knowledge integration (Weber and Tarba, 2010).

Therefore, I believe that:

**Hp. 3:** the higher the employees’ retention, the higher the proclivity of engaging in inbound open innovation

**Hp. 4:** the higher the employees’ retention, the higher the likelihood of benefiting from inbound open innovation

Linked to the above hypotheses, HRM practices, such as training and learning, proper recruitment and selection, have been found positively associated with knowledge acquisition, knowledge creation and innovation in literature (Laursen and Foss, 2003; Michie and Sheehan, 2003; Chand, 2010). Moreover, with reward systems these benefits are even stronger because employees feel incentivized to be work better (Ichniowski et al., 1997). In general, appropriate roles, structures, procedures and systems are also relevant in order to enable effective knowledge flows when innovation is carried out in collaboration (Petroni et al., 2012). Other scholars have highlighted the crucial role of human and organizational capital and related HRM practices in creating a context which favours knowledge sharing within the firm (Cabrera & Cabrera, 2005; Yang & Lin, 2009). Lazzarotti et al. (2015) suggest that firms should carefully manage several HRM practices, e.g. selection and recruiting of personnel, training, development, and reward system in order to promote knowledge transfer and innovativeness.

Finally, literature also recognizes that greater degrees of openess imply increasing organizational and managerial complexity (Bader & Enkel, 2014), and certain HRM practices can help in manage such complexity. From a social capital perspective, HRM systems may help in building social relations among employees by improving their opportunity, motivation, and ability to access and mobilize that may extend to collaborative ties externally (Adler and Kwon, 2002).

**Hp. 5:** the greater the use of HRM practices, the higher the proclivity of engaging in inbound open innovation

**Hp. 6:** the greater the use of HRM practices, the higher the likelihood of benefiting from inbound open innovation
METHODOLOGY

Research sample, design and variables

The research involves data gathered from CEO, R&D managers and HRM managers of high-tech firms located in Italy. First, a total of 1000 high-tech firms were selected from an Italian database. Second, an email with invitation to participate in the survey along with a letter containing an explanation of the study’s purpose was sent to all the firms. In total 192 firms have expressed the interest in entering the study. Third, a questionnaire, composed of 27 questions (open and closed), was sent to these firms, which was answered and returned by 118 firms, which is the final sample. The answers for all the variables and general information of the firm were gathered from the different key managers to avoid concerns regarding common method bias.

In detail, firms within the sample operate in manufacturing and services high-tech industries in the following specific sectors: electronic and electrical component; biotechnology; information and communication technology; phar and medicine; chemical; computer engineering. The majority of them are small and medium enterprises (79% of them have less than 250 employees).

The paper builds on the theoretical framework and the consequent conceptual model to conduct the empirical research, which follows two main steps. First, the literature review led us to develop the questionnaire and therefore the variables of our model. Second, I have tested the model and the
hypotheses through structural equation modelling (SEM), which was considered a suitable method for our research.

As stated before, the questionnaire was composed of 27 questions. The questions were stated according to a funnelling technique (Breiman et., 1984). Therefore, general questions were followed to the specific one. In this way, I collected general information about the firm such as number of employees, industry, financial data, etc. Consequently, specific questions were outlined and focused mainly on HRM with specific regard to team works, employees’ retention and HRM practices, open innovation and innovation.

With regard to innovation as a performance measure, it measures the ability of a firm in developing new products or services (Laursen and Salter, 2006).

Consequently, variables were developed using multi-item scales according to relevant literature in order to ensure content validity. Table 1 shows the specific questions and items for each variable. In particular, I asked to respondent to evaluate several statements with a seven-points likert scales.

Before the hypotheses testing with SEM, a measurement model is conducted to ensure reliability and validity of the scales. First, a confirmatory factor analysis (CFA) for each construct has been done in order to ensure the reliability of the measures (Henseler & Fassott, 2010), and data indicate that the Cronbach’s alpha are higher than 0.7, the threshold recommended (Hair et al., 2010). Also, composite reliability and average variance extracted are respectively above 0.7 and 0.5, the recommended threshold (Fornell and Larcker, 1981). The validity of the scale is confirmed by loading factors which are higher than 0.5, suggesting a good convergent validity. Also content validity is ensured given that scales are developed according to literature.

PROCEDURES AND RESULTS

The conceptual model shows the relationship among variables developed following the literature. In particular, the hypotheses have been tested through PLS – SEM technique, useful for small sample (Chin et al., 2010). It is also recommended for statistical models containing latent variables with several cause and effect relationships (Gustafsson and Johnson, 2004), and when mediation effect are willing to be assessed (Chin, 1998).
The path coefficients generated by PLS provide an indication of relationships and can be used similarly to the traditional regression coefficients (Gefen et al., 2000).

Figure 2. The PLS coefficients

Table 3 shows the relationship among variables through direct effects (standardized beta coefficients). In particular, it indicates that: first, teams is positively associated with open innovation (0.618; p<0.01), confirming hypothesis 1; second, employees’ retention is not associated with open innovation (0.123; p>0.05), therefore hypothesis 3 is not confirmed; third, HRM practices is positively associated with open innovation (0.553; p<0.01), confirming hypothesis 5.

For hypotheses 2, 4 and 6 potential mediation effects have been assessed. Mediation exists if the coefficient of the direct path between the independent variable and the dependent variable is reduced when the indirect path via the mediator is introduced into the model (Bontis et al., 2007). As figure 2 shows (right part), all the three direct path coefficient are lower when the indirect effect of inbound open innovation is introduced. In particular: a) the direct effect of teams on innovation is reduced from 0.523 to 0.402; b) the direct effect of employees’ retention on innovation is reduced from 0.062 to 0.029; c) the direct effect of HRM practices on innovation is reduced from 0.466 to 0.326.

For the sake of brevity, the paths of teams, employees’ retention and HRM practices to inbound open innovation are not reported in figure 2 but they are indicated in Table 3. These paths are positive and significant, meaning that all the component of HRM are positively associated with inbound open innovation.

Table 3. Direct path of independent variables on mediating variable
Path  |    Beta  |    p-value
---|---------|---------
Teams → Inbound open innovation  | 0.618; p<0.01 |
Employees’ retention → Inbound open innovation  | 0.123; p>0.05 |
HRM practices → Inbound open innovation  | 0.553; p<0.01 |

The indirect effect are calculated as follows. The indirect effect of teams to inbound open innovation and from inbound open innovation to innovation was 0.618*0.512=0.316. The indirect effect of employees’ retention to inbound open innovation and from inbound open innovation to innovation was 0.123*0.512=0.063. Finally, the indirect effect of employees’ retention to inbound open innovation and from inbound open innovation to innovation was 0.553*0.512=0.283.

**DISCUSSION AND CONCLUSIONS**

The main purpose of this paper was investigate the relationship between HRM and open innovation. Developing a conceptual model based on human resource and open innovation literature, several hypotheses have been tested through SEM-PLS.

In particular, it has been hypothesized that several HRM elements are important in engage with an open innovation approach, and that the open innovation approach mediates the relationship between HRM and innovation in firm. Results indicate that teams and HRM practices are important to establish an open innovation approach (hypothesis 1 and hypothesis 5), while employees’ retention is not essential in engaging in inbound open innovation (hypothesis 3).

Furthermore, our results suggest that inbound open innovation mediates the relationship between teams and innovation, and the relationship between HRM practices and innovation (hypothesis 2 and hypothesis 6). Whilst, despite open innovation improves the relationship between employees’ retention and innovation, I cannot conclude that a mediating effect exists. Therefore, hypothesis 4 cannot be confirmed absolutely.

Our research findings drive us to develop several implications to theory. First, our research contributes to theory indicating that the HRM aspect of open innovation is important for firms given that knowledge is the most important resource for innovation within firms, and innovation is driven by the knowledge possessed by firm’s employees. In this regard, acquiring or sourcing external knowledge may provoke many internal tensions requiring cultural and HRM efforts and practices. Despite this, there has been scarce interest in the intra-organisational aspects of open innovation so far (Vanhaverbeke et al., 2010; Petroni et al., 2012; Vanhaverbeke et al., 2014; Bogers et al., 2016).
Therefore, I suggest that some HRM activities have to be established before structuring inbound open innovation activities.

Second, by drawing on HRM literature, our research proposes several elements important in the management knowledge possessed by firms. Accordingly, the effects of teams, employees’ retention and HRM practices on inbound open innovation and innovation have been tested. In particular, team works for inter-organizational processes, for managing the innovation process, for creating new knowledge collaboratively, and HRM practices such as performance related rewards, flexible work, training and learning and recruitment and selection, are important in engaging in inbound open innovation and are fully mediated by open innovation for the improvement of the innovation performance. Therefore, with certain HRM activities firms are more able to develop innovative products and services as suggested by literature (Hoque, 1999; Andries and Czarnitzki, 2014). In turn, employees’ retention is not important in improving innovation, and this result is different from previous studies (Michie and Sheehan, 2003). One possible explanation is that, despite the employees’ turnover within the firm, important knowledge resides in few employees seen as talented. Therefore, firms can hold some employees for a long time and change some others without compromising the knowledge base or the ability to engage in inbound open innovation.

Our study has also practical implications. First, the management of the firms should adopt a HRM strategic view when approaching inbound open innovation. This underlines the importance of employees’ and human aspect in managing internal and external sources of knowledge as antecedents of innovation. In particular, HR managers must promote initiatives to stimulate collaborative approach to innovation and specific practices that can be useful to improve innovation. In the specific case of our paper, rewards based on performance, flexibility in workday training and learning activities, and recruitment and selection are seen as important elements in applying inbound open innovation and manage properly external sources of knowledge to enhance innovation.

The results of our work should be considered in light of several limitations. First, data were gathered from top managers of the firms involved in the research and therefore they can be influenced from subjectivity. Future studies can address the human aspect of open innovation analysing the perspective of the employees’ active in the management of knowledge and in collaborative activities. Second, our research focused on high-tech firms from a specific country; therefore, results in different context such as traditional firms can be different.

To conclude, our results strikingly indicate that employees’ retention is not associated with open innovation and therefore hiring talented human resources is important but retaining them for a long
time is not essential to approaching and benefiting from open innovation. This result opens for future questions and deserves surely more attention.

RE-AFFIRMING THE NEED FOR SYSTEMS THINKING IN SOCIAL SCIENCES: A VIABLE SYSTEMS VIEW OF SMART CITY

Saviano, Marialuisa; Caputo, Francesco

Department of Pharmacy, University of Salerno, Fisciano, Italy

ABSTRACT

Although widely recognized as fundamental to supporting the understanding of social and economic dynamics, systems thinking still seems to suffer from the old criticism of being considered too abstract to address solutions for specific real problems or maybe there is a lack of capacity to think about our societies in a more systemic and holistic way. With the aim of re-exploring the contribution of systems thinking in the field of management, the Viable Systems Approach (VSA) has been developed in the last decades as a methodology, rooted in systems thinking and based on the Viable Systems Model of Stafford Beer, which is useful to interpret and articulate complex social and business dynamics. As an exemplification of the way systems thinking can be applied in the context of social sciences through the VSA, the case of Smart City is proposed, which highlights how the VSA can contribute to bridging the gap between an abstract adoption of systems thinking and the application of its principles and models to specific problematic contexts of high social complexity.

Keywords: Systems Thinking, Viable Systems Approach, Smart City.

INTRODUCTION: RE-AFFIRMING THE NEED FOR SYSTEMS THINKING IN SOCIAL SCIENCES

In the last few years, various evolutionary trends have progressively changed social configurations (Beck & Sznaider, 2006), determining the emergence of new lifestyles and social behaviours (Lawson & Todd, 2002), increasingly based on information sharing and supported by the innovative instruments offered by Information and Communication Technologies (Huysman & Wulf, 2006; Caputo et al., 2016b; Evangelista et al., 2016). But a topic to develop is how can we move from an emphasis in information to communications and learning processes to increase the quality of our cities.

Progress, especially at the technological level, allows for the development of new possibilities, offering, on the one hand, ever new solutions and creating, on the other hand, ever new needs. As a consequence, an increasing variety can be observed together with an increasing interconnection...
between social, economic, and environmental phenomena (Lofland & Lofland, 2006), which make even more complex the understanding of socio-economic dynamics requiring the development of new interpretative models (Giddens, 1979; Manski, 1995; Parsons et al., 1965; Holling, 2001).

As a ‘soft’ science, social sciences typically deal with multi-dimensional phenomena the understanding of which require the adoption of multiple perspectives and the development of interdisciplinary knowledge. These requirements, however, are difficult to address because, over time, each discipline has developed its own interpretative models, making dialogue between different perspectives more problematic and the attempt to define ‘best’ solutions that could be applied to categories of similar problems fails (Gergen, 1985).

The understanding of this variety has led to the development of even more specific models by enriching the interpretative frameworks used, through the development of specialized and hyper-specialized knowledge (Johns et al., 2011, Caputo, 2017), thus ending up with complicated models. Moreover, with increasing information, the capability of models to effectively represent the observed dynamics results has weakened. Models, in fact, cannot include all relevant variables without losing their readability and capability to represent reality. The challenge is to find simple explanations for very complicated dynamics (May, 1976).

An increasingly analytical study of observed phenomena implies splitting up a problem and investigating its parts with the aim of defining an effective solution for the specific situation (Bohman, 1993). Through this reductionist approach, relevant properties that emerge from interaction will be lost and the functioning of the whole cannot be understood. Complexity, in fact, cannot be reduced because, as will be shown in the next section, it is interaction that yields “coherent patterns of behaviours” (Stacey et al., 2000: 7). This problem has long been evidenced by systems theory. In order to address complexity, it is necessary to identify the rules that govern those coherent patterns of behaviours, which cannot be completely designed and controlled – at least when they involve humans – as for any social phenomenon.

Believing that the increasing complexity of reality cannot be addressed by ‘complicating’ the models and departing in an opposite direction, this paper re-affirms the need for a general reference conceptual framework (Weber, 1949) and re-explores the contribution of systems thinking as one of the most general level frameworks of reference for investigating any kind of phenomenon of reality.

Systems theory, however, has been alleged to fail “in its attempt to deal with soft, unstructured problem situations where values and objectives are multiple and conflicting” (Mingers, 1980: 45).

Although limitations in the application of systems thinking to the analysis of social dynamics are still debated (Blanche et al., 2006), its interpretative power for complex social dynamics is unquestionable.
Recognizing the need for an interpretative framework that can ground the understanding of complex multi-dimensional phenomena, the contribution of systems thinking (Von Bertalanffy, 1968; Maturana, 1975; Checkland, 1985; Bogdanov, 1989; Senge & Sterman, 1992; Jackson, 2003) has been widely re-explored and re-affirmed (Maani & Maharaj, 2004; Galanakis, 2006).

In the context of management studies, the recognition of the necessity to adopt a systems thinking view in the interpretation of socio-economic dynamics, has led to the development of a research stream, the aim of which is to provide general reference interpretation schemes for the management and study of business as well as social organizations. Rooted in systems thinking and based on the Viable Systems Model of Stafford Beer (1984), the Viable Systems Approach (VSA). VSA is a useful methodology used to study socio-economic phenomena by integrating an analytical with a holistic approach.

VSA – like systems thinking – can be expected to provide interpretative tools that can be effectively applied to real problem-solving or dissolving problems and offering spaces for continuous learning processes. It should be said, however, as will be illustrated in the next section, that VSA aims to contribute to fill the gap at a general reference level for interpreting complex business and social dynamics, the understanding of which cannot rely on consolidated management tools as they are conceived in a specific problem-solving perspective.

An effective example of articulated multi-dimensional phenomena that can be effectively investigated through the adoption of the VSA is Smart City (Anttiroiko et al., 2014). In fact, the governance of Smart City implies the understanding of complex dynamics that involve multiple social, economic, and technical dimensions. Both theoretically and practically, Smart City is a challenging phenomenon to deal with, which requires interaction and collaboration between several different disciplines. In this perspective, the need of a general conceptual framework is apparent. Nevertheless, the study of Smart City still appears to lack the support of a general framework of reference both at a theoretical and practical level (Nam & Pardo, 2011; Jin et al., 2014).

With the aim of providing an exemplification of the way systems thinking can be applied in the context of social sciences through the VSA, the case of Smart City is discussed in this paper, highlighting how the VSA can contribute to bridging the gap between an abstract adoption of systems thinking and an application of its principles and models to real problematic contexts. A key research question summarizes the perspective adopted: Is a Smart City a designed or an emergent outcome?

The paper is structured as follows: following a brief review of the contribution of systems thinking to social sciences, the main focus is on the VSA as an interpretative methodology rooted in systems thinking. Subsequently, the case of Smart City will be discussed as an interesting multi-dimensional social phenomenon, the interpretation of which still lacks the support of a general framework of
reference. In order to bridge this gap, the VSA framework will be applied to outline the fundamental elements of a possible interpretative framework of common reference for the study and governance of Smart City. Finally, some conclusions and future directions for research will be proposed.

THE FUNDAMENTAL CONTRIBUTION OF SYSTEMS THINKING TO SOCIAL SCIENCES

In the first chapter of their book – Complexity and management: fad or radical challenge to systems thinking? Stacey et al. (2000: 7) stated that “there are alternative ways of thinking about causality, some of them suggested by the provocative thinkers in the complexity sciences […]. These thinkers suggest that interaction itself has the intrinsic capacity to yield coherent patterns of behaviours. They propose that the entities of which nature is composed interact locally with each other, in the absence of any blueprint, plan or program, and through that interaction they produce coherent patterns in themselves”. These words effectively summarize the challenges faced and the opportunities offered by systems thinking.

Over time, the scenario described by Stacey et al. (2000) has attracted the interest of an increasing number of researchers and research streams involved in defining possible applications and useful advancements in knowledge in social sciences in the light of systems thinking. Undoubtedly, systems thinking is nothing new; it has a long history originating in the research domain of natural sciences (Von Bertalanffy, 1968; Maturana, 1975). Only in the last century, however, have social and economic researchers tried to apply its principles and frameworks to the studies of social and economic dynamics (Von Foerster, 1984; Bogdanov, 1989). More specifically, the willingness to apply systems thinking in social domains was inspired by the increasing uselessness of traditional mechanistic, as well as reductionist, approaches in explaining social dynamics and trends (Hedström & Ylikoski, 2010; Calabrese et al., 2017). Many scholars have proposed the application of systems thinking in the social sciences domains (Boulding, 1956; Beer, 1979; Bowler, 1981), highlighting its general validity as an interpretative lens (Von Bertalanffy & Rapoport, 1963) and the need to build more explicative conceptual frameworks for social sciences (Mingers, 1980; Tronvoll et al., 2017).

Among the numerous works devoted to representing organizations from a systems perspective, one that still attracts interest from a significant number of scholars and professionals is that of Stafford Beer (1984) who developed the Viable System Model (VSM). The VSM builds on key concepts of cybernetics in order to propose a representative model of an organization able to produce itself by adapting its configuration to the external changes. The VSM offers a conceptual framework useful for underlining in what ways an organized entity can modify itself to ensure its survival (Espejo & Harnden, 1989; Espejo, 1990; Schwaninger, 2006). This conceptualization has several implications for
social sciences and has opened up a wider perspective in the studies of social phenomena (Jackson, 1992; Espejo & Reyes, 2011). The model is functional for any type of organization that aims to survive by modifying its logical and physical structure over time. Hence, ‘viability’ is the modality which characterizes the nature of social entities, expressing the interaction of an organization with its context in order to learn, adapt, develop itself, and improve its efficacy in relation to the specific aim of survival. However, the Stafford Beer’s model, based on the observation of biological and social systems, gives centralty an organization’s recursive structures.

An interesting advancement in this area was offered in the work of Schein (1985) which proposed an organizational culture model based on the differences among underlying values, espoused values, and artefacts. This model enriches previous knowledge by outlining the opportunities to analyse a system from different viewpoints; furthermore, it identifies possible implications of systems recursion in social sciences by acting on the construct of ‘organizational and occupational cultures’. The model, however, does not offer a clear explanation about the ways in which the culture evolves over time and impacts on the systems configurations (Škerlavaj et al., 2007).

From a different viewpoint, Hatch and Cunliffe (2006), with the aim of enriching the structural perspective of VSM, introduced in the model some ‘dynamic dimensions’ by identifying five major fields of organization theory: organizational culture and identity, organizational strategy, organizational design and structure, organizational behaviour and performance, and strategic response to organizational environment. This contribution underlines the relevance of dynamic dimensions in systems thinking (Hatch & Cunliffe, 2006).

Many difficulties arise, however, when dealing with social dynamics, and lead to recognition of the impossibility of including and considering all the relevant dimensions in a unitary framework by advocating the concept of complexity (Gell-Mann, 1995; Anderson, 1999; Di Nauta et al., 2015; Rosenberg, 2015; Basile & Caputo, 2017; Del Giudice et al., 2017).

With the aim of re-exploring the contribution of systems thinking to social sciences by shifting attention from the structures to the dynamics of social organizations living in turbulent environments, the VSÀ has been developed in the field of management by adopting a multi-disciplinary approach that integrates contributions from psychology, sociology, and philosophy (Barile, 2009a).

As will be illustrated in the next section, although essentially based on the same conceptual matrix of Stafford Beer’s VSM, to better fit the current problematic context of organizations, VSÀ introduces several innovations, above all in relation to the analysis of decision-making processes in conditions of complexity.
THE VIABLE SYSTEMS APPROACH AS A SYSTEMS THINKING METHODOLOGY

The VSA has been developed in the last few decades by an Italian group of researchers in the field of management and is gaining increasing interest at an international level (Barile, 2000, 2008, 2013; Golinelli, 2000, 2005, 2010; Barile et al., 2012). It builds on the key concepts of Stafford Beer’s VSM in order to develop a coherent framework for investigating the way viable systems survive in their environments by interacting with other systems entities (Barile, 2013; Saviano & Caputo, 2013); that is, the ways a system perceives, interprets, and reacts to environmental changes in order to become even more effective (VV.AA., 2011; Barile et al., 2013; Saviano et al., 2014).

Grounded in a constructivist view of reality (von Glasersfeld, 2001), the VSA states that the behaviour of a viable system, be it an individual or an organization, depends on a subjective perception of reality affected by the system’s previous experiences and knowledge, and by the strong beliefs that progressively define its identity (Barile et al., 2015). The identity of a viable system is represented through what the VSA calls its Information Variety (Barile, 2009b): a system’s identity made up of knowledge possessed (information units), cognitive capabilities developed over time (interpretation schemes), and strong beliefs that characterize its personality (categorical values). More specifically, the information units refer to the total amount of data held by the system and on which systems’ decisions are based. The interpretation schemes are the ways through which a system organizes the available information in order to represent a specific problem or situation. Finally, the categorical values are the strong beliefs that affect the systems’ perspective in defining elements that are relevant to the system.

By adopting the Information Variety Model in the study of social dynamics, it is possible to identify what elements are involved in the resolution of specific problems and/or in the analysis of a specific phenomenon. In this respect, Barile (2009a) states that it is possible to identify a relationship between the kind of problems subjectively perceived by a system and the different levels of the Information Variety Model. In particular, the model is useful to investigate conditions of harmonic interaction between systems at any level of interaction.

As shown in Figure 1, from the intersection of the dimensions of Information Variety, emerges the identity of a viable system. As any social entity can be viewed as a viable system, the model can be used for investigating social configurations of organized entities, from individual systems to networked systems (Barile et al., 2016).
What is relevant when interpreting a system’s behaviour from a VSÀ perspective is its dynamic of interaction, as observed both internally and externally. The need to shift to a dynamic view is clarified by distinguishing between two different perspectives that can support the study of organized entities as viable systems (Barile & Saviano, 2011): a static view that allows the description of the structural configuration of a system by focusing on the parts that compose it and relations between them; and a dynamic view that interprets the ways in which a system behaves and evolves over time as a consequence of the interactions internal to its structure and with the external environment as subjectively construed by the decision-maker (context).

By establishing relationships and interacting, viable systems create recursive structural configurations that involve other systems. In the current highly interconnected scenario ever more effectively supported by ICTs, a common configuration is that of networked systems; i.e., systems of systems (XHerron & Mendiwelso-Bendek, 2006; Di Fatta et al., 2016; 2017; Caputo & Walletzky, 2017). Although directed through regulation, the way these systems interact if not designed, however, is inevitably emergent. Hence, a fundamental problem is to have interaction directed towards the achievement of desired outcomes.

The VSÀ provides a useful criterion to evaluate the capability of a system to govern interaction towards the achievement of a planned goal; it depends on its degree of completion as a viable system (Barile, 2008). The VSÀ identifies three key evolutionary stages by distinguishing between the embryonic system, systems in via of completion, and accomplished systems (Golinelli, 2010). To evaluate the degree of completion of a system, it is necessary to verify, on the one hand, the presence and decision-making capabilities of a governing body – i.e., a subject recognized as responsible for the governance of
the system – and, on the other hand, the functioning of an operative structure, as defined by the intensity of interconnection among the parts that compose it and that are involved in the pursuit of the system’s goal. The three degrees of accomplishment of the observed system give information about its capability of governance, its contractual power in relationships, and its capability of influencing other systems’ behaviours (Barile & Saviano, 2010). As shown in Figure 2, the embryonic system is characterized by a set of components slightly and temporarily interconnected on the basis of emerging common interests; there is no recognized governing body, but only shared behavioural rules (an example is the market). The system in via of completion is characterized by emerging interactions among the parts that are activated in order to achieve specific goals through the definition of a temporary shared governing body supported by the formalization of a structure (e.g., a joint venture). Finally, the accomplished system is characterized by strong relationships among parts that share the willingness to achieve common aims and recognize a governing body (e.g., a company). This latter entity can be considered a fully viable system, which means a system whose components are committed to the achievement of a common goal and produce coherent patterns of interaction. Accomplished systems are more effective in developing long-lasting synergistic relationships and co-creating value.

**SMART CITY AS AN EXAMPLE OF A MULTI-DIMENSIONAL PHENOMENON**
In the last few years, social sciences have devoted increasing attention to the problem of interactions between physical and human resources (Stjernholm Madsen, 2005; Caputo et al., 2016c). Researchers have analysed the ways in which interactions take place and evolve in the social domains (Folke, 2006), the key variables able to affect and support social interactions (Yang & Chen, 2007), and the role of ICTs in ensuring efficient, effective, and sustainable social interactions (Del Giudice et al., 2016).

Among the various topics under study in social sciences, Smart City represents an interesting research stream because it is a typical example of multi-dimensional context of interaction in which, in particular, human and physical resources are involved. Smart Cities are essentially targeted towards the improvement of the quality of life of communities (Townsend, 2013; Shapiro, 2006). In effect, as stated by Bakıcı et al. (2013: 138), the Smart City is the “implementation and deployment of information and communication technology infrastructures to support social and urban growth through improving the economy, citizens’ involvement and governmental efficiency”. This definition clarifies that the Smart City concept essentially deals with structural and infrastructural aspects of a technical nature that can impact on the efficient functioning of a system. Conversely, the concept of ‘quality of life’ represents a higher level and more meaningful goal that, although basically including elements that impact on a community’s way of living, such as pollution, traffic congestion, crime, etc., also refers to “factors such as sense of achievement, love and affection, perceived freedom, and so on” (Dalkey, 1971: 9). In this view, the notion of quality of life approaches that of “well-being” (Polese et al., 2016). But more than anything else quality of life relates, as many have pointed out, to the capacity of the social systems to improve being, belonging and becoming conditions of its citizens. How the cities are empowering citizens to shape their city and their possibilities to progress and grow as individuals and collectively.

So far, the phenomenon of Smart City has been investigated from various viewpoints focusing on different dimensions (Nam & Pardo, 2011). Shapiro (2006), for example, underlines that the core essence of Smart City refers to the application of socio-technical innovations to support economic and social growth of a community; Paskaleva (2009) states that Smart City is the finalized use of innovative technologies and better performing infrastructures; Morvaj et al. (2011) point out the relevance of technological infrastructures in the functioning of Smart City.

Other researchers have focused attention on the role of citizens in Smart City and how to increase knowledge, skills and also how to observe structures and processes to enable effective citizens empowerment processes (Espejo & Mendielso-Bendek, 2011; Mendielso-Bendek, 2015). From this perspective, Winters (2010) analysed the key impact that citizens have in affecting the opportunity for the emergence and survival of Smart Cities; Edvinsson (2006) investigated the impact of Smart City configuration on human relationships and its relevance for the improvement of the quality of city life.
Combining the technological and human perspectives, Karwowski et al. (2014) identified four key dimensions of Smart City: structure, process, outcome, and market.

Despite the advancements in knowledge offered by all these contributions and the effort to combine the various dimensions, a shared conceptual framework for the domain of Smart City is still missing (Saviano et al., 2016). The existing literature on this topic, for example, does not provide a clear explanation about the ways in which a Smart City is created (or emerges) and remains viable, about the role of humans and the way their behaviours impact on the dynamics of a Smart City, about general reference approaches to managing the multiple dimensions on which Smart City functioning is inevitably based, and overcoming the divides between the different disciplines and perspectives involved.

In order to bridge this gap, in the next section an interpretation of Smart City through the interpretative lens of the VSA is proposed.

**TOWARDS A VIABLE SYSTEMS VIEW OF SMART CITY**

As highlighted in the previous section, the main literature about Smart City focuses attention on the structural and infrastructural ‘building’ of the Smart City. Smart City, however, activates and develops a multi-dimensional functioning in which the role of humans, as citizens, cannot be taken as given. Be it explicitly designed to or not, a Smart City develops dynamics that give rise to the emergence of socio-technical systems (Weber, 2003). Looking at a Smart City as essentially a technological (ICT-based) phenomenon would provide a structural view of the same. Indeed, citizens as users are not only the beneficiaries of technological investments typical of a Smart City. They are key actors whose behaviour strongly impacts the effective (and sustainable) functioning of a Smart City. Hence, combining the technological and human perspectives is fundamental. Adequate consideration of the citizens’ perspectives makes apparent the most challenging aspect of Smart City: although designed to be ‘smart’, the emerging socio-technical configuration does not ensure a ‘smart’ functioning. As clarified by VSA, from the same structure multiple systems can emerge depending on the goals pursued by actors involved in its dynamics. Human (viable) systems finally determine the ‘smart’ functioning of a city and their behaviours cannot be ‘designed’; however, at least they can be regulated and/or incentivized.

Accordingly, although designed to be smart, a city’s functioning will always be emergent due to humans’ unpredictable behaviours. A way to direct or influence humans’ behaviours is through the effective guidance of a recognized governing body or through the effective sharing of a common system of laws, norms and rules (Barile & Saviano, 2010; Caputo et al., 2016a).
In this manner, a Smart City, which, in VSa terms, is at least an embryonic system, can easily evolve to the configuration of a system in the process of completion, which would allow an effective smart functioning, synergistically contributed to (or co-created) by all involved actors.

To integrate this view with the previous literature about Smart Cities, in order to progress towards the building of a shared conceptual framework, it is possible to identify at least three essential elements to focus on: citizens (Nam & Pardo, 2011), infrastructures (Jin et al., 2014), and high quality of citizen life (Shapiro, 2006).

The interpretative models proposed by the VSa can be used to base a multi-dimensional analysis of not only the Smart City’s structure and infrastructures, but also (and mainly) of its social dynamics. In the VSa view: the citizens, as the only full viable entities able to assess, analyse, decide and act accordingly, are key actors of a Smart City; the infrastructures represent the ways through which citizens interact with the physical and technological resources of Smart City in order to achieve their aims; the high quality of citizen life represents the shared goal that can activate the synergistic functioning from which the Smart City system can emerge.

By integrating the Smart City components in the VSa framework, as shown in Figure 3, it is possible to identify a strong correlation among them and the elements that affect the degree of accomplishment of a system defined by the VSa: the set, the structure, and the system.

By adopting the interpretative lens of the VSa, it is possible to note that the goal ‘high quality of citizen life’ is the outcome of a unitary systemic functioning of the City that implies its full completion. Citizens and resources represent the set of possible components of the system’s structure. The ways in which citizens are connected to resources define the structure. Indeed, the VSa underlines that a Smart City will emerge only if citizens, as viable actors – i.e., systems capable of an autonomous existence in their environment (Beer, 1979) – embrace the shared finality of a ‘high quality of life’ and behave accordingly, producing coherent patterns. Therefore, a Smart City emerges as a consequence of a shared willingness to achieve the common aim of the high quality of citizen life. According to the Information Variety Model, it is possible to state that to ensure a shared willingness to achieve the aim of high quality of city life, it is not sufficient to act upon the information units (e.g., information sharing); an analysis of dominant and/or common interpretation schemes and of the categorical values that influence their decisions and behaviours is necessary to assess what the VSa calls the conditions of consonance (Barile, 2013; Barile & Saviano, 2013). In this view, Smart City becomes a conceptual model for creating social configurations of people, technology, information, and values, the integration of which allows for the emergence of a viable system.
PRACTICAL IMPLICATIONS AND CONCLUDING REMARKS

As illustrated with reference to the case of Smart City, many researchers interested in studying socio-economic dynamics have tried to address their complexity by enriching models in order to include their multiple dimensions. Re-affirming the need for a space to hold constructed conversations about conceptual social sciences frameworks, this paper highlights the advantages of applying systems thinking as an interpretative lens have a wider and deeper understanding of the dynamics and dimensions of social phenomena and the ways they interact.

By discussing the case of Smart City, the paper highlights the ways systems thinking can be applied to a social configuration that involves multiple structural levels, actors, and perspectives: the VSA helps to deal with complex multi-dimensional dynamics by exploring the key rules of effective interaction. The domain of Smart City is analysed in the light of the VSA perspective in order to underline in which ways different elements interact and should be managed in order to ensure the viability of the whole configuration.

From the application of the VSA to the understanding and management of Smart City, several managerial implications have been derived. Specifically, the VSA indicates directions for a better understanding of the ways users, services, infrastructure, and technologies interact to produce a coherent whole. The VSA helps to identify general level rules that explain the emergence and evolution over time of an organized entity.

Thanks to the application of the VSA, several opportunities have been demonstrated which would help to bolster the success of the Smart City plans. The VSA can support the understanding of requirements...
for a more efficient, effective, and sustainable organization of citizens’ life, and, consequently, the
development of better performing instruments, techniques, and models for the effective governance of
Smart City.

In conclusion, the success in planning and management of Smart City as a Viable System is related to
the ability to investigate its components and the relations that link them, without losing the view of
the whole: it is interaction that produces coherent patterns of behaviours (Mendiwelso-Bendek, 2002).
By adopting this interpretative approach, useful guidelines for the management of Smart City and
new research pathways in the domain of Smart City can be derived by the application of systems
thinking approaches like vSA; these developments, however, are not within the scope of this paper
and could be analysed in future research.

TAYLORISM AND AMAZON: SCIENTIFIC MANAGEMENT AT THE WORLD'S MOST SUCCESSFUL RETAIL COMPANY

Schein, Andrew
Business School, Netanya Academic College, Netanya Israel

ABSTRACT

Over the past hundred years many management theories have been proposed to help owners and managers of firms get the best results from their firms. However, there abounds much skepticism concerning the effectiveness of these theories. In this paper, we return to one of the first management theories, Taylorism or scientific management, and review its positive goal of helping firms produce more efficiently and the claim that it dehumanizes workers. Furthermore, we review the growth of Amazon and show how Amazon embodies most of the principles of Taylorism, except that while Taylor had a disdain for workers' initiative, Amazon encourages workers to initiate projects. The paper ends with a brief discussion as to whether Amazon could have grown even more had its management been more employee-friendly.

Keywords: Fredrick Taylor, Jeff Bezos, e-commerce, online shopping, hi-tech retail

INTRODUCTION

The Economist (2016, p. 59) decries the current state of management theory arguing that today's popular management theories "bear almost no relation to reality" and that management theorists are at "risk of being exposed as just so many overpaid peddlers of dead ideas." This damming criticism of new management theories suggests that maybe it is worthwhile to stick with old management theories, and one of the first management theories, Taylorism, seems to be having a very successful revival in the fascinating story of the growth of Amazon, the greatest retailer in the world in 2017. In this paper, we will review Taylorism, the growth of Amazon, how Taylorism applies to Amazon's management practices, and end with a brief discussion of whether Taylorism is really the best system for the workers and the owners of the firm.
TAYLORISM: PROS AND CONS

Fredrick Winslow Taylor (1856-1915), who on his death, The New York Times (1915) referred to as the “originator of modern methods of industrial management,” stressed the idea of efficiency in production and the manager’s role in having the work done in the most productive manner. His theory is referred to as the scientific theory of management, as he claimed that his method was scientific, or Taylorism.

Taylor was very bothered by workers who were, he claimed, not working to their utmost ability, what he called soldiering or loafing. He writes (1919, p. 33):

It is well within the mark to state that in nineteen out of twenty industrial establishments the workmen believe it to be the directly against their interests to give their employers their best initiative, and that instead of working hard to the largest possible amount of work and the best quality of work for their employers, they deliberately work as slowly as they dare while at the same time try to make those over them believe that they are working fast.

He claims (p. 14) that this soldiering is the cause both of low wages and low output, and he set out to correct this “evil.”

Taylor notes that he was not the first person to note this problem and he describes (p. 34) what he claimed was the best type of management system prior to his system, which he calls “initiative and incentive.” In this system, the manager uses various incentives such as higher pay, promotions, better working conditions, to the worker as an incentive for the worker to work his hardest. While this may seem like a reasonable system, Taylor (pp. 35,36) claims that success in this system “depends almost entirely upon getting the ‘initiative’ of the workmen and it is indeed a rare case in which this initiative is really attained.” Instead, Taylor proposed his theory of scientific management.

Taylor (p. 36) explains that there are four elements to his theory of scientific management. One, the manager is to develop a science for each element of a man’s work, as opposed having each man decide on his own how best to accomplish the task. This “science” means that the manager is to decide not only what work is to be done, but also how it is to be done and in how much time. The work is divided into as many smaller tasks as possible and the each individual task is timed. Two, the manager is to select and train the best workers. Three, the manager is to cooperate with the workers, and four, management does all the work for which they are better fitted than the workers. The Economist (2015) compresses these four elements into three categories: “Break complex jobs down into simple ones; measure everything that workers do; and link pay to performance, giving bonuses to high-achievers and sacking sluggards.”

Taylor attempted to implement his ideas in various factories and he claimed great success. For instance, in 1898, Taylor went to work for Bethlehem Steel Company, and he “determined” that the
workers could be working harder, that a worker could move between 47-48 tons of pig iron a day instead of the 12.5 tons they were doing beforehand (pp. 42-47). He then selected some workers, paid them a little extra, $1.85 a day instead of $1.15, had a man stand over the workers with a watch telling them when they could work and when they could rest, and "all of the pig iron was handled at the rate of 47.5 tons" (p. 47).

Even though the workers were working harder, Taylor claimed that his system was beneficial for the workers since a worker's prosperity will increase when he/ she is producing at his/ her maximum capacity (p. 11), and the workers' wages also will rise, as in the Bethlehem Steel Company, the salaries of the selected workers increased by 60%. As further proof of the worker's greater happiness with his system, he writes (p. 28) that in companies where his system had been implemented, "in place of the suspicious watchfulness and more or less open warfare which characterizes the ordinary types of management, there is universally friendly cooperation between the management and the men."

Accordingly, Taylor claimed that his system was a win-win situation both for the workers and for the firms, and many people have supported Taylor's approach. Drucker (quoted in Will, 1997) stated that

Taylor deserves to be ranked with Darwin and Freud in the trinity of makers of the modern world and that Taylorism is perhaps "the most powerful as well as the most lasting contribution America has made to Western thought since the Federalist Papers."

Blake and Moseley (2011) writes that Taylor's system was adopted in most of the industrial countries of the world except in Great Britain, and that (p. 350) "the successful and dramatic increase in mass production (in the US) during WWII was an indirect, but indisputable, result of Taylor's work." The corollary to this observation is that maybe Great Britain's fall as an industrial power was because it did not adopt Taylorism. This claim is made by Drucker (1974, p. 386), and is also maintained by Landes (1969) and Chandler (1994).

Taylor's ideas have also generated a great deal of criticism. Wrege and Perroni (1974) have cast doubt on eight of the details in Taylor's report of the workers moving the pig iron in Bethlehem Steel Company, and they label the whole account a "pig-tale." However, Hough and White (2001) dispute some of Wrege and Perroni's claims and they argue that the remaining discrepancies are minor and do not invalidate Taylor's theory.

More significant criticism is that Kiechel (2012) notes that "behind the effort of Taylor was an elitism, a class of arrogance, almost incomprehensible by today's standards." For example, Taylor (1919, p. 59) described the worker who moved the pig iron as "so stupid and so phlegmatic that he more nearly resembles in his mental make-up the ox than any other type." This elitism led Taylor,
even though he professed to be concerned for the welfare of the workers, to limit this concern to the worker's wages but to disregard their input and thought into how the work in the firm should be done. In a US Congressional Committee hearing in 1912, Taylor stated (in Will, 1997), "In our scheme, we do not ask the initiative of our men. We do not want initiative. All we want of them is to obey the orders we give them, do what we say and do it quick."

Drucker, who as mentioned above views Taylor very favorably, notes that (p. 202) Taylor is blamed for "dehumanization" of workers, but Drucker believes that the criticism is "unfair and unjust" since Taylor's goal was to create the "economic and physical base for the worker's welfare." However, even Drucker believes that the followers of scientific management, or as he calls them industrial engineers, only focus on the "logic of work" how the work is to be done, and not enough on the "logic of working" how to motivate the workers.

In 1960, Douglas McGregor (1960) challenged Taylor's belief that almost all workers want to "soldier." McGregor argued that this typecasting was only true for some of the workers, but other workers want their job to provide them with psychological satisfaction. He labeled a personality that causes a person to dislike and shun work, Theory X, while a personality that induces a person to want their job to lead to personal fulfillment, Theory Y. With regard to the workers who try to soldier, Theory X, then the manager's modus operandi is the tried and true method of carrots and sticks. On the other hand, with regard to the workers who want their jobs to provide them with psychological satisfaction, Theory Y, the manager needs to offer more responsibility to the workers, integrate them into the decision making process of the firm, and offer them the ability to have job enrichment to motivate them to work better.

Drucker notes (1974, p. 232) that while McGregor presented these two types of human behavior and corresponding managerial practices, "as alternatives and pretended to be impartial, no reader ever doubted – or was meant to doubt – that McGregor himself believed wholeheartedly in Theory Y." This idea that workers are to be treated according to Theory Y marks a large change from Taylor's views, and this became the dominant view in management theory in the US after WWII. Kiechel (2012) notes

The publication of Taylor's scientific management set off a century-long quest for the right balance between the things of production and the humanity of production...The overall thrust of the postwar managerial thinkers was to elevate the humanity of production.

However, surely there remain many Theory X workers where the carrot and stick method is still potent. A recent study by Bryson and MacKerron (2017) cast doubt on the belief that work provides physiological satisfaction for most workers. In their survey of tens of thousands of individuals in the UK with regard to their state of happiness when doing 40 different activities, paid work was not only
listed as one of eight activities which gave negative levels of happiness but also paid work was ranked lower with regard to a person's state of happiness than all the other 39 activities, except for being sick in bed. This negative utility from working raises doubts as to whether most workers are really Theory Y personalities.

Accordingly it is not obvious that Taylorism is no longer relevant in managerial firms and we will now review the growth and management practices of one of the most successful companies in the US in the last twenty five years, Amazon, which seems to have adopted Taylorism.

THE RISE OF AMAZON

In the 1980s and the 1990s, the retail book industry in the US had become highly concentrated. The independent booksellers, who previously had been the major sellers of books, were being pushed out by large bookstore chains, such as Barnes & Noble, Borders, and a few others firms, and it seemed that these large chains were going to be the dominant firms in the market for the foreseeable future (Bekken 1997/98). However, the internet was shortly going to upend these large firms.

In 1994, Jeff Bezos saw the potential of the internet which was just in its infancy, as Webley (2010) recalls that "one of the first known Web purchases (pizza) took place in 1994." Bezos quit his job in finance to found a company, Amazon, to sell books on the internet since he realized that even the large bookstore chains did not stock that many books in each store, which could give a seller on the internet an advantage since they could list many more books for sale (Packer, 2014). The Amazon website began to function on July 16, 1995, and almost immediately, sales began to pour in (Brandt, 2011). Amazon has since branched into numerous fields selling clothing, toys, electronic products (for example the kindle, first released in 2007), music, videos, grocery items, and even cloud service, AWS. In 2014, The Economist (2014) noted that it was estimated that "Amazon now carries 230 million items for sale in America—some 30 times the number sold by Walmart, the world’s biggest retailer." It was estimated that in 2014, its total sales were $75bn, of which books accounted for at most 7% of sales (Packer, 2014). In 2017 it is expected to pass Macy’s to become the top seller of clothing in the US (The Economist, 2017a), even though clothing is harder to sell on-line than books.

Amazon is not noted for its large profits since Bezos' strategy was to lower prices to consumer to increase sales (Thompson, 2013). A better way to measure Amazon's great success is through the incredible increase in Amazon's market capitalization. Perry (2015) notes

From January 2005 to December 2006, shares of Amazon and Wal-mart stock were trading at about the same price. During the 24-month period, a decade ago, Amazon's share price averaged $38.22 while Wal-Mart's stock averaged $38.27 per share. Since then Amazon's share
price has increased almost 16 times to nearly $600 compared to about a 1.5 time increase in Wal-Mart's share to $58.

This difference has continued to grow since Perry made this point in October 2015. On March 3, 2017, Amazon's stock price was $850, an increase of 42% from October 2016, while Wal-Mart's share price was $70, a respectable increase of 21%, but still less than the growth rate of Amazon's share price. By 2016, Amazon was listed in top ten most valuable firms in the Fortune 500 (Gandel, 2016), and Chang (2016) notes that in September 2016, Amazon became the fourth largest company based on market capitalization with a value of $382 billion, trailing only Apple ($609 billion), Alphabet (Google, $561 billion) and Microsoft ($449 billion). Markman (2017) notes that in 1997, at Amazon's initial public offering, the company was valued at $461 million, and based on a market capitalization of $360 billion, the company's market value has increased roughly 50.375% in twenty years. We see that Amazon has made itself to be considered and hence valued as a high-tech firm and not as a "simple retailer."

The Economist (2017b) questions whether this valuation of Amazon is realistic. They write:

> It is one of the most optimistically valued firms, with 92% of its current worth justified by profits after 2020. Outside investors have a lot at stake because it is huge, with a market value of $410bn (end of February 2017). About a third of this value is justified by its profitable cloud-computing arm, AWS. But the rest of the firm, which straddles e-commerce, television and films, as well as logistics, barely make money despite generating large sales. Nor is it growing particularly fast for its industry. To justify its valuation you need to believe that it becomes a sort of giant utility for e-commerce which by 2025 cranks out profits of around $55bn a year, or probably more than any other firm in America.

On the other hand, Markman quotes Scott Galloway, an NYU business professor, who believes that due its popular Prime subscription service, Amazon will continue to expand to become the first company to have a market capitalization valuation of one trillion dollars.

**AMAZON AND TAYLORISM**

There are several reasons for Amazon's great success, its business strategy, its commitment to consumer service, and its great technology for storing, sorting and delivering goods ("fulfillment centers"), but what about its management practices?

One unique aspect of Amazon's management style is that most of the successful high-tech firms lavish their workers with perks and an attentive work culture environment to increase employees' productivity, but not in Amazon. Lashinsky (2012) writes:

> Amazon is famously frugal. Unlike in much of Silicon Valley, Amazon employees pay for their meals. Desks are slabs of wood that could be used for doors. For years Bezos chose ultracheap
shipping rates for customers over expensive TV advertising. The penny-pinching applies to salaries, which are low throughout the 80,000-person-plus organization. “We pay very low cash compensation relative to most companies,” says Bezos. “We also have no incentive compensation of any kind. And the reason we don’t is because it is detrimental to teamwork.”… “You go to Amazon because there’s something big going on,” says Dave Cotter, another recently departed executive who also is working on a startup of his own. “Other companies pay more.”

Another aspect of Amazon's managerial practices is Amazon's obsession with measuring everything, as Anders (2012) writes that "Bezos calls it a culture of metrics." This measuring refers to measuring consumers in their purchases and preferences and the workers' productivity. The ability to measure is due to the growth in sophisticated computer software and computer power, and Amazon is in the forefront in the world in using new software to monitor its consumers and workers.

The point of measuring and monitoring worker's productivity is in order that Amazon will function in the most optimum manner. This drive for efficiency, as noted by The New York Times (2015), is that Amazon "is figuring out how to extract the most from its workers." One example of this efficiency is that Packer (2014) reports that, "According to a recent study of U.S. Census data by the Institute for Local Self-Reliance, in Washington, brick-and-mortar retailers employ forty-seven people for every ten million dollars in revenue earned; Amazon employs fourteen."

Brandt (2011) provides an example of this drive in Amazon to get workers to be more productive. In 1999, the customer service had about 500 people who job it was to answer emails from consumers.

The best of them could answer a dozen emails a minute. Those who dropped below seven were often fired. One customer-service manager recalled that, when the staff got a week and a half behind in answering email- despite putting in 12-hour days, seven days a week – Mr. Bezos called her to complain. When she told him they couldn't work any harder, he came up with a solution: They dedicated one weekend to competing with each other to see who could get through the most unanswered emails. During that 48-hour period, everyone worked at least ten hours beyond their regular shifts. Each person was given a cash bonus of $200 for every thousand messages he or she could answer. It cleared out the backlog.

This example of finding a way to get workers to increase their output above and beyond what was considered possible recall Taylor's pig-iron experiment. This association between Taylorism and Amazon is made explicitly by The Economist (2015) who refer to Amazon's management practices as digital Taylorism. They write that Amazon:
Uses classic Taylorist techniques to achieve efficiency: workers are constantly measured and those who fail to hit the numbers are ruthlessly eliminated, personal tragedies notwithstanding…. This new version of Taylor’s theory starts with his three basic principles of good management but supercharges them with digital technology and applies them to a much wider range of employees—not just Taylor’s industrial workers but also service workers, knowledge workers and managers themselves. In Taylor’s world, managers were the lords of creation. In the digital world they are mere widgets in the giant corporate computer…. And Taylorist managers are mixing the sweet with the bitter: Amazon’s “Amabots”, as they call themselves, seem happy to put up with micromanagement if they get a nice bonus at the end of the year. The most basic axiom of management is “what gets measured gets managed”. So the more the technology of measurement advances, the more we hand power to Frederick Taylor’s successors.

The same article in the Economist points out that Amazon is not unique in its application of Taylorism, as they write, "Far from being an outlier, it would seem that Amazon is the embodiment of a new trend, digital Taylorism." They also note that "digital Taylorism is just as unpopular as its stopwatch-based predecessor.” The backlash to Amazon’s Taylorist principles was most evident in a lengthy expose in The New York Times by Jodi Kantor and David Streitfeld (2015). They note:

It (Amazon) is conducting a little-known experiment in how far it can push white-collar workers, redrawing the boundaries of what is acceptable. The company, founded and still run by Jeff Bezos, rejects many of the popular management bromides that other corporations at least pay lip service to and has instead designed what many workers call an intricate machine propelling them to achieve Mr. Bezos’ ever-expanding ambitions. “This is a company that strives to do really big, innovative, groundbreaking things, and those things aren’t easy,” said Susan Harker, Amazon’s top recruiter. “When you’re shooting for the moon, the nature of the work is really challenging. For some people it doesn’t work”. Bo Olson was one of them. He lasted less than two years in a book marketing role and said that his enduring image was watching people weep in the office, a sight other workers described as well. “You walk out of a conference room and you’ll see a grown man covering his face,” he said. “Nearly every person I worked with, I saw cry at their desk.”

The expose in The New York Times generated a large response. In a follow up article, Streitfeld and Kantor (2015) noted that former workers in Amazon had mixed reactions to the expose. "Some defended the culture as highly demanding but humane, while others described feeling pummeled by unrelenting demands, over-the-top-competition, and a feeling they could never meet the standards that the company boasts are unreasonably high."
The most prominent person to respond to the expose was Jeff Bezos himself. In a letter to Amazon employees, Bezos wrote (Mac, 2015):

It (the article) claims that our intentional approach is to create a soulless, dystopian workplace where no fun is had and no laughter heard. Again, I don’t recognize this Amazon and I very much hope you don’t, either. More broadly, I don’t think any company adopting the approach portrayed could survive, much less thrive, in today’s highly competitive tech hiring market. The people we hire here are the best of the best. You are recruited every day by other world-class companies, and you can work anywhere you want. I strongly believe that anyone working in a company that really is like the one described in the NYT would be crazy to stay. I know I would leave such a company. But hopefully, you don’t recognize the company described. Hopefully, you’re having fun working with a bunch of brilliant teammates, helping invent the future, and laughing along the way.

Bezos’ response that the work should be fun and the workers should be laughing along the way would imply that he wants the workplace at Amazon to be in accord with Theory Y, and this accords with the company’s philosophy to encourage workers to contribute new ideas and to develop them.

For example, the expose by Kantor and Streitfeld reports that:

Stephenie Landry, an operations executive, joined in discussions about how to shorten delivery times and developed an idea for rushing goods to urban customers in an hour or less. One hundred eleven days later, she was in Brooklyn directing the start of the new service, Prime Now. “A customer was able to get an Elsa doll that they could not find in all of New York City, and they had it delivered to their house in 23 minutes,” said Ms. Landry, who was authorized by the company to speak, still sounding exhilarated months later about providing “Frozen” dolls in record time.

This attitude is one area where Amazon differs from Taylorism since, as mentioned above, Taylor showed disdain for workers’ opinions. It seems that Bezos is trying to soften to some extent the Taylorism by encouraging worker’s imitative, but while maybe this is his goal, the expose in The New York Times shows the difficulty in softening Taylorism.

One wonders if Amazon could have been even more successful if the company was more employee-friendly. One of the responses to the expose was by an ex-employee of Amazon, named Dan, who had worked at Amazon for 15 years. Dan wrote (The New York Times, Aug. 18, 2015):

Amazon is a great place to learn from fantastically skilled and intelligent people. It's a terrific place to work on systems on a scale that most companies can't even fathom. It's a thrilling place to work if you thrive and love being part of something huge and powerful. ..... It's a great place to work if you don't have any interests outside of work and if you're a corporate-ladder-climber.
type. But corporate culture doesn't really promote treating its employees like human beings who have feelings and a life outside of work. ... I wish Jeff Bezos and Company continued success, but I wonder how much more successful they could be if they would only show the same kind of obsessive care about their employees as they do about their customers.

Borison (2015) quotes a similar idea from Piper Jaffray analyst Gene Munster. Munster notes while "Amazon’s been a wildly successful company and probably one of the top five most successful tech companies, the company could probably be even more successful if they would have had a more employee-friendly culture." While this claim is possible, this is an argument which cannot really be verified, as who could ever know whether the company would have been even more successful. All that is known is that Amazon exemplifies Taylor’s principles of management with the added proviso that the company encourages employees' initiatives and the company has been successful. This confluence leads support for Taylorism, a hundred years after Taylor formulated his principles, and calls for further research whether and to what degree Taylorism should be more softened to be more employee-friendly.

Conclusion

While there abounds much skepticism about the effectiveness and usefulness of current management theories, one of the oldest management theories, Taylorism or scientific management, is having a revival in the twentieth first century. With the development of software to track workers, companies are now able to measure more concretely their workers productivity. The company that is in the forefront of this development is Amazon, which tracks not only its consumers but also its workers to become as efficient as possible. While Amazon embodies many aspects of Taylorism, it differs in one way that Amazon encourages worker’s initiative, and Taylor did not. Taylorism suffered from much criticism that it promoted a harsh culture to the workers, and Amazon too has come under considerable criticism for its treatment of workers and even managers. Amazon has been unbelievably successful, but the question remains how much of this success is due to its Taylorist management practices and whether the country could have grown even more if was more employee oriented. This is an important question for firms today and one that warrants further research.

WHAT IS SMART LEADERSHIP IN LUXEMBOURG?

Schinzel, Ursula

Unicaf University: Online Education www.unicaf.org with Partner Universities Marymount California University and University of Nicosia

ABSTRACT

The purpose of this study is to determine what smart leadership is in multicultural and multilingual Grand Duchy of Luxembourg. 42 semi-structured interviews were conducted between March and October 2016 among four categories, notably: 1) Lux.Nat. (Luxembourgers with Luxembourgish nationality), 2) Lux.Foreigner (foreigners who reside in Luxembourg), 3) cross-border workers (people who come to work in Luxembourg every day from Germany, France, and Belgium), and 4) the rest of the world (World). Interviews were in Luxembourgish, French, English, German, and Italian with executives. The following results were found: While worldwide attributes of smart leadership apply also in Luxembourg – have a vision, motivation, communication, delegation, prioritization, search for talent, trust, confidence, collaboration and creativity, particularities were found – the trilingual public education system, multiculturalism, integration of the different, and tolerance. While the small size of the country represents advantages – knowledge of your people, networking, it also represents disadvantages – nepotism, lack of resources. However, the geographically central location right in the middle of Europe with borders to France, Belgium and Germany allowed for political European integration decisions, the creation of a common economic and monetary market, the treaty of Schengen, the common currency Euro, and peace, wealth, and stability in Europe. Some interview citations are reprinted in the results paragraph. Conclusion, discussion, implication, limitations, future research and references follow.

Keywords: Smart leadership, cross-cultural management, education, international business, Hofstede, management and language, Luxembourg

1 INTRODUCTION

The purpose of this research is to discover what smart leadership is in multicultural and multilingual Luxembourg. 42 semi-structured interviews were performed between March and October 2016 among four categories, notably: 1) Lux.Nat. (Luxembourgers with Luxembourgish nationality), 2) Lux.Foreigner (foreigners who reside in Luxembourg), 3) cross-border workers (people who come to work in Luxembourg every day from Germany, France, and Belgium), and 4) the rest of
the world (World). Although responses from all four categories were quite similar, they still were different. The author has been carrying out cross-cultural research in these four categories since 2009, while starting her doctoral studies in cross-cultural comparison following Geert Hofstede’s cultural dimensions. Even though other categories could be chosen, these four categories demonstrate similarities and differences in replies quite significantly.

The structure of this paper will be as follows: first, this paper will briefly review the extant literature on Smart Leadership, then describe Luxembourg’s linguistic and cultural peculiarities, and then present a proposition. Second, the applied method - semi-structured interviews - will be described. Respondents were asked: 1) what is smart leadership in general and 2) what is it particularly in Luxembourg? Third, the results from the four different categories of respondents will be presented, some interviews will be reprinted entirely, some partially. Finally, a summarizing table is offered for the reader’s convenience.

1.1 Smart Leadership

“There is only one irrefutable definition of a leader: someone people follow. Therefore, leadership is a relationship between the leader and the led. Unlike management, the leadership relationship cannot be delegated or automated” (Maccoby and Scudder, 2011).

Smart Leadership, alongside with strategic leadership (Elenkov, Judge, and Wright, 2005), supportive leadership (Banai and Reisel, 2007) and responsible leadership (Maccoby, 2015) has been in the focus and has attracted attention of several great leaders. Peter Drucker was one of them, if not the most renowned. Among the over forty books he wrote, What makes an Effective Executive (2004) and Management Challenges for the 21st Century (2011) are interesting for this research. For him, ethics and integrity were key to effective leadership. In brief, his eight rules for effective leaders are: “Ask what needs to be done. Ask what’s right for the enterprise. Develop action plans. Take responsibility for decisions. Take responsibility for communicating. Focus on opportunities, not problems. Run productive meetings. Say ‘We’, not ‘I’.” (Drucker, 2004). Any person, but especially a CEO needs to set priorities, and while doing so, there are four rules to be followed (Drucker, 2004): Focus on the future, not the past. Focus on opportunities, not problems. Do not climb on bandwagons and forget safe options. Aim high, aim at making a difference. Rao (2012) summarizes the leadership lessons from Drucker: “Follow your passions and lead a complete life. Manage your time. Focus on your core competencies. Differentiate between persistence and futility. Reinvent yourself constantly. Focus on achievement rather than making money. Spend time on community service and work for non-profit institutions as it widens your mental horizons. Never put off your work for the next day as every day is a good day to finish your work. Learn to live in an imperfect world and strive to make it perfect.
Pursue your passions at every stage of your life. You can work from anywhere if your knowledge is portable. Abandon old practices systematically. Treat employees as assets. Focus on the customer. Leave a legacy for tomorrow.” (Rao, 2012, pp. 117, 118). For Drucker, it was important to have diverse skills in several areas, he called it having a parallel career, best started at a younger age, as they provide meaning and stability to your life. If one area suffers a downturn, you still can work in the other(s). It also makes you a rounded and interesting person, having multiple areas of interests. Drucker called on us to search for happiness in our present, not in our future, stressing that ‘Happiness is a journey, not a destination’ (Souza cited by Rao, 2012, p. 119), and Einstein said, “Try to be a person of value rather than a person of success” (Einstein cited by Rao, 2012, p. 119). Drucker wanted us to lead our life completely by pursuing our passions and interests, in order that we do not have any regrets on our deathbed (Rao, 2012, p. 119).

“Besides Peter Drucker, Jack Welch, Ram Charan (2007), Jim Collins, John Maxwell (2007), Anthony Vlamis (1999), Gita Piramal and Jennifer Netarwala (2005), William Austin (2009), Marshall Goldsmith (2007) authored important publications, articles and books on smart leadership. Max Weber, James MacGregor Burns, Bernard, M. Bass, Warren Bennis, and Nanus have written about transformational leadership” (Rao, 2012, pp. 101, 108, 109). “We have seen several smart leaders who inspired our lives more or less: Mahatma Gandhi, Mother Teresa, Dalai Lama, Aung San Suu Kyi, Martin Luther King Jr, Florence Nightingale, Barack Obama, Frances Hesselbein, Warren Buffet, Bill Gates, Steve Jobs, Mark Zuckerberg... These have positive energy, while other big leaders had negative energy: Adolf Hitler, Osama Bin Laden. Some charismatic leaders lead to the disintegration of their empires, as they did not train any leaders to follow them and were able to replace them: Alexander the Great, Ashoka, Genghis Khan.”

Here are the 5 leadership levels by John C. Maxwell (2013, p. 12):

“1. Position - People follow because they have to. 2. Permission - People follow because they want to. 3. Production - People follow because of what you have done for the organization. 4. People Development - People follow because of what you have done for them personally. 5. Pinnacle - People follow because of who you are and what you represent.”

Success is defined by John C. Maxwell (2008, p. 5): “Knowing your purpose in life, growing to reach your maximum potential, and sowing seeds that benefit others.” “Two things are required (for success): the right picture of success and the right principles for getting there.” (Maxwell, 2008, p. 4). Following Rao (2012, p. 9) the six steps for success as a leader are: “you must connect, communicate, understand, network, synergize, and accomplish the desired outcomes”. Gina Rudan (2011) publishes a five-step plan to re-genius us: “Visualize success. Recognize and remove negative thoughts from your mind. Focus on the present and let go the past. Overcome your phobias and fears. Avoid
superstitions. Avoid fear of failure. Solitude is fortitude. Avoid information overload” (Rudan, 2011; Rudan cited in Rao, 2012, pp. 12-14). “Great leaders – the truly successful ones… all have one thing in common. They know that acquiring and keeping good people is a leader’s most important task.” (Maxwell, 2012, p. 1).

Anthony Vlamis (1999) interviewed eight leaders on smart leadership, asking eleven questions, the first being: Do you have a personal vision of good leadership in these times? In summary, here is what they said. The complete interviews are in Vlamis’ book. Dan R. Bannister: (1) they have to be comfortable in global situations, (2) they must have an endless supply of energy; and (3) they have know-how to energize people; breadth of knowledge and long-term performance; continual learning; people skills; studying what leaders or other companies do; earn trust; a willingness to take risks; create buy-in. James Champy said, it is, first and foremost, a certain inborn sensing capability, and secondarily are integration skills, “it’s how to make integration work across your company and your customers and your suppliers”; and thirdly: empathy (Champy cited by Vlamis, 1999, p. 13). “People have to trust your business judgment, and they have to trust your values.” (p.14). It is knowing when to act (p. 16). “Many young people are going to high-paying big banking and financial services firms to do big deals. They may be doing big deals. But are they doing anything new? I don’t think so. They are often driven by greed…the people I would want to put in a boat setting out to sea on a new adventure, are smart people who would be excited about the opportunity to create something different and something new, something that meets a real need out there that nobody else has seen or discovered yet.” “The quintessential guy is Jack Welch. It’s true. He has all those qualities, sensing capability, the right sense of where to integrate, what to do, and so forth. He has much more of a humanistic sense than he is given credit for. I have experienced him personally as being very caring” (James Champy cited by Vlamis, 1999, p. 17). In Mort Feinberg’s opinion, it is, first: “Know what you want to accomplish in your company. What is your vision for the company?” Second: “…know what basic resources you need to accomplish your mission: economic, people, the kinds of relationships you need with your people, your suppliers, and your customers…. Next: Go out and find able people. Next: Create a boundaryless culture…. Third, a leader needs sheer physical energy. Finally, make certain that the message is heard throughout the organization: so, it is: vision, equipment, energy, boundaryless culture, everybody works toward a common vision…. A smart leader has to wander around, giving feedback and celebrating successes” (Feinberg cited by Vlamis, 1999, pp. 19-23).

Following Frances Hesselbein, smart leadership is a matter of how to be, not how to do it. A good leader embodies the vision, mission, and principles of the organization. He is mission focused. And leads by example, from the front, with clear, consistent messages and values that are moral and a sense of ethics. He earns peoples’ trust, inspires through example, language and inclusion. (Hesselbein...
cited by Vlamis, 1999, pp.25-26). For **Thomas R. Horton**, leadership “is a very individualistic thing; it has to do with a leader being fully himself or herself, and motivating others to be the same” (Horton cited by Vlamis, 1999, p. 31-35). For him, it is about integrity, communication, alertness to opportunity, decision making, focus, tenacity, fairness, people development, compliance and expanding business. **Victor Kiam**’s “leadership philosophy is “Lead by example, try to instill an entrepreneurial spirit throughout the organization not based solely on monetary rewards, and be constantly alert to the changing global and domestic marketplaces and the effects of peripheral factors on the business” (Kiam cited by Vlamis, 1999, p. 43). A smart leader needs to be decisive, be honest, be fair and lead by example. **Ed Ridolfi** said: “Leaders are people who take you to places you’ve never been before. Managers get things done. They implement strategy. Managing is about blocking and tackling. Leadership is about defining strategy” (Ridolfi cited by Vlamis, 1999, p. 51). Leaders have a high level of integrity. They uphold quality and ethics every day, without exception. They focus on results, motivate others, have a strategic vision and thinking, they communicate, they are customer/market oriented, they are accountable, they have enthusiasm and energy (Ridolfi by Vlamis, 1999, pp. 53-55). The new global leader will be aware of technology and has the ability to effectively manage complexity and uncertainty! (p. 57). **Glen Tobe**’s most important element is authenticity or realness. “Leaders need to communicate who they are as people”. He cites Robert Greenlead’s 2002 book, originally from 1977: Servant Leadership. He says, the smart leader remains present in the room. “He listens to what people have to say, just like Colombo” (Tobe cited by Vlamis, 1999, p. 62).

### 1.2 Luxembourg

Luxembourg is a parliamentary democracy and a constitutional monarchy, it is the only remaining Grand Duchy in the world. Luxembourg is one of the smallest countries in Europe with a total size of only 2,586 km². It is 82 km long and 57 km wide and has borders with Germany (138 km), with France (73 km), and with Belgium (148 km) (The World Factbook). As of 1st of January 2016, Luxembourg's total population consisted of 576,200 inhabitants of whom 307,000 (53.28%) were Luxembourgers and 269,200 (46.72%) were foreigners (statec, 2016), these included 93,100 Portuguese, 41,700 French, 20,300 Italians, 19,400 Belgians, 12,800 Germans, 6,100 British, 4,000 Dutch, 32,100 other EU countries, and 39,700 other, see http://www.statistiques.public.lu/stat/TableViewer/tableView.aspx. The cross-border workers are a key component of Luxembourg’s employment situation. Domestic employment was 405,600, comprising 170,200 cross-borders (41.96%): 84,400 from France, 43,100 from Belgium, and 42,700 from Germany. The minister for the Greater Region in 2016, Corinne Cahen, gives insights into the Greater Region’s future (Langenbrink, 2016), looking for bilateral solutions, language learning programs,
bilingualism as horizon 2030 in the Saarland, a traffic concept, education system, agriculture, ecology and energy solutions.

Luxembourg’s motto is: ‘Mir wëlle bleiwe, wat mir sin’ [‘We want to remain what we are’]. The language situation is anchored deeply in the country’s history (Schinzel, 2013): with three official administrative languages: French, German, Luxembourgish (statec, 2016); Luxembourgish is the national language (Lëtzebuergesch). The public education system is trilingual: the language of instruction in kindergarten is Luxembourgish, being replaced by German as language of instruction in primary school and then gradually replaced by French as language of instruction in secondary school (Kraemer, 1995; Schinzel, 2014a; 2014b; 2017; Weber and Horner, 2008). Citizenship is only awarded to those who speak Lëtzebuergesch (Spizzo, 1995). The language defines the in-group (Briley et al. 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group (Schinzel, 2014).

In 2010 the author replicated Geert Hofstede’s cultural dimensions’ study in Luxembourg and compared the findings with Hofstede’s estimates. Luxembourg’s specific cultural environment is characterized by low Power Distance (PDI=29), high Uncertainty Avoidance (UAI=95), low Individualism = high Collectivism (IDV=34) (COL=66), medium Masculinity (MAS=54), high Long-Term Orientation (LTO=65), medium Indulgence versus Restraint (IVR=55), and low Monumentalism (MON=24).

Table 1 (Schinzel, 2015) shows Hofstede’s (2001) and Hofstede et al. (2010) cultural dimensions of Lux.Nat. and Lux.All., Hofstede’s estimates on Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA, and Japan, where the cultural differences become clear.

Table 1 Cultural Comparisons: The author’s Luxembourg, Lux.Nat. in comparison with Hofstede’s
UK – Belgium FR – Belgium NL – Italy – the Netherlands NL – China – USA – Japan (on a scale
from 1-100, 1 being the lowest and 100 the highest score)

It is worth citing Hofstede himself: “At 70 Luxembourg has a high score on uncertainty avoidance
which means that as a nation they are quite reluctant to test unknown territories. Security is a key
word in Luxembourg; there is not one activity which is not depending on some sort of security control
from authorities; from banker’s money to safety exits in a restaurant. It makes life in Luxembourg very
safe, but some would argue a bit boring. New ideas, new methods, new management techniques must
first be proven to work in other countries in order to be accepted in Luxembourg. Historically more
“farmers” than “traders” the inhabitants kept that good old “common sense” made of cautiousness
which has proven to be profitable for a country who managed not to be at war since the Napoleonic
time!” (http://geert-hofstede.com/luxemburg.html).

In September 2015 Jeremy Rifkin presented his ‘third industrial revolution’ for Luxembourg,
including subjects such as energy, mobility, construction, nutrition, industry, financial sector, smart
economy, circular economy and a social model, comprising digitally linked houses, shared cars and
100% digitalized economy (Schmit, 2016a). Directly after Jeremy Rifkin’s presentation, doubts arose: is
this concept realizable in Luxembourg? At date, discussion among professionals is ongoing. The
‘Sustainability Forum 2016’ invited everybody to participate in Jeremy Rifkin’s second presentation,
allowing for more discussion. See also http://www.troisiemerevolutionindustrielle.lu.

In this context and taking into consideration the potential changes that Luxembourgers wish to
carry out, the author asked this question: what is smart leadership – in general, and in particular: in
the Grand Duchy of Luxembourg? Having read the extant literature in general, she wants to break it
down to the special context of the Grand Duchy of Luxembourg. She comes up with the following
proposition:

Proposition: ‘Smart leadership in Luxembourg’ is deeply anchored in Luxembourg’s cultural and
linguistic identity in the middle of Europe.

This will be examined in the following sections.

2 METHOD

Semi-structured interviews were carried out during spring, summer and autumn of 2016.
Respondents were asked: 1) what is smart leadership in general and 2) what is it particularly in
Luxembourg? Respondents were from the four categories: Lux.Nat. (15), Lux.Foreigners (11), Cross-
border workers (3) and the rest of the World (3). Interviews were carried out in Luxembourgish,
English, French, German, and Italian. They were in person, by phone, via skype or email exchange.
and lasted between 30 minutes and 2 ½ hours. While some respondents took this research seriously by dedicating to me all the time needed to clarify all the necessary points, other respondents obviously had less time to devote. Sampling was convenience sampling. For confidentiality reasons, interviews were not taped, nor recorded or filmed. In-depth notes were taken during the interviews. After the interviews, the respondents were presented the summary of the interview and their consent was asked. Interviews in Luxembourgish, French, German, and Italian were translated into English.

3 RESULTS

Between March and September 2016 the author performed a total of 42 semi-structured interviews with business men and women in companies in the four categories 1) Lux.Nat., 2) Luxembourg Foreigners, 3) Cross-border workers, and 4) the rest of the world (World). The interview languages were for 16 in English, 10 in French, 8 interviews in Luxembourgish, 5 in German, and 3 in Italian. Interviews were mainly held in person, or on the telephone, via skype and via email conversation, indebt notes were taken. The longest interview lasted 2.5 hours, the shortest 30 minutes. The 42 interviews can be divided in 4 categories: 16 Luxembourgers with Luxembourgish nationality (Lux.Nat.), 11 foreigners living in Luxembourg, 3 cross-border workers, and 12 respondents from the rest of the world. Among the 11 foreigners living in Luxembourg 3 were Italian, 2 German, 2 Belgian, 1 Portuguese, 1 Australian, 1 Czech. The cross-border workers live in the neighbouring Germany (1), France (1) and Belgium (1). The respondents from the rest of the world come from the USA (1), Canada (1), Australia (1), the UK (2), Germany (2), Poland (2), South Africa (1), China (1).

Here are the respondents’ mother tongues: 16 speak Luxembourgish as mother tongue, 8 French, 5 English, 4 German, 3 Italian, 1 Portuguese, 1 Russian, 1 Hebrew, 1 Czech, 1 Arabic, 1 Chinese, 2 Polish, 1 Afrikaans. 3 respondents have 2 mother tongues: Luxembourgish and French, Russian and Czech. To summarize the language situation: 2 respondents speak six languages, 8 respondents speak 5 languages, 16 respondents speak 4 languages, 4 respondents speak 3 languages, 8 respondents speak 2 languages, 2 respondents speak one language, see table 2.

In summary, the 42 respondents come from 15 different countries, hold 15 nationalities and speak 15 different languages. One respondent holds the double nationality.

What about gender? 27 respondents are male, 15 are female. What about age? Respondent’s age is mainly between 35 and 59 (36 respondents out of 42), while there is no category 0-19, neither 20-24, nor 25-29, 5 are age 30-34, 12 age 35-39, 8 age 40-49, 15 age 50-59, and 2 are over age 60.

The education level of the 42 respondents is as follows: 4 with A-level, 0 with professional education, 11 hold an undergraduate degree, 12 hold a master's degree, and 15 a doctorate. With the following industry sectors: 10 from the banking and finance sector, 9 employed at the State as civil servants, 15 in education, 2 in commerce, 2 in the health sector, 1 in Telecom, 1 in construction, 1 in science, and 1 in law. As for the job level, there are 32 managers and 10 assistants, there are no blue-collar workers.

3.1 Results from the interviews
In this section, the results from the 42 interviews in the four categories are summarized. In a first paragraph the positive points – the advantages – are presented in main points in the four categories, followed by a second paragraph on the negative points – the criticism respondents expressed. Responses from all four categories being different, a distinction is made in the results paragraph between the four categories.
3.1.1 Results of Interviews - Luxembourg Nationals (Lux.Nat.) – positive points

The number one advantage of Luxembourg is to be situated right in the middle of Europe, at the crossroad of three cultures: the German, the French and the Belgian cultures. This particular geographic situation is the origin of one of the most important smart decisions Luxembourg has taken: Europe!

To cite one Lux.Nat. respondent: “Luxembourg was among the initial 6 founding members of the CECA, which later led to the European Union EU. Luxembourg was able to attract parts of the European Parliament to Luxembourg, other parts are in Strasbourg (France) and in Brussels (Belgium). Especially smart was the fact to attract the Judicial and the Secretary and the Financial parts, with the EIB – European Investment Bank (BEI - Banque Européenne d’Investissement), the European Central Bank being in Frankfurt (Germany).”

Most Luxembourgish leaders have studied abroad, in neighbouring countries, and are travelling in these countries. They are interested in travelling and in knowing what happens not only in other European countries, but worldwide, they always have their eyes open with the aim to see / foresee what happens next, and how to forecast future decisions.

Second, Luxembourg is small, really small, approximately 80 km long, 40 km wide. This being often a disadvantage, in the case of smart leadership, it seems to be an advantage. Following some, not all respondents, Luxembourg’s leaders have the ability to take bold decisions, to do bold things, to live their dreams, to realize their futuristic ideas. Big countries cannot experiment in this way. When a Luxembourgish leader makes an error, he causes an uproar, but 3 days later it is forgotten. The USA cannot just go ahead and experiment on ideas. Luxembourg does. Many of these ideas failed, but many others succeeded. One of these ideas is the creation of SES (Société Européenne des Satellites) in Betzdorf under Pierre Werner, prime minister of Luxembourg 1959 - 1974 and 1979 - 1984, followed by Pierre Frieden, Gaston Thorn and Jacques Santer. Gaston Thorn was not only Prime Minister of Luxembourg, 1974 - 1979, but also President of the European Commission, 1981 - 1985. The ‘Werner Plan’, initiated in 1970, to create a European economic and monetary union was not immediately realized, but later by Jacques Delors, paved the way for the euro, the European common currency. Werner’s centre of interest was European integration. Pierre Werner was also Minister of Culture, and a fan of cricket, creating the Luxembourgish Cricket Club. Jacques Santer succeeded Pierre Frieden as Prime Minister, 1984 - 1995, then became President of the European Commission, 1995-1999, while Jean-Claude Juncker succeeded as Prime Minister, 1995 - 2013, and then President of the European Commission in 2014.

As stated by one Lux.Nat. respondent: “No other European country has provided three Presidents of the European Commission, except Luxembourg.”
The Grand Duchy of Luxembourg has many politicians with high importance for European integration, the peace process after World Wars 1 and 2, the creation of a common economic and monetary market, the EC, the EU, the treaty of Maastricht, as well as the treaty of Schengen, signed on 14 June 1985 in Schengen, Luxembourg, effective since 26 March 1995, with original signatories being: Belgium, France, West Germany, Luxembourg and the Netherlands.

SES Astra was created in 1985, with the help of the Luxembourg Government, under the name ‘Société Européenne des Satellites’ at Betzdorf. The first ASTRA satellite was launched in 1988. In 2015, SES owned 54 satellites, covering nearly the entire world – 99% coverage. O3b Networks was acquired on 1 July 2016, again with the help of the Luxembourg Government who remains one of SES’s shareholders. See: http://www.ses.com/4232583/en, and http://www.ses.com/fleet-coverage:

“Welcome to SES

We are the world-leading satellite operator, providing reliable and secure satellite communications solutions to broadcast, telecom, corporate and government customers, reaching 99% of the world’s population.”

“Fleet and coverage

Our global fleet of 53 geostationary satellites covers 99% of the world’s population to deliver reliable and secure connectivity. Our vast satellite footprint enables operators to deliver thousands of hours of the latest digital TV content every day, companies to provide broadband networks in remote locations and governments to connect their sites.”

One Lux.Nat. respondent said: “If you want to have ideas, you need to travel a lot, and to make economic prospection, with the aim to identify the domains of interest that need development. This requires a huge open mindedness and strategic intelligence.”

Luxembourg is the first nation on earth preparing to mine raw materials from space, together with SES.

Other respondents were of a contrary point of view; there being no difference between an American or a Luxembourgish leader. The same criteria for smart leadership apply for both of them: 1) understanding my own motivation; 2) respect, comprehension, empathy, communication, humility, positivity, love and integrity; 3) knowing my teams; 4) collaborating with competent employees; 5) delegating and prioritizing; 6) encouraging creativity; 7) concentrating on positive aspects; 8) being direct; 9) return on experience: what works, what doesn’t; 10) the obstacles to success.

Luxembourg being so small, networking is essential, vital and critical. Several respondents underlined the importance of knowing the right people. This being true in big countries, it is even truer in small Luxembourg. The smart leader needs to have the right networks, he/she needs to have other smart leaders to network with.
One Lux.Nat. respondent said: “It is so small here, everybody knows or thinks they know everything about the other(s). We had a candidate here for an interview for a new job, and, imagine, her current employer already knew about her interview appointment. New employers automatically call the current employer to check on the person, especially as they all know each other, they all are friends, go together to the same events, sports, supermarkets, where they talk and exchange information.”

Third, it is a multicultural society, where everybody ought to speak at least 4 languages: Luxembourgish, German, French and English, where learning Luxembourgish is beneficial for all nationalities. The Luxembourgish language is important here. The more foreigners come to Luxembourg, the more they become aware of the importance of the Luxembourgish language.

One Lux.Nat. respondent said: “Our identity is our language. Our language is my heart. This is shown in the history, especially World War 1 and 2, and the civic education. As a foreigner, you show, by learning Luxembourgish, that you are not only there for the money.”

Fourth, Luxembourg is a long-term oriented country, following Hofstede et al. (2010) and Schinzel (2013), Long-term Orientation is 69 out of 100. Planning is done for the long term, always with continuity in mind, preserving the environment and nature, and forecasting for the generations to come.

One Lux.Nat. respondent said: “When a construction company builds a new building, it is built following the method ‘quadle to quadle’, meaning that everything will be recycled in the end.”

Although trust, confidence, collaboration and creativity are key assets for the smart leader in Luxembourg, control mechanisms should be put in place to avoid abuse.

One Lux.Nat. respondent said: “Although smart leaders (as project leaders) should put their trust in others, they should never forget to have and use some powerful and accurate tools to check if people (customers, providers, partners, shareholders, employees, interns…) are sticking to the rules and are speaking the same language!”

Business often is done fast in Luxembourg, faster than in other countries, given its small size. This speed in action might be unusual for newcomers. While in other countries making an appointment may take several weeks or months, in Luxembourg it might be minutes or hours.

One Lux.Nat. respondent said: “A smart leader in Luxembourg has to quickly recognize and understand unique local situations and particular issues of his employees (expatriates, cross-borderers / accept homeworking), clients (depending on the size, location and field) and providers… in order to be able to negotiate and obtain win-win-win results. A smart leader in Luxembourg must be a good, well-prepared and enthusiastic trainer as well, in order to mould the perfect squad.”

In Luxembourg, things do happen fast, except if you work for the State. If you do work for the State, things happen extremely slowly. Respondents confirmed the generally known fact, that at the State
level, things happen slowly, people work slowly, and hardly anything changes. At the State level, the boss is the boss, and the lower-level civil servant is/remains just that. Nothing ever changes, nobody ever changes, and every day has the same procedure. While Change Management happens in other companies, at the State level, hardly never anything/anybody changes. One respondent proudly confirmed that the turnover is zero, as never anybody had quit the department in his/her 25 years at the head of the office.

One Lux.Nat. State employee said: “It is about time that things change here at the State!”

Another Lux.Nat. State employee expressed exactly the contrary: “I have been the boss here for the last 28 years, never anybody gave his notice letter here, I have 0 turnover, and this shall continue exactly like this forever.”

Fifth, the smart leader in Luxembourg can experiment more than in other countries.

One Lux.Nat. respondent said: “He can go and try out new adventures easily.”

This is done by a clear vision of performance, long-term orientation, in new ideas, new concepts, start-ups, there are several big examples, i.e. the construction of the newly established University, the Belval Plaza site, with movie-centre and University campus, new train station, a mall, including many shops, restaurants, gyms, new apartment buildings, sport events, the Rockhal (a concert hall):

“Definitely the best thing on the whole site: since its opening, many super famous actors have visited Luxembourg- RHCP, Mariah Carey, Pink, The Pussycat Dolls...., many of them would have never come to the Atelier because of its small size. Not to mention all the other events that take place at the Rockhal.”

Another example is the CFL Multimodal cargo-train-station between Bettembourg and Dudelange, from where huge cargo trains depart for France, Italy, Spain, Portugal and other European countries, filled with cargo, to avoid street traffic. See: http://www.cfl.lu/espaces/groupecfl/en/legroupe/participations/cfl-multimodal
or http://cfl-mm.lu:

“CFL multimodal is a global service provider and offers a broad service portfolio: combined rail-road transport, freight solutions for rail, road, waterways and air, warehousing, customs services and all other services of the logistics chain. In addition, CFL multimodal offers city logistics services targeted at Luxembourg City’s retailers.”

By setting clear objectives, another smart leader in Luxembourg is Cargolux. Who is Cargolux? See http://www.cargolux.com/:

“Cargolux Airlines International Cargolux, based in Luxembourg, is Europe’s leading all-cargo airline with a modern and efficient fleet composed of 13 Boeing 747-8 freighters and 11 Boeing 747-400 freighters. The Cargolux worldwide network covers 90 destinations, some 70 of which are served on
scheduled all-cargo flights. The company has more than 85 offices in over 50 countries, and operates an extensive global trucking network to more than 250 destinations as well as full and part-charter services. Cargolux also offers third-party maintenance at its modern two-bay maintenance hangar in Luxembourg. The company is specialized in B747 line and hangar maintenance up to and including C-Checks. It offers a range of specialized maintenance services and holds line maintenance approval for 777 aircraft. The Cargolux Group employs close to 1,900 staff worldwide.”

Despite the cargo flights from all over the world to Luxembourg, the Government imposed a night flight prohibition on Cargolux and every other flight company. The airport being so close to town, inhabitants would suffer tremendously from night time noise, disturbing their natural sleep. This is an example of smart leadership.

Another company active in Luxembourg is DuPont de Nemour. Its Tyvek fabric provides new techniques for protection, packaging, and insulation, with an innovative, multipurpose sheet. DuPont in Luxembourg has a 100%-security policy, with an objective of: “Security is 0 accidents”. Not only is security encouraged inside the company, where non-respect of the security-rules is strictly punished, going as far as job termination. But also security outside the company, at home, is encouraged, following the idea that healthy employees are more beneficial for the DuPont Company than employees hurt at home while cleaning the house or other household accidents. This is where DuPont takes social responsibility as a smart leader. DuPont is enlarging its facilities in Luxembourg-Contern in 2016/2017, investing 350 million euros in the construction of a new production line for Tyvek (Adam, 2016). In 2016, 1063 people worked in Contern, producing four product lines: Mylar, Typar, Hytrel and Tyvek. The new Tyvek production line will add 120 people. Tyvek does not have any equivalent competition worldwide, as opposed to Mylar, the polyester film, which is under enormous international pressure, and DuPont has to keep its production costs in Luxembourg low, while guaranteeing highest quality. See: http://www.dupont.com/products-and-services/fabrics-fibers-nonwovens/protective-fabrics/brands/tyvek.html:

“Tyvek® brand - For Greater Good™

What if you could lessen your worries?

Like weather conditions that could affect your home and your family time. Or the worry that the hazardous materials you handle responsibly could put you at risk. For almost 50 years, DuPont™ Tyvek® has provided the protective barrier people need to worry less, so they can focus on accomplishing bigger things. Tyvek® is a family of tough, durable spun bonded olefin sheet products that are stronger than paper and more cost-effective and versatile than fabrics. Lightweight and durable, Tyvek® has introduced new dimensions of protection, security and safety in a wide variety of applications—building envelope, protective apparel, medical packaging. Even graphics. And we
continue to innovate today. We encourage our customers to develop new ideas for Tyvek®, and to dream big. Because once Tyvek® frees from you from worry, a world of greater good becomes possible.”

**Fage International** announced the construction of a new yoghurt production line in Bettembourg/Luxembourg, able to produce 40,000 tons of yoghurt per year from 2018 on (Cortey, 2016), using 180,000 tons of milk, approximately half the country’s annual production, collaborating with Luxlait for supply in milk, and with ADEM (Administration de l’Emploi) for training the 100 future employees, investing 100 million euros.

**Euro-Composites** in Echternach will invest 61 million euros in 2016/2017. Etienne Schneider, Luxembourg’s Minister for Economy said: “This is the third major investment we announce this month. After Dupont (350 million) and Euro-Composites (61 million) the announcement of Fage International brings the investment at more than 500 million euros and 450 job creations” (Cortey, 2016). So many announces make Etienne Schneider ‘a happy minister’, demonstrating that the country’s economy is competitive beyond the financial center (Cortey, 2016).

**Guardian** invests in glass and exports most of its glass, including to Dubai, building the Burj Khalifa – the skyscraper. For Guardian, values are primordial, they publish them on their website and have the slogan: “People are making our difference”, see: http://www.guardian.lu/values/index.htm

“Values that govern our business conduct

**Integrity:** Conduct all affairs with integrity, for which courage is the foundation.

**Compliance:** Strive for 10,000% compliance with all laws and regulations, which requires 100% of employees fully complying 100% of the time. Stop, think and ask.

**Value Creation:** Create long-term value by the economic means for customers, the company and society. Apply MBM® to achieve superior results by making better decisions, pursuing safety and environmental excellence, eliminating waste, optimizing and innovating.

**Principled Entrepreneurship:** Apply the judgment, responsibility, initiative, economic and critical thinking skills, and sense of urgency necessary to generate the greatest contribution, consistent with the company’s risk philosophy.

**Customer Focus:** Understand and develop relationships with customers to profitably anticipate and satisfy their needs.

**Knowledge:** Seek and use the best knowledge and proactively share your knowledge while embracing a challenge process. Develop measures that lead to profitable action.

**Change:** Anticipate and embrace change. Envision what could be, challenge the status quo and drive creative destruction through experimental discovery.
**Humility**: Exemplify humility and intellectual honesty. Constantly seek to understand and constructively deal with reality to create value and achieve personal improvement. Hold yourself and others accountable.

**Respect**: Treat others with honesty, dignity, respect and sensitivity. Appreciate the value of diversity. Encourage and practice teamwork.

**Fulfillment**: Find fulfillment and meaning in your work by fully developing your capabilities to produce results that create the greatest value.”

**Enthusiastic people**: Communication should be done continuously and informally.

The Luxembourgish supermarket **Cactus** is considered as a smart leader in Luxembourg. It has collaborated with Luxembourg city since 1990 to run the annual City Jogging event, see: http://www.cactus.lu/fr/yuppi/gallery/city-jogging-luxembourg-0. Cactus always adapts their offer to clients’ needs, e.g. increased offer in organic products, vegetarian products and household products at reasonable prices. Adapting to people having less time, they cook and offer take-away lunch food, first only at lunch times, now all day long. Opening hours have been adapted as well, opening early mornings, later in the evenings and on Sunday mornings. Despite the fierce international competition by huge international supermarket chains, Cactus has always known to reinvent itself to maintain its dominant position in Luxembourg’s supermarket landscape. Cactus helps sustaining local farmers, local producers, local people, not only by selling local products – local milk, meat, apples, juice – but especially by sponsoring local events, by growing trees, supporting farmers, beekeepers, by educating children, with the Yuppi mascot, by sponsoring sports and cultural events, e.g. City Jogging, Run for the Kids, Fackellaf, Relais pour la Vie – 24- hour race against cancer – see http://www.relaispourlavie.lu/.

In addition to the local supermarkets, Luxembourg’s smart leadership aims at attracting other companies to Luxembourg. After Mc Donald’s and Quick, they attracted Burger King, Dunkin Donuts, and more recently Starbuck’s. Even though, this seems to be smart for those globalized companies, it needs to be confirmed if it is smart for the local small cafés and restaurants.

**Lush Cosmetics** is considered a smart leader in Luxembourg, because they combat animal testing, favouring natural products, Fairtrade and charity events.

**Solar energy** is promoted by the Luxembourg government, having as objective the year 2020 with 11% energy production from renewable energy, and in 2030, the European objective is 23% (Schmit, 2016b). Currently the government focusses on supporting solar panels on private houses’, schools’ and sports halls’ roofs, one photovoltaic system on the ground being in Langsur-Mesenich, next to the highway to Trier, on the Mosel. Other such ground installations are still rare.
Sixth, on a smaller scale, the sport activities organized all over the country by the respective communes is a great example of smart leadership. The ‘Sports pour Tous’ from ‘Ville de Luxembourg’, see: http://vdl.lu/sports.html, was founded in the 1980’s with the objectives to increase the quality of life, to create social contact among people, to keep people healthy, in good shape, to prevent sicknesses and ultimately to improve joy and happiness, without any competitive character. The City of Luxembourg does everything in order to offer daily sports activities, indoors, outdoors and in the water, providing infrastructure and high quality classes to its citizens. Not only the City of Luxembourg, but most communes nowadays offer their sports/fitness program for all. The sports classes were at the beginning but have since been followed by other classes: language courses, photography, computer, cooking, walking, hiking, painting…. These courses are generally offered at a low price.

One Lux.Nat. respondent said: “These courses are not too expensive generally, but of course the wonderful city of Esch has to exaggerate when it comes to their language classes, but their sports classes are actually really reasonable. With the result that many people acquire new skills and qualifications and possibly new jobs. Many people work out in fun groups, improving their motivation and consequently their health improves, their physical health in general, while the risk for dementia decreases.”

3.1.2 Results of Interviews – Foreigners in Luxembourg

One Italian in Luxembourg is specializing his research on ‘smart cities’. In his research he underlines his theory: the smart city of tomorrow is digital. Luxembourg will have to adapt to the change from the ‘physical’ city to the ‘digital’ city, claiming companies make more profit digitally than physically. Here is his citation: “The difference between ‘private’ and ‘public’ today is between ‘private’ and ‘digital’ (google). Google knows more about me than myself. The concept of reality is completely changed.

Public offices are archaic, they do not understand this change to the digital world. I bought ‘The Art of War’ by Sun Tzu, and I read the book over and over again: Nowadays it would be important to understand better, how Google functions. You need to be better than Google, Facebook and Twitter. The problem is the organization of the city, as it has completely changed. Here one story from 2013:

A 45 year old man (married, one 15 year old daughter) receives gifts at home, without having ordered them. He is astonished by the content of the gifts: body creams against pregnancy stripes, pregnancy creams … teenage pregnancy creams.

What he didn’t know, but Google did: was that his 15 year old daughter used his computer to consult websites about teenage pregnancy, because she was pregnant. Only she and google knew. Google sent
The globalization trend was pointed out by one respondent as being highly damaging, saying, all city centres look exactly the same. They have all the big same, identical chains all over. Luxembourg looks like any other big city. Where is the typical Luxembourg? Where are the small, typical little shops, and famous city centers?

Recently a new law was voted by the Luxembourg government for the 1-Euro-company, allowing the creation of more small companies, notably start-ups.

The respondent said: “This is smart leadership in Luxembourg: to help small companies and single company-owners. Nowadays only the big chains survive, killing all the small local shops. What a shame! Luxembourg holds against this dying of little companies with the 1-Euro-company. Single people are encouraged to create their own start-up, whatever their genius idea might be.”

“In Copenhagen, Denmark, they have their amusement park ‘Tivoli’ running all year long, while the Schouberfouer in Luxembourg lasts traditionally 3 weeks end of August, beginning of September.”

Another example is the creation of financial instruments such as Bank of China listing its first Green Bond in 2016 at the Luxembourg Stock Exchange, allowing for future generations to save the environment by investing in ecological, green projects worldwide. See: https://www.bourse.lu/ and:
https://www.youtube.com/watch?v=xzT8vXCAb-I  Bank of China lists first Green Bond in Luxembourg.

The vision is to take the country Luxembourg further, to make it profitable for future generations, to have this vision of wealth and health for everybody, by inspiring people.

One respondent said: “Smart leadership is to encourage people to go further, by listening to people what they have to say, rewarding the job done, providing them with a vision, giving them clear directions, ensuring the objectives make sense, and are achievable. Change peoples’ minds. This fast changing world needs fast adaptation, the ability to change. The most important saying is this one for the smart leader: ‘Train people well enough so they can leave, treat them well enough so they don’t want to’.”

Seventh, the smart leader in Luxembourg knows his employees well. He knows their capabilities, their talents. He establishes a ‘competences map’ and offers necessary training and coaching to his employees. Typical for Luxembourg is the abundance of resources and talents. On the one hand, there is a lack of talent, because of the small size of the country, on the other hand there is an abundance of talents given the fact that many people are migrating to Luxembourg from Europe and other countries worldwide. This constitutes also the next advantage for Luxembourg: the cultural mix, the differences between all these different cultures represent an advantage and creates the richness of the country, making it easier to create connections, to increase creativity, to build winning teams.

One respondent said: “For me, smart leadership means the optimization of resources by using employees’ natural talents. Smart stands for: Simple or specific, measurable, achievable, realistic or relevant, time scaled or time line. Here is my favorite quote: Everybody is a genius. But if you judge a fish by its ability to climb a tree, it will live its whole life believing that it is stupid”. Me, for example, I am not strong in mathematics, I prefer delegating mathematics to a person naturally talented. The smart leader is capable of detecting employees’ natural talents, identifying everybody’s strong points.”

This statement is confirmed by other similar statements by cross-border workers, saying they bring talent to the country. Cross-border workers and foreigners in Luxembourg proudly confirmed they bring the necessary talent to Luxembourg, as Luxembourg was lacking talent before their arrival. This is no longer true, thanks to the foreigners and the cross-border workers, a fact confirmed by leaders in Luxembourg, cross-border workers and foreigners living in Luxembourg. The talents originally lacking in Luxembourg are attracted to the country, allowing leaders sufficient choice in talent.

3.1.3 Results of Interviews – Cross-Border Workers
Eighth, the smart leader uses the country’s multilingualism as a power house. There being three official languages: Luxembourgish, French, German, everybody is supposed to speak at least these three languages, as well as English and any other language: Portuguese, Italian or Spanish, depending on the country of origin. This mixture in languages, but also in cultures makes the richness of Luxembourg. The Government is pushing this mixture to be a major asset, advantage, and a plus for Luxembourg, contrary to most other countries. The Luxembourg Government with its education policy was capable of integrating the three official languages Luxembourgish, French, and German into the education system, adding English to it, more or less obliging everybody to speak all of these languages, and more. While many migrants confirm the high wages were initially the cause of them migrating to Luxembourg, later they appreciated the tolerant and open lifestyle and the multilingualism, all three not necessarily present in other countries.

One respondent from Belgium stated: “The Belgium Government was/is not capable of the integration of the three languages in Belgium into the education system. In Belgium, people speak only French, or only German, or only Flemish, depending on where they live. But nobody has to learn all three languages in school. This is the biggest asset of Luxembourg’s education system, where the Government was so intelligent to integrate the three/four languages into the education system of everybody.”

Cross-border respondents said, the integration of the mainly Moslem refugees into the education system and the work environment represents the biggest challenge Luxembourg and Europe faces after a long period of European construction and integration.

3.1.4 Results of Interviews – Rest of the world

One respondent offered his PESTLE and SWOT analyses for Luxembourg:

“PESTLE
Political:…Original member of the EU/EC, many EU/EC groups based here, small country surrounded by much more ‘powerful’ countries, often prepares legislation quickly in anticipation of future trends (end of secret banking, domiciliation of companies, tax reform, etc.), former Prime Minister Juncker is now the President of the European Commission
Economic:…Niche market, Value added expertise, excellent business conditions in general
Social:…Multi-cultural, cosmopolitan, vibrant and active, yet stuck in the past,
Technological:…Fibre-optics, aerospace, outer space, efficient and competitive production units, data-centres (or even IT in general)
Legal:…Intellectual Property, same-sex marriage, nationality, but not giving the foreign residents the right to vote
Ecological: just look around you! A lot of green space, movement away from pesticides, etc.

SWOT:
Strengths: Agile, competence-centric, attractive
Weaknesses: ‘Be careful what you wish for because you just may get it’ regret, poor image, public education system
Opportunities: well-placed to continue being a financial sector. Could even do more
Threats: Other countries have copied Luxembourg’s model

References:
https://www.mindtools.com/pages/article/newTMC_05.htm

One respondent from Poland said: “Yet, what I think smart leadership is - is leadership that involves human energy to reach goals, when people feel that company goals are their own, when the leader is authentic, honest and tries to use the potential of people, when they develop their skills. With regard to smart leadership in Luxembourg - additional factors - cross-cultural issues that the leader needs to take into account, more opportunities but also challenges.”

Another respondent from Poland said: “Local banks domiciliated in Luxembourg implement models of sustainability to their activities (e.g. environmental and social due diligence for project finance).

One respondent from China replied: “I feel uncomfortable to talk about smart leadership in your country that is something I barely have knowledge off.”

One respondent from Syria answered: “I guess, you are more knowledgeable in this field, but what makes your research interesting is doing it in a particular place ‘Luxembourg’ so I would only suggest to see whether there is anything special in Luxembourg itself that leaders have to be aware of. For instance, leaders’ or followers’ traits/ or how leadership is transmitted over there? You might be surprised with my answer, but I will be direct. I don’t think there is something called (in my opinion) "responsible leadership" simply by asking one question: have you ever seen a leader who is not saying he/she is responsible? Let's say theoretically; all leaders would say I am responsible especially to make his/her picture nice, great, and cool.

I try to say that there are foundations in how people think, feel, and act in the workplace. Wherever they are, there must be something they believe in which has a great impact on the way they do things. After researching I found that people’s personal values are the foundation they rely on to do, decide, make connections, communicate, prioritize, and as you can see in the model of PPV in my paper. In the Arab world, there are different things you need to consider in order to operate business as same as any other country, it is not only about culture. It is more about the human him/herself. I can say that I
am closer to values-based leadership in the Arab world. But there is still a need for more research to prove that.

As a summary, I don’t have enough knowledge to assess smart leadership as you do. I would rather be keen to discover more on how people think, feel, and act and see what can have an impact on them, what can drive, inspire, and lead them.”

One respondent from Germany said: "It is difficult to define 'smart' in this context. I assume it alludes to a possibly innovative contemporary style of leadership.

I regard myself to be in the tradition of transformational leadership as I am convinced that our current manifold political social/cultural, economic, ecological and technological challenges and problems urgently call for transformation of structures to improve our environment. This transformation, in my view, should be pursued with a strong reflective and restitution spirit. You might call it 'Curative Leadership'. For 'curative' movements to create, a smart leader must be able to attract followers who share the vision and mission voluntarily and passionately, as applied successfully in some social entrepreneurship ventures.

The notion of 'sharing' in this respect implies to emphasize on using social media for international networking, with the latter being a key leadership characteristics based on a high level of emotional and intercultural competence. In generating 'curative' movements, a smart leader must be able to unlock potential of diverse follower segments, such as the Generation Y or digital natives and/or the middle agers and old agers.

For me, the current 'magic word' in business is co-creation which necessitates to appeal to a variety of diverse internal and external stakeholders when attracting resources for the movement at hand. Finally, following Erich Kästner’s sentence 'es gibt nichts Gutes ausser man tut es' (there is no good thing except we do it) I suggest to combine transformational leadership with transactional leadership to have, in additions two visions, also 'landing gears' for quicker implementation of change”.

One respondent from Israel and one from Australia said: “It is about civility”.

One respondent from the UK answered: “I found the list below from some Mickey Mouse website - actually, it looks quite good to me. I guess, if you think it looks good also, you should use it and put a Luxembourg example on each point, possibly thinking of a typical young female perhaps.

1. Develop your personal leadership style. No one is born knowing how to be an effective leader. Spend time learning as much about yourself as possible. When you work on yourself, you're working on your leadership. Consider finding a good leadership program, coach, or mentor.
2. Learn from experience. Think strategically about how you can gain the experience you need. Delve into challenging projects that may give you unusual problems to solve; practice observing situations from different perspectives and learn from everything you do.

3. Don't be afraid to fail. Unless you're not trying at all, you will almost certainly fail, maybe more than once. The important thing is to learn how to take responsibility for your failures, extract their lessons, and change directions while still moving forward.

4. Have a compelling vision. When a crisis hits—and it will—having a vision and knowing that people are aligned with that vision keep things in check. If you are trusted as a leader, you'll be perceived as someone who can bring people through and keep things on track instead of falling apart.

5. Polish your people skills. Great leaders have great interpersonal skills. They care for their people. As a leader, you need to know how to listen quietly and hear what people are really saying, by asking questions and being open to the truth. When challenges come, it's especially important to open up and show you care.

6. Motivate yourself. Your commitment is a signal for others. If people can see that you are working hard toward attaining a goal, they will join you. Learn to tap into the motivation that gives you energy and passion, so in turn you can inspire others through difficult times.

7. Keep people informed. When times get tough, it's always tempting to hide, but that's the worst thing you can do. Stay visible and keep people informed even when it's bad news. People don't like to feel excluded from progress or from problems; when you keep them current, they will be invested and prepared to help.

8. Inspire others. Inspiration is empowering; when you inspire people, you also give them a sense of purpose. When you lead by example and people feel inspired by who you are, it empowers them to be more effective and productive.

9. Find a true mentor. When times are challenging, find someone who has been there before, learned his or her lessons, and is willing to guide you along the way. A good mentor should have the experience you want to gain, and should also have a sincere desire to help you along the way. Mentoring has to be genuine and positive to be truly meaningful.

10. Take care of yourself. The best leaders take care of others, especially in challenging times. But if you neglect yourself you will soon be overwhelmed by pressure. Do what you need to do to keep yourself sharp and healthy, and remind yourself often that what you do is valuable.”

Yet, another respondent from the UK compared ‘smart’ leadership with ‘wise’ leadership, stating: “Smart Leadership knows how to build and nurture a valuing environment in whatever organization. Wise Leadership goes beyond the technical competence and skills and knows how to build and
nurture from human dimension. This is important in an age of digital life. My next publication is entitled ‘Smart Leadership - Wise Leadership’.

Before discussing the critical points of smart leadership in Luxembourg, a concluding sentence to the positive points of smart leadership in Luxembourg. One respondent created this slogan: “Work smarter, not harder!”

3.1.2 Smart Leadership - Criticism

More critical respondents reported about lack of ‘smart leadership’ in Luxembourg, bringing critical situations to the surface, including incompetent people at decision taking positions, bad management, bad working atmosphere, bullying, work harassment, stating:

“Smart leadership in Luxembourg is confused with delegation to other people with only one goal: “doing less - maximizing your personal revenue. I am speaking from 20 years of experience in the financial sector.”

Luxembourg being small especially implies nepotism. Everybody knowing everybody implies more often hiring family members, not always the most competent candidate, or helping friends. Knowing the right people, not your qualities, guarantees your personal career.

One respondent said: “The constitutional referendum in 2015 and the left wing of the government in general.”

“Smart leadership in Luxembourg? small country, many people know each other? How many people hire friends and family for positions? In a country where many people want to earn money to buy things to impress their neighbours, how many people work for their team, their business rather than their own profit?

Many positions require experience, but won’t hire people who are just a tiny bit older, whereas, the people who have just graduated have only limited experience but are not given the opportunity to gain experience – this is a vicious circle. Personal style? No. People competing with others on many levels (professional and private) no such thing as personal style.

Many people would rather go for a secure job (civil servant jobs – ministry, teachers…) - not many leadership possibilities. “

Respondents said, globalization having the grip over the entire world, there is no longer any difference between Luxembourg or any other country in the world regarding ‘leadership’ or ‘smart leadership’ principles. Literature that inspired was by Buckingham and Coffmann (2015), Hersey (1984), and Lencioni (2005). Most companies in Luxembourg being a subsidiary of a big international company, the rules of the international company prevail. Only while looking at typical Luxembourg
companies – Cactus, Luxair, Namur, Oberweis, Frank Schleck bikes... and privately owned small Luxembourg companies or of course the State positions with their Civil Servant status, typical Luxembourghish rules and values can still be found. Smart Leadership comprises: Coaching, motivation, decision taking, problem solving, training, communication, separation private – professional life and personal empowerment. Setting clear objectives is key.

“What is typical Luxembourghish here? I am working in a Belgium-American company. Luxembourg doesn’t exist here. In the Civil Servant positions, they are asleep! Otherwise everything is more and more globalized. Everything is the same. There is no more Luxembourg!”

“Empowerment means setting clearly defined objectives. If my objective is working 12 hours a day, instead of 8, then the smart leader has to interfere and live per example. It cannot be that some people need to be first and last in the office every single day.”

An Australian living in Luxembourg answered: "It is difficult in Luxembourg for SMART leaders as there is a great problem with culture for a majority of stakeholders. The leadership to drive change is not really there, it all seems to be just words, even though Luxembourg business and political leaders understand they must adapt. Communication is lacking or uninspired. In general, Luxembourg management and shareholders are wary about innovation, often to the point of not taking risks. There is a very low level of true entrepreneurship in the country although this is slowly changing. There is an historic resistance to accepting creative ideas and creative methodologies. Despite, these negative points, I am broadly optimistic for SMART leadership in Luxembourg as new companies, new leaders and changes in the way of thinking emerge."

Several critical respondents said, there is no such thing as ‘smart leadership’ in Luxembourg. One respondent even said, there was no leadership at all. Nor smart nor anything else, leadership in general was not existent in Luxembourg.

“Smart Leadership in Luxembourg doesn’t exist.”

Especially the newly created University of Luxembourg was criticized by respondents and in general is heavily criticized by students for being anonymous, cold, without any flair. The University of Luxembourg was founded in 2003, and moved from several spread locations in the city of Luxembourg to one single location in Esch-sur-Alzette in 2015, 20 km away from the city, in a newly built, modern and futuristic building. The bad reputation only increased.
One respondent said: “I fight against what happens at the University of Luxembourg. That’s the reason why I never applied for being a professor there. What happens at the University of Luxembourg is ridiculous. They all are obstinate, confined, limited, restricted on themselves to publish ridiculous publications that are completely useless and that nobody wants to read.”

Another respondent stated: “The University of Luxembourg should not offer all studies. It is better for students to study outside of Luxembourg, at a highly specialized university, with high quality studies. Especially Medical studies, Luxembourg does not hold the capacities nor the patients to be able to offer medical studies.”

“The University – Campus Belval – has a bad reputation amongst students, however, it is a nice example showing that they (the Government) actually wanted this place to flourish.”

“Conclusion: while the idea was good, one of the best since I was born, there are still many improvements to be made.”

Respondents also named Asport, Delphi, some banks and lux-Airport as non smart leaders, where the general working atmosphere is bad, so they said, with a climate of fear and oppression, low motivation, high number of layoffs and dismissals (Luxemburger Wort, 27 September 2016, p. 13).

Several respondents emphasized the need for planning Luxembourg as a ‘smart city’, if it wants to remain attractive in the future. With the question in mind: “How to attract talent to Luxembourg?”, the city/country needs to reflect on ‘smart city issues’, in order to avoid traffic collapse, traffic jams, housing issues, expensive real estate, environmental issues, preservation of nature (Leanza and Carbonaro, 2017).

While there are many good ideas in Luxembourg, their realization often is more difficult than initially thought, requiring continuous improvement by talented people. The intentions often are good, but less good are the realization and outcome. It is easier said than done. With this last statement, this section comes to an end. A summary table regrouping the above arguments follows.

### 3.2 SUMMARY TABLE: Criteria for Smart Leadership in Luxembourg and in the world

In conclusion, it could be said, that it is the mixture of cultures and of languages that make the wealth of Luxembourg. The results in differences in the answers following the four categories are elaborated in the following: In conclusion, Lux.Nat. speak about the pioneering role of Luxembourg in Europe’s development, the multiculturalism and the benefits of multilingualism, especially trilingualism in education and about the efficiency of their companies, the low turnover, the good working conditions. It is their tolerance, their openness for the different that guarantees wealth and peace. Foreigners and cross-border workers say, they bring the talent to the country – because the country is lacking talent, and they like the multiculturalism, multilingualism, the tolerance and openness for the different, and of course the good working conditions. The rest of the world often has little knowledge or awareness, asking “Where is Luxembourg?” The author’s contribution to knowledge is exactly to fill this gap, to put Luxembourg on the map. The University of Luxembourg was only
created in 2003, there is a considerable backlog regarding research in general and on cross-cultural comparison in particular.

4 CONCLUSION, DISCUSSION AND IMPLICATION

The purpose of this research was to discover what ‘smart’ leadership is in Luxembourg. The 42 interviewees from the four different categories confirmed mainly the literature. Similarity and differences in the four categories where shown in the interviews section. While mainly the extant general literature is confirmed, there is however new knowledge added to the existing knowledge about smart leadership in particular in Luxembourg.

The biggest cultural peculiarities are Hofstede’s cultural dimension scores: High Uncertainty Avoidance, high Collectivism, low Power Distance, medium Masculinity/Femininity, high Long-term Orientation, and medium Monumentalism. These place Luxembourg on the map of the world in a quadrant without any other country around, a unique constellation, found nowhere else worldwide. Indeed, this research is about civility.

Another peculiarity is the trilingual public education system, passing from Luxembourgish in kindergarten as language of instruction, to German in primary school, to French in secondary school as language of instruction.

With around 50% foreigners making up the population, multilingualism and multiculturalism is lived every moment. With the cross-border workers representing 30% of the current workforce this situation changes radically during the working hours 8h-18h, with enormous flows of people from the neighboring countries, including traffic jams. The tolerance for the different is the next peculiarity of Luxembourg, situated right in the middle of Europe, being the heart of Europe, the engine, the creator of many European ideas and realizations, e.g. the Schengen treaty….

In comparison with the rest of the world and the extant literature discussed here above, the main attributes of smart leadership are fulfilled in Luxembourg, see also http://www.businessnewsdaily.com/5352-smart-leadership.html;

https://www.entrepreneur.com/article/199908

So, what is different in the Grand Duchy of Luxembourg? Despite this research’s results showing mainly Luxembourg matching the theory of ‘smart leadership’, the main differences have been elaborated. These are the trilingual public education system, multilingualism, multiculturalism,
the mixture of cultures, and the openness and tolerance for the different. The trilingual public education system works as follows – in shortened version: the language of instruction is Luxembourghish in kindergarten, in primary school the language of instruction is German, and in secondary school the language of instruction is French. For details see Weber and Horner (2008), also explained by Schinzell (2014b, 2017).

In conclusion, it is the mixture of cultures and languages that makes the richness of Luxembourg’s smart leadership, together with the tolerance and openness for the different.

What is more, Luxembourg has always had new ideas to ensure wealth and health for its citizens. It was always capable of re-inventing itself, thanks to its long-term orientation. Uncertainty Avoidance being near 100%, Luxembourgers argue this as an advantage: once everything else is ensured and secured, they can take care of the fun part of life.

Respondents named the following attributes of smart leadership, equivalent to the rest of the world: have a vision, inspiring people, my own motivation, respect, trust, understanding, empathy, communication, humility, positivity, love, integrity, knowing my team(s), talent and competences, delegation, prioritization, clear objectives, simplify, stop the so-called hard work, creativity, return on experiences, training and coaching, change management, rewarding the job well done, problem solving, empowerment, separation professional life – private life. What is specific for Luxembourg is: the trilingual public education system, multilingualism, multiculturalism, the mixture of cultures, the openness and tolerance for the different.

Respondents named the following smart leaders in Luxembourg: Cactus, SES Astra, CFL Multimodal, DuPont de Nemours, Ville de Luxembourg, Cargolux, Guardian, Lush Cosmetics, the Luxembourg Stock Exchange, CBL.

Respondents named the following ‘not-smart’ leaders in Luxembourg: University of Luxembourg, Asport, lux-Airport, and the constitutional referendum in 2015 and the left wing of the government in general.

In conclusion, the author’s proposition was confirmed: ‘Smart leadership in Luxembourg’ is deeply anchored in Luxembourg’s cultural and linguistic identity in the middle of Europe.

5 RESEARCH LIMITATIONS

Cultural research has been in the focus ever since Hofstede’s landmark study. While huge numbers of researchers gather to research groups, around Robert House (2004) - the GLOBE – and Ronald Inglehart (2008, 2011) – the World Values Survey, see: http://www.worldvaluesurvey.org/wvs.jsp, the author, as a single researcher, obviously cannot compete with these big groups. Nevertheless, this study, a combination of Hofstede’s cultural
dimensions study together with ‘smart leadership’, can pave the road for further research at the crossroads of culture and leadership. Time limitation and financial limitations are other limitations of this study, performed mainly during spring-summer-autumn 2016, with the objective of conference participation and publication in 2017. This research might be useful for people working and living in Luxembourg. Human Resources managers and other deciders might find the results of the 42 interviews interesting, finding themselves in some of the citations.

Hofstede’s cultural dimensions in Luxembourg being as follows – in short: high Long-Term Orientation (LTO), high Uncertainty Avoidance (UA), high Collectivism (low Individualism), combined with high salaries and a very good healthcare system, with high fringe benefits, seem to attract talent to Luxembourg. All these attributes, together with the trilingual public education system, representing a challenge for every pupil and parent, working in Luxembourg, is attractive, despite the peculiar weather.

6 FUTURE RESEARCH

Future research could focus first on transformational leadership and on change management in Luxembourg. “How to make change happen in multicultural, multilingual Luxembourg?” “What are the differences in ‘change management’ between Luxembourg and the rest of the world?” or: “Is change fast or slow in Luxembourg?” Another path of further research could be: “Smart City Luxembourg?” Future research could also focus second on talent search in Luxembourg, in combination with responsible and smart leadership, and linguistic and cultural specificities. The research question could be: How to find the talent your company needs in Luxembourg? How to attract the right people? How to train the existing people? The title could be: “In search for talent in multilingual, multicultural Luxembourg.”

WHAT IS SUCCESS OR FAILURE IN M&AS? A STAKEHOLDER PERSPECTIVES

Schriber, Svante1; Meglio, Olimpia2

1Stockholm Business School, Stockholm University, Stockholm, Sweden
2DEMM, University of Sannio, Benevento, Italy

ABSTRACT

Success and failure arguably are the soundboard concepts in acquisition research. So far, the academic debate has been primarily concerned with measuring performance and assessing success and failure from the shareholders’ perspective. In this paper we offer a different view. Several stakes, and therefore stakeholders, are touched on by acquisitions. Consequently, we propose to conceptualize success and failure needs in the light of the stakeholder perspectives. We achieve this aim by critically analyzing some of the most common approaches in extant research and elaborating a perspective explicitly building on organizations as comprising a multitude of stakes. In turn, this allows broadening the debate to discuss for whom acquisitions may be a success, how stakes change over time, and point to both common biases and overlooked insights. In so doing, this study contributes to critically assess and complement existing hegemonies in conceptualizing success or failure in acquisition research. It thereby serves to increase success or failure construct clarity and sensitivity to nuances, variations, dynamics, and overlapping interests in one of the most common strategic tools with far-reaching consequences to societies, firms, and individuals.

Keywords: mergers and acquisition, success, failure, acquisition performance, stakeholders, multiplicity of performance measures, acquisition outcomes.

INTRODUCTION

Success and failure are soundboard concepts in acquisition research. Strategic management perspective typically stresses acquisition success as vital to increase firm competitiveness and the many explanations for this are in focus. (Harrison et al. 1998, Zaheer, Castañer and Souder 2011). Increasingly, concerns are raised about the operationalization of acquisitions outcomes. Since the very perception of success or failure depends on how success and failure are measured, several scholars have convincingly advocated for paying more attention to the measures of acquisition performance.
As a result, research has focused on the technical aspects and resulted into ever finer nuances of success or failure both in aggregate meta-measures (King et al., 2004), and specific measures (e.g. Lubatkin and Shrieves, 1986; Zollo and Meier, 2008; Cording et al., 2008).

We contend however that important issues remain insufficiently addressed. While we see value in e.g. revealing drivers of acquisition success and failure, and identifying more precise measurements, we believe acquisition research suffers from a limited attention to what these concepts may mean. As their meaning largely has been taken for granted if not completely overlooked, we contend that most research represents a homogeneous view. More precisely, most acquisition research argues implicitly or explicitly that acquisition success or failure is best measured in financial terms, leaving a more nuanced and multifaceted understanding of these concepts yet to be developed. Before this issue is better understood, debates about what measurements to use are likely to remain fragmented, biased, and incomplete. We build on the recognition that acquisition success has received insufficient attention (e.g. Meglio and Risberg, 2010), and that potentially several important perspectives remain in the shadow of dominating research accounts.

This is the gap this paper intends to fill, that is, the conceptualization of success or failure in acquisitions. We therefore aim to answer the following: “What is success/failure in acquisitions?”. We achieve this aim by broadening the domain of analysis from the prevailing, unifying perspective of the shareholders to other, often neglected, or silenced stakeholders.

We adopt a stakeholder view (Freeman 1984) to analyze the most common approaches in extant research. In turn, this allows broadening the debate to discuss for whom acquisitions may be a success, and point to both current biases and less commonly debated insights. In so doing, this study contributes to critically assess and complement existing hegemonies in conceptualizing success or failure in acquisition research. It thereby serves to increase success or failure construct clarity (Suddaby, 2010). Second, it illustrates that different groups are typically ascribed different stakes that acquisitions might sensitize. While these are shown to be unevenly attended by acquisition researchers, we also point to interests not yet covered thus pointing to potential ‘blind spots’ in research that, if not addressed, may delimit theorizing about acquisition success, failure, and performance.

**BACKGROUND**

Acquisition research is, despite its seemingly unifying label, a number of complementary fields that cover numberless angles, and is enriched by various theoretical perspectives and empirical foci (Haleblian et al. 2009). In turn, this has encouraged a rich research searching for various performance
drivers and a corresponding interest in how performance is defined (Zollo and Meier, Meglio and Risberg 2011).

The debate seems to be polarized around the following choices: financial versus accounting measures, objective versus subjective measures, single versus multiple indicators, short term versus long term. Meglio and Risberg (2011) found that the majority of the studies they reviewed (101) measure acquisition performance as the share price variation around the announcement date. In other words, financial and objective measures dominate the acquisition field. However, some scholars claim that one can also understand acquisition performance as a set of interpretations made by the acquiring company’s executives in their attempts to understand the generating mechanisms of acquisition performance (cf. Côté et al. 1999). Therefore, objectivity and subjectivity live side by side in the acquisition field.

The multidimensional nature of acquisition performance is another important trait of the construct. Cording et al. (2008) find that acquisition performance is not one, but several measures, and that these measures tell different stories regarding how an acquisition performs. Zollo and Meier (2008) assess the measures that are used for acquisition performance, pointing to a variety of variables, and echo the claim that this concept as multifaceted. Despite these claims, research appears to provide a dominatingly homogeneous picture of the acquisition performance concept. In their review Meglio and Risberg (2011) find that even though scholars claim that acquisition performance is multidimensional, they tend to measure it along a single dimension and often use a single indicator.

Regarding the time interval of measurement, the extensive use of stock-market based measures indicate that acquisition performance is measured in a short time window around the date of announcement. When ex ante and ex post measures are compared, interestingly, they seem to be divergent, as noted by Schoenberg (2006), suggesting that initial projections suffer from lack of information that unfolds, and hence can be captured, only as the process evolves. Moreover, Zollo and Meier (2008) find that the common short-term event-study measure remains unrelated to other metrics.

From this brief reconstruction, it emerges that the concept, while treated as unitary, presents a multiplicity of meanings, dimensions, indicators and time intervals that make findings fragmented and inconclusive. Following the same line of reasoning we contend that, just like acquisition performance, acquisition success or failure are broad and ambiguous concepts but are generally treated as unitary. We also would like to outline that success does not simply mean “outcome or result”, it may also mean the degree of attainment of a desired outcome (Merriam-Webster Dictionary and Thesaurus, 2016). This, applied to the acquisition domain, means that the assessment of an acquisition as successful or not calls into question expectations of actors involved into the
process. So far, as discussed above, acquisition scholars have emphasized or given voice mainly to shareholders or top managers. These latter are given voice e.g. in interview or survey studies of acquisition performance (e.g. Kitching, 1967; Graebner, 2004; Bauer and Matzler, 2014), where the perspective of top management is accounted for. While we have no problem with research explicitly taking the perspective of managers or providing them with advice, we contend that a richer understanding can be achieved by considering other ways to define success and failure and explicitly debating about whose success or failure is primarily considered. Put differently, we believe there are other, legitimate stakes in acquisitions and that this, so far, is poorly reflected in acquisition research. Our underlying idea is to broaden the variety of ways in which acquisition success or failure might be measured, but also adding clarity by specifying an important boundary condition (Suddaby, 2010): success or failure for whom? By answering this question, we break down the unifying view of acquisitions as reflecting the stakes of shareholders or of top managers only, which are fairly well voiced in existing literature, and enlarge the domain of analysis taking into account the stakes of stakeholders other than shareholders.

TAKING A STEP BACK: WHOSE STAKES?

As discussed above, success calls into question the attainment of goals. This applied to a firm pursuing an acquisition implies that success or failure should be assessed in relation to the goals the deal is intended to achieve. Goals for acquisitions are typically broadly stated: improving competitiveness, achieving synergies, entering new markets and the like. Acquisition performance measures used so far are assumed to be suitable to account for such broad goals. Here we do not want to state the merits of various measures. Rather, we would like to outline that in assessing success or failure we should not simply take into account goals of those initiating acquisitions but also stakes touched upon by acquisitions. Of the multitude of stakes acquisitions influence, mainly those of shareholders and top managers are generally voiced in the conventional discourse. We contend that silent or silenced stakes in the decision-making process may play an important role during the post-acquisition process and have an impact on the ultimate acquisition performance. This paper takes, therefore, a stakeholder perspective (Freeman 1984). A stakeholder perspective implies considering the interests, power, and positions of various groups with an interest in a focal venture. Despite its proven usefulness in many fields in business studies more broadly, a stakeholder perspective has remained relatively overlooked in acquisition literature with some exceptions (Anderson, Havila and Nilsson 2013, Meglio 2015).

Embracing this perspective might offer several advantages. It allows bringing existing yet sometimes fragmented studies together within a more coherent framework and condensing some of the main
stakes associated with each stakeholder. It allows pointing to differences between the stakes of different stakeholders, and it is possible to sketch the stakes that are not yet described in acquisition research. If of less value in terms of mere gap-spotting in the narrow sense (Alvesson and Sandberg, 2011), this renders a liberating power to break the confinements within which goals can be expressed or thought. It therefore seems to us that a stakeholder perspective offers much by means of moving research forward with regards to what constitutes success or failure.

**ACQUISITION AS MULTIPLICITY OF STAKES**

Opening up the debate to the more fundamental issue of what stakes may be involved in acquisitions requires developing how this research has, or has not, described, the stakes of stakeholders, other than shareholders, typically involved in acquisitions. Put differently, the key to the contributions of this paper lies in discussing how each stakeholder has typically been treated in acquisition research, highlighting the stakes ascribed, silenced or even denied, and whether and how these stakes are intertwined. Our starting point is the most popular, if not sole, stakeholder accounted for by extant research; the shareholder, and then move onto the discussion of other and more neglected stakes and stakeholders.

*Shareholders*

The traditional shareholder perspective argues that the overall goal function of a firm should be to maximize shareholder value (Capron 1999). Moreover, it has more important implications since it argues that firms not only should keep their eyes on the prize in terms of stock price, but that deviations from this rule or complementing it with other perspectives is potentially detrimental not only to financial performance but may come at a loss to societal productivity (Friedman, 1970). This view is the taken for granted perspective in much acquisition research (e.g. Lubatkin and Shrieves, 1986).

However, the notion of shareholder value must be considered simplified. Several studies have highlighted the difference in returns to acquiring and target shareholders, many of which claim that target owners gain at the expense of acquiring shareholders (Datta et al. 1992, Bruner, 2002). In sum, when we assess success or failure from a shareholder’s perspective we should clearly state whether we are considering the acquiring or the target companies’ shareholders.

*Managers*
Managers are also well voiced in existing literature. Whereas managers are typically ascribed the role of serving shareholders’ interests, this is not always true. Agency theory argues that owner-manager separation inevitably comes with potential goal deviation. For instance, managers can attempt to enrich themselves financially and in terms of status without this benefiting, or even coming at the expense of owners, as in the case of acquisitions (Mueller 1969). Indeed, Trautwein (1990) found empire-building aims to have more research support than efficiency gains.

The agency theory has been subject to huge scrutiny that has outlined several drawback (see for instance Goshal’s 2005 penetrating analysis of implications for management practices). Here we want to outline that there is a tendency to conflate the managerial hierarchy to top managers. This denies the possibility to differentiate between those in the top with an influence on the acquisition in decision process, and those set to execute it – if they get to stay. Although often overlooked in research some research has described the precarious squeeze of middle management (Meyer, 2006). On the one hand, they are expected to implement the acquisition. On the other, they run the risk of being made redundant by overlapping competencies with manages from the other firm. Thus, middle managers are at simultaneously tool and victim in acquisition processes (Schriber, 2012).

**Employees**

Employees are well represented in existing literature. Many studies have highlighted the negative effects on employees that acquisitions may have. For instance, acquisitions often are motivated by resource overlaps that offer room for efficiencies through resource reduction and redundancies (Siegal and Simons 2010). There are many studies taking an explicit perspective that highlights the effects on employees (Seo and Hill, 2005), pointing to stress, anxiety, fear of job loss, identity challenges, conflict (Meyer 2008), cultural clashes and the like. The fundamental view conveyed, therefore, is one where employees wish to avoid uncertainty, keep their jobs, remain unaffected by new identities, keep existing power order, and not have basic assumptions and other cultural aspects altered.

While one can easily sympathize with many of these, they are not necessarily complete or always true. For instance, Teerikangas (2010) showed that target employees may well stand to win from acquisitions when the situation before was uncertain. Thus, the aim to keep uncertainty low may well remain, but acquisitions might actually reduce it, rather than increase it. Moreover, while acquisitions can challenge existing status or power orders (Meyer, 2008), this does not by necessity mean a change for the worse. There is enough evidence in research of poor working conditions in non-acquisition settings to suggest that while acquisitions may well make matters worse, this might not be the entire picture. For instance, Cooke (2006) found that employees can experience both benefits and drawbacks, simultaneously: acquisitions by foreign firms into China often leads to higher wages, but also tighter
performance controls of employees. Put differently, some efforts may be welcomed, others less so, but this granularity is often lost in acquisition research.

Moreover, when distancing oneself from the literature it is possible to see that there is an understandable but limiting emphasis on current employees. Put differently, although completely legitimate and more concrete, current employees only constitute one potential stakeholder group. If one takes a broader, temporal perspective (Shi, Sun and Prescott 2012) another hidden group in acquisition research appears, the one made up of potential employees who are rarely receiving a matching level of attention. Concretely, successful acquisitions leading to firm growth opens up to new employments. The worry explicated in much acquisition research is that this merely increases the number of people exposed to a variety of stress, anxiety, and job loss (e.g. Seo and Hill, 2005). In sum, while strategy research is concerned with acquisitions as means to firm growth, organization behavior research has not been equally concerned with overlapping interests between managers and current employees, or how profitable acquisitive growth offers positive opportunities to potential employees, but focused squarely on negative aspects on current employees.

Customers and suppliers

Several studies have shown how external relations may be affected by acquisitions. One of the main themes refers to loss of stability in network relations. Acquisitions encompass a broad spectrum of changes that actually cause the dissolution of business relationships with customers and suppliers (Anderson, Havila and Salmi 2000). Key personnel leaving a company, dissatisfaction produced by failure to meet customer requirements, bad reputation and financial difficulties of the acquiring company, less favorable business conditions, or product replacement may all be causes for terminating a business relationship (Öberg 2013). This in turn requires careful scrutiny of customers with the goal of reassuring them using customer relationship management strategies to nurture the business relationship with them.

Öberg, Henneberg and Mouzas (2007) showed how acquisitions can influence customer perceptions of the relation if not carefully managed through communication and symbolic efforts. Indicating the magnitude of this problem, Bocconcelli, Snehota and Tunisini (2006) showed that as many as 80 percent of customers may leave for another supplier, especially when a previously trust-based relation shifts toward increased formalization based on contractual agreements.

Suppliers are key stakeholders as purchasing is strictly related to the cost and quality of the purchased components (Holtström 2013). Acquisitions emphasizing cost savings in this function have a direct impact upon suppliers’ corporate profitability. It may imply reduced/increased volumes, generally lower prices, and compressed lead times. Revising any of these aspects may put the supplier in a difficult position. Empirical evidence about horizontal mergers shows that, on average, suppliers...
experience significant declines in cash-flow margins subsequent to downstream mergers, as a consequence of an increased buying power. Fee and Thomas (2004) further contends that purchasing gains for the merging companies depend on the type of suppliers (retained versus terminated) and the industry contexts (concentrated versus fragmented). Suppliers who are terminated after a merger experience significant negative abnormal returns at the merger announcement and significant cash flow reduction after the deal. Moreover, buying power effects are more pronounced when the merging companies operate in relatively concentrated industries.

Suppliers, just like employees, are not all alike: their relative importance might depend on the type of material/service supplied, or the existence of alternative suppliers and of switching costs. Taken together, these factors determine the type of relationship between the parties. A deal does not necessarily negatively affect the position of suppliers, yet it certainly adds uncertainty to the relationship with the merging parties and requires the renegotiation of contractual provisions. Again, the tendency also of allegedly critical acquisition research to embrace a typical competitive strategic viewpoint becomes visible in the emphasis on belligerent, rather than symbiotic relations. For instance, acquisitions leading to increased competitiveness e.g. through new innovation (Puranam and Srikant, 2007) may benefit suppliers and customers – a point rarely noted in current acquisition research.

Consultants

Acquisitions are, on the whole, typically rare events in the history of firms. This places managers at a disadvantage when conducting acquisitions, in turn creating fertile ground for consultants offering advice at various stages in the acquisition process. Although often not mentioned explicitly but considered from a competence resource, others have taken a more critical stance, openly questioning consultant loyalty to shareholder values (Parvinen and Tikkanen 2007). Among consultants investment banks play an important role. As Kesner, Shapiro and Sharma (1994) outline, the circumstance that investment banks act as agents for both the bidding and the target create conflicts of interests. Such conflicts of interest may cause bidding companies to bid beyond their financial capacity or pay a price where the target company is not worth buying. For its peculiar position, an investment bank experiences the so called “negotiator’s dilemma”, that is, choosing between collaborative tactics that create value for all the parties involved in the deal, and opportunistic tactics that yield even greater value for itself and lower value, or even no value, for the other parties. This generally produces greater premiums paid and puts at risk the achievement of acquisition goals for the acquiring firm. Of course, the position of the acquiring is weaker than that of the target, whose shareholders generally benefit from greater premium prices. Reputation effects for continued business likely mitigate self-interest by investment banks.
SUCCESS AND FAILURE MULTIPLICITY

The academic debate on acquisition success has been heavily geared toward issues to do with acquisition performance. More specifically, this debate has centered on measures within a very narrow perspective leaving some important issues unaddressed, and typically taking an explicit or implicit shareholder perspective. Within both the financial and the strategic management fields, success squarely is equaled to financial value creation to shareholders.

In turn, this has several potential explanations. One is the fundamental interest in strategic management research to produce insights to managers and, in turn, to offer increased financial value to shareholders. Another is the preference for (seemingly) objective, observable and easily quantifiable data, explaining why acquisition performance research is so heavily biased toward financial or accounting data from secondary, archival sources (Barkema and Schijven 2008) in turn associated with the proliferation of databases (Haleblian et al. 2009). Although some have drawn on other measurements such as interviews with managers (Kitching 1967), there is a dominance by financial measures, in turn reifying financial institutions and taking-for-granted a financial outlook on acquisitions.

Here we would like to discuss the role scholars play in influencing this state of affairs. Acquisition scholars play an important role in giving voice to stakes other than that of shareholders. If the majority of the stakes we have discussed in this paper are not only silent but also silenced in research, this is because scholars have not shed light on them. Reasons are many. The tendency to conformity referred to as gap spotting research (Alvesson and Sandberg 2011) is probably the most important because is strictly linked to our publishing norms in management journals and editors’ policies. Their stake is to get published in order to get promoted and this explains their tendency to reproduce the same stock of knowledge, often, with minor contribution to advancing our knowledge. Moreover, the system of peer review may promote traditional, linear theoretical development at the expense of those contributions that challenge taken for granted accounts.

Regardless of the explanations, the effect to us seems to be an unfortunate bias that however can be addressed by shifting perspective. We have argued that it is fruitful, at this stage, in acquisition research to take a step back to allow for a broader picture. Financial goals measured in shareholder value are undoubtedly important in acquisitions. This means we do not wish to detract from the value of measuring financial outcomes, but rather that the dominance of one measure can, if not discussed, risk becoming hegemonic to the degree that others are considered irrelevant or illegitimate. Moreover, we have argued that different stakeholders have not only different goals, but different sources of power upon which to base their claims. This places the various stakeholder groups unevenly in terms of their chances of influencing.
Using a stakeholder framework advances to consider new aspects of success and failure. First, considering stakeholders constitutes an important step forward from the dominating homogeneity ascribed to how acquisition outcomes are typically depicted (Meglio, 2015). This means that we simply allow ourselves to recognize discrepancies between various interest groups in organizations. Second, as we have argued, to analytically separate various groups in this manner should not detract from clear empirical overlaps. For instance, top managers are sometimes encouraged to invest in their firm, thus making managers also shareholders. Of course, this is an option open also to non-manager employees.

Third, there are sometimes clearly symbiotic interests also between distinctly different, stakeholders (Pfeffer and Salancik 1978). For instance, both managers and employees can benefit from increased competitiveness since it can offer job security (after all, managers are also hired) or room for salary increases. With mentioning this we also would like to distance ourselves from a sometimes tiresome simplification in the critique of financial figures as relating solely to an anonymous market. But more fundamentally, this also should make us sensitive to how deeply financial institutions, mechanisms, and rhetoric permeate today’s society. Thus, acknowledging both differences and overlaps between stakeholder goals stands in no contrast to seeing more fundamental powers at play.

CONCLUSIONS

The issue of success and failure constitutes the soundboard to virtually all acquisition research, as a problematic practical dimension, as the likely effect of a variety of organizational phenomena, or a recurring rhetoric phenomenon. However, this one-dimensional view of acquisition outcomes has given a preferred position to certain, typically financial effects, at the expense of others. In contrast to the richness of research often motivated by poor acquisition performance, the concept of acquisition performance itself has remained fragmented and lopsided. In particular, we have been concerned with a tendency to “technify” discussions by focusing on the merits of measurements, however mainly within a very limited scope representing a narrow interest. Success or failure, the arguably more fundamental terms, have remained in the background, thus diverting from the fact that there is an apparent lack of attention to the fundamental goals.

This leads us to consider a number of empirical and conceptual avenues for future research that appear, also in light of the shortcomings of our own paper, to carry much potential. We would welcome further elaboration on the different goals associated with acquisitions. This paper has drawn on stakeholder theory to condense and summarize research within the acquisition field. However, empirical data is needed to both substantiate and elaborate this theme. More conceptually, this research prompts further theoretical advances. This multiplicity of perspectives of what constitutes
goals, dimensions of success or failure in acquisitions, and the questioning a taken for granted view of certain perspectives or stakes are regularly subordinated, raises important questions. Potentially, any transaction could be considered from an almost inexhaustible number of perspectives. The contrast between actual research and that largely untapped potential has helped us illuminating what views or coalitions that are regularly considered as valid and point to fruitful avenues for future research. On the one hand, leaving homogeneous assumptions raises important issues such as if it becomes possible to say that a merger was a success or a failure in general or on average? Put differently: how can different interests be weighed against each other to form a balanced and coherent view of the outcome of a transaction? On the other hand, to what extent does this risk leading to a fragmentation of accounts? Is there a risk, for instance, that the fates of some become relativized by referring to benefits of others? Can this lead to the dead end of a complete relativism, making justified critique weaker? Our answer is that it is no longer possible to state that a merger was a success or a failure in general, but for whom.

ABSTRACT

Growth in the economy, changing consumer preferences, the climate for labour relations and technological progress are all exogenous events, part of an external environment to which an organisation reacts and which it does not fully control. These events all highlight the borderless nature of entrepreneurship. To ensure the success and progression of business, entrepreneurs require the ability to seize the opportunities identified and avert the threats presented by the external environment. Entrepreneurs aim to develop innovative approaches and ideas through establishing both formal and informal relationships and connections. These relationships take the form of collaborative partnerships both internal and external to the organisational network. This can be seen through partnerships with research centres, consultancy groups, other organisations and universities amongst others. However, unless effectively managed such collaborations and partnerships could be constrained through a variety of factors. Imperfections such as risk management, asymmetric information, and hold-up problems, all stand to disrupt these collaborative partnerships and limit opportunities for innovation. In order to address these issues, this research seeks to demonstrate how an entrepreneur overcomes these imperfections by adopting the open innovation model. Therefore a holistic case study will be presented to offer a deep and real story of a business in the UK. This research has been submitted to the 10th annual EuroMed academy of business (EMAB) conference focused on “global and national business theories and practice: bridging the past with the future”. This study presents a summary of the theoretical development which will be deeply developed in a further publication, a holistic case study of a Scottish small to medium enterprise, and final remarks.

Keywords: technological change, open innovation model, risk management, entrepreneurship, innovation management

THEORETICAL DEVELOPMENT

Currently entrepreneurs and research partners face multiple market imperfections in their relationships. These include moral hazard, effort provision, entrepreneurial risk management (ERM),
asymmetric information, and hold-up problem (Zsidisin and Ellaram, 2003; Smith, 2003; Moore, 1983; Liebenberg and Hoyt, 2003; Waters, 2007).

Whilst each provision alleviates some of these problems, it also exacerbates others. Focusing on some of these “imperfections” such as hold-up problem, ERM, and asymmetric information, this research focuses on the impact of these issues on open innovation.

In the digital era these imperfections frequently occur due to the difficulties to manage dynamic development of new technologies just using internal resources. Hence companies need more knowledge and expertise which are acquired by establishing new relationships with external partners (Del Giudice et al, 2011; Smith and Fischbacher, 2009). The increase of new relationships reduces costs and risk linked to innovation.

In fact the components “borrow” resources from other business and in the same time a company “lends” resources and knowledge to research centres, consultancy groups, other organisations and universities amongst others. Furthermore a company also invests in research and development to enhance the absorptive capacity and knowledge so as to create a new product or service (Cohen and Levinthal, 1990).

The present mainstream brief of open innovation evokes the classical idea of the economic institution, i.e. firms are the nexus of contracts. According to Jensen and Meckling (1976) the negotiations between the interested parties may provide efficient economic solutions. A contract could motivate each party to exploit external talent and knowledge so as to improve the innovation process. In addition, the management of property rights and patents could encourage companies to build new external relationships and invest in new research ideas.

A company makes a decision to create and buy or create or buy in reference to a need to buy the legal rights to be able to use technologies patented by others as a way of improving its own contractual position ex post. In fact it decides to exploit external resources (either tangible or intangible) in relation to the prices of the components supplied, the delivery programs, and transaction costs. In this way, a company should discover where get those resources efficiently, make a contract in order to guarantee the effective transfer of the resources, learn and absorb externally sourced resources, and manage the inter-business relationships.

Success or failure thus may depend on companies managing such imperfections and consequently the relationship with their own sellers.

This research, proposes that entrepreneurs and external partners carry out innovative initiatives using the open innovation model and that they collaborate in a scenario characterized by high risk equilibrium and partially private information, where each agent’s investment choice is public...
information. Consequently there is an opportunity to improve the innovation performance of their company. On the one hand the competition reduces these imperfections increasing the options available to both entrepreneurs and research partners in new projects. On the other hand the open innovation model enables to the companies to develop something new through the establishment of formal and informal relationships. Indeed the open innovation may resolve some imperfections such as the uncertainty associated with costs regarding delimitation of the boundaries of ownership.

On this basis we propose the following assumptions:

1. Where entrepreneurial risk management is the lead factor in the relationship between entrepreneurs and external research partners, innovation performance will be increased through technological monitoring.

2. Where asymmetric information is the lead factor in the relationship between entrepreneurs and external research partners, innovation performance will be increased through the control of rights (copyrights and patents).

3. Where the hold-up problem is the lead factor in the relationship between entrepreneurs and external research partners, innovation performance will be increased through open innovation.

The study will address these assumptions using a holistic case study in order to investigate deeply how an entrepreneur tends to overcome these imperfections by adopting an open innovation model.

On this basis, the research aims to shed light on the relationship between entrepreneurs and external research partners. The “imperfections” comprise improvements in technology that render current technology and development efforts obsolete (Robertson and Gatignon, 1998). The inability of an entrepreneur to stay abreast of technological changes, has a negative effect on costs, competitiveness of products in the market and lead-times. Although the creation of new technologies have enforced the entrepreneurial attitude of exploiting external opportunities to generate new business ideas (Schumpeter, 1934).

The research aims to answer relevant questions concerning boundaries of the company (Coase, 1937; Williamson, 1985; Grossman and Hart, 1986; Hart and Moore, 1990). In addition the analysis imperfections stemming from open innovation has been fruitfully applied to many relevant economic topics which are no longer restricted to the theory of the firm. This research complements existing studies on open innovation theory in two ways. Firstly, we will focus on specific topics which received particular attention by researchers in recent years and emphasize open questions that should be addressed in future research. Secondly, we will offer a narrative entrepreneurial journey of a business in the UK which will extend existing studies on entrepreneurship offering a different view on the borderless nature of an entrepreneur.
METHODOLOGY. THE CASE STUDY: KESTROS LTD

In order to offer a deep analysis of entrepreneurship applied to the process of the open innovation model to overcome the ‘imperfections’ of the technological change, we present an holistic explorative case study (Johnson, 2008; Yin, 2013). This case study supports new quantitative research and offers a better understanding of a complex phenomenon (Punch, 1998). In this specific case, a particular entrepreneurial journey is presented so as to show how an entrepreneur tries to face the aforementioned ‘imperfections’ by adopting an open innovation approach.

The present study analysed a British company for two reasons. First of all, enterprise culture is strongly embraced in this country (Hall and Hubbard, 1998). Secondly a sustainable endogenous economic development is promoted so as to offer a business – friendly market (Eisenschitz and Gough, 1993).

The company Kestros LTD was founded in 2009 by Manjit Mooker in the United Kingdom and was sold in 2014. The company that bought it over retained the entrepreneur for two years to run the project then he left to start a new business.

</tbody>
</table>

Table 1. Kestros LTD – general information.

The founder identifies himself as ‘a disruptive early innovator’ because his stated vision was to “change the face of healthcare”. In 2013 with the clear growth of mobile usage I recognised an opportunity in the area of outpatient management application with the capability to empower patients with a digital solution in the form of an app which would allow them to access to their own information and manage their own appointments and other aspects of their care in a single digital location. After carrying out time and motion studies around patient throughput within various sectors of the NHS I was able to both confirm that a gap existed and also convince the Health Board that this opportunity was worth exploring further. The product itself was called “Mi Checkin”; an outpatient management app which the patient can download free from the App Store which allows the patient themselves to make, confirm or reschedule appointments, provides prompts for patients about their appointments and uses GPS to guide patient through the physical environment of the...
hospital in addition to other features. Whilst, as can be seen, there are clear benefits of this innovation for the care provider the product was designed with the patient in mind and improved patient experience was the key driver throughout the innovation process. Key benefits of the product include;

- It delivers significant time savings for the hospital using the app at all stages of the process.
- It reduces the amount of missed and cancelled appointments thus saving considerable financial expense for the NHS.
- It improves customer experience and satisfaction rates by allowing them to manage key aspects of the process themselves and integrating and coordinating information they receive in terms of their care package such as; appointment times, travel directions, car parking, patient check in, updates of delays etc. through their mobile phone or tablet.
- The app delivers the equivalent of 3 to 4 Full Time Equivalent reception staff which equates to around £100k savings per year for the hospital.

Open innovation Approach

Having discovered the gap in the market and identified market opportunities, the entrepreneur decided to change traditional attitudes, cultural norms and ways of doing things within healthcare in order to develop a customer centred product which has the potential to completely disrupt the market in this sector. The entrepreneur confirmed that he adopted an open innovation model stating:

*I did adopt an open innovation approach. I took processes within the health care sector and combined these with the patients’ own mobile technology on a consent-based basis and integrated other features such as mapping and GPS technology which already existed and combined them in an innovative way to create a completely new product. Features of mobile device technology which offered potential benefits for the patient where exploited at every stage of the process and without the adoption of an open innovation approach the product could not have been developed and delivered to market.*

This innovation was generated though the collaborations with the external environment. As he puts it;

*In order to develop the product and bring the product to market the I had to collaborate with a diverse range of stakeholders which were external to my own business such as; Scottish and English Health Boards, GPs, The Care Quality Commission, Primary Care Trusts and Patient representative bodies however there was no collaboration with research centres or universities as I was able to provide the resources I needed myself without needing to think about bringing in those types of organisations. Each stakeholder involved in the project had their own agendas and priorities which created a huge range of barriers to the innovation process, the extent of which, I feel I grossly underestimated. Whilst initially I believed that I did not need to develop networks and relationships I soon came to realise as a result of going through the innovation process that I should have spent a*
lot more time developing relationships in order to overcome these barriers and build rapport and trust especially in the early stages of the process. This would in my opinion have allowed the product to be delivered to market much sooner.

Whilst the entrepreneur was willing to develop external collaboration, he was at times demotivated by significant bureaucratic barriers which needed to be overcome such as;

- Public procurement procedures;
- Data Processing Agreements;
- Internal instruments of governance;
- Contract terms and agreements;
- Policies governing integration of systems with external partners;
- Governance around information. Culture of protectionism around patient data – The hospital viewed themselves as the “guardian and protector of the patients’ information”;
- Ambiguity around ownership of data. The patients’ information is their property but if a GP writes a report then there is a question around whether the GP owns that data.

Some of these barriers can be categorised as ‘imperfections’.

**Entrepreneurial risk management (ERM).**

Regarding the ERM, Manjit claimed that:

*There were some issues around getting access to the Hospital and wider NHS systems in order to integrate the product systems both from a bureaucratic point of view and because they had never done things before in the way I wanted and needed them done. In some instances what I wanted to do could not be achieved as the obstacles were too high and other innovative solutions needed to be developed for example I was not permitted to directly access the Hospital Intranet so a parallel system was developed which worked around this problem. Inversely there were also some issues around sharing of information where the I felt the need to protect myself for example I was asked to provide commercially valuable information relating to how my technology was set up and operated which did not impact on the project and which in the end I declined to provide. In terms of risk the risk management process was both ad hoc and evolving and at times I adopted a “seat of the pants approach” and had to think on my feet to come up with solutions to problems as they presented themselves. However as I gained more experience of the stakeholders and their needs and expectations I was able to better manage these risks which included;*

- Digital data breach, loss or theft for all parties.
- Management of costs in order to stay within budget constraints for all parties.
- Building, developing and maintaining trust in the product for the Owner.
- Reputational risk for stakeholders resulting from failure to deliver on promise.
- Negative publicity for stakeholders resulting from failure of the product.
• Management of expectations of end user.

The potential outcomes of these risks for my Company could have been; loss of reputation, loss of contract, increased costs because of unforeseen delays and loss of future commercial opportunities.

Asymmetric information

Other problems were also experienced around information exchange which could be attributed not to a lack of trust but rather to miscommunication, misunderstanding or misinterpretation of instructions and expectations. In these cases the information was provided in good faith but could not be trusted.

Manjit stated that:

There were no issues whatsoever around IP. I retained 100% of the intellectual property and I made it very clear at the beginning that I was not able to design a product specifically for the Hospital or Trust and that this product was designed for the patient themselves who were free to move between different Trusts and therefore the product should move with them.

Hold up problem

A contract was stipulated to avoid any contractual hazard, e.g. hold up problem. It set out the terms of the project and the key partner (a hospital) was used to dealing with external partners on a daily basis. On this regards, the entrepreneur declared that:

Whilst I encountered challenges over an extended period of time which were significant at no time did I feel that I could not overcome them nor did I consider giving up. I will admit to being demotivated around the challenges especially at the beginning of the process where the greatest barriers to innovation were encountered but also in the final stages as I moved towards exit from the project. I feel that, looking back, of my total time spent on the project I spent 10% developing the actual product and 90% managing the innovation process in order to overcome barriers to market.

DISCUSSION AND CONCLUSION

The imperfections such as entrepreneurial risk management (ERM), asymmetric information, and hold-up problem are all capable of interrupting collaborative partnerships and limiting innovation opportunities (Zsidisin and Ellaram, 2003; Smith, 2003; Moore, 1983; Liebenberg and Hoyt, 2003; Waters, 2007).

This research shows how an entrepreneur faces these imperfections by adopting an open innovation model.

All the imperfections were noted in this case however the entrepreneurial skills attributes attitude and aptitude of the owner allowed him to overcome them or limit their impact on the innovation process.
The imperfections do not limit innovative capacity and alienation comes only from a viable sale opportunity; paradoxically, the imperfections have not been limitative but have played the leading role for open innovation.

In the aforementioned story, the deliberate strategy of open innovation is clearly evident: this implies the absorption of knowledge from a dense network of external relations, only possible thanks to technological monitoring.

According to Schumpeter’s theory (1934), the entrepreneur is the innovator; as technological perception increases, risk is minimized, confirming the essence of ERM.

Managerial literature has sanctioned that new relationships bring with it the risk of opportunistic behaviors; the protection of intellectual property is the appropriate deterrent to minimize the risk in terms of emerging strategy, however, the entrepreneur dominates all intellectual property right from the start and has to dedicate the prevalence of his time in the development of innovation. A behaviour of fact arising from the perceived risks (loss of reputation, loss of contract, increased costs because of unforeseen delays and loss of future commercial opportunities).

The current industrial conformation has made open innovation the only lever capable of generating innovation, in the absence of a phase of substantial initial investment.

The case study would seem to confirm the three assumptions; the empirical significance of a single case does not allow theorization. The research offers an interesting result to be deepened in terms of empirical – quantitative approach; a viable alternative could be the development of a parallel case for conducting a comparative survey.

On the conceptual front, risk and innovation could be linked by a cause-effect relationship, re-opening in terms of strategies the diversification of ideas, thus interpreting innovative behaviour as an escamotage that minimizes entrepreneurial risks.

A further theoretical implication plays on the role of trust within the hypothesized conceptual framework. Risks management and perception, as well as informational asymmetries, are less manageable when the level of confidence between counterparties decreases.

It might be hypothesized to affect all the “relational theory”, so extending the range of assumptions.

CONSUMER PERCEPTIONS AND USES OF SOCIAL MEDIA AROUND VARSIY CUP RUGBY: A TRADITIONAL SOUTH AFRICAN UNIVERSITY

Serra, Pamela

Tshwane University of Technology, Marketing, Logistics and Sport Management Department, Pretoria, South Africa

ABSTRACT

Globalization and technological advancements have diffused the physical confinements placed on the operations of any business. Social media platforms are new marketing channels that are global communication tools, each serving a different purpose and target market. The exponential growth of social media and technological advancements pose major difficulties, as well as the impact of the effectiveness of the current wave of technology is already established, the next surge of advancement is already upon us. Emphasis must be placed on continuously learning about trends and subsequently adapting to them. Marketing communications are a core aspect of any institutions marketing as it is used to not only create awareness but also to gain support. FGX Engage (2013) reports suggest that social media has created more awareness around the tertiary institutions sporting brands; yet, further research is needed and can be conducted to further investigate the South African tertiary institutions’ consumer perceptions of social media communications. The purpose of this study was to identify consumer trends of a traditional university and preferences with regards to social media communication platforms around the Varsity Rugby Cup. Findings clearly deciphered the most frequently used source of technology, the preferable social media communication platforms, the daily usage, as well as what time of day these platforms were most actively utilized. Attitudes and preferences concerning the introduction of online ticket purchases and a Varsity Cup application were further explored. The findings can be used to align and implement improvement strategies around the marketing of tertiary institution sport.

Keywords: Social media, social media trends, Varsity Cup Rugby, South Africa

INTRODUCTION

Social media has become an area of interest to not only marketers, but researchers, students, celebrities and many other economic, educational and socio-political institutions. This has to do with the belief that the power of globalisation has led many people to be online in order to cope and survive with the
demand of the information era (Musa, Azmi & Ismail, 2015). Today, not only are young people surrounded by media in their homes and schools, but the portability made possible by the increased miniaturization of digital media means that they can remain connected almost anywhere they wish to go. Social media is viewed as any digital media that can be used to share messages, photos, news, information, music and videos with cyber communities (Papoola, 2014). For this reason, social media heavily relies on mobile applications and websites created for social interactions which allow users to generate, express and share information about themselves and others. One of the main differences between social media and traditional media, such as newspapers, magazines, radio and television, is defined in economic terms and it’s clearly in the advantage of the online medium (Ionescu, 2013). It has been estimated that the economic impact of social media on an organization could exceed a trillion in the near future, most of which is gained from more efficient communication with their customers (Chui, Manyika, Bughin, Dobbs, Roxburgh, Sarrazin, Sands & Westergren, 2012).

With the introduction of Varsity Sport competitions at Higher Education Institutions (HEIs), a common challenge among university campus marketers specifically, is obtaining, maintaining, and increasing student attention and participation (Bayne & Cianfrone, 2013). Thus, campus sport marketing plans often aim to inform students through promotions online via social media platforms, in an effort to keep students aware of and engaged in the offered programmes and events (Bayne & Cianfrone, 2013). With this in mind, the popularity of social media sites, such as Facebook and Twitter, has impacted the sport and recreation field (Bayne & Cianfrone, 2013). Whichever social media site is used, it can be easily accessed by computer, laptop, tablet and smartphone so that communication can be instant and always on hand – at the click of a button thoughts can be shared with thousands of others (Ault, 2004; Wylie, 2014).

As social media grows and gains an increasingly larger following on a daily basis, the understanding and utilising of this markets growth potential poses immense high value to the business. Since its inception in 2004, Facebook has evolved as the global market leader of social media communication platforms. In recent earning reports, Facebook has announced 1.23 billion active users worldwide with annual revenue of R888.26 billion for 2013 (Herrold, 2014). Twitter, however, is used more for information or news-related aspects which boasts 288 million active users per month for 2013 (Gibbs, O'Reilly & Brunette, 2014). With the largest growth rate of active users for 2013 of 23%, Instagram could potentially become the new front runner for marketers to utilize (Knibbs, 2014). With the largest growth rate of active users for 2013 of 23%, Instagram could potentially become the new front runner for marketers to utilize (Knibbs, 2014).

As internet penetration keeps widening (with over 13.17 billion users of the internet today) and social media platforms continue proliferating, Whiting and Williams (2013) claimed that there is limited knowledge of why and how people use social media which is the basic foundation of the Uses and Gratifications Theory (UGT) (Katz, Blumler & Gurevitch, 1974). Students are described as the major
users of social media and therefore the Uses and Gratification Theory is an ideal theory to identify and analyse the reasons and perceptions of why they use social media (Whiting & Williams, 2013; Yoo & Kim, 2013). Some scholars such as Gallion (2010) predicted that the emergence of widespread usage of the internet would come with new changes in roles, personal and social habits of media users. Li (2005) stated that people use social media to satisfy their needs which include cognitive needs, affective needs, personal and integrative needs, social needs, tension release needs and medium appeal needs. For this social media has become a prolific research field demonstrating the direct relevance of the UGT and its participants (Matei, 2010). In this review of the related studies, the researcher synthesized and examined works of Asemah (2011), Gallion (2010) and Whiting and Williams (2013). According to these scholars, the majority of people use social media for interaction, killing time, entertainment, seeking and sharing information, socialization, education and surveillance and communication.

*Social interaction or integration* (Asemah, 2011) is one of the predominant factors for people making use of social media. One of the key functions of mass media is to be a forum for public discussions. Social networks such as Facebook and Online Forums allows users to participate and interact on various issues. People use social media to interact with family, friends, spouses and loved ones (Papoola, 2014, Whiting & Williams, 2013).

*Killing time* is another reason for people to use social media so as to be able to release any stress or tension or similarly as a form of diversion. Studies (Asemah, 2011; Musi, Azmi & Ismail, 2015; Whiting & Williams, 2013) reported that respondents used Facebook when they felt bored. *Entertainment* is unquestionably amongst the most cited functions of mass media as people often prefer to be in a good mood and kept entertained. Gallion (2010) found that their respondents solely utilised media for leisure purposes. Whiting and Williams (2013) elaborated that entertainment was achieved through listening to jokes, reading humorous comments and watching the silliest videos.

Social media allows for people to *search and find information* effortlessly. Whiting and Williams (2013) posited that people used social media to find information about deals, sales, products and on how to do things yourself. *Socialisation* according to Gallion (2010) is one of the most central functions with the desire to make new friends, sustain relationships and socialise with people are among the socialisation needs. Musi, Azmi and Ismail (2015) highlighted that their respondents used Facebook to make new and rediscover old friends.

*Education* can be regarded as one of the prime purposes of social media where people turn to social media for learning and self-education. In Papoola’s (2014) study, it was posited that respondents utilised social media for academic purposes with search engines such as Google and Wikipedia at the disposal of the online user.
Asemah (2011) stated that individuals used certain social media platforms to check on and examine what happenings within and outside their domain are taking place otherwise known as surveillance. Similarly, Papoola (2014) and Whiting and Williams (2013) reported that social media allowed respondents a wider variety to report and upload images, videos, photos and voicenotes. Communication is the last function that social media delivers on. It allows people the opportunity to express their feelings and opinions and communicate freely through the use of forums, various groups, pages, blogs etc. Whiting and Williams (2013) found that 56% of their respondents utilised social media such as Whatsapp, Twitter and Facebook to discuss, gossip and talk with their friends and receive real time feedback. This diversification of the use of media is what promotes the UGT.

As there are limited studies to revalidate the UGT in relations with social media, specifically around sport, this paper intends to apply the UGT to help explain the following:

1. To investigate whether sport consumers use social media;  
2. To examine the social networks preference among these sport consumers; and  
3. To demonstrate the relevance of the UGT in the sport consumers’ use of social media.

With having said this, it is of vital importance that the efforts put forward by the institution are accurately meeting the social media trends, needs and perceptions of the greater university sport community to ensure further growth and higher return on investments for the university’s sport brand.

MATERIALS AND METHODS

Design

This study was exploratory in nature and made use of a survey research design which is a very valuable tool for assessing opinions and trends (Thomas, Nelson & Silverman, 2015). The underlying principle for the use of this research design was that the survey questionnaire allowed the researcher to elicit the respondents’ opinions and perceptions on their usage of social media and the gratifications they derive (Thomas, Nelson & Silverman, 2015).

Sample

A purposive sampling approach was used in this study based on the accessibility and voluntary participation of the sampling pool (Patton, 2002). Purposive sampling allowed accessibility to important and in-depth first-hand information regarding the respondents’ opinions and perceptions on their usage of social media (Patton, 2002). The participating sample pool (n=209) consisted of university students (n=105), athletes (n=100) and staff members (n=4) from two of the university’s
Campuses. The spread of the sampling pool included both males and females of all ages and ethnicities.

Instrument and procedures

Lewis, Messina & Wellington’s (2014) social media questionnaire was adopted, adapted and piloted before direct distribution to the sample of respondents. The questionnaire consisted of six sections whereby participants were requested to answer questions based on the following: a) biographical information b) Practice of social media c) Types of social media platforms used d) General social media accessibility (how and when they access) e) Reasons for utilizing social media and f) Gratifications derived from utilizing social media.

Validity and reliability

With regards to the reliability of the instrument, prior the initialization of the research, the questionnaire measured a Cronbach alpha coefficient of 0.67, outlining an acceptable reliability score for the instrument and 0.69 post adaptation. The test-retest method was further conducted prior to the fieldwork so as to ensure content validity of the questionnaire.

Data analysis

The questionnaires were analysed utilising the Statistical Package for the Social Sciences (SPSS – Version 24). The results are illustrated through simple descriptive statistics such as frequencies and percentages.

RESULTS

Section A: Biographical information

Survey questionnaires were distributed to 209 respondents with 42% were males (n=88) and 58% females (n=121). The overall racial demographics of the sample group consisted of 55% African (n=114), 3% Asian (n=7), 7% Coloured (n=15), 5% Indian (n=11) and lastly, 30% Caucasian (n=62). When focusing on the current level of study, 89% constituted of undergraduate students (n=186), 6% of postgraduate students (n=12) and 5% of staff members (n=12).

Section B: Practice of social media

When it came to the practice or usage of social media, the study revealed that the majority of respondents (n=200, 95.7%) made use of social media compared to 3.8% of respondents that did not (n=8).

Section C: Types of social media platforms
Social networks have become an integral part of sport consumers’ life. When it came to their most preferable social network, 26% preferred Facebook, 24% preferred Whatsapp and 16% preferred YouTube with Twitter (12%) and Instagram (11%) completing the Top 5 preferred social networks to use due to the functions of sharing information and being able to upload and share video and photos.

![Figure 1: Preferred social networks used](image)

**Figure 1: Preferred social networks used**

**Section D: General social media accessibility**

Findings clearly illustrated that the source most used for accessibility to social media sites among the respondents were laptops (n=63, 30.4%) and smartphones (n=65, 31%) due to their convenience. On the contrary, desktops (n=30, 14.3%), tablets (n=35, 17%) and University computer labs (n=15, 7.3%) were the least often utilised.

![Figure 2: Source used to access social media](image)

**Figure 2: Source used to access social media**

The findings in Table 1 suggest that there is a distinct time frame in which the most activity occurs with regards to social media platforms and the respondents’ subsequent usage. Between 20.00-22.00,
as the highest usage period for the identified respondents (17%) followed by 17.00-20.00 (14.4%) and then 08.00-10.00 (14.2%).

**Section E: Reasons for utilising social media**

Figure 3 outlines respondents’ eight main uses or reasons for utilising social media. 100% of respondents outlined **communication** as the top use for social media usage (n=209), followed by 95.6% of respondent signalling **entertainment** (n=200) such as movies and videos as the second highest reason for social media practise. **Socialising** (n=180, 86%) via Facebook and **staying connected** and being able to **freely express** one’s opinion on forums and/or blogs measured equally by 83.7% respondents (n=175). **Staying informed** (n=170, 81.3%) and **sharing news** (n=160, 76.5%) were rated lower on the scale with only 38.2% of respondents outlining **making friends** as the least apparent reason for making use of social media (n=80).

**Figure 3: Reasons for utilising social media**

**Section F: Gratifications/benefits derived from utilising social media**

In Figure 4, the gratifications respondents derived from the utilization of social media are outlined. The most predominant gratification derived from social media was outlined as being that of
immediate feedback \((n=209, 100\%)\). 95.6\% of respondents cited diversion through the means of releasing tension or as a means of escapism as the second most predominant gratification derived from social media \((n=200)\). Being informed \((n=190, 90.9\%)\) and being entertained through \((n=180, 86\%)\) was further outlined as forms of gratifications experienced during social media consumption. Being able to express oneself was measured at \((n=170, 81.3\%)\) as a means of gratification with 165 respondents \((78.9\%)\) highlighting the function of bringing people together and limiting distance through social media as another form of gratification. Similarly important but not as popular means of gratification derived from the usage of social media was that of finding bargains \((n=150, 71.7\%)\) and support learning \((n=150, 71.7\%)\).

Figure 4: Gratifications derived from social media

**DISCUSSION**

The objective of this study was to identify the sport consumer uses of social media and gratifications derived from the usage thereof with the idea of aligning or implementing improvement strategies around the marketing of university sport based on the findings.

Results illustrated that the majority of the respondents made use of social media \((95.7\%)\) which was a trend found to be prevalent in studies done by Musi, Azmi and Ismail (2015) that posited that the power of globalisation has led more people to be online in order to cope and survive with the demand of the information era.

With regards to preferences of social media platforms, this study’s findings illustrated that Facebook was the most daily utilized social media platform \((26\%)\) amongst the university’s sport consumers reaffirming its global dominance on social media platforms as expressed by Herrold (2014). Similarly, this finding echoed studies of Whiting and Williams (2013) and Papoola (2014) which highlighted Facebook as the leader of social media platforms. Likewise, Twitter and Instagram were listed as
alternative top two social media platforms postulated in Gibbs, O’Reilly and Brunette (2014) where both Twitter and Instagram were underscored as social media platforms with the largest growth rate of active users.

Results illustrated a fine margin (0.6%) between the source of a laptop and smartphones being used to access the internet amongst participants, which was a trend found to be prevalent in other studies such as Wylie (2014) where research delineated that due to the rapid evolvement and the ease of accessibility of mobile technology, traditional methods of marketing were becoming less efficient with smartphones providing a channel for followers to continually access platforms and stay connected with their brands. Contrasting Ault’s (2004) conclusion on desktops and tablets being as dominant as laptops and smartphones as sources of technology in accessing social media platform, this study measured desktops and tablets low, respectively 14.3% and 17% as sources of technology.

The time frame 20.00-22.00 prevailed as the time slot in which most social media activity occurs suggesting the gratification of diversion/entertainment as Gallion (2010) and Whiting and Williams (2013) posited that respondents used media mainly for leisure purposes with this time slot reclining within post working hours. Similarly, the less active time slots (22.00-24.00) outline the resting hours of the respondent.

This paper identified eight reasons and gratifications why students used social media which are communication, entertainment, socialising, staying connected, self-expression, staying informed, sharing news and making new friends. These showed that social media allows users to satisfy and gratify many of their needs which could not be possible in the conventional media as supported by Gallion (2010), Papoola (2014) and Whiting and Williams (2013).

STUDY LIMITATIONS AND IMPLICATIONS FOR FURTHER RESEARCH
A distinct limitation of the study was the fact that the sample size was generated from only one university within the Varsity Cup Rugby competition. The results of the study can therefore not be generalised to the sport consumer populations of South African universities. Further research could include more universities within the competition of Varsity Cup Rugby to gain further insight of the tertiary institutions’ sport consumer trends on social media. Finally, due to the ever-changing nature of social media communication platforms, future studies should account for the technological advancements, forms and updates.

CONCLUSION
This study explores the UGT in the usage of social media among sport consumers pertaining to the Varsity Cup Rugby. The use of social networks among the sport consumers at university is becoming
omnipresent indicating that these social networks have become an immense part in the life of the sport consumers. More studies regarding the impact, be it positive or negative, of social media on sport consumers across all sporting competition platforms should be conducted. The study further outlined that the Uses and Gratification Theory is a valid and relevant communication theory when it comes to social media studies and therefore is a contribution to both literature and to the theoretical framework of mass communication. By understanding the uses and gratifications derived from different social media platforms, universities’ marketing departments can build a two way dialogue with their sport consumers and in turn build and improve on their marketing strategies and in turn sporting brand.

OWNERSHIP STRUCTURE AND FINANCIAL PERFORMANCE OF COMPANIES IN THE FRENCH STOCK MARKET INDEX CAC 40: IS THE FRENCH GOVERNMENT A PERFORMING SHAREHOLDER?

Spurr, Michael1; Goehlich, Veronique1; Fournier, Guy2

1Pforzheim University, International Business, Pforzheim, Germany
2Pforzheim University, Global Process Management, Pforzheim, Germany

ABSTRACT

The French state’s shareholdings constitute a distinguishable exception in comparison to equally developed industrialised countries and their financial markets, with respect to the degree of state ownership and its significance to the overall national economy. The French government’s agency for administering the state’s investments in public listed companies is a substantial investor on the stock exchange and holds a portfolio of several billion euros. Thereby, the shareholdings in companies that are part of the leading French stock market index “Cotation Assistée en Continu 40” (CAC 40) are of quintessential interest due to their financial weight, publicness and external image. Therefore, an analysis of the interdependences of (state) ownership in public listed companies and their economic performance will aid in evaluating the economic viability and meaningfulness of such investments.

Consequently, this paper examines the relation between the type of shareholder and the financial performance of the CAC 40 companies, by comparing the degree of voting shares held and the respective financial indicator in a correlation analysis. The sample consists of the 40 listed companies in the CAC 40 stock market index in the period of 2012 to 2015. After considering the national differences and specific features of French shareholder types, the results indicate an overall inferior performance of state shareholdings. Rather than identifying an across-the-board superior ownership form, each of the other shareholder types seems to excel in a certain category depending on their individual motivations and viewpoints.

Keywords: State ownership, state shareholdings, French stock market index, CAC 40

INTRODUCTION

In a 2014 study the Organisation for Economic Co-operation and Development (OECD) examined the degree, size and significance of state-owned enterprises within the OECD countries in 2012. The results varied greatly from country to country, however overall, majority and minority state-ownership was
still common despite numerous privatisation efforts. The study identified that sectors of strategic importance for the broader economy such as network industries (gas, electricity, telecommunications, and transportation) are coined by a high degree of state involvement. Yet, on average state-owned enterprises were only responsible for 2.5% of national employment in the OECD countries. Furthermore, the study showed the importance of the state as a shareholder in listed companies on national stock exchanges. Considering the corporate forms of state ownership, 31% (by value) of state-ownership were held in listed majority-owned companies.

Among the most advanced and largest economies represented by the Group of 7 (G7) France overwhelmingly employ the most working people with 2.54 million jobs depending on companies with state-ownership. Additionally, the state involvement of the French government measured by market value (279 billion USD-dollars) exceeds all other G7 countries except Japan. Especially compared to its European neighbour country Germany, the Hexagon’s surplus of 147 billion US-dollars seems impressive. (OECD, 2014)

This raises the question if the strategy of the French government is the right one and especially if the state as a shareholder outperforms other types of shareholders. To clarify this question, we will first show in a literature review the link between ownership and firm performance and explain the different types of ownership in France. In a methodological chapter, we will then examine how to measure the financial performance of companies and describe the used sample to measure the performance in France. Finally we will analyse if the performance of state owned companies is more performant than others in France.

**LITERATURE REVIEW**

*Analysis of Ownership and Firm Performance*

The financial literature on the analysis of the interdependences between ownership and firm performance is extensive and has been a continuous topic of interest during the last decades. Due to historical factors, economic circumstances and the evolution of financial markets, the context and conditions of these analyses varied to the same degree. Studies differentiate between the regional or global scope, the measurement of firm performance as well as the type of ownership to be analysed. One can distinguish between the concentration of ownership, i.e. shares held, the nature of the shareholder as well as the distinction between main, second and third, i.e. majority and minority, shareholders. (Mard et al., 2014)

The analysis of the interdependences of ownership structure on firm performance fundamentally stems from three central hypotheses. The “convergence in interest theory” by Jensen and Meckling, which is
based on Berle and Means (1932) work, concludes that a higher degree of managerial shareholdings will lead to a great focus on value maximization as executives participate from the firm’s performance. In contrast, the “neutrality hypothesis” of Demsetz (1983) reasons that a company’s performance is dependent on restrictions within the environment of an enterprise and thus the type of ownership structure is irrelevant. Lastly the work of Shleifer and Vishny (1989) presents the “entrenchment hypothesis” which argues that executives holding a large amount of shares will not be easily inclined to unite the interests of smaller shareholders. Various empirical studies on the degree of ownership as well as its structure have tried to confirm the theories, however a concluding statement concerning the relationship of ownership and firm performance cannot be made. (Séverin, 2001)

Due to the importance of context concerning such studies, a large amount of regional analyses has been performed. As the assessment of state ownership forms the cornerstone of this paper, a number of country-specific studies will be presented in the following. Yu (2013) lists and summarises several key studies on the dependences of state ownership and firm performance. China marks a special case due to the country’s economic and political developments in recent decades as well as due to the significance of the Chinese state as a shareholder on the stock exchanges. The presented studies examine time periods from 1991 to 2004 whereby different samples of Chinese public listed companies were researched. However, the results vary greatly. Whereas Qi et al. (2000), Sun and Tong (2003) and Lin et al. (2009) observe a negative relationship between state ownership and firm performance, Wei and Varela (2003), Tian and Estrin (2008), Wei et al. (2005) and Hess et al. (2010) identify a U-shaped relationship. Furthermore, Hovey et al. (2003) observed no relationship and Sun et al. (2002) analysed an inverted U-shape interdependence. (Yu, 2013)

Chen et al. (2009), in analysing Chinese listed companies in the time frame 1999 to 2004, points out that in the case of China state ownership appears in the form of different state asset management bureaus and state-owned enterprises affiliated to local or central government, so that these should be distinguished between each other. This further highlights the importance of national differences when examining the influence of ownership structure. They conclude that enterprises owned by central government outperform other state-ownership types as well as private investors. (Chen et al., 2009)

In further regional studies, Ahmad et al. (2008) identified a superior accounting performance (measured by the return on assets) as well as a better performance on debt, growth and profitability of Malaysian government linked companies compared to non-government linked companies. In a sample of Saudi-Arabian listed companies (2000-2003), Eljelly (2009) observed an outperformance of listed government related companies compared to private listed companies measured by the return on assets, return on equity and net profit margin. A further positive relationship was analysed by Rafiei (2014) in
examining the Tehran stock exchange from 2009 to 2011. The results showed a significant positive effect of state ownership on performance and dividend pay-out.

The regional studies show that it is essential to recognise national differences, as was concluded based on the OECD study on state ownership in OECD countries. It is due to these national differences, that it is necessary to look at studies performed in the European and specifically French context, to achieve a certain degree of comparability. Mard et al. (2014) studied the connection between ownership structure and performance of French listed companies in the “Société des Bourses Françaises 250 index” from 2004 to 2008. Due to the relative inexistence of studies that combine the degree of ownership as well as the nature of the shareholder, they performed their analysis of shareholder concentration and type, and identified a U-shaped relationship concerning the degree of shares held by the main shareholder independent of the type of shareholder. For the second and third shareholder, they analysed a curvilinear-convex relationship. With respect to the state shareholdings, they identified a negative correlation with the companies’ profitability (return on assets) as well as market value (Tobin’s q). Mard et al. (2014)

To thoroughly prepare the analysis and interpretation of results, it is required to analyse the types of shareholders and ownership in France before examining their respective impact on the CAC 40 companies’ financial performance.

**Shareholder Types in France**

In France, as in the majority of capitalist countries, several different types of shareholders can be identified. The most wide-spread and important forms are management and executive shareholders, family shareholdings, financial institutional investors (banks, insurances, investment firms) industrial shareholders and the State as a shareholder – the State shareholder. (Mard et al, 2014) This structure of shareholders is in line with La Porta et al. (1999) who defined family or individual shareholders, State shareholder, financial institutional shareholders (bank insurance company) and lastly miscellaneous shareholders.

The French model of corporate ownership is considered an insider model due to the high concentration of ownership, whereas the outsider model – defined by a wide dispersion of ownership – can be found in the United Kingdom, the United States and most of Continental Europe. La Porta et al. (1998) identified the historical relevance of shareholder regulation and protection as being integral in the shaping of ownership structures. In the case of France, Murphy (2005) determined a number of historical developments that shaped the ownership structure in the Hexagon. Firstly, a series of severe economic volatility starting with the rise and fall of John Law’s Mississippi Company, followed by the hyperinflation during the French revolution and lastly the demise of “Crédit Mobilier” and “Union
Générale” in the nineteenth century, lead to the necessity of self-financing of companies and thus the facilitation of a high ownership concentration and the prevalence of family ownership. Secondly, according to Murphy (2005), the engagement of the state in the economy can be traced back to the 17th century when Jean Baptiste Colbert (controller general of finances) was responsible for initiating considerable state involvements. Additionally, he analyses that alternating waves of nationalisations and privatisations during the last centuries influenced the balance between companies and the state, and thus cemented the importance of the French state. Lastly, the “pay-as-you-go system” (Murphy, 2005) in pension funding has led to an absence of fund and insurance investment and thus the importance of financial institutional investment is less relevant as compared to the United Kingdom or the United States. (Murphy, 2005)

State Shareholdings

In 2004, the French government established the “Agence de participations de l’État” (APE, decree n°2004-963, 9 September 2004) as an organisation of national competence under administration of the Ministry of Economy. The decree stipulated APE’s objective, as being the administration of the state’s shareholdings, whereby indirect and direct, as well as minority and majority participations of the French state were considered. (SGG, 2004)

In the financial year 2014-2015, APE controlled a portfolio of participations that was valued at 110 billion Euros and which paid 4.1 billion Euros in dividends to the French state’s general budget. Moreover, the companies in the state’s portfolio accumulated approximately to a combined 1.8 million jobs. These numbers show APE’s economic significance to France. Furthermore, it illustrates APE’s mission statement which specifies the goal of the state shareholder as being an investor in companies that are judged of strategic importance to the country, to stabilise their capital and potentially accompany them as they develop and transform. In light of APE’s strategic considerations, the agency has defined four economic sectors of national importance to the French state. Thus, the agency holds investments in the following industries: energy, heavy industry, services and transportation. Michel Sapin (Minister of Finance until 2017) and Emmanuel Macron (Minister of Economy, Industry and Digital Affairs until 2016, French President since Mai 2017) specified in the annual report 2015 the French state’s shareholding strategy. Firstly, the state acts as a long-term investor and aims to conciliate the strategy of the companies that are held by the state with the state’s strategy for France. Secondly, the state shareholder aspires to be a model for other shareholders concerning its social and environmental responsibility. (APE, 2015)

Whilst the French government is exclusively positive concerning this system, there are also critical voices existent, which condemn “the great return of state capitalism” (Ben-Abdelkader, 2014). Data provided by INSEE (national institute of statistics and economic studies) shows that in the period of
2007 until 2014, the French state’s shareholdings increased by 76%. In 2012, there were 1500 companies where the French state held a majority share, and 500 companies that were held by a minority share. (Ben-Abdelkader, 2014)

Amongst all the OECD countries, France holds the largest minority shareholdings measured in market value of its participations (160 billion US-dollars) and thus show that France most excessively makes use of this instrument. (OECD, 2014) Thereby it is relevant to refer to the discussions regarding the “Loi Florange” (Florange law). The Florange law stems from the closure of two productions sites in Florange (north-west of France) by ArcelorMittal. The loss of jobs induced the French government to introduce this law that obligates companies to make all possible efforts to find a buyer before closing a production site. The most discussed article however related to double voting rights, as the law offered the possibility to implement the principle, that shareholders of a minimum of two years, are automatically granted double voting rights. Additionally, it gave companies the possibility to deactivate the 30%-threshold that, when reached by a single shareholder, obligates that shareholder to make an offer to the other investors. (Financial Times, 2015)

As the French state is not a speculative investor, it can build on these two provision of the Florange law to increase its voting rights without buying additional shares. With more voting rights, the state can consequently further influence a company’s strategy and impede hostile takeovers. The introduction of the law was heavily criticized by investors, however for the French state it provides a mean to enlarge its influence without additional costs and in continuing to collect dividends. As such it implies the state shareholder – which was presented as a “transitory step” on the route to a liberal capitalism – has turned into the French state’s long-term strategy. (Ben-Abdelkader, 2014)

Family Shareholdings

In France, the concept of family shareholders is not only limited to the sector of Small and Medium-sized Enterprises (SME) but also exists among the largest listed French companies of the CAC 40 stock index. Especially companies that have specialised in the industry of high-end luxury products and services are predominantly held by family shareholders. The internationally most well-known French brands and manufacturers are largely controlled by the members of one single family. Pernod Ricard, LVMH, L’Oréal and PPR (Kering) are only a few examples of corporations that are managed by a family’s second or third generation and that have a long heritage as well as history. These large groups exhibit the significance of family shareholdings to France – both economically and culturally. (Wood, 2011)

One reasoning that explains the phenomenon of strong family ownership in France looks at the historical financial traumas during the last centuries which prevented a wider dispersion of ownership. The need for self-financing translated to the necessary presence family- or individual-funding and also
cemented the intergenerational nature of family ownership. In the 1930s, the then French prime minister Edouard Daladier condemned the “grandes familles” (Power dynasties) that controlled financial markets, business life and the press. Even though Anderson (1965) disproved the existence of the assumed two hundred large dominating families, the concentration and prevalence of family-ownership can still be observed today. (Murphy, 2005)

Mard et al. (2014) highlight that family shareholders are very conscious and concerned about their (family’s) reputation. However, the researchers debate the danger of a “rootedness” in the companies’ management to the extent that family shareholders, to preserve controlling power over the firm, might be induced to refuse the implementation of transparent communication systems and effective governance structures. (Mard et. al, 2014)

In 2015, France held the third place concerning the percentage of listed companies under family control (>25 %-share voting rights or capital) in a European comparison. Approximately 30 % of listed companies were family-controlled, compared to an average of 17 % among all 31 examined European countries. Solely Italy and Belgium displayed a more elevated degree of family control. (FEAS, 2015)

Financial Institutional Investors

Financial institutional investors are the largest group within the CAC 40 stock market index, however there are some difficulties to structure and group the different types of institutional investors amongst each other. In 2013, 32% of the shares in the CAC 40 index were held by financial institutional investors. (Mard et. al, 2014)

This type of shareholder can be differentiated based on its status, its origin and its behaviour and degree of involvement in the management of a company. Overall, one can structure institutional investors in three categories: Mutual investment funds (“Les Organismes de Placement Collectif” (OPC)), insurances and pension funds. (Oheix, 2007) Moreover, different types of institutional investors are characterised by their degree of participation and intervention in a company’s management. As such they can be classified in active and passive investors. An institutional investors’ involvement is dependent on the investment horizon, the level of participations (percentage share) and the nature of the relationship between investor and company. In light of these differentiations, financial institutional investors can operate as active shareholders and influence a company’s decision making heavily, however they can also be passive investors that only earn the dividends of their investment and want to profit from a rise in share prices. (Sahut and Gharbi, 2010)

Institutional investors are often accused of only focusing on the short-term benefit of their investments, and as such pressure the executives of a company to favour decisions that profit the corporation in the short-term. In that manner, financial institutional shareholders would be ready to accept the impediment of important long-term value creation. (Mard et. al, 2014)
Industrial Shareholdings

Share ownership of non-financial companies in France – industrial shareholdings – experienced a period of decline from 1977 up until 2013. Whilst the degree of industrial shareholdings was at around 30% during the 1970s, the ownership percentage of non-financial investors halved until 2009 when it stabilised at around 15%. However, from 2009 until 2013 non-financial shareholdings in France increased again to about 22%. (OEE, 2013)

Mard et al. (2014) argue for a comparison of the Japanese “Keiretsu” system of investments and linkages amongst the largest Japanese companies, with the French and Swedish system of mutual investments by the large corporations and groups amongst each other. The researchers indicate the loss of flexibility and the difficulties with respect to governance questions as being drawbacks of this shareholder type. Central to industrial shareholdings is their long-term strategic interest. As such, companies often cooperate and collaborate on certain common products or projects. (Mard et. al, 2014)

A prominent example of such a long-term industrial cooperation is the case of Renault-Nissan in France with Daimler in Germany. In 2010, the two companies exchanged a certain degree of share ownership to consolidate their industrial partnership. The two car manufacturers agreed on the cooperation concerning the development of small vehicles, utility vehicles, power trains and electric vehicles. Through this partnership Renault-Nissan and Daimler aim to save costs by sharing investment expenditures, to benefit from economies of scale and to profit from the specific qualities of the other manufacturer. (Pluyette, 2010)

Employee Shareholdings

In contrast to Mard et al. (2014) who defined the category of managerial and executive share ownership, this study will broaden the perspective and highlight the significance of employee shareholdings in French listed companies.

Before elaborating on the status of employee shareholders in France, it is essential to give a definition of the term. The term “Actionnariat Salarié” (employee shareholder) is defined by the French Commercial Code (le Code de Commerce). Contrary to the implied sense of the words, the term refers to a company’s “Plans Épargne Entreprise” (PEE) (employee savings scheme), “Fonds Commun de Placement d’Entreprise” (FCPE) (employee mutual investment fund) and shares of privatisations (depending on if they are still in their period of non-transferability). By implication this signifies that all the people working for a company – its employees – holding shares of that company, do not necessarily have to be considered as employee shareholders. In 2014, France was designated “European champion” (ERES, 2015) of employee shareholdings as the country accounted for 40% of employee shareholders in Europe (3,3 million in France versus 8,3 million in Europe) which held 30% of the total market capitalisation (82,7 billion Euro in France versus 286,5 billion Euro) of employee-held shares. Moreover,
the democratisation rate – the number of employee shareholders compared to the total of employees – was 18 percentage points higher than in Europe. Lastly, the share of total capital held by employee shareholders was the highest among European countries: France (3.9 %), Austria (2.4 %), United Kingdom (1.5 %), Germany (1.0 %) and Europe (1.6 %). (ERES, 2015). In 1999, the “Fédération Française des Associations d’Actionnaires Salariés et Anciens Salariés” (French Federation of Associations of Employee and Former Employee Shareholders) (FAS) launched a stock market index of employee shareholding companies (“L’Indice de l’Actionnariat Salarié” (IAS)). The index is composed of companies in the SBF 250 stock market index. Amongst others BNP Paribas, Orange, Peugeot, Safran and Vivendi are part of the IAS index while these companies are also represented in the CAC 40 index. Moreover, in 2015 a study of the “Fédération Européenne de l’Actionnariat Salarié” (FEAS) (European Federation of Employee Share Ownership (EFES)) showed, that among the twenty companies with the largest employee participation in Europe (measured by the employee-held capitalisation, ranking position in brackets), eleven were French: Total (2), Bouygues (5), AXA (6), BNP Paribas (7), Safran (8), Vinci (10), Sanofi (11), Société Générale (14), Essilor (15), L’Oréal (17) and Schneider Electric (20).

DATA AND METHODOLOGY

Measuring Financial Performance

The before-mentioned studies measured firm performance by applying a number of different indicators. However, three main measures for performance can be identified across nearly all studies (Mard et al (2014), Ammari et al. (2014) Ahmad et al. (2008), Sun et al. (2002), Tian and Estrin (2008), Wei et al (2005), Hess et al. (2010)): return on assets (ROA) and return on equity (ROE) to measure the company’s accounting performance and profitability, and Tobin’s q to measure a company’s market performance by comparing market value with book value.

Presentation of the Sample and Limitations

The analysis in this paper is conducted on the sample of the 40 companies in the leading French stock market index CAC 40. The index is a main indicator for the performance of the French financial markets and one of Europe’s most important indices. The CAC 40 displays the market sentiment and development of the French economy, so that an analysis of its components concerning the ownership structure and the financial performance will yield meaningful results. To be able to determine interdependencies between these two variables and due to the relatively small sample size, it is essential to classify the shareholders with respect to their nature. However, one must also regard that the conclusions drawn from this analysis cannot be valued as definitive and are mainly applicable in the context of this study.
The forty companies in the CAC 40 have been structured in five categories of shareholders. Furthermore, the study examines the averages for the selected financial indicators in the period from 2012 to 2015, spanning four reporting periods of data. Data was available for all companies and sourced from investment research websites. The ownership structures were analysed based on the information provided by the companies’ web presence or annual report, and evaluated according to the shareholder’s share of voting rights. Where such information was not provided the share of capital was considered assuming no deviation in the voting structure. The publication date of the ownership figures ranges from December 31, 2014 to June 30, 2016, thereby leading to the assumption that no significant changes in the structure have occurred.

Among the 40 companies there are 12 enterprises with state shareholdings, 10 with family shareholdings, 30 with financial institutional shareholdings, 12 with industrial shareholdings and 32 companies that recorded employee shareholdings.

**Explanation of the Variables and Measures**

The shareholders of the respective companies were classified – as presented in the literature review – in five different categories: state shareholdings, family shareholdings, financial institutional shareholdings, industrial shareholdings and employee shareholdings.

In deviating from the financial indicators applied by most of the existent studies (return on assets, return on equity and Tobin’s q) in the current financial literature, this study has decided to use the following measure to evaluate the firm’s respective financial performance: profitability (net profit margin and return on equity), economic development (revenue growth rate), financial attractiveness to shareholders (dividend payout ratio) as well as short-term (current ratio) and long-term financial stability (debt to equity ratio).

In the following the correlation between the group of shareholders that recorded ownership in a company and their associated financial indicator value have been calculated, so that the impact one type of shareholder has on the firm performance can be assessed.

**RESULTS OF THE ANALYSIS**

The correlation analysis of the shareholder type and the evaluated financial indicators yielded the results displayed in Table 2, and aids in examining the interdependences of the two variables shareholder and performance. More specifically it helps to answer the question: How does ownership of a certain type of shareholder influence the financial performance of a company? Table 1 shows the average values per shareholder type and financial measure.
The influence of state shareholdings shows a majoritarian negative picture. Whereas the correlation with the dividend payout ratio is positive, the relationship with the debt to equity ratio, the revenue growth rate and the net profit margin show a negative trend. Especially concerning the impact on the financial stability measured by the debt to equity ratio and the company’s profitability measured by the net profit margin (see Figure), a negative correlation can be observed (-0.35 and -0.56 respectively). It is also further notable, that the state shareholdings have the lowest net profit margin, return on equity, current ration and debt to equity ratio among all shareholder types. Lastly the return on equity (-0.04) and the current ratio (0.05) do not show a clear trend regarding the state’s influence.

Companies with shareholdings of financial institutional investors seem to be the most profitable, as this group of investors has the highest average net profit margin and return on equity. Furthermore, a positive correlation concerning the current ration and debt to equity can be observed, implying an increased financial stability. The influence of industrial shareholders is ambiguous. On the one hand, this type of shareholder leads to the highest positive correlation measured in the sample with respect to the revenue growth rate (0.73). This could stem from the increased cooperation on products and projects. On the other hand, a clear negative relationship regarding the current ration and thus financial stability can be observed.

The analysis in this paper further showed and confirmed stereotypical assumptions concerning family shareholdings. Whereas the financial caution and prudence is displayed in the lowest dividend payout ratio (66.9 %) as well as the strong negative correlation (-0.58), the long-term financial stability is significantly the highest among all types of shareholders. Lastly, the impact of employee shareholders on the firm performance gives an unclear picture. Companies with financial participation of their employees display a superior absolute profitability and a high dividend payout ratio. However, the relationship with respect to the short-term and long-term financial stability show a negative correlation. Having outlined this, it should not be neglected that the average percentage of ownership by employee shareholdings is at only 5.7%.

Table 2. Results of the correlation analysis

CONCLUSION

The initial goal of this paper was to answer the question whether the state as a shareholder outperforms other types of shareholders. The analysis was performed on the forty companies in the leading French stock market index CAC 40 for the period 2012 to 2015. The state shareholder was compared to family, financial institutional, industrial and employee shareholdings. The financial indicators applied in the study assessed the company’s profitability, economic development, financial stability and attractiveness to shareholders.

The correlation analyses showed that state shareholdings do not lead to a superior financial performance. In contrast, the analysis showed a clear negative relationship and thus degradation concerning the profitability, long-term financial stability and economic development. Notable however
is the strong positive impact the state shareholder has on the dividend pay-out ratio. In conclusion, the state shareholdings seem to have a negative impact on the firm’s performance. From an investor perspective however, the positive correlation concerning the dividend pay-out ratio could be evaluated rather favourably.

Furthermore, the analysis did not identify one type of shareholder that outperforms all other shareholders or a shareholder which provides a distinguishably more positive relationship than other shareholders. Rather, each ownership type excelled or displayed a comparably favourable in a certain category. Therefore, it is necessary to consider the individual shareholder type's viewpoint which explains their respective motivations.

Whereas financial institutional shareholders are primarily interested in their financial advantage exemplified by the payment of dividends, family shareholders are coined and their actions dominated by the intergenerational nature of preserving and passing the company on to their descendants. In contrast, industrial shareholders are concentrated on the cooperative nature of their investments and the benefits from sharing development costs. Moreover, employee shareholders are mainly interested in the financial advantages of their pension provisions and thus a secured retirement. In that same manner, the French state as a shareholder, as defined by its mission statement focuses on the alignment of the respective company’s strategy with the strategy for France. Additionally, it sees itself as a supporting and stabilizing actor of the French economy, based on the shareholdings in the four defined strategic sectors: energy, heavy industry, services and finance and transportation. Consequently, the government aims to be a role model shareholder for other investors concerning its social and environmental responsibility.

If one bases the answer to the initial question of the state being a performing question solely on the quantitative analysis, giving the answer is easy: the French state is not a performing shareholder. Depending on a qualitative analysis of the company’s performance however, could lead to different results. Moreover, despite its significance for the French economy, the sample of the stock market index CAC 40 cannot lead to conclusive answers. Thereby, an analysis on a large sample size of listed French companies combined with a multivariate regression analysis, testing an equation that has performance as dependent variable and other variables like the size of the firm, the type of industry, type of ownership etc. as independent variable would have to be conducted.

BIG DATA IN SME - FINDINGS OF AN EMPIRICAL STUDY
Sterk, Matthias; Graue, Carolin; Britzelmaier, Bernd
Business School, Pforzheim University, Pforzheim, Germany

ABSTRACT
The aim of this study is to provide an analysis of the relevance, challenges and potentials of big data analytics for small and medium-sized enterprises (SMEs) in Germany. Big data is a comparatively young topic and the literature indicates that little research has addressed big data in SMEs in a German context. Given the lack of knowledge in this field, this paper follows a rather explorative approach. Based on literature review there is a research gap for SMEs in terms of relevance of big data analytics, of affiliated challenges and risks as well as opportunities and potentials and responsibility issues. Following a multi-perspective approach, twelve experts with various backgrounds were interviewed in order to get a holistic view of the topic. Half of them are employed in SMEs; whereas the other six experts come from external consultancies and academic institutions.

Keywords: Big data analytics, small and medium-sized enterprises, SMEs, relevance, challenges, potentials, Germany

INTRODUCTION
This paper shows the results of a qualitative study, which analyses the relevance, challenges and potentials of big data analytics for small and medium-sized enterprises (SMEs) in Germany. The term “big data” is a relatively recent construct and was first used in 1997 by researchers Michael Cox and David Ellsworth at NASA (Bundesrechenzentrum, 2015), who addressed the rapid and unstoppable increase in data volumes (Press, 2013). Due to the increasing digitalization (Roßmeißl and Gleich, 2014; Seufert, 2014, Feindt and Grüssing, 2014) and an increased storage of pictures and videos, there is an ever-increasing data expansion (Vierkorn et al., 2014; Stockinger and Stadelmann, 2014). Additionally, the “Internet of Things” had made it possible to connect the digital world to the physical one for several years now (Roßmeißl and Gleich, 2014). Meanwhile, machine-generating data such as log files or sensor data are also being obtained (Stockinger and Stadelmann, 2014). This rapid growth in data volumes and availability is considered the main initiator of big data.
Due to its novelty, big data was until recently a buzzword, which was not clearly defined. However, this has changed and most companies of all sizes now seem to be fully aware of the topic.
Internationally and nationally, there are a variety of different studies on the subject of big data analytics. But up to now there is a research gap for big data analytics in SMEs, which this paper tries to bridge.

BIG DATA AND SMES

Definition of big data

There have been several independent attempts to define big data. The global management consulting firm McKinsey (2011) determines the term as follows and deals mainly with the increasing volume of data: “Big data refers to datasets whose size is beyond the ability of typical database software tools to capture, store, manage, and analyze.” Davenport (2014) agrees to that in his view of big data as “The broad range of new and massive data types that have appeared over the last decade (…)” and adds the feature data variety. Another important feature of big data is the non-negligible data velocity. On the one hand, this is the accelerating transfer rate, in which data is currently being generated in highly diverse fields of applications. On the other hand, these huge amounts of data must be analyzed within a small time frame or even in (almost) real time for the fastest possible response (BITKOM, 2014a). Dumbill (2012) refers to this third characteristic in his interpretation of big data: “Big data is data that exceeds the processing capacity of conventional database systems. The data (…) moves too fast, or doesn’t fit the strictures of your database architectures.”

For data management, Laney (2001) was the first one to define volume, velocity and variety as integrative and interdependent. His understanding of the so-called “3 V’s” is nowadays used by many specialists and organizations (Berman, 2013; BITKOM, 2014a; Miele et. al, 2013; Schroeck et al., 2012). But some experts and institutions expand the 3V model by a fourth dimension, veracity, which was initiated by IBM (Schroeck et al., 2012; Grönke et al., 2014; Baumöl and Berlitz, 2014).

“Volume”, a characteristic already contained in the name of big data, is the exponential growth of the data sets (BITKOM, 2014b). According to studies, a total of 90 percent of today’s data volumes have only emerged in the last two years (Kaufmann, 2014) and data volume doubles every two years (Fraunhofer, 2012; Dorschel, 2015). This enormous growth in global data volume makes clear that the ratio between applicable knowledge and information from existing (and disproportinately growing) data is becoming ever-smaller (Kaufmann, 2014).

“Variety” reflects the fact that data is produced in new areas of life. When considering the variety of the data, a distinction is made between “structured”, “semi-structured” and “unstructured” data (King, 2014). Structured data is extracted from ERPs, CRMs and transaction data. However, McAfee and Brynjolfsson (2012) note that they are nowadays untenable as single databases and are only suitable to a
limited extent for big data. Enterprises therefore include semi-structured data, which are created automatically and cannot be processed by standardized instruments (King, 2014). Examples are social media applications, GPS signals, sensor data, geodata, online purchases or smartphone applications (McAfee and Brynjolfsson, 2012). Unstructured data are not consistent in both, their format and structure and therefore require new technologies for processing, evaluating and filtering (King, 2014). The best-known unstructured data are emails, text documents, audio and video files or other internal business documents (McAfee and Brynjolfsson, 2012; King, 2014). Dealing with data variety is, according to Burow et al. (2014), the greatest challenge for many companies.

“Velocity” describes the increasing speed with which new data are generated, as well as the reduction of the period in which they can be used to create value (Fasel, 2014; McAfee and Brynjolfsson, 2012). Often large amounts of data with different data characteristics only provide added value if they are evaluated and analyzed as fast as possible and (almost) in real time, so that a company can act more agile than its competitors and is able to respond quickly to economically important events (Baumöl and Berlitz, 2014; Bendler et al., 2014; Mayer-Schönberger, 2015; McAfee and Brynjolfsson, 2012).

“Veracity” refers to the quality of the data in particular for its authenticity, completeness and ambiguity (Baumöl and Berlitz, 2014). Many data, such as internet videos or data from social networks, do not have high trustworthiness and represent a great risk because of the high manipulability (Burow et al., 2014).

All four elements solely describe the characteristics of big data. Grönke et al. (2014) and King (2014) point out that a single consideration of volume, variety, velocity and veracity of the data is not sufficient if big data is to create value within companies. The real additional value of big data is the creation of new insights based on an analysis and evaluation of the data (big data analytics).

This results in following definition which shall be used for this study: Big data analytics describes the processing and evaluation of constantly growing data sets with a diverse data structure in the highest possible data quality at a high speed, whose goal it is to generate economic value.

**Big data responsibility in companies**

The general responsibility for big data in companies is not entirely clear. Big data can impact many business areas, resulting in the need to coordinate new findings. Not only in business practice but also in literature, it is agreed that the departments management control and IT play an important role in the coordination process (Burow, 2014). Although according to Weber (2014), there is a lack of suitable persons who have an adequate overview of the company, management accountants are most likely to see and implement big data’s interdisciplinary opportunities due to their interaction with all management levels and functions. Burow (2014) also underlines the necessary cooperation with the IT
department, which is the enabler that provides the IT systems for the data handling. The processing (analytics) of big data is carried out by the management control department, that provides decision-makers with evaluated analysis results (Burow, 2014). However, this close interlinking of IT and management control makes it necessary, that management accountants deal with new, changed requirements (Horváth and Aschenbrücker, 2014; Becker et al., 2015; Grönke and Heimel, 2015; Michel et al., 2015).

The possible improvement in transparency through previously unavailable data from customers, products, resources, business processes, etc. is an important by-product (Gänßlen and Losbichler, 2014). Likewise, big data affects the planning and control system and can be used there. The “Internationale Controller Verein” (2014) (association of management accountants from Germany, Austria and Switzerland) mentions examples such as forecasting, scenarios or early identification.

*Definition of small and medium-sized enterprises*

SMEs economically play a very important role in Germany (Mac an Bhaird, 2010). Their importance is substantiated by the following points: More than 99 percent of German companies are considered SMEs, they employ around 60 percent of the employees, accounting for over 30 percent of the total turnover and contribute almost 55 percent to Germany’s overall economic performance. In addition, SMEs have the comparatively highest importance in Germany compared to other European countries (BMWI, 2014; Statistisches Bundesamt, 2012; European Commission, 2014).

However, there is no legal and generally valid definition for the concept of SMEs in Germany. That makes a comparability of studies on SMEs complicated (Curran and Blackburn, 2001). However, two definitions are used in science and practice: the SME definition of the European Commission as well as the one of the “Institut für Mittelstandsforschung (IfM) Bonn” (Reinemann, 2011).

The definition of SMEs by the European Commission (2003) is based on a subdivision into micro, small and medium-sized enterprises. It uses the criteria number of employees (< 250), turnover (< EUR 50 million) and the balance sheet total (< EUR 43 million). But the most widely used definition in Germany is the one of IfM Bonn (2016). It also refers to quantitative criteria, but only considers the criteria number of employees (< 500) and turnover (< EUR 50 million). The advantage of using purely quantitative aspects is the simple determination and availability of statistical data (Reinemann, 2011). However, the actual classification of SMEs often does not take place through purely numerical differentiation criteria, but also takes into account qualitative and structural aspects, which sometimes allow a differentiation from large enterprises without size limits. Similar to the quantitative analysis, there is also no consensus in determining the relevant qualitative criteria.
According to literature, one of the most important qualitative criteria is that SMEs are characterized by the unity of ownership and management (Schäfer, 2004; Reinemann, 2011; Britzelmaier et al., 2009). Additional characteristics are flat hierarchies and a personal relationships between the company and its environment. Also the legal independence, which means the exclusion of group-dependent companies from the circle of SMEs, is always taken into account (Becker et al., 2008; Reinemann, 2011; Schäfer, 2004).

Due to the novelty and complexity of big data, which leads to a lack of familiarity also with larger medium-sized companies, an own defined definition shall be used for this research. Hence, the thresholds of up to 3,000 employees and annual sales of up to EUR 600 million are set as quantitative indicators. These are subjectively determined, but are based on the analysis of various studies and the knowledge gained from them. In addition, the listed qualitative aspects are considered, but are rated as complementary and do not always have to be fully applicable to the companies under investigation. There is no application of corporate or group interlinking in this research. Accordingly, small and medium-sized enterprises which are dependent on a group are not included in the definition of SMEs.

Current state of research

Big data analytics is a very young field of research in both, the theoretical scientific view and the practical implementation in companies (Schroeck et al., 2012). Also the literature research shows that first relevant professional literature or research-specific studies have been published no earlier than 2011.

A study conducted by the Experton Group (2012) reveals, that almost 50 % of the respondents have not yet started any concrete big data activities. 38 % plan activities in the future, while only 13 % have already implemented and executed big data projects. Consequently, only about 50 % of German companies are actively engaged with the issue, while internationally 75 % of the companies already deal with big data. This rather conservative and waiting attitude towards big data in German companies is confirmed by a study conducted by the auditing firm KPMG (2014). The study shows that 47 % have neither planned the use of big data solutions at present nor in the future and only 11 % carry out pilot projects. The study also reveals that the younger the participants, the higher the potential and importance of big data are weighted. After all, the more advanced a company deals with big data, explores possible potentials and is actively involved with big data solutions, the higher the potential is also assessed.

Studies also confirm, that the responsibility of big data is often not clearly defined in companies. Due to the novelty as well as the lack of experience, interdisciplinary project teams are responsible. According to the BARC (2014) study, the departments IT (44 percent), finance and management control (39
percent) as well as those of the BI organization (36 percent) are particularly important. The same can also be observed in the actual application fields of big data. According to BITKOM’s (2014b) study report, big data solutions are particularly used in finance and management control (44 percent) as well as in IT (33 percent). Big data activities also take place in the areas of logistics (33 percent) and HR (26 percent). By far the biggest use is, however, in the fields of marketing and sales (74 percent).

In a study conducted by the professional services firm Deloitte (2014), the growing importance of big data is also apparent for SMEs. 87 % of surveyed SMEs reported that there was a sharp rise in data volumes in the recent past, which made a more intensive debate indispensable. Furthermore, 77 % of respondents strongly support the need for ever-faster decision-making due to the increasing complexity of the environment. Hence, despite the high significance of big data for SMEs, it comes as a surprise that according to BARC (2014), only 7 % use big data solutions as an integral part of business processes or 13 % have at least a pilot project. The remaining 80 % have no active discussion of the topic. Similar results are evident in the survey of BITKOM (2014b). Only 7 % of SMEs up to 499 employees already use big data solutions, whereas 64 % did not plan a concrete use of it. For comparison, 27 % of the companies with more than 500 employees already use big data solutions.

A study of the auditing company PwC (2014) takes a closer look at the surprising and paradoxical attitude of SMEs towards big data, whose importance they are aware of. It compares the familiarity with big data on the basis of different company sizes and the already mentioned lack of knowledge becomes clear. There is a correlation between company size and familiarity with the topic. With increasing company size, the familiarity with big data also increases. Only 10 % of SMEs with up to 499 employees see themselves as “very familiar” with the topic. For comparison, 60 % of the companies with a workforce of 1,000-4,999 and 65 % with more than 5,000 employees show a familiarity. This relativity thus has an effect on further results. SMEs with up to 499 employees have the highest “non-familiarity” (33 %) compared to companies with more than 5,000 employees (6 %), and see themselves not in a position to successfully integrate big data activities into company processes.

RESEARCH QUESTIONS

As shown above, most studies do not follow a specific size of companies like SMEs. They also do only differentiate very limited or not at all between qualitative features. Nevertheless, a number of studies show the strong reluctance of SMEs to deal with big data activities compared to large corporations. The main reason is their lack of familiarity with the topic. Although there are some new insights regarding big data in general, the research on SMEs is yet to mature. Their statements are often limited and very superficial. Given this background, the study aims at answering following research questions:

- RQ 1: How relevant is big data analytics for SMEs?
• RQ 2: What are the challenges and risks, but also opportunities and potentials concerning big data?
• RQ 3: Who can take the responsibility for big data activities in SMEs?

In this respect, the study shall contribute to important questions concerning big data in the context of small and medium-sized enterprises, whose outstanding importance for the German economy is undisputed.

The necessary confrontation of SMEs with big data analytics is obvious. Big data is generally a very young and complex research area, which is why in practice there are often more uncertainties regarding the handling, the concrete use as well as the potentials. Although it became clear that SMEs increasingly have problems with the subject of big data analytics (PwC, 2014), only very limited research and studies in the context of SMEs are available. This is why this research needs to be deliberately wide-ranging in order to gain the most comprehensive insights possible. The overall objective is therefore to create a holistic picture of big data analytics in SMEs.

RESEARCH METHODOLOGY

Researchers can use methods of empirical data collection to describe the reality and investigate a special topic (Bortz and Döring, 2016). It is generally differentiated between two types of measurement and evaluation; quantitative and qualitative research methods (Brosius et al., 2012; Bryman and Bell 2015). Qualitative research interpretatively processes verbal or non-numerical data and often describes a complex phenomenon in its entire breadth. In contrast, the analysis of measured values in the quantitative approach is carried out statistically and numerically (Bortz and Döring, 2016; Brosius et al., 2012). Due to the uncertainty concerning big data in SMEs, quantitative research would be unrewarding since general knowledge needs to be explored first. Therefore, the acquisition of expert knowledge seems to be the best choice as the big data issue is discussed across all companies, but there is inadequate knowledge for SMEs and the research needs are therefore very extensive. For this reason, the expertise of experts will be the focus in order to identify and analyze the limited knowledge of big data in SMEs. This justifies the use of expert interviews, although authors like Fischer (2006), Sedlmeier and Renkewitz (2013) consider them as problematic because of the lack of the sample’s representative status.

Expert interviews are part of the category of qualitative interviews (Bryman and Bell, 2015). Brosius et al. (2012), Alvesson and Ashcraft (2012) as well as Flick (2014) make clear that open questions are to be preferred in qualitative methods, because they lead to answers with larger amounts of text and thus to new knowledge. Due to the novelty of big data, it is advisable and necessary to interview experts from various areas. Thus the intention to obtain a holistic picture of the research object can be taken into
account. A multi-perspective approach is selected for this purpose and company internal and external interviewees were chosen.

Within companies, the departments management control and IT are most likely responsible for big data. Therefore, experts from both departments were interviewed in order to obtain a comprehensive picture of big data regarding the company’s internal situation. The internal interviewees are, in their entirety, employed in companies which apply to the defined subject of this study and meet the criteria. On the company external side, experts from consultancies were interviewed. While those experts are not employed in the research subject of SMEs, they do have an extensive experience in business practice due to their advisory activities and thereby contribute a more practical approach. However, since these three areas are all derived from the corporate practice, experts from the theory-led field of science were also interviewed to obtain a holistic picture. In order to provide the same weighting to all four individual areas, three experts were interviewed per area. Following table 1 provides an overview of the functions of the selected twelve experts. The expert interviews took place in the period from June 29, 2015 to August 04, 2015. At the beginning, an additional test interview was carried out.

Table 17. Overview of selected experts

After conducting and transcribing the interviews, the information obtained will be evaluated. For an analysis of such large amounts of data obtained by expert interviews, the literature pleads for the method of qualitative content analysis (Mayring, 2016; Meuser and Nagel, 2005; Bryman and Bell 2015; White and Marsh 2006), which was also used.
FINDINGS

Relevance of big data

All experts clearly expressed that big data is very relevant to SMEs. They especially regard the increasing data volume as a signal to deal with big data analytics. Anyone who does not consider this in the future will have big problems with the doubling of the data volume every two years and will not be able to master them anymore. Moreover, they agreed that SMEs are still very reluctant with regard to this topic and that there is a high potential for catching up.

Big data is often associated with negative aspects such as the espionage affair of the NSA around Edward Snowden. Nevertheless, the experts argued that the hype surrounding the buzzword “big data” was the stumbling block for awareness, which is why SMEs have become aware of the rapid development of data after all. This was also very urgent, since big data can have a strong impact on the competitiveness of SMEs. Competitive advantages can become particularly apparent when the company is in a severe recession. These newly acquired information and insights can help companies to overcome crises in order to free themselves from a crisis faster than competitors. Some experts even go so far that they consider the trend of big data as a possible factor in the market displacement of businesses.

The respondents further indicate that there is no industry that can be excluded with respect to the relevance of the current data development, as the newly gained information and the resulting findings can lead to an improved decision-making base for strategic orientations. Nevertheless, big data shows a higher relevance for such industries, which generate relatively large amounts of data. Due to data protection, big data is somewhat less relevant to companies who work with very sensitive personal data.

In addition, pioneering sectors have been mentioned, where big data is already very much addressed and applied in an advanced way. Driven by the external pressure of government and media with regard to “Industry 4.0” (high-tech strategy of German government), companies in manufacturing and other industries in particular are described as pioneering sectors. For example, big data can offer decisive benefit in mechanical engineering. With the increasing competition from countries such as China or India, it can help companies identify new cost savings potentials. Experts also see the sectors of trade, especially online trade, as extremely relevant, since a large number of electronic data, like the purchasing behavior of customers, are being generated.

Similar to the industry view, the interviewees also agreed that the impact of big data will be noticeable in all areas of the company, as there is a higher degree of interest in different analyses. Big data will have a particularly high impact on the areas of production and sales. For example, a great deal of data
is generated throughout the production process. After processing and evaluation, quality controls can be optimized or production processes can be improved and monitored more effectively. Big data can also lead to an improvement in the predictions about the quality of products. In addition, the areas of marketing and management control were frequently mentioned. According to the experts, it will also have a strong influence on the IT, as it is responsible for providing the respective tools and has to discuss them with the relevant departments.

Challenges and risks

The experts consider big data with an enormous complexity for companies, therefore a correspondingly highly qualified work force is required to effectively deal with the topic. All experts, however, agree that a lack of professional staff is one of the main reasons for the lack of debate. Various aspects can be considered in the differentiation of this finding. On the one hand, there is a lack of expertise within the company to deal with the new kind of data analysis. In the opinion of the experts, highly qualified people in the field of big data need both, very specific technical IT knowledge and a well-developed business management understanding. This combination of specialists is currently very rare on the market and especially for SMEs very difficult to get. The experts also complain that the subject matter is so new that young academics and graduates have too few points of contact with big data analytics. Consequently, there is a lack of suitable specialists for data analysis in the high-end environment. Thus, many companies only have the opportunity to engage external consultants.

This leads to a further main problem in the opinion of the experts, the extremely high costs. Some of the interviewees said that in many SMEs the information and data analysis, as well as the IT infrastructure are below average, and do not have the necessary basic prerequisites for the successful engagement with big data. One expert described this metaphorically as an “investment backlog” of the past. Due to the increasing and especially abrupt new meaning of big data, this new awareness makes it clear to many companies that they need to invest a great deal of money in the near future. These high investment costs amount to external consultants, corresponding big data tools and software, but also the time of the engagement and thus the bound personnel costs. In this context, new staff is often unavoidable; some experts even advocate the creation of new departments.

Not only the recognition of the high costs, but also the question of a corresponding budget has to be considered. Most of the experts note that in SMEs, often no or very limited budget is provided for big data topics. In this context, an expert mentioned the often inadequate cost center structure in SMEs, which makes the allocation of budgets difficult. He described this as a non-existent “global cost center” that would benefit all sectors of the company.
Also the demands placed on the IT departments are growing ever further and many experts see an overloading of the IT in many SMEs. But the inclusion of this department is essential for big data. Moreover, SMEs place great importance on data protection and, according to experts, are particularly sensitive to data handling. They are very skeptical towards big data technology innovations, especially cloud systems in the US. The reason is the fear of the lack of verifiability of access to such cloud systems, which is partly due to the negative associations against the background of the espionage scandal of the NSA by Edward Snowden. It leaves SMEs reluctant to deal with big data due to the opacity and lack of transparency of the scandal.

As a further not negligible aspect, some experts mention the prevailing demographic structures in SMEs. Many of the management positions are occupied by people of the so-called “baby boomer generation”. An expert described a large part of these persons metaphorically as “technological Neanderthals”. They are not accustomed to ever-changing technological changes and often find it difficult to adapt to the fast-moving and constantly changing technological innovations and to select the innovations relevant to their company. They are constantly confronted with new technologies - as is big data - and often do not deal with such modern topics because of the lack of knowledge and mental overload. Furthermore, some experts also referred to family enterprises, which are often run by comparatively very old owners, with a markedly lacking interest in the company management. The conservative mindset “everything as usual” is very strong and it is often difficult to convince elderly owners of the cost-benefit ratio of big data.

If SMEs do not deal with big data intensively in the near future, the experts see a number of risks. The interviewees see a strong to very strong competitive disadvantage, which can vary depending on the industry. If SMEs ignore big data’s possibilities, they cannot uncover weak spots in the company or possible cost advantages. Many experts also argued that a not confronting might have a negative impact on the market strength, or even lead to a possible insolvency, if the corresponding trends are not or too late taken into account due to the lack of information. Many SMEs often postpone dealing with big data due to the problems mentioned so far and choose a “follower strategy”. Considering the rapid data development, many experts see this as very dangerous. As there are already many first movers in different sectors, they strongly urge SMEs to follow as soon as possible. There is a high backlog demand for SMEs in this context. Especially industries in which many (customer) data are generated are severely affected. It can also have a significant impact on markets where disruptive technologies and innovations often dominate the market, as it is the case with electronics consumer goods. These risks, however, cannot be generalized, since they are often sectoral and market-related and must be examined individually.
Risks can also occur after the implementation of big data applications. Almost all experts see the main risk after the introduction of big data applications in the mere collection of data that is not used since many SMEs do not know what to do. Another risk is due to the complexity of such tools and the difficult data management. Many experts see a lack of personnel, which is familiar with the complex big data tools, and that often leads to improper handling.

Big data is characterized by the four properties of the data volume, variety, velocity and veracity. The experts agree without exception that the increase in data volume is noticeable in all companies, but the handling of the increasing amounts of data and their storage is not a big problem for SMEs anymore. Also the data velocity was only briefly mentioned as a possible problem by one of the experts. Very often, however, data variety was mentioned as one of the biggest challenges for SMEs. Problems can arise in the processing of different data structures, i.e. the linking of unstructured, semi-structured and structured data, as well as the decision which data should be integrated into which business and decision-making processes. These must then be managed with new database technologies, which then again require corresponding knowledge and personnel. Likewise, the experts consider the veracity of data as particularly important and challenging. It has to be guaranteed and is regarded as the basic prerequisite for drawing decisive value from the information.

In order to address the challenges, the experts state the necessary requirements and prerequisites. Most of them suggested that a clear, structured big data strategy should be considered ahead of the preparation. Before SMEs are concerned with a mere, unconsidered accumulation of data, they should work through the following roadmap shown in Table 2, which results from the statements of the interviewed experts:

<table>
<thead>
<tr>
<th>1.</th>
<th>Personnel-related questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Are there qualified employees? Do external people need to be involved in the big data strategy?</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2.</th>
<th>Development of a data governance model</th>
</tr>
</thead>
<tbody>
<tr>
<td>Due to the high sensitivity of the data topic: Storage duration and usage, corresponding agreements from data protection points, protection against unauthorized data access.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>

<table>
<thead>
<tr>
<th>5.</th>
<th>Concreting and consolidation</th>
</tr>
</thead>
<tbody>
<tr>
<td>What added value should and can be achieved? A purposeful use must be defined in order to make relevant statements.</td>
<td></td>
</tr>
</tbody>
</table>

Table 18. Roadmap

The experts therefore recommend a retrograde approach. Specific questions are derived from the big data strategy in order to look at what a company wants to achieve in concrete terms by using big data. Only a clearly structured big data strategy leads to a useful information gain.
As a further prerequisite, the experts advocate for a future closer collaboration between IT and the departments that would like to gain new insights from big data. An expert summarized this in such a way that the previous “corporate IT departments” have to turn into “business IT departments”. In this function, they act as internal consultants and show the specialist departments which technical solutions are available for their needs.

Big data and the new methods of data analysis can lead to cross-sectoral changes. It can have strategic implications and influence processes, systems and structures. As a result, an effective change management has the task of informing employees about these innovations and preparing them accordingly. Whereas big data is a continuous process, data must always be up-to-date and, if necessary, new data needs to be integrated. In addition, the data used must always be critically interrogated and adjusted.

**Opportunities and potentials**

The experts generally see an enormous potential for big data in SMEs. Due to the immense additional information, big data can add real value in all areas.

Big data technologies enable completely new possibilities to collect and analyze unused customer data as well as market data. In this context, the experts agree that the customer, and also the often closely connected market understanding, can be significantly improved. For example, it is possible to evaluate products and services more holistically through the new data. Thus, an earlier counter-reaction concerning poor ratings is possible (e.g. product enhancements). In addition, it is possible to better analyze customer needs. The questions “What does a consumer want?” or “What does a consumer need that he does not know yet?” are easier to answer, e.g. using unstructured and semi-structured social media monitoring data. Thus, trends in customer needs can be better recognized. In this context, the new findings of big data also enable better-customized products that are tailored to individual customers. It is also easier to find out how to use a product at the customer’s optimum level and which sales channels are the best to reach the individual customer. The mentioned aspects often result in an improvement in customer loyalty.

The interviewed experts also frequently stated that the new market forecasts also provide opportunities for SMEs to become active in new markets, as the additional data and information provide new insights of previously unused potentials. This can be based on entirely new business models, or on the possibility of entering with completely new products.

Not only on the external side, but also internally, the experts see a multitude of opportunities and potentials. Thus, a clear improvement and optimization of business processes in all areas were often mentioned. In addition, better and often faster decisions can be made, since the decision-making bases
have holistic aspects based on correct data (veracity). Frequently, unused potential savings are becoming visible, e.g. in production. This can lead to an optimization of the production costs or an efficiency increase in the process, e.g. by early identification of waste. It would also be possible to use a “predictive maintenance” to make faster and more accurate statements as to when a machine fails or when its optimum maintenance period is. In addition, an increase in efficiency can be achieved with the use of raw materials or energy. Such resource conservation can sometimes be reflected in the reduction of throw-outs. Some experts argued that the above stated points, if used correctly, can all lead to an increase in turnover or profitability.

The potentials presented can offer real value added to SMEs in many respects. Insofar as companies consider the topic of big data as extremely important and want to use it in many areas, this often has a wide impact in many areas of the company. The experts, who had taken this fact into account in their comments, would in this case advocate a linkage of the big data strategy to the company’s objectives resp. strategies.

Due to the wide range of influence in the company, it also has a great influence on the business strategy. An enterprise-internal expert, in whose SME big data analytics already plays an important role and whose use is well advanced, called such a link as inevitable. In his experience only then the significance of the subject matter can be made clear to the employees.

SMEs have advantages over large companies in many areas, including the handling and implementation of big data. The flat hierarchies, which are often typical for SMEs, result in shorter decision-making processes. With regard to big data, this time factor makes itself noticeable with a faster release of the required budget. In addition, a first pilot project can be launched and implemented more quickly, as it is easier to bring together all project participants and project managers. This time factor plays an important role for SMEs and can bring decisive competitive advantages through the faster implementation of big data technologies.

After a big data project launch, another advantage of SMEs is their higher flexibility regarding necessary adjustments such as changes in the concept or an expansion of the budget. Furthermore, some experts mentioned that faster implementation leads to comparatively quicker and more decisive decisions, which can also bring competitive advantages.

As already stated in this study, big data is, in the opinion of the experts, relevant to all companies, but the intensity of the dispute is to be examined with regard to the meaningfulness in the individual case. In this respect, some experts have mentioned another advantage of SMEs: They examine the necessary investments for big data more precisely and question the meaningfulness significantly more than it is often the case in large companies.

*Responsibility*
The experts agreed without exception, that the company’s management is to be actively involved in the task of stepping up and supporting the topic within the company. Big data has to be pushed ahead from the highest level, as it is a strategically important topic. The management must therefore deal with it and take responsibility for the fact that it must bear and ensure not only the political but also the corporate responsibility. Through the active participation and conscious support, it can ensure a corresponding enforcement within the company. An expert who has already been involved in many big data projects in SMEs has pointed out that there is no other chance and that big data has to be “pressed into the company” by the management, since the issue is top priority. If the company management does not back it, the urgency and importance of the issue is not seen within the company.

When big data is specifically addressed within a company, the experts argue that the responsibility should not lie on a lower hierarchical level, but on the executive level. This seems conclusive, as they must release temporal resources, employees and other necessary means. The interviewees, however, do not agree in their statements which department can assume the overall responsibility for big data. Nevertheless, from the different statements two departments stand out: Some experts do not see the general responsibility at the IT department, but it is very important for the implementation and use of big data. It must provide the necessary systems and tools and generate the various data, although many of them lack the corresponding business background for the analysis (analytics). Here, the department of management control was often put into play, which is most likely to have the overall overview and the appropriate know-how for the evaluations. A few experts also argued that the responsibility of the evaluation does not have to lie with the management control departments, but with the individual areas in which big data is used. Certainly, both views are comprehensible and must be examined individually for the implementation of big data in a company.

By contrast, the interview partners agreed without exception that a big data initiative should not immediately implement the new technologies and applications companywide; rather, they advise that the complex issue shall be addressed by means of a small project or use case. Otherwise, there is a great danger of not being able to recognize a multitude of problems and thus the risk that the actually desired added value cannot be claimed. The goal of such first small use cases is the creation of awareness within the company as well as the identification of advantages and added values by the initiative. Other departments get ideas on the areas in which big data could be applied to them in a profitable way as well. After carrying out a suitable use case, it is also desirable to monetize the demonstrated advantage.

Big data is a complex issue that can have an enterprise-wide impact. For this reason, the experts clearly advocate an interdisciplinary project team for the big data initiative in order to get a holistic view.
any case, they consider it essential to involve the IT department, since it must act as an internal advisor for big data applications of the individual departments.

CONCLUSIONS AND OUTLOOK

Conclusions

From the findings of this study, it can be said that SMEs have to deal with the actual core of the topic - the current data development - in all its complexity. For them there is a considerable backlog and action demand with regard to big data analytics.

In terms of RQ 1, the doubling of the worldwide data volume every two years is scientifically proven and makes a prompt discussion with the topic big data unavoidable. In this context, large companies are relatively early adopters of new data technologies. Due to the strong relevance for SMES, the quickest possible discussion is advisable in order not to lose any competitiveness in the future. If the new potentially generated data are not considered and used, the risk of a competitive disadvantage is high, as other competitors can gain clear market advantages through the information advantage. The extent to which big data has a more or less strong relevance in the individual sectors must be examined individually in advance.

Concerning RQ 2, the results show that due to the lack of professional personnel, especially SMEs are encouraged to acquire the necessary professional know-how as soon as possible either internally through appropriate continuing learning or, if necessary, (additionally) through external consultants. This is essential because the new big data technologies are far more complex than the previous applications and require corresponding knowledge. After the perception is created within a company, the advantages are pointed out and corresponding projects are regarded as worthwhile, SMEs are often faced with the increased investment costs. These should, however, not only be seen in the short but in the longer term, since big data is a strategically important topic.

Data protection plays an important role especially in SMEs and is often treated very critically. It is therefore recommended to develop and implement a corresponding data governance model that regulates the core points of data protection and the legal and ethical handling of sensitive and personal data.

Regarding RQ 3, the inclusion of the company’s management is particularly important in the case of SMEs, since big data can influence all company segments and bring corresponding values there. It is also a strategically important issue. For the first discussion of the topic, it is advisable to set up an interdisciplinary big data initiative.
Big data is a topic that also affects the IT department very much due to the new technologies. Accordingly, there must be a closer and more trusting collaboration between the relevant departments and the IT. The latter has to be more strongly understood as “business IT”, which increasingly serves as an internal consultant for the respective needs of the departments.

Outlook

The qualitative study has shown a holistic view of big data’s current situation in small and medium-sized enterprises and has thus generated a first impression. This was based - due to the lack of studies specifically on SMEs - on the generation of additional knowledge by experts. Now this impression can be refined, for example by a higher number of interviews. It is also possible to extend the present work by quantitative methods and to use the results as the basis on which a quantitative analysis can be built on.

The focus of this study was on the business background. However, the technological area or the intensive examination of specific IT technologies was less addressed. Further research needs can be undertaken here by carrying out an intensive investigation and evaluation of possible big data solutions by means of IT technologies, software or other tools.

PROMOTING INTERNET USAGE: AN ANALYSIS OF NONUSERS

Teerakapibal, Surat

Department of Marketing, Thammasat Business School, Thammasat University, Bangkok, Thailand

ABSTRACT

Extant literatures associate Internet usage rate with economic growth by analyzing data on Internet users. However, developing mechanisms to foster Internet use based on users alone may be misleading. Therefore, this study aims to investigate the underlying reason for why individuals are not using the Internet via an analysis of nonusers. The logistic regression model is estimated to fit Thai survey data which was administered to citizens across regions (Bangkok, Central, North, Northeast, and South) and area of residence (Municipal, Non-municipal) from 2013 to 2016. Empirical results illustrate the importance of urbanization in determining Internet usage rate. Interestingly, parameter estimates suggest that individuals decline to use the Internet because they do not know how to use it as opposed to limitation of broadband infrastructure or high cost of access. Managerial implications are then discussed.

Keywords: Internet Usage; Digital Divide, Nonusers, Logistic Regression.

INTRODUCTION

Benefits of the Internet have been realized by citizens virtually everywhere in the world (Robey, Gupta and Rodriguez-Diaz, 1990; UNCTAD, 2001). Not only is it able to eliminate limitations due to geographical boundaries, the Internet provides communication at a minimal cost. Only a couple of decades earlier, the global penetration rate of the Internet was merely 1 percent. This figure has grown at a rapid rate to reach 40 percent in 2016 (Internet Live Stats, 2016). Arguably, the Internet is the backbone of the digital era. According to Frederick (2016), approximately 19 percent of smart phone owners in the United States participates in e-commerce with their mobiles, a striking 61 percent year-over-year increase. At the global scale, Statistia (2016) forecasted that the B2C e-commerce sales worldwide account for 1.7 trillion U.S. dollars in 2015. Furthermore, this figure is expected to reach over 2.4 trillion U.S. dollars in 2018.

With its importance on economic growth, nations places Internet usage rate among first priorities (Chen, Gillenson, and Sherrel, 2002; Teo, Lim, and Lai, 1999; Wang et al., 2003). For instance, Brazil government aims to provide access to broadband for 50 out of every 100 households (World Bank Group, 2016). Malaysia, on the other hand, sets a goal to realize the broadband penetration rate of...
75 percent (World Bank Group, 2016). Consequently, governments employ various mechanisms to promote Internet use among its citizens with the objective to bolster its economic expansion. In particular, Chile adopted a national broadband strategy to drive advancements in information and communication technology (World Bank Group, 2016). In the United Kingdom, 1.5 billion pounds were spent to construct digital infrastructure (Curtis, 2015).

Though the Internet provides numerous benefits, its positive influences does not uniformly reach all individuals. This phenomenon has been named the “digital divide.” In particular, extant researches documented that those with higher education level, income level, residing in urban areas, greater resources will not only have better access to the Internet but will also be able to exploit its benefits in comparison to their less fortunate counterparts (Anderson et al., 1995; Benton Foundation, 1998; Hoffman and Novak, 1998, 1999; Pew Center for the People and the Press, 1995; Strover, 1999). This ultimately raises a concern as to whether the Internet will promote equality or widen the inequality gap.

While extant researches focus on examining users of the Internet, this paper aims to shed light on how to effectively promote Internet usage by analyzing nonusers instead. In particular, the objective of this paper is to answer the following research questions:

1. What are the main obstacles to access the Internet?
2. Does urbanization determine Internet usage rate?

Understanding the underlying cause(s) of not using the Internet will allow policy makers to employ appropriate mechanisms to improve Internet usage rate. This should in turn help fostering economy both at the national and global level.

The rest of the paper is organized as follows. In the next section, I describe the survey data utilized in the analysis. The logistic regression model is then explained. Next, I present the empirical results. Finally, I conclude with discussions and conclusions.

DATA AND METHODOLOGY

Data

As the objective of this paper is to examine the determinants of nonusers, it requires that the data must come from a market where access to the Internet has not reached the maturity stage at the time when data is initially collected. Therefore, Thai macroeconomic data are used for the analysis. In terms of Internet usage, more than 38 million Thais currently are able to access the Internet. This figure has grown tremendously from merely 26 million in 2013.
This paper utilizes the annual number of Thai Internet nonusers by regions (Bangkok, Central, North, Northeast, South), area of residence (Municipal Area, Non-municipal Area), and reasons for not using the Internet (Don’t know how to use, Not interested in using, Access to the Internet is too expensive, No equipment to access the Internet with, No broadband infrastructure in the area, other) from 2013 to 2016, made available by the Thai National Statistical Office. The data is collected by the Ministry of Information and Communication Technology via the Information and Communication Technology survey.

**Model**

Let $n_{ijt}$ be the number of nonusers of the Internet in region $e \{Bangkok, Central, North, Northeast, South\}$, living in area $j \{Municipal Area, Non-municipal Area\}$, at time $t$ and $population_{ijt}$ be the number of residents in region $i$, living in area $j$, at time $t$. The log-odd of being a nonuser is defined by:

$$\log \left( \frac{n_{ijt}}{population_{ijt}} \right) = \alpha + \gamma R_i + \delta A_j + \beta X_{ijt} + \epsilon_{ijt} \quad (1)$$

where $\alpha$ is an intercept term representing intrinsic log-odd of being a nonuser. This implies that a negative intercept would mean that people are more likely to use the Internet in absence of exploratory variables. On the other hand, a positive intercept would imply otherwise. $\gamma$ captures the effect of region on Internet usage decision. $\delta$ measures the impact of urbanization on Internet usage. Here, $A_j$ takes on the value of 1 if the area is a municipal area, and 0 if otherwise. Notably, municipal area is more urbanized. $\beta$ measures the extent to which each reason ($X$) contributes to the decision to not use the Internet. Lastly, $\epsilon_{ijt}$ is the random error term which is assumed to follow binomial distribution.

Parameter estimation was conducted using SAS statistical package. The GENMOD procedure fits the logistic regression by the method of maximum likelihood.

**EMPIRICAL RESULTS**

**Model Fit**

<table>

<tr>
<td>BIC</td>
<td>12084055</td>
</tr>
<tr>
<td>Log Likelihood</td>
<td>-323243437</td>
</tr>
</tbody>
</table>

Table 1: Fit Statistics
To assess goodness of fit, we employ three distinct measures: log-likelihood, Akaike information criterion (AIC), and Bayesian information criterion (BIC). AIC is developed by Hirotugu Akaike (1974) and is defined by:

$$AIC = 2k - 2 \log LL$$

(2)

BIC (Schwarz, 1978), on the other hand, can be written as:

$$BIC = -2 \log LL + k \log n,$$

(3)

where \( k \) denotes the number of parameters in the statistical model, \( LL \) represents the maximized value of the likelihood function for the estimated model, and \( n \) denotes the number of observations. Log-likelihood, \( AIC \), and \( BIC \) are calculated to be -323243437, 12084018, and 12084055, respectively.

*Boldface denotes estimates which are statistically significantly different from zero at the significance level of 0.05

Table 2: Parameter Estimates

Empirical results show that individuals are generally inclined to use the Internet as the intercept is negative (-7.3284) and statistically significant at the 0.05 level. Variation of Internet usage rate is also evident across regions and area of residence. Results illustrate that Bangkok, the capital of Thailand, is the area where Internet usage is prominent. Proportion of citizens who refuse to use the Internet is much larger in the Central, North, Northeast, and South regions of Thailand (0.2103, 0.2292, 0.1953, and 0.1552, respectively). Moreover, there are fewer nonusers in municipal area as the estimated coefficient for non-municipal area is found to be positive (0.0958) and statistically significant at the 0.05 level.

The focal variables of the analysis are the reasons why people choose not to use the Internet. Based on the Wald Chi-Square statistics, the most prominent reason is found to be “Don’t know how to use” (6.7126), followed by “Not interested in using” (5.6365), “No equipment to access the Internet...
with” (2.2788), “Access to the Internet is too expensive” (1.6301), and “No broadband infrastructure in the area” (0.4553).

DISCUSSIONS AND CONCLUSIONS

The potential of the Internet has urged governments to promote the use of Internet among their citizens. Various mechanisms have been employed to boost the Internet usage rate. However, there are still significant number of nonusers around the world. Most studies focus on analyzing Internet users in order to uncover the determinants for usage. This paper attempts to shed light on the issue with an opposite approach. Using the Thai macroeconomic data, I examine the underlying reason for individuals’ reluctance to get online.

Empirical results reveal that the most prominent reason for nonusers is the skills to use the Internet, whereas the limitation of broadband infrastructure in the area and price of Internet service come in last. This implies that governments should shift their focus from expanding infrastructure to training courses. Equipping nonusers with skills to exploit the benefits of the Internet would be effective in shifting nonusers to the user segment. Moreover, interest in using the Internet is also another reason for why individuals refuse to use the Internet. This suggests that policy makers should be proactive in communicating benefits of the Internet to citizens. In addition, providing citizens with equipments to access the Internet with would also foster Internet usage. In addition, this paper reinforces the claim made by extant researches that urbanization plays an important role in determining Internet usage. In sum, this paper contributes to both literatures and practitioners. Based on empirical results, I propose the priority of actions in promoting Internet usage.

MANDATORY DISCLOSURE OF NON-FINANCIAL INFORMATION: A STRUCTURED LITERATURE REVIEW

Testarmata, Silvia; Sergiacomi, Silvia; Fortuna, Fabio

Department of Business and Economics, Niccolò Cusano University, Rome, Italy

ABSTRACT

This paper reviews the field of mandatory disclosure of non-financial information (MDNFI) to develop insights into how MDNFI research is developing, offer a critique of the research to date, and outline future research opportunities. We find that most published MDNFI research presents normative arguments for MDNFI and there is little research examining MDNFI practice. Thus, we call for more research that critiques MDNFI’s rhetoric and practice. Thus, this paper offers an insightful critique into an emerging accounting issue.

Keywords: mandatory disclosure of non-financial information, structured literature review, external reporting.

INTRODUCTION

Corporate Social Responsibility (CSR) has become a well-established concept whereby companies integrate social, environmental, ethical human rights and consumer concerns into their business operations and core strategy in close cooperation with their stakeholders (EU, 2011a). As defined by the European Commission, CSR is “the responsibility of enterprises for their impacts on society” (EU, 2011b, p. 6).

According to the triple bottom line approach, CSR outcomes encompass economic, social and environmental dimensions (Elkington, 1998). Economic responsibility references a company’s contribution to the on-going viability of the larger economic system. Social responsibility considers the company’s impact on the local communities in which it operates, ranging from corporate philanthropy to providing safe working conditions. Environmental responsibility regards a company’s effect on the physical environment (Testarmata, Fortuna, Ciaburri, 2015).

In turn, companies have rapidly entered a dialogue with their stakeholders to communicate their CSR initiatives and interventions and their impacts on society (Freeman and Moutchnik, 2013; Gibson, 2012; Gray et al., 1995; Morsing and Schultz, 2006).

Prior research has noted the role of corporate disclosure in sharing CSR initiatives with stakeholders (e.g., Branco and Rodrigues, 2007; De Bakker et al., 2005; Parker, 2011). The early research on CSR
disclosure has primarily focused on financial reports (Deegan and Gordon, 1996; Gray et al., 1995; Gray et al., 1987; Guthrie and Mathews, 1985). Afterwards, studies have shifted their focus on voluntary non-financial reports such as social and environmental reports (Crawford and Clark Williams, 2011; Deegan et al., 2002; GBS, 2013; Gray et al., 1996; Guthrie and Parker, 1990; Roberts, 1991), sustainability reports (United Nations Global Compact, 2009; GRI, 2013; Gray, 2010; Kolk, 2004) and integrated reports (Busco et al., 2013; Cheng et al., 2014; Dumay, 2016; IIRC, 2013, Eccles and Krzus, 2010). Over the last decade, research has begun to analyse the Internet as a new tool for communicating with stakeholders (Campbell and Beck, 2004; Frost, 2005; Patten and Crampton, 2004; Williams and Pei, 1999). More recently, research has noted that in the digital age corporations are rapidly expanding their use of social media (such as Facebook, LinkedIn, and Twitter) as an instrument for corporate disclosure (see, Dumay, 2017; Alexander and Gentry, 2014; Jung et al., 2014; Paniagua and Sapena, 2014; SEC, 2013; Zhou et al., 2015).

Despite there being continual calls for over 40 years for the inclusion of additional information for investors beyond the financial in external disclosure and reporting, there is still no framework that has succeeded in achieving this end (Milne and Gray, 2013). The importance of divulging non-financial information such as social and environmental factors was recognized by EU, that issued the EU Directive 2014/95 as regards mandatory disclosure of non-financial and diversity information by certain large undertakings and groups.

Considering the fragmented development of the disclosure of non-financial information and its move from a voluntary approach to a mandatory approach, it would be interesting to see how academia is responding through research into the mandatory disclosure of non-financial information (<MDNFI>). Stemming from these considerations, the purpose of the paper is to provide an overview of the current state of the literature by developing a structured literature review (Massaro, Dumay and Guthrie, 2016) on <MDNFI>.

METHODOLOGY

Our research examines the <MDNFI>’s research foundations, so that we can establish the focus of <MDNFI> literature and offer some insights into how it may develop in the future. For this paper we use the structured literature review (<SRL>) methodology as developed by Massaro, Dumay and Guthrie (2016), that is a method for studying a corpus of scholarly literature, to develop insights, critical reflections, future research paths and research questions.

Massaro et al., (2016, p. 769) argue that:

[…] for experienced academic researchers an SLR offers an alternative approach that can either confirm one’s knowledge or open up new avenues for research to which the traditional approach may not provide
access. The latter is the likely outcome, therefore, an SLR can help experienced scholars develop new and interesting research paths by accessing and analysing a considerable volume of scholarly work.

Additionally, the SLR method complements traditional literature reviews because the approach helps to yield different outcomes that are defensible. The SLR can be useful for higher degree students and emerging scholars, allowing them to demonstrate that their literature reviews are defensible (Massaro et al., 2016, p. 769).

THE STRUCTURED LITERATURE REVIEW

In our study we adopt an SLR method to provide insights and critique that will help identify future research agenda for <MDNFI>. Essentially a structured literature review is a form of content analysis whereby the unit of analysis is the article, as opposed to words, sentences or paragraphs, as is commonly found in content analysis research (Massaro et al., 2015, p. 533). Accordingly, the review process is conducted in ten different stages shown in Figure 1.

The Literature Review Protocol

The structured literature review protocol, proposed by Massaro et al., (2016), consisting of the following steps: statement of research questions, literature search, articles impact analysis, definition of analytical framework, reliability, validity, articles coding, insights and critique, further research on <MDNFI>.

Research questions

Researchers use SLRs to map and assess the existing intellectual territory to identify future research needs (Dixon-Woods, 2011, p. 331). Before proposing a path of future research development with the literature review, we need to analyse from a critical point of view the existing field of knowledge by developing research issues. Subsequently, in the second stage we adapt the three generic research questions to focus specifically on the <MDNFI> literature.

1. How is research for inquiring into <MDNFI> developing?
2. What is the focus and critique of the <MDNFI> literature?
3. What is the future for <MDNFI> research?

The literature search

The third stage involves the selection of data sources for the review. We select articles from internationally recognised academic journals covering different disciplines, including, but not limited to, the accounting literature based on the term ‘mandatory disclosure of non-financial information’ appearing in the title, abstract or keywords of the article.
Figure 1. The process to develop the structure literature review adapted by Massaro et al. (2016)
We focus on three types of academic articles (based on Scopus, the largest abstract and citation database of peer-reviewed literature): articles by citations, articles in press and conference papers, using specific keywords. In fact, “a keyword search can help researchers to find relevant articles that extend existing topics in a particular field. Although a keyword search is a powerful tool, researchers have to be careful in the keyword selection criteria” (Massaro et al. 2016, p. 777). Furthermore, according to Cronin, Ryan and Coughlan (2008, p. 40) “keywords need careful consideration to select terms that will generate the data being sought”.

We retrieve data from Scopus database on 1 April 2017, for a period of 25 years. We used 1 January 1991 as a starting date and adopted a cut-off date of 31 December 2016. As a result, we identify 1,184 articles.

Subsequently, we examine the titles, abstracts and keywords of all the retrieved academic journals and select articles examining <mandatory disclosure of non-financial information> to ensure the articles are relevant. As a result, we identify 77 articles.

We then download the PDF versions of these articles and stored them in a public Dropbox folder with full referencing details.

*Article impact*

In the forth stage we determine the articles’ impact according to the number of Scopus citations. To do so we download from Scopus the articles’ citation data as of 10 May 2017.

We used the citation metrics to measure the article’s impact because interesting insights can come from an analysis of the number of articles in terms of citation metrics (Dumay, 2014b). Citation metrics allow researchers to understand how the literature develops and if the research topic is important, by examining the impact different articles have over time (Massaro et al. 2016, p. 774). In fact, as Serenko and Bontis (2013, p. 309) outline, “a key assumption is that there exist a strong positive relationship between the number of citations attracted by a journal and its overall quality”.

But this method can have some problems. Dumay and Dai (2014, p. 270) outline that “One problem with determining the impact from citations alone is that older articles can accumulate more citations”. For this reason we have set the period analysed from 1991 to 2015 excluding the articles published in 2016 because they may have less citations.

First, we examine the results of the preliminary literature search that identifies 1,184 articles in terms of timeline, source, author, author affiliation and country.

Figure 2 shows a noticeably growing trend of <MDNFI> articles, that reaches a peak in 2015. This is explained by the fact that the Directive 2014/95/EU was introduced in 2014. So, scholars paid a growing attention to this issue due to the regulation change.
Looking at the type of academic journals, we note a predominant interest for the <MDNFI> literature from accounting and auditing journals as we expected (see Figure 3).

Figure 4 shows the main authors that publish articles on <MDNFI>. They are K. Hussainey, J., Guthrie, C. Leuz, D. Cormier, L. Hail and E. Lee.
More interesting is Figure 5, that explains the most recurring affiliations. At the top lies the Macquarie University, University of Chicago ranks second and the University of New South Wales UNSW Australia is the third. These results show that the <MDNFI> items are mainly studied in Australia (there are six Australian universities among the first ten universities that study <MDNFI> issues). There are also a remarkable component in the USA.

Figure 6 shows the documents by country/territory. The first three countries where <MDNFI> is investigated are United States, Unites Kingdom and Australia; so, these results express a strong interest on <MDNFI> research according to the evidences outlined in the previous graph on authors affiliations.
After the first analysis, we select 77 articles examining the titles, abstracts and keywords of all the retrieved academic journals to ensure the articles are relevant. We use Scopus citations to measure the academic impact of the articles and to provide insight into the evolution of the <MDNFI> literature.

In Table 1 we report the top ten articles by Scopus citations, highlighting the authors name, the publication year, the article’s title and the total number of citations. For example, the article by Beyer, Cohen, Lys, Walther (2010) has been cited 293 times indicating that it has a strong impact on the academic <MDNFI> debate. The same consideration could be done for the article by Beattie, McInnes, Fearnley (2004), that has bee cited 206 times.

Subsequently, in Table 2 we report the top ten articles by Scopus citations per year (Massaro et al. 2016). From a comparative analysis with the results of the previous tables, we observe that some recent articles (Frias-Aceituno, Rodriguez-Ariza, Garcia-Sanchez, 2013; Campbell, Chen, Dhaliwal, Lu, and Steele, 2014; García-Sánchez, Frías-Aceituno, Rodríguez-Dominguez, 2013) appear in the list of Table 2, and each has been cited more that ten times, indicating that they have already had an impact on the <MDNFI> debate.

Table 2. Top ten articles by citations per year (CPY) - As at April 1, 2017

Define the analytical framework
To pursue an SLR, we must identify units of analysis within selected papers and treat them as independent elements to be analysed. Thus, in the fifth stage, we define an analytical framework in order to help us to organize the existing literature on <MDNFI>.

To develop this framework, we adopted the criteria used by (Massaro et al. 2016). Particularly, “as part of developing the framework three authors initially coded five articles to determine the suitability of the adopted frameworks and to determine if any other criteria or attributes needed changing, adding or deleting” (Dumay, Bernardi, Guthrie, Demartini 2016, p. 171).

The literature review reliability

Because structured literature review is a form of content analysis, we use subjective coding to analyse the selected articles because the “research is based on data generated by human beings asked to make some kind of judgment” (Hayes and Krippendorff, 2007, p. 77). So, it is important to develop particular forms of control and triangulation that reduce the “bias by integrating theories, methods, data sources and researchers with complementary strengths and non-overlapping weaknesses” (Modell, 2009, p. 209). In fact, if researchers could reduce bias they would be able to argue that their coding and analytical framework are reliable.

In fact, the reliability measure can help researchers to demonstrate that their data: “(a) have been generated with all conceivable precautions in place against known pollutants, distortions and biases, intentional or accidental, and (b) mean the same thing for everyone who uses them” (Krippendorff, 2013, p. 267). We discuss the coding system together and, after having clarified the questionable issues, we develop the remain part of the analysis.

Testing literature review validity

External validity in concerned with whether the results of a study can be generalised (White and McBurney, 2012, p. 145). In our study, we select the most representative articles of the available literature. Firstly, we do a content analysis of the selected articles reading the abstracts and, in some cases, the full content of the articles to select the articles that are more representative of the academic literature on <MDNFI>.

Article coding

We define the analytical framework and we check the framework’s reliability. After this, we code the articles we recorded the results in an Excel spreadsheet. Furthermore, we retain an open coding approach alongside coding for the pre-established categories in the framework, in case we discover any relevant new article attributes or categories.
As such, we add two of the extra three criteria to the analytical framework, after the first pass at coding, because we found new insights as we read and coded the articles. This highlights how the SLR process is not just a rigid approach, but is flexible and develops iteratively (Dumay et al. 2016, p. 172).

**INSIGHT AND CRITIQUE**

In this section we present the main research results of our analysis of <MDNFI>’s articles and attempt to answer to the research questions. The research follows the SLR method, classifying the articles according to the SLR schema and the changes we include for analysing <MDNFI> criteria (see the following tables).

**Jurisdiction**

We adopt the Jurisdiction criterion from Guthrie et al. (2012, p. 71). It examines the context of <MDNFI> research. We also sub-classify these attributes into “Industry” or “Organisational” subcategories either from “Supra-national” or “National” perspective.

In the “Supra-national” perspective, we categorize articles in which authors have compared two or more countries. For example, we classify articles that do not have an empirical based as “Supra-national/International/Comparative-General”. The sub-category “National-Industry” includes papers based on a specific industry belonging a single country. On the contrary, the “National-General” subcategory includes articles whose analysis concerns a single country but not a specific industry.

As shown in table 3, in the National perspective the articles analysed are concentrated in the “Industry” and “General” subcategories; instead, in the “Supra-national” perspective major of articles adopt a general approach because there is a greater concentration in the subcategory “Supra-national/International/Comparative-General”.

*Table 3. Results of analysis of <MDNFI> – Jurisdiction*

**Country of research**

The Country of research criterion shows the place in which the authors conducted their researches and helps the field identify other places that could be subject to investigation.
We build a classification scheme dividing the Country of research in seven regions: USA/Canada, Australasia, United Kingdom, European Union, Asia, Africa and Other. The results suggest that the most studied locations are the European Union and the USA/Canada with twenty-six and twenty-one articles respectively, so these are the contexts dominating the <MDNFI> research agenda (see Table 4).

Table 4. Results of analysis of <MDNFI> – Country of research

Research methods

In this section we propose the research method criterion adopted from Guthrie et al. (2012) and we include five attributes.

In particular, the first three attributes relate to studies that are empirical in nature (Dumay et al. 2016): “Case/Field study/Interviews”, “Content analysis/Historical analysis”, “Survey/Questionnaire/Other empirical”. The next two attributes are normative in nature and include “Commentary/Normative/Policy” and “Literature review”.

The results of our analysis show that empirical analysis (“Survey/Questionnaire/Other empirical”) is the most common methodology for the <MDNFI> research. “Content analysis/Historical analysis” ranks second, so it is also popular for investigating <MDNFI> items.

Whereas we retrieved six contributes adopting a “Literature review” research method, four contributes that can be included in the “Case/Field study/Interviews” attributes and only two articles about “Commentary/Normative/Policy”.

Academic, Practitioners and Regulators

In our study Academic, Practitioners and Regulators is a double criterion used to know the authors of the articles and the subjects to which the articles are addressed. For this reason, we identify three categories: “Academic(s)”, “Practitioner(s)”, “Regulator(s)” and “Academics, practitioners and regulators”.

<table>
<thead>
<tr>

<th>Academic(s)</th>
<th>Practitioner(s)</th>
<th>Academics and practitioners</th>
<th>Total</th>
</tr>
</thead>
</table>

Table 6. Results of analysis of <MDNFI> – Academic, Practitioners (as authors)

On the basis of the examined articles that constitute our sample, the analysis shows that <MDNFI> studies are usually prepared by academics and mostly intended for academics and practitioners and much less than just regulators.

Table 7. Results of analysis of <MDNFI> – Academic, Practitioners and Regulators (as readers)

Organisational focus

The Organisational focus helps to identify the type of organisations that a research paradigm investigates. In our research this criterion consists of six attributes: “Publicly listed”, “Private – SMEs”, “Private – Others”, “Public sector”, “Not-for-profit”, “General/Other”.

We find that the majority of <MDNFI> studies focusing on “Publicly listed” companies (with 46 articles), so these are the most commonly researched type of organisations. “General/Other” attribute has 26 contributes and “Public sector” has five articles.

Table 8. Results of analysis of <MDNFI> – Organisational Focus

Focus of <MDNFI> literature

We develop the Focus of <MDNFI> literature from Guthrie et al. (2012) original classification scheme. In particular, we changed the original format to highlight the research topic of our analysis, so we introduced a specific focus “External reporting” that is further investigated in the table 10 and two others explanatory categories of research focus, that are “Ethics and CSR” and “Risk disclosure”.

This analysis shows that the most discussed focus is “External reporting” with forty-six articles. “CSR” ranks second followed by “Accountability and Governance”. Looking at the “External reporting” focus we observe that ten articles analyse the “Environmental reporting and disclosure).

Table 9. Results of analysis of <MDNFI> – Focus of <MDNFI> literature
### THE FUTURE RESEARCH QUESTIONS

Based on the results and analysis, we argue that the way forward for MDNFI research is a transformation from its current desk-bound traditions into a modern global discipline. Researchers need to be innovative in searching for MDNFI, for example investigating new media such as news media and social media.

Additional evidence that current MDNFI research is the persistence with which the majority of studies examine publicly listed companies suggests to focus on other organization types. One last comment relates to the synonymous nature of the terms “reporting” and “disclosure”. We feel the use of these two terms needs to be further explored.

To conclude the research examines the MDNFI’s research foundations. The study establishes the focus of MDNFI literature and offers guidelines for future research and suggests to move beyond the first stage towards second stage research on MDNFI.

ABSTRACT

Motivation and creativity principles have diachronically concerned employees throughout organizational hierarchies, as they contribute significantly to productivity, efficiency and innovation. Leaders have particularly been the ones who mostly cultivate these principles in the workplace, so as to streamline their organizations and make them more productive. In this research we investigate how Greek business leaders and the wider hierarchy can stimulate employee motivation to a degree that would lead to generation of innovative creative ideas. The research combines primary qualitative and quantitative data, through interviews and a survey of over one hundred employees, of various job positions and hierarchy levels. Both methods investigated primarily the subjects of motivation and creativity in the workplace and particularly in the context of leadership styles and hierarchy. The main findings of this research show, that once both leadership and hierarchy motivate the employees to a level where employee job satisfaction is achieved, the employees thereafter become creatively innovative. The research validates for Greece the mainstream international theoretical arguments which are documenting the effectiveness of leadership and hierarchy in motivating the employees to become creative.

Keywords: Motivation, Creativity, Innovation, Leadership, Leadership Styles, Hierarchy, Job Satisfaction, Greece

RESEARCH BACKGROUND AND AIM

Leaders have long been seeking ways and tactics to enhance creativity in the work place. A key element which could prepare the work place to accommodate creativity that potentially leads to innovation, is employee motivation (Amabile, 1988).

The aim of this research is to assess the effectiveness of hierarchy and leadership styles in motivating employees in Greece to become more creative; and to assess the degree to which creative ideas generated are actually materialized and actually lead to innovation (Zhou & Hoever, 2014). In this
context the research establishes the theoretical foundations of the subject to generate and quantitatively and qualitatively test hypotheses, to ultimately draw explicit conclusions that expand the theoretical knowledge on the subject and identify managerial implications towards practical implementation.

THEORETICAL FINDINGS AND RESEARCH HYPOTHESES

This section builds on the findings of an extended literature review, including the works of Avolio and Gardner (2005), Baek-Kyoo et al. (2013), Bass and Riggio (2006), Bass et al. (2003), Birasnav et al. (2011), Bresciani et al. (2013), Černe et al. (2013), Chebbi et al. Chebbi H., Y(2017), Conger (1990), Crossan and Apaydin (2010), Dikshit and Dikshit (2014), Fisher and Sharp (2009), Ford and Gioia (2000), Gagne and Deci (2005), George et al. (2007), Gilley et al. (2009), Gong et al. (2009), Herrmann and Felfe (2014), Ilies et al. (2005), Jaques (1990), Mumford et al. (2007), Pearce et al. (2007), Rosing et al. (2011), Rossi et al. (2013), Santoro et al. (2017), Shalley et al. (2000), Shalley and Gilson (2004), Sosik et al. (1998), Taggar (2002), Treffinger et al. (1994), Vrontis et al. (2010), Walumbwa and Hartnell (2011), and Wilson-Evered et al. (2001, 2004). The literature review presents a positive relation of leadership and hierarchy with employee motivation for creativity in the work place. Particular styles of leaders can stimulate employee perception on the relation between leader support with motivation and creativity. These leaders emphasize on emotional as well as coordination support behaviors (Amabile et al., 2004). Coordination support, equips the employee with the proper expertise in order to perform well, while at the same time the leader prompts the employees’ intrinsic motivation for creative work. With this instrument the leader facilitates the employees with the tasks he has to carry out in a creative way (Amabile et al., 1996). With the interpersonal support, the leader reveals his interest, empathy and consideration to the employee for the tasks he has to perform, which was found to enhance employee creativity (Oldham & Cummings, 1996; Amabile et al., 2004). Innovation support perception states the depth where the employee realizes the leadership engagement to support him to come up with novel ideas, which lead to innovative solutions. This is directly linked with the leadership styles. For instance, the rational transparency element authentic leaders possess, as part of the self-regulation characteristic, evidently reveals to the employee his leader true self (Gardner et al., 2005).

Hypothesis 1: Positive leadership style work place environment effect stimulate employee motivation for generating creative ideas towards innovation.

According to Fletcher & Ka’ufer (2003) shared leadership stimulates the team members to focus more on collaboration, act mutually with their peers, rather than having a classic hierarchical format such as
a leader-follower cooperation. Furthermore, Pearce & Manz (2005) state that shared leadership is substantial for organisations which foster constant innovation so as to offer innovative products and services to their customers and thus remain competitive in a very dynamic environment. On the other hand flexible organisations have the infrastructure to support creative ideas and innovation (Chebbi et al., 2016). Based on Hyypiä & Parjanen (2013), generation of ideas and innovation are quite likely to emerge from flexible and flat organizations, as they are more open to communication throughout the entire organization. Hence, in this way, they cultivate an organizational culture which focuses at communication throughout the organization, which fosters employee commitment to creativity and innovation across all organizational layers. Several research studies have also shown that transformational leadership has been categorized as a positive leadership style, which can increase employee motivation and innovation (Gumusluoglu & Ilsev, 2009). What is more, leadership can substantially influence the employees to collaborate better, become more creative so the organization can foster innovation (Amabile, 1998; Gumusluoglu & Ilsev, 2009).

Hypothesis 2: Shared leadership can yield sustainable creativity towards innovation.

Effective cooperation amongst peers superiors and subordinates can bring astonishing outcomes to the organization. According to Bligh et al. (2006) development of shared leadership can be effective when dealing with complex problems. Shared or lateral leadership has the ability to engage multiple employees with knowledge and skills on different sectors in order to solve a complex problem. In other words, teams with various skills, advanced knowledge and experience can replace the hierarchical superior with one of the members of the team, whom they mutually agree on. Hence they are not supervised by a hierarchical superior, instead they are headed by one member of the team. This set up may lead to a powerful and successful type of leadership, which might yield motivation for creativity (Cox et al., 2003).

Transformational leaders critically affect employee creativity for two main reasons. Firstly, leadership is important to intriguing the individual traits that are critical for creativity, as well as the skills that are relevant to creativity and task motivation; and, in turn, these factors influence the level and frequency of employee creative behaviour (Amabile et al., 1996). Secondly, since leaders are empowered to manage rewards and sanctions, they ought to have the leadership behavior to identify whether the creative ideas employees come up with could potentially be beneficial, or instead they can be costly and jeopardize the company (Detert & Burris, 2007; George, 2007). Leadership styles which motivate employees to act creatively by exploring new ideas, support them during uncertain times, cultivate creative work and demonstrate to employees that acting creatively is not so risky. Transformational leaders assess the individuality context and the unique perspectives (Bass, 1985) and
subsequently build an environment which encourages the employees not to fear and to feel comfortable with creative activities.

**Hypothesis 3:** Lateral and transformational leadership can yield sustainable creativity towards innovation

Development employee problem solving skills, is an important element for the contemporary organizations. It is often mentioned that organizations are not that effective in innovating independently, and are often accused of having insufficient internal capabilities for facing the challenges of the external dynamic environment which is constantly changing (Hyypiä & Parjanen, 2013). The nominated leader are usually the ones who promote agility, rationality, systematical thinking, and approaching problems cautiously. The leader approaches problems spherically before proposing potential solutions or guiding its subordinates; and considers all perspectives. S/he then proposes new approaches for examining how to complete the tasks and encourages the re-evaluation of ideas which had not been argued properly in the past (Bass & Avolio, 1994). In this way the leader stimulates his subordinates to come up with creative ideas by questioning assumptions, re-evaluating problems and approaching old issues in new and perhaps innovative ways. Rank et al. (2009) found that transformational leadership has had meditating effects on employees with low self-esteem, increasing their motivation and making them more innovative.

**Hypothesis 4:** Superiors’ guidance to subordinates towards creative problem solving ideas positively affects their ability to overcome barriers that hinder innovation

Jaques (2009) argues that managerial hierarchy is the most difficult, albeit efficient and factually the most normal structure large organisations have ever invented. Properly structured organisations in terms of hierarchy can motivate employees to come up with creative ideas normalize productivity and improve moral. Furthermore, Jaques (2009) stresses that the mould where organisations are casted in, utilises people to work, and in order to utilise them effectively it employs managerial hierarchies’ systems. In this sense organisations keep the employees accountable to get their job done. Quite few other or adjacent mechanisms are presented in extant literature, which charismatic CEOs could use so as to influence organisations performance. For instance an inspirational and tangible vision could intrigue the employees, and various other stakeholders to increase their motivation level, as well as their commitment to serve the organisation even better (Shamir et al., 1993). Furthermore, when they demonstrate confidence in their employees’ efforts and capabilities CEOs could maximise motivation (House, 1977). Organisations with solid identity i.e. having a strong brand, is a key element for
organisational identification (Ashforth et al., 2008; Kreiner & Ashforth, 2004) and very likely to affect positively employee motivation for creativity (Shamir et al., 1993).

Hypothesis 5: Employee motivation and facilitation towards creative idea generation and implementation is a key function of organizational structure.

METHODOLOGY

Towards this research both qualitative (interviews) and quantitative (survey) data have been employed, with their combination providing more comprehensive analyses on the research subject. Through the applied triangulation method the quantitative and qualitative data have been mixed so as to enrich the research analyses and discussion of the research subject (Robson, 2002; Tashakkori and Teddlie, 2003).

The survey sample is purposive and is composed of 114 responses for both closed type and in-depth interview questionnaires. The sample consists of employees who are currently employed in multinational and large size companies, which operate in the sectors of construction, manufacturing and services. For practicality purposes a convenience representative sample was chosen.

For the completion of this research we distributed the closed type questionnaires via the web so as to collect the quantitative data. In the meantime, several interviews were carried out for the collection of the qualitative data. The next stage, after the collection of the primary data was to run the statistical analyses on the responses of the closed type questionnaires via SPSS and align them with the measurement model.

Firstly, we have measured the respondents and carried out the frequency analysis of the demographics data, so as to obtain the majority of the respondents’ characteristics. Following we have carried out a factor and reliability analysis through SPSS so as to confirm the coherence and the quality of the quantitative data we have collected. The factor and reliability analysis helped create a research model for the analyses of the results; and employed a retrogression measurement model to test the research hypothesis. Subsequently, retrogression analysis carried out via SPSS concluded the final group of the quantitative data, which is composed by the following elements: (1) Creativity, (2) Lateral-shared leadership, (3) Hierarchy incentives, (4) Hierarchy supporting, (5) Hierarchy Motivation, (6) Leadership bridging gaps, (7) Leadership inspiration. These elements contain both dependent and independent variables examined in this research, with the SPSS analysis identifying the interrelation between these. The main advantage of the retrogression technique is that it can reduce huge amounts of raw data into more actionable informations, and with the aid of SPSS we also
made sure that that quantitative data matched perfectly with the model, and that the model is seamless.

Following the analysis of the quantitative data, we deployed and injected the qualitative ones in order to reinforce the results from the quantitative data and the research hypotheses. For the collection of the qualitative data we have used ten questions which aimed to derive the perception and the views of the respondents on the research subject. The ten questions purposefully have common ground with some of the questions of the closed type questionnaire in order to achieve (a) coherency between the qualitative and quantitative data, (b) alignment between qualitative data and the research model, and (c) results alignment

RESULTS, DISCUSSION AND FINDINGS

Measurement model

The below model (figure 1) has emerged naturally from from the research hypotheses as well as from both the quantitative and qualititative data. Initially we have checked the correlation between the dependent and un-dependent variables, based on the significance column in the coefficient matrix. In the first selection, ‘creativity’ is the dependent variable and the predictors are ‘self-motivation’, ‘hierarchy-motivation’, ‘lateral leadership’, ‘hierarchy supporting’, ‘hierarchy incentives’, ‘job satisfaction’, ‘leadership bridging gaps’, and ‘leadership inspiration’ (see table 1). In the second selection, the dependent variable is ‘job satisfaction’, and the predictors are ‘hierarchy-motivation’, ‘hierarchy supporting’, ‘hierarchy incentives’, ‘leadership bridging gaps’, ‘lateral leadership’, and ‘leadership inspiration’ (see table 2)

Figure 1: The Measurement model
Quantitative Research Findings

The quantitative results revealed that the dependent variable ‘creativity’ is driven by two predictors. The first one is self-motivation and the second is job satisfaction. Based on the SPSS results, self-motivation is driven by the inherent will of the employee to be motivated, or perhaps s/he is inspired by the intrinsic incentives or rewards s/he obtains from her/his work and thus her/his motivation level grows more and more. Self-motivation is the process where the employee evaluates her/his performance based on the targets to be achieved, timeline, budget and other critical for her/his evaluation elements. This form of motivation, mainly operates via internal comparison processes, and requires setting personal standards which are able to evaluate the employee performance (Bandura & Shunk, 1981). The dependent variable job satisfaction is driven by three predictors, hierarchy incentives, lateral–shared leadership and leadership bridge gaps. The significance value of all the above mentioned predictors lies below the 0,05, which is the threshold that discloses the relation of the dependent variable from its predictors. More specifically the significance level of predictors’ job satisfaction and self-motivation is 0,019 and 0,018 respectively when creativity is the dependent variable.

Based on the results depicted above (table 1) there is a positive relation between the dependent variable ‘creativity’ and the predictors job satisfaction and self motivation. The employees perceive the two predictors (job satisfaction and self motivation) as key drivers leading them to creativity. What is
more the significance level of predictors hierarchy incentives, lateral–shared leadership and leadership bridging gaps is 0.004 – 0.001and 0.067, when job satisfaction is the dependent variable.

</table>

Based on the above outcome, the drivers which make employees feel satisfied with their job are both leadership and hierarchy. The employees feel satisfied with their job when hierarchy provides them with adequate incentives in order to carry out their job. Furthermore, they praise the leadership styles which bring them closer with their leaders and make them cooperate even better with their colleagues. Hence, based on the above mentioned results, the predictors can drive the dependent variables towards the desired results.

Injecting the Qualitative Research Results: Discussion and Findings

Based on our model and research findings is appears that creativity is highly dependent on self-motivation and job satisfaction. Self-motivation can be considered as an inherent merit of employees which drives them towards creativity. Whereas job satisfaction, is driven by leadership and hierarchy.

Hypothesis 1 and 4 appear aligned with the research findings. Based on the results, leadership can bridge gaps between the regular employees and the superiors, at a level where the employees are satisfied with their job. Following, job satisfaction leads to creativity which can lead both to innovative solutions or efficient problem solving methods. Hence, leadership appears to influence positively both the employees and the superiors in their efforts towards setting goals and working hard to achieve these goals.
Enthusiasm does not appear to be taken too much into account: the majority of the respondents do not come across enthusiasm in their daily working life for the goals to be achieved. However, it turns out that all of them understand the value of being inspired and of demonstrating enthusiasm for the company goals. Unenthusiastic employees are less willing to engage in tasks, they are dissatisfied and perhaps de-motivated.

Hypothesis 2 and 3 seems to be aligned with the research findings as well. Based on the data analysis there is relation between lateral, shared leadership and job satisfaction which in turn leads to creativity.

Based on the qualitative data the employees communicate often with their peers, subordinates and their managers. They either communicate via well-established processes which support effective communication between the employees, or by building both professional and personal relations. The close and constant communication motivates the employees to come closer and supports the adoption and perhaps materialization of creative ideas. The leaders have actively contributed to the cases where they could share knowledge, experience and in general where they could contribute. The leaders have acted like role models and this action has stimulated the employees to act the same. Furthermore, the leaders have encouraged the employees to emphasize more to develop creativity and communication in the organization.

Problems that arise at work potentially disorganize employees and engage more resources to resolve them. Based on the qualitative data below, the problems arising at work are dealt with at the team level, and depending on the complexity of the problem they are then elevated to higher levels within the organization. The employees share their experience, knowledge, skills in order to come up with a creative solution to the problems and adopt a more proactive approach to avoid repetition. What is more, they use the tools, procedures and all organizational means available to solve a problem efficiently and before it escalates. Subsequently, they try to adopt proactive/preventive methods.

Based on the quantitative results the incentives a properly hierarchically structured organization provides leads to job satisfaction, an outcome aligned with the fifth hypothesis. The employees, therefore, are satisfied with their job when they receive either intrinsic or extrinsic rewards. Based on the qualitative data, employees appear engaged in their organisation, and committed to generating new ideas, which could lead to innovative solutions. They are close to their customers, they understand the significance of their needs and they strive to fulfil them. Furthermore, their organisation provides them the tools they need to carry out their job and to become creative.
Communication between employees and their superiors also appears good. Superiors are close to employees, guiding them by sharing the organization's goal and try to help them overcome the barriers they come across in their daily working life. Superiors provide adequate incentives to the employees, both intrinsic and extrinsic. The former are: challenging tasks, close communication, support, good relationship backed up by trust, smart and tangible goals, and constant review of their performance. The latter are: annual bonuses and non-monetary incentives like days off.

Hence, the organization and thus the hierarchy across the various layers of the organization provide adequate incentives, thereby boosting their performance and motivation level. Furthermore, employees feel free to express business related ideas they might have, and this approach seems to be encouraged by their entire organization as well. Furthermore, creative ideas are taken seriously into account and creative employees are rewarded.

CONCLUSIONS & RESEARCH LIMITATIONS

There are several contributors which make the employees feel motivated so as to yield creative solutions. This research concludes that employees in Greece have a positive perception of the motivation and creativity notions, and believe they are essential to the workplace. Moreover, the incentives provided make employees feel satisfied with their job and in turn they become creative. This is something we have seen in the quantitative data analyses and in the qualitative data as well. Further, employees utilize the processes and procedures their organization towards the above ends. Employees have a good relation with and feel close to their leaders, and enjoy cooperating with their colleagues in order to achieve a common goal. However, they miss the enthusiasm element, or perhaps they prefer to utilize their powers otherwise to ‘survive’ in a competitive environment. Evidently, employees have developed self-motivation skills, which often lead them to creativity. First and fourth hypotheses arise to be true, as the employees feel they are close with their superiors, they are satisfied with their job and they work in a creative way which leads them to innovation. Furthermore the workplace is overwhelmed by positivism as the gaps between the lower and higher levels are bridged.

Employees appear to be excited when it comes to cooperating with other peers, subordinates and superiors. They acknowledge the value of lateral and shared leadership where employees with various skills, different expertise, education and seniority level join forces, and they work as a team for achieving a common goal. They prefer to leave aside personal issues and any other kind of barriers which hinder goal achievement, and instead they prefer to work as a team, act creatively towards reaching an innovative solution. So the second and third hypotheses are true as well.
Properly structured organizations support motivation for creativity. Based on both the quantitative and qualitative data, the hierarchy provides adequate incentives to employees to become creative; hence the fifth hypotheses is proven true as well. This outcome shares also some common ground with some of the abilities of the transformational and transactional leaders to motivate the employees for creativity.

Finally the objective of this study and the research hypotheses are aligned with the research findings. Employees perceive the authentic, transformational, transactional leaders as well as the lateral shared leadership as positive styles of leadership, which strengthen their motivation for creativity. Furthermore the employees are satisfied with well-structured organizations which provide them the desired incentives they need in order to become creative. Finally, self-motivation has not been considered by this research, however, from the primary data it emerged that employees are empowered with the inherent merit of self-motivation towards creativity and innovation.

The research has some limitations, largely stemming from as yet unrefined nature of terms and their explicit interrelationship; which also partly constitute further research directions. Further to the obvious limitation of the rather constricted sample, the first limitation stems from the disproportionate focus on larger and multinational organisations, calling for further research with a more distinct SME focus. The second limitation relates to the model’s self-motivation element, which remains unexplored with regards to its drivers and its relationship with creativity and innovation. The third limitation stems from the research’s combination of leadership styles and hierarchy. Further research may focus on a specific leadership style to draw more explicit conclusions. Finally, the qualitative data have given rise to ‘enthusiasm’ as a critical factor of creativity, which is, albeit, insufficiently explored herein and could constitute an enticing area to research.

Overall, the research has successfully interlinked the organizational elements of leadership style, structure, motivation, creativity and innovation, in the specific context of Greek businesses, and at a time when the specific context is characterized by idiosyncrasies stemming from the rather extreme socio-economic conditions. And while this scientific accomplishment lacks the degree of accuracy and refinement to produce absolute and unquestionable conclusions, it does pave the way, setting the foundation for further research to follow.

EXPLORING ALTERNATIVE VIEWS ON CLUTCHES OF UKUTHWALA IN THE PATRIARCHAL CULTURE OF SOUTH AFRICA: BALANCING OF HUMAN RIGHTS

Van der, Bank; Christiena, Maria

Vaal University of Technology, South Africa

ABSTRACT

Ukuthwala involves the act of taking a marriage partner in unconventional ways, seemingly forceful ways, sometimes with the sanction of certain adults who have stake in the possibility of formalising a resulting partnership. “Ukuthwala” is a form of abduction that involves kidnapping a girl or a young women by a man and his friends or peers with the intention of compelling the girl or her family to endorse marriage negotiations. This type of kidnapping has become traditionally acceptable, as long as cultural rules are followed. This study explores alternative views on Ukuthwala as contrary to the community’s perception of justice or the legal convictions of society. Abuses of ukuthwala have clearly perpetrated without the girl’s consent and have proven to have an adverse effect on her education, health and physical wellbeing. Disadvantages of women and girls are a major source of inequality. Women and girls are discriminated against in health, education and in the labour market which are very negative.

The Bill of Rights in chapter 2 of the Constitution plays an important role in deciding whether conduct of ukuthwala is contrary to public policy or the community’s sense of justice and is therefore unlawful. The Constitution guarantees persons who belong to a cultural community the right to enjoy their culture and the right to participate in the cultural life of their choice. However, neither of these rights may be exercised in a manner that is inconsistent with any provision of the Bill of rights and therefore competing rights must be balance.

*Keywords: Constitution, ukuthwala, equality, custom and balancing of rights.*

INTRODUCTION

There is a huge problem associated with the shift and changing meanings, and also with perceptions of ukuthwala. In this study, the researcher is seeking to explore why the practice of ukuthwala has come
under intense scrutiny through a growing number of revelations that young girls have contracted HIV after being forced into marriage.

_Ukuthwala_ is describes as “to carry on head and shoulders or load gripping by the hands” (Doke, Malcolm, Sikakana and Vilakazi, 2008). Other definitions are more figurative and may include a mention of “pregnancy” and “carrying a bride home”. It also includes the concept of taking a partner in unconventional ways. Bennet describes _ukuthwala_ as one of the unconventional methods of “opening marriage negotiations” (Bennet, 2004). “Ukuthwala” is a form of abduction that involves kidnapping a girl or a young women by a man and his friends or peers with the intention of compelling the girl or her family to endorse marriage negotiations (Maluleke, 2009). This type of kidnapping has become traditionally acceptable, as long as cultural rules are followed.

There are multiple understandings of what constitutes _ukuthwala_ in the different cultures, which are themselves contested. There is paucity in the literature on the beautification of women in the African continent. This gap in the literature has motivated the researcher to raise social awareness about the importance of the _ukuthwala_, and its changing meanings from a Southern African perspective. We believe that the study may contribute to African literature – and also the black feminist movement in South Africa.

It is practised among indigenous African Communities in Southern Africa, in various mutations, within the context of many other customary practices related to marriage. Many of these practices are aimed at satisfying the traditional standards or norms relating to marriage, and sometimes unconventional ways of doing so. The practice of _ukuthwala_ is said to be cultural and to have been practiced by indigenous people. However, the way it is practiced currently is illegal and harmful to the wellbeing of young girls (Modisaotsile, 2016).

The overbearing preferences of people who hold traditional or cultural power and control over the lives of young men and women seeking to establish conjugal relationships may linked to some instances of _ukuthwala_. Popular references to _ukuutwala_ as a culture unduly create an impression that the practice is a rigid and formalistic prescript, whereas it was originally devised as optional safety valve against too extreme a parental authority.

This paper seeks to determine whether _ukuthwala_ is a cultural right or a crime perpetrated under the guise of culture. Some of the factors that make the practice occur regardless of the Children’s Act, the impacts of the practice on the educational, economic and social well-being of the child are also discussed.
FEMINIST PERCEPTIONS

Feminism is chosen to form the theoretical framework that undergirds this study. Jane Freedman writes that Feminism is concerned with women’s inferior position in society, and with the discrimination encountered by women because of their sex (Freedman, 2001). Estelle Freedman defines feminism as a belief that although women are inherently of equal worth, most societies privilege men as a group (Freedman, 2003). As a result, social movements are necessary to achieve political equality between women and men, with the understanding that gender always intersects with other social hierarchies, such as the perception held by people, and in particular, patriarchal Zulu men.

This study is located within the feminist theories, which hold that although women are inherently of equal worth, most societies privilege men as a group. As a result, social movements are necessary to achieve political equality between women and men, with the understanding that gender always intersects with other social hierarchies (Freedman, 2003).

The literature shows that the perception of a woman’s body by patriarchy is an issue that is addressed by feminists. Spivak claims that women have been doubly colonised: firstly by their patriarchal culture, and secondly by the colonial regime. Patriarchal culture determines how women should look and dress (Spivak, 1988) Morrison (Morrison, 2012) challenges the male-dominated society and encourages women to know their own inside “free person” – and to not permit anybody to decide “who” they have to be.

Mkhwanazi states that the Zulu culture is used to justify indecent behaviours in the modern world (Mkhwanazi, 2008). This shows how patriarchal cultural men undermine women, and how culture is always in favour of men – even when they are in the wrong. Luvuno suggests that societies should be discouraged to stereotype women and for looking at, and treating women, as the subordinates of men (Luvuno, 2004). This gender regime constructs men as being in the dominant and public position within society and it continually allows violence against women and imposes traditional systems of controlling women in the post-colonial nation-state.

Sandi Schultz organised the Slut Walk protest that took place in Johannesburg to bring awareness of sexual harassment and violence against women perpetrated in public places. Carr states that the Slut Walks is initiated by young Feminists who are furious with victim-blaming, slut-shaming patriarchal cultures (Carr, 2013). Carr posits that the focus must not be on what women wear; but rather it should be on the rape culture (Carr, 2013). Patriarchal custom and tradition often hold the power to determine what is proper and what is not acceptable.

Gender inequality starts early and keeps women at a disadvantage throughout their lives (Worldbank, 2000). Inequality in the lives of women that is deeply imbedded in history, tradition and culture
affects them for the rest of their lives. This also impacts on women’s access to and enjoyment of economic, social and cultural rights (International Covenant on Economic, Social and Cultural Rights, 2002).

Aspects of culture are evident in everything we do in our daily lives - from speaking to eating to clothing - yet to define the term is not an easy task. Local cultures and traditions influence the way the custom of early marriage is practiced in different regions, but the causes and consequences are universal (Marry, 2008).

Harmful traditional practices emanate from the deeply entrenched discriminatory views and beliefs about the role and position of women in society. The role differentiation and expectations in society relegate women to an inferior position from birth throughout their lives. Harmful traditional and cultural practices maintain the subordination of women in society and legitimize and perpetuate gender based violence (Wadesango, Rembe and Chabaya, 2011).

RESEARCH METHODS

The chosen methodology for this study is qualitative. Qualitative research is concerned with developing explanations of phenomena. It aims to help us to understand the social world in which we live, and why things are the way they are. It is concerned with the social aspects of our world; and it seeks to answer questions about: Why people behave the way they do; how opinions and attitudes are formed; how people are affected by the events that go on around them; and how and why cultures
and practices have developed in the way they have (Hancock, Windridge and Ockleford, 2009). The qualitative research paradigm is relevant for this study, as it assists in understanding the meaning of the phenomenon of *ukuthwala*. It is significant for this study, as it deals with understanding a social issue, which has allowed us to explore how society perceives ukuthwala as a social issue, and how people behave and react towards the practice of *ukuthwala* (Homes, 2015).

The qualitative research methodology is important; as it focuses on words and creating meaning, rather than on mere numbers and statistics. This study is based on creating meaning for the practice of *ukuthwala* and reviewing how *ukuthwala* has been seen throughout the years.

**THE CONSTITUTION**

South Africa enjoys one of the most progressive Constitutions in the world with numerous organisations that work to protect the rights of women and child (Homes, 2015). The values reflected in the Constitution – such as human dignity, the achievement of equality, and the advancement of human rights and freedoms – are crucial in deciding this issue (Section 2 of The Constitution of South Africa 108 of 1996). It is therefore imperative to review the practice of *ukuthwala* and all its consequences, in particular forced marriages and child marriages and the violence which has come to characterise this practice, in light of the Constitution as the supreme law of the Republic (Section 2 of The Constitution of South Africa 108 of 1996). The supremacy of the Constitution is specifically enunciated by the Founding Provisions of Chapter 1. Section 2 of the Constitution provides that the Constitution is the supreme law of the Republic; law or conduct inconsistent with it is invalid, and the obligations imposed by it must be fulfilled. As regards the interpretation of the Bill of Rights, section 39 (3) provides that the Bill of Rights does not deny the existence of any other rights or freedoms that are recognized or conferred by common law, customary law or legislation, to the extent that they are consistent with the Bill (Section 39 of The Constitution of South Africa 108 of 1996).

Moral values that are crying out for renewal in Africa can be summed up in the principles of human rights, democracy and good governance. These are important in themselves because they enable African people everywhere to realise the values of *ubuntu*. This is the moral principle that promotes social responsibility and solidarity, the duty of care, the virtues of sensitivity, selflessness and devotion to duty, and the vision of a society founded on justice and equality. Kofi Annan, the secretary-general of the United Nations, states emphatically that: Respect for human rights and the rule of law are necessary components to any effort to make peace durable. They are cornerstones of good governance. By signalling its commitment to building a society in which all can live freely, a government can demonstrate its commitment to building a society in which all can live free (Annan, 1999).
Snyman puts forward an argument that we must follow a human rights-centred approach. In Chapter two of the Bill of Rights it was stated that the Constitution plays an important role in deciding whether conduct is in conflict with public policy or the community’s perception of justice and is therefore unlawful (Snyman, 2008).

BALANCING COMPETING RIGHTS

On the one hand, the Constitution recognises that South Africa is not a homogenous society. The Constitution guarantees persons who belong to a cultural community the right to enjoy their culture and the right to participate in the cultural life of their choice. However neither of these rights may be exercised in a manner that is inconsistent with any provision of the Bill of Rights.

In relation to girl children, the Constitution considers everyone below the age of 18 years to be a child, and accords to this category of persons (with a few exceptions) the same rights as those granted to adults. Some of these rights are:

- The right to equality which must be read in conjunction with the Promotion of Equality and Prevention of Unfair Discrimination Act (Act 4 of 2000). This Act prohibits, among other things, customary practices that impair the dignity of women and undermine the dignity and wellbeing of girl children; the Act also prohibits sexual harassment.
- The right to human dignity (The Constitution 108 of 1996).
- The right to freedom and security of the person, which included the right to be free from all forms of violence.
- The right to education (The Constitution 108 of 1996).
- The rights of children in section 28, which include the right to protected from maltreatment, neglect, abuse and degradation, and the right not to be required or permitted to perform or to provide services that are inappropriate for a person of that child’s age, or which would place at risk the child’s wellbeing, education, physical or mental health or spiritual, moral or social development. Furthermore and most importantly, the Constitution enjoins everyone to take into account the child’s best interest in very matter involving a child. The Children’s Act elaborates what the principle of the “best interests of the child” entails, providing (for example) that in matters concerning a child, the following factors must be taken into account: the child’s age, maturity and stage of development; and the need to protect the child from any physical or psychological harm (Section 7 of the Children’s Act 38 of 2005).

The right to enjoy one’s culture has been thrown into competition with other rights and inevitably this has led to conflict. The Constitution gives no indication whether other rights supersede cultural
rights; the fundamental rights are not ranked (the Constitution 108 of 1996). The SALRC has considered the interplay between individual rights and group rights in the Constitution, particularly with regard to children, and concluded that:

There can be no doubt that the South African Constitution recognises the importance of customary law to the majority of South Africans. The Commission also accepts the importance of customary law and practices for a very large portion of our population. However, the Commission notes that customary law is recognized as a system of law provided it operates within the broad principles of the Constitution of 1996. Given the fact that the best interest of the child principle in section 28 (Section 28 of the Children’s Act 38 of 2005) is paramount and the individualistic nature of human rights protection, it would seem that the right of an individual child supersedes that of cultural or religious group.

EMPOWERMENT OF WOMEN

The world empowerment is used in many different contexts and by many different organisations due to its widespread usage. A review of definitions of empowerment reveals both diversity and commonality. Most definitions focus on issues of gaining power and control over decisions and resources that determines the quality of one’s life. Most also take into account structural inequalities that effect entire social groups rather than focus only on individual characteristics. Major issues in measuring women’s economic activity include gender-based stereotypes, the employment status of unpaid family workers, the informal sector and rural activities (Vickers, 1997). Bennett developed a framework in which “empowerment” and “social inclusion” are closely related but separate concepts. Social inclusion is defined as the removal of institutional barriers and the enhancement of incentives to increase the access of diverse individuals and groups to assets and development opportunities (Bennett, 2004).

Women contribute to the economy and to combating poverty through both remunerated and unremunerated work at home, in the community and in the workplace. The empowerment of women is a critical factor in the eradication of poverty. In developing countries, industrialisation tends to coexist with agriculture, rather than displacing it. The same is true of family businesses – from farms to small enterprises. In South Africa a vicious circle of debt, inflation, economic stagnation and unemployment has placed the heaviest burden on women.

One of the ways generally advocating is strengthening affirmative action to promote gender equality. Positive steps must be taken to increase the representation of women and minorities in areas of employment, education and business from which they have been historically excluded. Affirmative
action is not about women taking over from men but is a process of sharing and recognising the need to make provisions for equality to all citizens of a country.

Early marriage violates a girl’s right of a future and by doing so perpetuates the feminization of poverty (this is a global trend whereby women increasingly and disproportionately are numbered among those that live in poverty) (Thomas, 2007). It does so by denying a girl opportunities and compromising their development in areas such as education, livelihood and personal growth. Loss of schooling is more likely to reduce the chances of lessening household poverty, as a result of loss of both the education and skills necessary for gaining employment.

Education is the key area where many a child bride loses out when they are married too early. In many areas in South Africa girls are withdrawn at puberty often to undertake domestic duties or specifically for marriage (Grant and Hallman, 2008).

DOMESTIC LAW

In the Republic, customary marriages are regulated by national legislation that was enacted after the advent of constitutional dispensation, and by laws promulgated by the former Transkei, Bophuthatswana, Ciskei, and by KwaZulu and Natal (Schedule 6 of the Constitution of South Africa 108 of 1996). Whether or not the marriage laws enacted by these self-governing territories and independent states should continue to exist, despite the coming into operation of the Recognition of Customary Marriages Act, is an issue beyond the scope of this investigation; the SALRC does not wish to express any view in that regard. The Children’s Act, to the extent that it deals with the marriages entered into by children, will also be considered here (The Children’s Act 39 of 2005).

There are serious gaps in the legislation, particularly in national legislation, which could exacerbate the abuse of ukuthwala. The various laws listed in this paragraph are considered below.

RECOGNITION OF CUSTOMARY MARRIAGES ACT

In view of the fact that ukuthwala is a prelude to a customary marriage and should eventually lead to such a marriage, the essentials of a valid customary marriage as set out in the Recognition of Customary Marriage Act must be complied with (Section (3) of the Recognition of Customary Marriages Act). The Act clearly states that the parties to a customary marriage must be older than 18 years, and that they must both consent to the proposed marriage (Section (3)(1) of the Recognition of Customary Marriages Act). This Act also makes it possible under a number of provisions for people under the age of 18 to conclude a valid customary marriage. The Minister of Home Affairs or a person by him or her grant permission to a person under the age of 18 to marry, if such a marriage is
desirable and in the interest of the prospective spouses (Section 3(4) of the Recognition of Customary Marriages Act). *Ukuthwala* does not meet this requirement or the age requirement and is not a valid marriage arrangement in terms of the Marriage Act or the Recognition of Customary Marriages Act.

**REGISTRATION AND DETERMINATION OF AGE**

The requirement of consent in the Recognition of Customary Marriages Act contains a number of safeguards at ensuring that the parties to customary marriages comply with the essentials set out in this Act. It states that the age of majority is determined by statute law and not by customary law (Section 9 of the Recognition of Customary Marriages Act). The Children’s Act 38 of 2005 set the age of majority at 18. The Children’s Act states that a child is anyone below the age of 18, and that is in all matters affecting a child, the child’s best interest and his or her involvement in decision-making are of paramount importance (Section 9 and 10 of the Children’s Act 38 of 2005).

**CULTURAL PRACTICES**

The attributes of culture are dearly held and valued by the community. Studies have defined culture as a coherent self-contained system of values and symbols that a specific cultural group reproduces over time, which provides individuals with the required signposts and meanings for behaviour and social relationships in their everyday life (Iyanuolu, 2008). The above statement shows that culture is a social heritage which includes all knowledge, beliefs, customs and skills that are available to members of a social group. It is also a source of individual and group identity within a given society (Wadesango, Rembe and Chabaya, 2011). The Children’s Act also makes it clear that children should not be subjected to social, cultural and religious practices which are detrimental to their wellbeing (Section 12(1) of the Children’s Act 38 of 2008).

However, non-compliance with this provision does not attract criminal liability. It also provides that a child below the minimum age set by law for a valid marriage may not be given out in marriage or engagement, and that a child above minimum age may not be given out in marriage or engagement without his or her consent. Failure to adhere to this prohibition constitutes a criminal offence punishable by a fine of 10 years imprisonment or both, in the case of a first offender, and 20 years’ imprisonment in the case of a second offender.

Section 12(2)(a) prohibits giving out a child in marriage. A child subject to *ukuthwala* practice is not in any conventional sense of the word given out (Children’s Act 38 of 2008). These provisions of the Children’s Act which were aimed at preventing forced marriages and child marriages have been
rendered nugatory by the lack of specificity. The legislature did not specify the minimum age of marriages in the Republic. In the context of customary marriages, the provisions of the Children’s Act referred to above should be interpreted to mean that a girl of 12 years and a boy below the age of 14 cannot conclude a marriage at all, and addition to the approval of a marriage by their parents, also consent to the proposed customary marriage. The Children’s Act effectively prohibits the customary marriage of a girl below the age of 12 years, but sanctions the marriage of a girl older than 12 but younger than 18 years, provided she consents. This provision is problematic as it does not contemporaneously require the involvement of an official of the state, nor does it require that such a marriage should be allowed if it would be in the interest of the girl child. Prevention and combating of trafficking in persons and make it punishable to conclude a forced marriage with another person.

COMMON LAW AND STATUTORY OFFENCES

The age of the victim, people involved in the planning of ukuthwala where the consent of the bride is lacking could possibly be prosecuted for offences such as being an accomplice to rape, kidnapping, assault, rape, statutory rape and common law abduction (Snyman, 2008).

VARYING VIEWS ON UKUTHWALA

Ukuthwala is regarded as amounting to the abuse of women. Abduction and kidnapping incidents are often accompanied by violent sexual abuse and therefore perpetuates a form of gender-based violence in the context of a culturally sanctioned patriarchy; and that it entrenches patriarchal power.

Abuses of ukuthwala have clearly perpetrated without the girl’s consent and have proven to have an adverse effect on her education, health and physical wellbeing. Disadvantages of women and girls are a major source of inequality. Women and girls are discriminated against in health, education and in the labour market which are very negative.

Instances of ukuthwala commonly take place during times when men, mainly workers in big cities of South Africa, visit their rural homes. Many cases are reported to have occurred during the festive season as well as during major holidays. On returning to their rural villages, it seems that some men feel a heightened and urgent need to have a wife who will be responsible for domestic chores and fulfilling the man’s sexual needs. Some girls reported that they were beaten and assaulted if they tried to escape. Some were given muti or traditional medicine which weakens them and makes it easier for their abductor to control them. Besides the fact that they may end up pregnant and have to drop out of school, they are also faced with lack of social and economic opportunities. The domestic
demands placed on them often result in unsatisfactory school experiences and poor academic performance. Statistics show that rather than decreasing, the ukuthwa custom is gaining popularity from decade to decade among the adherents of customary law among the Nguni tribes in South Africa (Koyana and Bekker, 2007).

Various reasons exists for the practice of ukuthwa, some of which are arguable strong and weighty. They include: to force the farther of the girl to give his consent, to avoid the expense of the wedding and to speed matter up when the women is pregnant. However these reasons are also suggestive of the fact that the girl or the unmarried women involved is, in some cases, ab ducted without her consent. Culture as a way of life for people, is given a place in our Constitution, but no culture should be above the law (www.awid.org).

The practice of ukuthwa and early marriage is unconstitutional and it is discriminatory against the girl child on grounds of sex and gender.

CONCLUSION

The study shows that Ukuthwa has faced criticism; because it is seen as an ‘unAfrican’ or foreign culture. Ukuthwa is a symbol of an intrusion of colonial ideas, and of the moral degeneration of urban youth, as a consequence of the intrusion. The common man on the street became agitated by this intrusion; and as a result, there are attacks against women.

Men use culture to justify their indecent behaviour, breasts and almost naked. Mkhwanazi clearly states that culture undermines women and is in favour of men, even when they are in the wrong (Mkhwanazi, 2008). Men should not feel entitled to a woman’s body, and think that they have a right to respond to the signals they think a woman is sending.

We believe that, in order for women to be taken seriously by men and culture, women should stand up for themselves and fight against such a patriarchal system. Having regular marches that address issues, such as violence against women, could be a good initiative. According to the South African Constitution, we live in a democratic country, where everyone is supposed to be equal, and sexism should not exist; but in real life, the freedom from colonial regime is replaced by a patriarchal culture that oppresses African women.

What is human dignity and how important is it? Dignity is a proper sense of pride and self-respect, respectfullness or formality in any person’s behaviour and bearing, the condition of being worthy of respect, esteem or honour. It is also described as the state of being worthy of honour and respect (Moloi, 2006).

De Vos states that African men have not internalised the excellent provision in our Constitution that guarantees every woman the right to equality, human dignity and bodily integrity. South Africa
enjoys one of the most progressive constitutions in the world, with numerous organisations that work to protect the rights of women and child (De Vos, 2008). It is intolerable that ukuthwala is being allowed to continue. We need to work harder to highlight the plight of these young child brides and bring pressure to bear to end this practice, which is another form of human trafficking.

Culture as a way of life for people, is given a place in our constitution, but no culture should be above the law (www.awid.org, 2011). The practise of ukuthwala and early marriage is unconstitutional and it is discriminatory against a girl child on grounds of sex and gender. Marriage in South Africa and in other countries, regardless of religion or culture, requires the full consent of both parties. The practice violates the rights of the girl child and endangers her future wellbeing, therefore it should be discarded. Child marriages deprive girls of the opportunity to obtain education which would be helping them live an economically rewarding life in future (Wadesango, Rembe and Chabaya 2011).

There rights to choose their life partners are deprived because they were not given a chance to counter the decision to be married.

SHAREHOLDER DILEMMA: WHAT STAKE TO OFFER TO FINANCIAL INVESTORS? PROPOSALS BASED ON FINANCIAL PRINCIPLES

Vashakmadze, T.; Martirosyan, E.; Sergeeva, A.

IBS RANEPA, Moscow, Russian Federation

ABSTRACT

Companies in their growth stage often require sums of money that exceed their operating cash flows. A need for raising funds might be associated with entering new markets, expanding production, acquiring other businesses. Debt and equity are the two main sources of capital available to businesses and each have advantages and limitations.

A sale of ownership stakes to private equity funds and other financial investors is an attractive alternative as far as it does not increase leverage and leads to competitive advantages achieved thanks to expertise and access to capital markets provided by the investor.

Private equity financing requires business owners to find their way solving a number of questions, including a choice between a strategic, financial and operational investor as well as making a decision on a stake offered to him.

Keywords: private equity, financial investors, stake offered to investors.

INTRODUCTION

In the course of its development, a growing company faces a need for external financing for realizing its investment programs.

Various sources of financing are available. Two basic types of funding are debt financing and equity financing. The debt financing options might be limited: bank loans are only available to firms with good credit history and mature sales. Moreover, some business owners feel uncomfortable dealing with banks and deliberately avoid this option. Attracting a financial investor who is eager to provide financing in exchange for a share in business can be considered as a reasonable alternative.

TYPES OF INVESTORS

Generally, there are two types of investors distinguished, namely they are financial and strategic investors. The major distinction between them is the following. Strategic investors besides economic viability are concerned with a strategic potential of a purchase and tend to accept offers not less than a controlling interest. By contrast, financial investors supply firms with capital and they are aimed at
exiting the business as soon as feasible, usually in 5-7 years earning annually not less than 25% return on invested capital.

Financial investors act as providers of sources both operating expenditures (OPEX) and capital expenditures (CAPEX). Primarily financial investors are focused on getting return on their investments. The most important indication of success for them is the price of their shares. The major driver of investment decisions of financial investor is the expectations of the exponential growth of the business within 3-5 years. Financial investors are motivated by capitalization increase and receiving dividends while holding a share. Usually financial investors require the following company’s characteristics: consistent earnings, reasonably high growth rates, effective CEO and management team. They are always on the lookout, searching for willing buyers for their stake. The stock exchange is a common exit strategy.

In its turn a strategic investor is predominantly oriented on long-term investment horizons. They are concerned with a business model itself and its improvement. In the frame of this article we assume that strategic investors do not have speculative intentions and actively participate in managing a business aiming at revenue growth.

Alongside with financial and strategic investors we suggest introducing a notion of operational investors. How can an operational investor contribute to a business? His input may include base of clients, distributors and suppliers with beneficial business conditions, administrative resources. These market players invest in a target company achieving the growth of it as well as the growth of their core businesses. Thus, a target company is an instrument for stimulating growth of the core business that an operational investor holds. However he works on achieving synergy at companies that has aroused his interest.

In this article we describe aspects of business valuation and try to find the way to identify a share that can be offered to a financial investor. Strategic and operational investors are irrelevant for the objectives of this research as far as the owners of fast-growing businesses are often reluctant to attract strategic investors because shareholders are not willing to go out of their business.

**LITERATURE REVIEW**

Attracting a financial investor is an effective tool for increasing business value. Exit strategies have a significant influence on business value and risk to owners of a business. Compared to strategic investors, financial investors are more conservative with respect to the business valuation (Zakharov, 2010). Due to the concentration on achievement of financial goals (high return on investment), and the possible lack of industry experience financial investors are not aimed at acquiring a controlling interest in business. One of the reasons for that is the risk avoidance. Most likely financial investor will...
not be able to manage the business as efficiently as acting team of managers or owners. However, as a rule, a financial investor is interested in getting a share is not less than the blocking.

From the risks point of view the group of financial investors is not heterogeneous. Researchers (Weidig, Mathonet, 2004) stays that each type of private equity investment vehicle has a different risk profile. A direct investment has a total loss probability of 30%. A fund or a portfolio of direct investments has a very small probability of total loss. A portfolio of funds has a small probability of any loss.

In our research private equity funds takes a core place as financial investors. Financial mass media calls private equity funds as “new kings of Wall Street”. These financial investors deal with a wide range of business entities from startups to large corporations.

Significantly, private equity funds provide not only the initial capitalization for companies, but management and operational advice as well (Black, Gilson, 1998). Almost all private equity funds are set as limited partnerships, with private equity firms operating as a general partner (GP) of the funds, and big institutional investors and wealthy individuals providing capital as limited partners (LPs) or passive investors (Harris, 1998). The structure of the relationship between these investors and their fund managers set the base for potential several for investors to monitor an allocation of their investments. Interests of managers and investors often differ. On the one hand investors require managers to use their expertise to maximize the value of their investments. On the other hand, fund managers intuitively might want to shrink responsibility, and hide information or redirect resources for their own benefits. Thus an agent problem is created.

According to researchers, decisions of private equity funds are based on the market timing theory. Ljungqvist and Richardson (Ljungqvist, Richardson 2003) link the timing of funds’ investment to exit decisions, and the returns they earn on portfolio companies, to shifts in the demand for private equity. Following this logic, when investment opportunities improve and the demand for capital increases existing funds accelerate their investment flows and earn higher returns. Rises in supply lead to more intense competition for deals, and private equity fund respond by shrinking their investment programs.

Liquidity of securities may be a parameter that researchers associate with private equity decision-making process. Lerner and Schoar (Lerner, Schoar, 2004) present a model in which a private equity firm chooses the degree of illiquidity of shares to screen for investors with long horizons. The idea of the model is driven by the information asymmetry between inside and outside investors. Illiquidity is approached as a choice variable, which can be influenced by the manager of the fund and allows him to screen for deep-pocket investors. Low liquidity would not scare away long-term investors, but investors who expect to face many liquidity shocks in the future would find these restrictions
irrelevant and therefore would avoid investing. The benefits of having liquid investors become apparent once the firm has to go back to the market to raise new capital.

A number of studies are dedicated to an issue of investment attractiveness of a business. Methodology of Valinurova and Kazakova (Valinurova, Kazakova, 2005) suggests considering fifty-five parameters characterizing an enterprise. These parameters determine the cumulative investment potential and investment risk and then an integral index of investment attractiveness of the business is calculated.

For identifying company’s investment attractiveness there has been developed a number of concepts, including the three-factor model (Sizykh, 2012), which allows to evaluate the investment attractiveness with regard to the preferences of investors in three areas: profitability, risk and corporate governance. Sevryugin’s Methodology (Sevryughin, 2004) evaluates the following indicators of investment attractiveness of enterprises of different organizational forms: financial position, corporate governance and market environment. Financial position of a company is considered by some researchers (Kuznetsov et al, 2004, Krylov et al, 2003) as a core of a set company’s investment attractiveness factors. Among the factors of investment attractiveness of an enterprise researchers also take into account the corporate governance practices, relations with the regions, and a role in the social division of labor (Doroshin, 2005).

Our experience in dealing with financial investors and the literature review have allowed us to create a test that determines the willingness of financial investors to consider business as an investment target.

A sign, that financial investors may be interested in a company is a positive response to the following three questions:

**QUESTION 1. IS AN EXIT STRATEGY CLEAR FOR AN INVESTOR?**

Analysis of an investment target usually begins with an assessment of prospects for exiting the business (exit strategy). A private equity fund analyzes recent transactions in the industry, paying attention to exit ways of financial investors. Even if there are few or no deals, at the moment of entering the business the fund should clearly see an option for making a successful IPO or sale of a share to a strategic investor.

**QUESTION 2. ARE THE BUSINESS AND BUSINESS MODEL SUSTAINABLE AND SCALABLE?**

Revenue model and the model of the company’s profits should be understandable. Lack of ability to multiply (being reused in different environment) the business model, even if it is stable; make the
business unattractive for financial investors.

**QUESTION 3. IS A MANAGEMENT TEAM PROFESSIONAL, AND WHETHER IT HAS A STRONG MOTIVATION FOR ACHIEVING AN EXPONENTIAL BUSINESS GROWTH?**

The managing team need not only to prove its willingness to develop and implement a business strategy, but also be able to find new opportunities emerging in the market and launch new projects. However, in our literature review we have not found an answer to the question of how an owner can determine the share offered to investors. Further, on the hypothetical example we consider a situation that often occurs in practice, and suggest recommendations.

**WHAT STAKE TO OFFER?**

According to a definition provided by International Private Equity and Venture Capital Valuation Guidelines, a fair value is the price that would be received to sell an asset in transaction between market participants at the measurement date.

In order to identify a share to offer, it is important to understand a need in external financing and identify a fair value of equity at a day of negotiations.

Often business owners include into valuation assessment of future investment projects. However, since there is likelihood that investment projects can be launched later, or not implemented at all, the projects can be viewed as call option out of the money (OTM) and, therefore, they have an extremely low price today. Thus, firstly it is important to valuate the business "As It Is", and then take into account the investment projects.

Business valuation "As It Is" allows us to correctly identify a share offered to an investor while business valuation with projects enables an investor see gains in investment projects implementation.

**BUSINESS VALUATION "AS IT IS"**

Suppose you are a food products manufacturer, and in 2013 you received the following financial indicators:

- Revenue – 600 million rubles,
- profitability EBIT - 8%
- required working capital - 10% of revenue,
- loans and borrowings - 100 million rubles,
- income tax rate - 20%.
For annual growth of 10-12% you need net investment (capital expenditures minus depreciation) that amount to 4% of the revenue. You expect that by 2018, due to internal improvements the EBIT margin can be increased up to 10%. Then, the cash flow will be as follows (Table 1):

**Table 1. Cash flow forecast**

<table>
<thead>

</tbody>
</table>

**BUSINESS VALUATION WITH INVESTMENT PROJECTS**

Suppose the market provides good growth prospects. If the net investment in business the next two years will amount to 200 million rubles, then from 2016 to 2018, we can expect an annual revenue growth of 45%, and by 2018, EBIT margin of 12% with a projected 8.7 % in 2015. Then the company’s cash flow will be following (Table 3):

**Table 3. Cash flows forecast with investment projects**

<table>
<thead>
<tr>
<th>Million Rubles</th>
<th>2013</th>
<th>2014</th>
<th>2015</th>
<th>2016</th>
<th>2017</th>
<th>2018</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenue</td>
<td>600,0</td>
<td>660,0</td>
<td>726,0</td>
<td>1052,7</td>
<td>1526,4</td>
<td>2213,3</td>
</tr>
<tr>

**WHAT MINORITY STAKE TO OFFER TO AN INVESTOR?**

In practice, share will be determined at the negotiations and will largely depend on the balance of forces during them, but if we approach financial investors with an offer of 29% (the necessary investments, divided by the cost of equity with investment projects), such an offer be rejected immediately. The main reason for that is the following. The cost of equity of 679 million rubles we get if a financial investor invests 200 million rubles. Without 100% investment equity share will worth 284 million rubles. Thus, the financial investor should be offered a stake of 41% (the necessary investments, divided by the sum of the cost of equity and the investments required).

As far as the value of a privately held company is subjective category, a share offered to a financial investor (assuming that the forecasted free cash flows accepted by an investor) depends on two factors: risk assessment (WACC) and the exit multiple.

A sensitivity analysis shows the following. If a financial investor believes that the risks in the business are higher than we describe, therefore value the company, using WACC of 20% and the exit multiple of 5 times EBIT in 2018, he will begin negotiations with the controlling stake, namely 54%, as shown in the table below (Table 5). In such scenario, an investor valuates 100% of the equity without investment projects as 173 million rubles.
CONCLUSION

Both debt and equity financing are important sources of capital for business enabling it to fund its operations. Deciding which to use or increase depends on the long-term goals of the business and the amount of control shareholders willing to maintain. Private equity financing and financial investors are the center of attention of this research paper.

In this article, we have described types and motives of investors while acquiring equity interests in a business and proposed solely financial argumentation for calculating the share offered to investors. Major result of the presented research is the concept for finding a size of a share offered the on the basis of financial calculations. This brings us to a recommendation to offer investors a share based not on “feeling”, but on a solid basis of a particular method built on financial principles.

SCREENING AND SCORING PROCESS IN M&A DEALS OF SERIAL ACQUIRERS. EVIDENCE FROM THE RUSSIAN AND INTERNATIONAL MARKETS

Vashakmadze, Teimuraz; Martirosyan, Emil; Sergeeva, Anastasia; Krechun Margarita
The Russian Presidential Academy of National Economy and Public Administration, Moscow, the Russian Federation

ABSTRACT
This paper presents a study on the screening and scoring process as part of M&A strategies in Russian and international companies. It is hypothesized that an arrangement of the screening and scoring process in M&A is one of the key factors for the success of a transaction. Successful deal making requires a well-defined strategy. Serial acquirers that dominate the market consider M&A as an extension of their company’s growth strategy. Targets’ screening and scoring within an acquisition strategy develop clear view on prioritized growth opportunities, reflect M&A needs and create a pipeline of priority acquisition targets. All companies set targets for an acquisition on the basis of the corporate strategy. Some omit compiling long lists and short lists, but all companies consider strategic compatibility as a key criterion when choosing a target. A developed strategy sets the basis for elaborating criteria for the targets search, such as location, client portfolio, a range of products or services. The majority of companies adhere to the traditional approach to screening and scoring. Search for potential targets is conducted through analyzing market opportunities, comparing acquiring assets with strategic objectives. Some companies invite external parties such as banks, investment consultants or exploit the internal potential by involving company's business units, which understand the need for assets to expand the business. Companies tend to regularly update their long lists of targets, which requires fewer resources than creation of new target lists each time for a new deal. Some companies constantly monitor and analyze the market.

Keywords: merger and acquisition (M&A), serial acquirer, target company, acquisition screening, scoring, acquisition strategy, Due Diligence.

INTRODUCTION
This paper presents a study on the screening and scoring process as part of M&A strategies in Russian and international companies. It is hypothesized that an arrangement of the screening and scoring
process in M&A is one of the key factors for the success of a transaction.
Serial acquirers amount to 9% of all the companies involved in M&A activities. They dominate the marker in terms of volume of mergers and acquisitions. They build M&A programs around frequent, continuous deal making and achieve notable success through establishing a full cycle of M&A process, focusing on searching target companies and integration process. They accumulate increasing expertise in conducting transactions, thus their best practices in targets’ search have become the ground for a detailed study.
Theoretical part of the article includes case studies of 10 international serial acquirers. The practical part consists of 15 expert interviews conducted with representatives of strategy and M&A departments of Russian and foreign companies. Comparison of information on M&A activity of 10 serial acquirers with practical information obtained from 15 expert interviews proves the similarity of approaches of different companies during M&A.

Case Analysis

There have been selected 10 companies, classified as serial acquirers whose M&A processes are of potential interest for a detailed study and information on the screening process and scoring which has been available in open sources. There companies are: Dow (chemical industry), Tyco (security systems), Polycom and Cisco (telecommunications), Cemex (construction supplies), Mahindra & Mahindra (Automobile industry), Hindalco, Tata Steel (steel industry), Schneider Electric, Kone (engineering industry).

Analysis of Experts Interviews

A search for experts for interviews has been carried out on the basis of the following parameters. An expert needs to be a representative of a Russian or foreign company that regularly makes M&A transactions, have relevant experience in the field of M&A, hold a managerial position, be personally involved in several M&A deals. Some experts asked not to disclose the name of their companies. In order to preserve confidentiality, we pointed out their position and the company’s industry.

</table>
Serial acquirers have become a center of attention of researchers investigating theory and practice of M&A. Both a high rate of M&A and a high variability of the rate are negatively related to performance. An acquirer’s size, the scope of its acquisition program, and acquisition experience weaken the negative effects (Laamanen and Keil, 2008). According to another research (Kengelbach et al., 2012), multiple deal makers exhibit a 0.4 percentage points lower short-term abnormal return, equal to a $31M shareholder value disadvantage. However serial acquirers can gain proficiency in some specific types of deals.

Developing a screening process for M&A targets is a significant step in creating an efficient M&A strategy (Rosner, 2006). A proactive, structured screening process enables companies accurately assess targets that can advance corporate business strategy. Applying a formal screening methodology involves establishing clear inclusion/exclusion and prioritization criteria, building a comprehensive candidate list, applying the criteria to narrow a group of potential targets, creating in-depth candidate profiles to enable a more informed approach and support the initial due diligence stage. In addition to better M&A performance a well-established screening process provides such benefits as enhanced strategic consistency, opportunity prioritization, effective use of recourses and a framework for ongoing analysis.

Researches highlight an importance of the search period. Analysis of markets and competitors and the search process for potential candidates is the following step after the definition of an adequate strategy. To conduct a value adding search, preliminary search criteria must be determined. These are coherent with the company strategy, organizational form, and goals defined during the planning. The calculation of a target’s strategic fit, synergies, and costs savings is conducted and with effective management. Potential targets are organized and the best fitting target is selected (Gleich et al., 2012). It

is reasonable to take time for an adequate evaluation of a target and review the potential seller company on its fit into an acquirer’s strategy and consider potential alternatives (Boos, Heitger, 2005).

CASE STUDIES

Serial absorbers’ influence to the M&A market

Companies use M&A as a tool for non-organic growth to increase profits, market share and gain competitive advantages. M&A statistics over the last 10 years shows that more than half of mergers and acquisitions turn to be unsuccessful failing to reach their objectives.

However, serial acquirers refute the statistics. Research of Accenture consulting company (Kubel D., Langthaler, 2011) conducted between 2003 and 2009, showed that the serial acquirers have a significant impact on the market. 9% of all the companies involved in M&A activity are serial acquires (Figure 1). They implement 1/3 of the number of transactions and accounted for a half of the total volume of transactions in the market.

Figure 1. M&A Activity by the types of companies
Moreover, Accenture conducted a large-scale study of 2500 M&A in 110 different companies from 2007 to 2009. The sample included serial acquirers, companies what regularly implement M&A transactions. The study found out that the market is dominated by serial acquirers. Typically, serial acquirers make large transactions. Average transaction of serial acquirers is larger by 28% in comparison with other companies (Figure 2).

*Figure 2. Volume of M&A deals*

European serial absorbers companies are more likely to make cross-border transactions in emerging markets, which account for more than half of M&A in the BRICS countries. In 2003-2009 they closed 27% more mergers and acquisitions than any other company (Figure 3).

Serial acquirers are experiencing considerable difficulties. To maintain the flow of transactions, companies need to handle multiple transactions at the same time and manage a portfolio of projects at all stages of the transaction. However, some of the processes of serial acquirers can be improved. The majority of companies in Accenture’s study are very strong in the traditional M&A process, namely in developing a strategy and managing a deal. But they are weak at the post-merger integration and the effectiveness management of M&A.

*General Characteristics of the Screening Process*

Among a variety of suitable targets a well-established rigorous search mechanism of target companies defines the ones that match the customer requirements best. The key to success in the targets search is a clear definition of the basic principles and criteria for screening within the frame of a company’s M&A strategy. However, the criteria for screening are specific for each company and each transaction. Today acquirers are interested in the stability of a business model, competitive advantages of target companies and successful management of the post-merger integration. Furthermore, they evaluated M&A
transaction in terms of risk. Financial institutions and business development specialists involved in the development of a target search methodology help to improve the efficiency of the process eliminating obstacles in the deal’s implementation. The strategic compatibility and companies suitability after a deal are considered as critical factors in the M&A analysis. Qualitative and quantitative screening criteria are used to compare and evaluate possible strategic fit between the two companies.

The formal screening methodology includes 4 steps (Figure 4) and starts with defining clear inclusive/exclusive criteria for selecting and prioritizing target companies. Secondly comes drawing up a long list of potential targets. The next step is applying the search criteria to shrinking the long list. And finally an acquirer selects the most attractive companies to acquire.

**Figure 3. Screening stages**

**M&A Strategy as a Continuation of the Company’s Strategy**

An acquisition strategy is being developed on the basis of a company’s overall strategy that reflects the desired goals is the first step in the M&A process. After defining the strategic objectives a company’s management need to formulate a set of strategic business alternatives. For the implementation of a selected alternative a company may combine in different proportions both types of growth, organic and M&A. For example, CEMEX combines internal business growth with strategic acquisitions and capital investments. And Dow Chemical is developing mainly due to active M&A activities capturing new markets, technologies and gaining access to new customers. In total, the company has acquired more than 200 businesses from 1983 to 2009. As well as Kone that implements 20-30 acquisitions a year, of which 6-8 of transactions exceed the value of 5 million euros.

The M&A process consists of 5 stages (Figure 5). The process starts with a decision on the strategic fit of the transaction and planning its milestones. Than a company runs screening and scoring of the wide range of potential targets for acquisition in order to narrow the list of the target companies. An acquirer negotiates and familiarizes himself with target companies and harmonize conditions of the deal. The next step is Due diligence (DD) that forms a clear picture of the investment’s object, provides an assessment of the company’s financial status and comprehensive study of its activities. Finally comes a stage of closing the deal.

**Figure 5. M&A Process**
Serial acquires have achieved considerable success through alignment of the full cycle of M&A process, focusing on technology of searching suitable target companies and post-merger integration practice.

The Objectives of M&A Deals

Companies’ objectives in M&A differ according to the chosen business strategy. High-tech companies such as Cisco, Tyco and Polycom are usually aimed at new technologies and the expansion of the product line. For instance, M&A deals aimed at gaining access to new technologies are an integral part of the Cisco’s strategy. This strategy was unique for the market of high-technology companies as far as the majority of market players perceived an appeal to the external sources new technologies as a sign of weakness. Cisco is also considering M&A transactions as a way to protect rare intellectual assets. M&A strategy of Polycom was aimed at expanding the product range of cloud services. While choosing targets for the acquisition attention was paid to a development team and engineers that can improve R&D capabilities of the company. Tyco in the selection of potential targets paid the prime attention to the product line, which could complement or improve its own range of products.

M&A objectives of companies from emerging markets such as India Hindalco and Tata Steel can form a separate group. Indian companies make M&A transactions with a long-term strategic bias. Through takeovers companies are gaining access to technology, knowledge and competencies necessary for the implementation of their strategy. Determining their weaknesses, Indian companies are selecting M&A targets to eliminate their weak spots. The deal with Novelis has allowed Hindalco to become a global leader in aluminum rolled products. Moreover, it would take Hindalco 10 years of its own research to develop high quality aluminum production technology by itself. Tata Steel after acquiring Corus Group has become the fifth largest steel company in the world, up from 56th place. With the help of M&A transactions it has united access to low-cost steel production with access to highly developed global markets of automobile manufacturers in Europe and the United States. An advantage of these M&A deals for both companies has become a supply of raw materials (steel and aluminum) to Western partners, that make the final production, and their manufacturing facilities are located close to the European consumers. Also, Indian companies have benefited from access to new advanced technologies and R&D competencies.

CEMEX’s aggressive acquisition strategy has begun with purchasing of local companies aimed at becoming the largest cement producer in Mexico. When the company gained M&A competencies it has launched its international expansion in developing countries with a similar culture and language. After Spain CEMEX entered the Latin American market, where knowledge of the specifics of developing
countries, a similarity of language and culture have become advantages over European competitors. Global expansion has been reducing fluctuations of operating performance indicators in the regions of presence.

Dow used M&A deals mainly in order to improve its position in the market of specialized chemical products of a high demand. At the same time it created joint ventures for the purpose of diversification and risk mitigation. The company located its most mature business in regions with high growth rates, at the same time benefiting from the fact that it had access to cheap raw materials by working with local partners.

A table 2 summarizes purposes of M&A deals, which have been identified in a study of 10 companies. On the basis of the study of 10 serial acquirers, 3 key reasons for M&A can be pointed out. The major reasons are to enhance and extend a product line, acquire new technologies and R&D capabilities, geographically expand and access new markets and customers.

Channels of Information for the M&A Targets Search

There are several ways for serial acquirers to find potential M&A targets. The main way of drawing up a long list of target companies is a focused search based on specific criteria in accordance with the M&A strategy. Also a company can create and regularly update a database of potential targets for acquisition in order to pick one of them at the appropriate time. For example, Schneider Electric, Dow Chemicals and Mahindra & Mahindra used to define potentially interesting targets and monitored the actions of competitors in the market in order to take advantage of the economic difficulties of target companies and initiate M&A.

Often an initiative for an acquisition comes from business units of companies. For instance, the Polycom managers through communication with customers, suppliers, strategic partners have determined which products or technologies the company is lacking and what target companies have necessary competences. A Kone provides its affiliates with the power to compile a long list of potential targets, as far as its local representatives had more information on competitors and market conditions in the regions.

Usually investment banks provide assistance in finding targets for mergers and acquisitions have investment banks.

And finally one of the most common methods of obtaining information on targets for a takeover is receiving offers from small companies working with serial acquirers.

The study reveals 5 main channels of information on potential targets, including directed target search by the set of criteria, database creation, business units of a company, investment banks, small companies associated with the larger ones.

Criteria for the Screening Process

While planning objectives and the results of M&A transactions a company need to define the criteria for screening and scoring, which suit its M&A strategy. One of the most important criteria for selecting
targets for M&A transactions is a strategic compatibility of an acquirer and acquiring companies. Unsuitable companies can be identified at an early stage of the screening before wasting significant resources on a transaction that is lacking in prospects.

As a rule, companies assess the strategic fit considering compatibility of the potential targets with the strategy of the company as well as specific screening criteria, including the feasibility and difficulty of the integration process. Also, challenges and risk factors that need to be considered are defined for each M&A target. The most common selection criteria correlate with the objectives of the M&A strategy and are linked to the range of products and services, technological base and operations geography of a target company.

For example, Dow has a comprehensive approach to the selection process. A target company needs to suit the strategy, the spirit and vision, be in a good financial condition, discover new advantages and create value for shareholders. The company also needs to be suitable in terms of strategic vision in the field of technology, geography, business model, market position and product line. High-tech companies such as Cisco, Tyco, and Polycom, primarily looking for acquisition targets on the basis of the range of products and services to strengthen their market position. Important screening criteria for them are were innovative and progressive technologies of target companies, that are supposed to enhance their own potential.

Moreover, while searching for targets of M&A some companies pay much attention to specific screening criteria. For Tyco, a target’s ability to increase its income quickly after M&A was an important screening factor. Polycom was getting involved into M&A only if it can be implemented within two quarters. Expanding the geography of its operations Kone chose markets that were not dominated by large companies in order to be able to take a leading position there. Indian companies, Tata Steel and Hindalco, was choosing targets of acquisitions primarily on the basis of synergy effects and high technological competence. The geography of production and sales of the target company were key factors that would allow them to gain access to developed markets. The majority of Mahindra & Mahindra acquisitions were made during an economic downturn.

The table 3 provides a summary of the screening criteria for M&A transactions, which have been identified in a study of 10 companies. Serial acquirers are looking for targets considering a variety of criteria. The table reveals the most important of them for specific companies.

Systematic screening process improves the chances of success in mergers and acquisitions. Most of the harmful factors that can destroy the value of an acquirer can be identified at an early stage and a waste of considerable resource on the wrong acquisition can be avoided. Deloitte identifies several “red flags” to filter the list of targets:
• Incompatibility of the accounting reporting, procedures and rules. The screening needs to consider standards of financial statements - IAS, GAAP;

• An impact of the transaction on the Balance Sheet and Profit and Loss Statement of an acquirer. It is important to identify how the deal will influence the Balance Sheet and EPS, how differences in accounting standards will be regulated;

A company’s name/
Screening criteria

1 Strategic compatibility

2 Specific products and services range

3 Certain technological competence

4 Innovation (technology, products, business model, etc.)

5 Market leadership

6 Location and geography of operations

7 Potential to dominate a particular market

8 Linguistic and cultural similarities

9 Poor infrastructure

10 Good financial condition of the target company

11 An economic downturn

12 A pace of an acquisition
13 Synergy effects

Table 3. Criteria for screening

- The next point is taxation. The understanding of tax accounting structure of a target company may have a significant impact on the amount of taxes paid and cash flows;
- The size of investments in a target, including direct transaction costs and investments into the working capital and the development of the company after M&A;
- An analysis of target’s liabilities, some of which may not be reflected in the balance sheet;
- A comprehensive approach to risk analysis, which also includes the collection of information on the management of the target company;
- Operational and financial “red flags” that are a number of key customers and suppliers, and the company’s dependence on them.
- A sharp improvement in the operating performance of the company represented by a short-term increase in sales, profit and cash.

The earlier potential hazards are identified, the less risk of picking a wrong M&A target is. The main criteria for screening targets, selected on the basis of the study of 10 serial acquirers include strategic compatibility, the necessary range of products and services, availability of the necessary technological competence, geography of operations and a target company’s customer base. In the analysis of activity of 10 serial acquirers it was found that the companies did not have a unified approach to the search of targets for M&A. But the majority of cases have shown the dependence of criteria for the target search and a firm’s M&A strategy.

Some companies prefer to buy market leaders, while others, on the contrary, go to markets where there are no major players. For some companies distribution channels and a target’s customer base are important, others acquire advanced technology and skilled technicians.

The study has indicated that the majority of companies tend not to disclose the information on the screening and scoring process in their M&A activities.

EXPERT INTERVIEWS

General Provisions

In the majority of companies in this study a process of M&A fits an overall business strategy of inorganic growth. Business units may get involved into the global strategy development and determine what competencies the company needs to improve on. This is the case of Caterpillar or Schneider Electric. In other cases the head office forms the strategy and communicates it to all departments. This
is how Evraz Group S.A. acts. All companies in the study choose M&A targets, if the deals correlate with the goals of the global strategy that reflects a geographical factor, promising industries, certain range of products and services. If a company has a less deep approach to screening that is based on current market opportunities, like Evraz Group S.A., this can later lead to erroneous from a strategic point of view acquisitions. In general, for Russian companies in the study, except the Group of Companies "Riemer", it is more common to have less rigorous approach to M&A deals in comparison with foreign entities. One of the main constrains for Russian companies is the lack of market information and companies’ reports while some published communication materials may be uninformative. Companies in the oil industry as TNK-BP, have their own peculiarities in a search for M&A targets, due to the limited market offer. Indian company Aditya Birla Group shows an in-depth approach to M&A deals. Each transaction of this company is made strictly on purpose to expand existing facilities or acquire specific skills for enhancement current business.

The amount of M&A Deals

Sometimes companies are carrying several M&A projects simultaneously and do not complete a part of them. For instance, Metso may have up to 5 ongoing projects in different lines of business. The reason for quitting or delaying a deal may be disagreements on value of business between a buyer and a seller, additional information received after due diligence, better offers received from competitors, etc.

Channels for receipt of information about the

Among all sources of information about the targets for the acquisition there can identified two main channels. Namely they are company’ units and external consultants as well as investment bankers. Business units have relevant information on the market that is suitable for initiating M&A process. Moreover, suppliers and distributors can also be source of M&A offers.

10th Annual Conference of the EuroMed Academy of Business

with the M&A process;
- consulting services for business units dealing with joint venture creation, strategic alliances

Schneider Electric No 8 (M&A team) - Corporate Strategy Division is responsible for screening targets, an assessment of the strategic relevance and feasibility of a deal;
- M&A team reports to CFO and is responsible for M&A from choosing a target till finalizing the deal.

Metso Oyj No 2 (constantly focused on M&A) - Corporate Strategy Department is responsible for transactions support. The Department includes a sub-team specializing in M&A;
- Functions are flexibly allocated within the Department, and powers, employees are involved in M&A processes 40-50% of their working time;
- the department supports the entire process and get stuff from business units involved at different stages.

Aditya Birla Group - A team from a Corporate Strategy Department performs functions of M&A support.

TNK BP Yes 3 employees M&A Department collaborates with relevant business units, holding coordinating functions at all stages involved in a deal

Evraz Group S.A. Yes N/a An M&A department supports deals but it does not searching target companies

"Novaport" LLC No – - A Corporate Finance Director and an analyst deal with M&A processes in the company;
- Shareholders are involved in M&A process.

"Alliance Oil Company" No – - A Business Development Department represented by 2 employees is in charge of the M&A targets search;
- During a deal the Department works closely with other entities in the company.

"MTS" OJSC No – M & A functions are performed by the Department of Strategic Development

Table 7. M&A department in companies and its main functions

At Caterpillar the M&A department has all the functions of consulting and transaction support. At Schneider Electric this process is divided between a Corporate Department, assessing the strategic
feasibility of a transaction, and an international team of 8 professionals who directly carry out all stages of a deal. In Metso an M&A function belongs to a team within a Corporate Strategy Department. The number of staff members involved depends on the number of projects in work. Department of M&A company Evraz Group S.A. does not deal with a search for targets except cases where offers received directly from banks.

*Compiling long list and shortlist*

Not every company from our sample has a well-established procedures and rules for building up the list of targets.

- **A company**Formation of a long list
- **Caterpillar**Defining potentially interesting companies in 8 key sectors of the economy
- **Schneider**No long list, target companies are identified by the company’s business units. There is a list of interesting targets that are regularly being monitored
- **Metso**Company continuously monitors the industry and related sectors, tracking major players and competitors
- **Aditya Birla Group**A dynamic long list of targets, containing 60-70 companies with a description of market activities and main characteristics. There are 3 criteria: manufacturing capabilities and potential synergies, MCap, financial multiples. A separate long list is created for each industry.
- **TNK-BP**A long list of potential target companies is pre-determined based on the market and its key players.
- **Evraz Group S.A.**A long list is compiled on the basis of raw materials and production base of companies.
- **Group of companies "Riemer"**A search of companies is divided by 3 groups of competencies: drilling, production and servicing of downhole equipment and construction assets. The long list exceeds 100 items.
- **LLC "Novaport"**There is a long list of 15 companies chosen by such characters as passenger traffic, geography and availability for M&A
- **Alliance Oil Company**Continuous monitoring of potential 200 targets with an annual increase of 15-20 offers, mainly small oil companies and oil fields. The criteria to include a company in the list: the volume of oil and gas reserves, the price factor.
- **OJSC "MTS"**A list includes 20 potential companies. The criteria to include a company in the list: valuation multiples EV / EBITDA = 5,5, EV / Sales = 2,3, the city’s population is 200 thousand or more, the company’s market share is at least 20-30%, good financial performance.
- **OJSC "Power Machines"**A list consists of strategically relevant companies based on their financial and economic condition.

*Table 8. Criteria for a long list*
The process of target selection may be based on the current market offerings. Or, alternatively, target selection is carried out in line with a strictly developed methodology. It is a common practice to combine these two approaches while compiling a long list. For instance, Metso monitors only potentially interesting companies within the industry, but does not initiate a global search.

Another reason a company may be reluctant to conduct a large-scale search is a familiar market and well-known market players. This is the case of an oil industry and TNK-BP. In 2010, Caterpillar identified key markets through the study of the profile of buyers, with whom it was willing to collaborate. In order to evaluate the key characteristics of target companies, there was developed a system of indicators for industries and companies. An industry-oriented system checked the growth rate and profitability, while a companies-oriented system checked a market share, growth rate, regional coverage, competence of employees. The Russian Group of companies “Riemer” also has a detailed approach to creating a long list of targets for M&A. The company defines three key competencies: drilling, production, and servicing of downhole equipment and construction assets. Aditya Birla Group has a similar systematic approach to form a long list has a company, conducting a weekly monitoring companies in the list and monthly producing peer reports. Schneider Electric does not create a long list, considering it a waste of time, because a lot of companies in its potential list cannot be sold and the list of potential targets includes thousands of items.

In the study, companies didn’t point out a geographical position of the target as a separate factor, since it is part of the overall strategy of the company and it is taken into account when searching for targets.

According to the study, while transforming from a long list of targets to a short one the key criteria for selection is the availability of a company for a deal and the possibility to implement a transaction. Obtaining a precise response from a target company is possible by establishing a primary contact or determining its owners.

The lack of information for a decision on further detailed analysis of the company remains a challenge while converting a long list into a short one. Especially it is a complex issue if a target is a non-public company or a market is not studied enough. In such cases, companies use all available resources to gather more information. They involve employees, contractors and exploit materials from open sources. At the same time, companies engage consultants who gather all the necessary information.

TNK-BP’s approach to the selection of targets for an acquisition is based on the strategic objectives and by comparing offers available on the market. An important role was played by political factors since oil production can be attributed to strategic sectors of the economy. However, a smaller oil company focused on the Russian market, Alliance Oil Company, runs an ongoing analysis of the market focusing on changes in oil prices and its transportation costs. A long list is based on financial analysis and a
A short list is compiled as a result of more detailed calculations. An approach of Evraz Group S.A. differentiate itself from common practice by the lack of clear criteria for the transition from a long list to a short list. Targets are selected on the basis of market opportunities and prospects of the deal. The main criteria for the company are the following: infrastructure, being close to customers and potential demand for the product on the market. Return on the acquired assets need to be no less than 20% per year. However, the choice of targets is usually closely linked to a strategy of development of the company and is aimed at the creation of a vertically integrated system and the improvement of the transport system.

Generally, compiling of a list of potential targets for a takeover companies focus on industry-specific criteria. For instance, for oil companies these criteria are the amount of oil reserves, production costs and NPV of the project, while telecommunication companies concerns about the city’s population and a base of subscribers.

Metso is leading several projects at the same time despite choosing one target. The large scale of business and different areas of its acquisition interests make it reasonable for the company to manage several M&A processes simultaneously. Aditya Birla Group, as well as other Indian companies such as Hindalco and Tata Steel, determines the criteria for acquisition on the basis of specific parameters for the company’s current needs. This is typical of companies from India to choose a target on the basis of its strengths.

A company | A criteria for a short list composition
--- | ---
Caterpillar | A product range and a rate of differentiation; the skills of the management team; a technological base, a cycle of a business; intellectual property; compatibility with the Caterpillar distribution network; R&D capacity; synergy opportunities.
Schneider Electric | Stage 1 - ranking and evaluation of targets by the company's business divisions with the involvement of the Department of Corporate Development and Corporate Strategy;
 | Stage 2 - using the general criteria of the investment attractiveness, industry specific criteria.
 | A list includes 5-10 companies on the basis of geography and product line.
Metso | Strategic compatibility in products and services; company’s size does not exceed the financial capabilities of Metso; company is available for sale; environmentally friendly companies; profitability and operational efficiency improvement of an acquired assets after becoming a part of Metso.
Aditya Birla Group | Each company is selected strictly for specific needs
 | Financial and non-financial aspects are evaluated on the basis of all available public information about it. Comparison of costs of building a similar business from the scratch and M&A; financial forecast of a target company before and after the acquisition; changes in the market position of a target company before and after the acquisition; synergy effects.
Short list depends on offerings on the market; reaching new markets through M&A; financial attractiveness of the company (NPV); volume of inventory; political factors.

Shareholders' selection of target companies; market research; comparison of costs of building a similar business from the scratch and M&A.

Stage 1 - studying companies from a long list considering 7 criteria: type of production/services; scope of activities; geographical factor; production capacity; major clients (customers); shareholders; financial results.

Stage 2 - 3 ranking criteria: an opportunity to acquire control in the shareholders capital; operational efficiency; detailed competency analysis.

Availability for M&A deal - readiness for sale; a price factor.

Financial modeling, evaluation of the production profile, CAPEX, OPEX.

Availability for M&A deal - readiness for sale.

Strategic relevance of business, financial and economic condition of the company.

Table 9. The criteria for the short-list

The interviews with experts from Russian and foreign companies that are directly involved in M&A transactions reveal practically oriented issues expanding the base by adding new theoretically relevant information and relevant experience. The conjunction of both parts of the study provides a comprehensive look at the process of merger and acquisition.

Firstly, all companies set targets for an acquisition on the basis of the corporate strategy. Some omit compiling long lists and short lists, but all companies consider strategic compatibility as a key criterion when choosing a target. A developed strategy sets the basis for elaborating criteria for the targets search, such as location, client portfolio, a range of products or services.

Secondly, the majority of companies adhere to the traditional approach to screening and scoring. Search for potential targets is conducted through analyzing market opportunities, comparing acquiring assets with strategic objectives. Some companies engage external parties such as banks, investment consultants and contractors or exploit the internal potential by involving company’s business units, which understand the need for assets to expand the business. Companies tend regularly update their long lists of acquisition targets, which requires fewer resources than creation of new target lists each time for a new deal.
Thirdly, the general screening criteria include sectorial and geographic filters, the possibility of acquiring a target company, a more detailed valuation of operating assets, its financial condition, as well as a price cap of the acquirer. Some companies constantly monitor and analyze the market. When ranking the companies and compiling a short list many acquirers face a problem of a shortage of information, especially if the target is non-public, or belongs to an insufficiently explored industry such as logistics. If an availability of a target company for sale was not examined at the stage of drawing up a long list, this criterion is beginning crucial for a short list. Also, at this stage, companies valuate targets and assess multiples and conduct peer analysis.

Analysis of case studies and expert interviews contains key indicators and approaches for screening and scoring target companies for acquisitions, but these methods are not a universal solution. Companies belong to different industries and countries, manage deals that differ in terms of volume and scale. Described approaches can be used as a theoretical base and practical examples of M&A process, but not as a template. A key to success in M&A is a company’s understanding of its development trajectory and generating necessary competences, which, in turn, are associated with the corporate strategy.

WHEN THINGS GO WRONG: UNTANGLING THE ORIGINS OF INTER-FIRM NETWORK TERMINATION

Vernizzi, Silvia; Cantele, Silvia
Department of Business Administration, University of Verona, Italy

ABSTRACT

This paper sought to explore factors affecting the termination of networks among firms. Starting from previous literature contributions, the study classifies factors influencing inter-firm relationships duration into six main groups: 1) Prior experience, 2) Goals definition, 3) Partners compatibility; 4) Risk / return balance; 5) Governance mechanisms; 6) Soft items.

Results show a lot of different factors that in several ways can drive network failure. Some of them are “hard” factors such as (governance mechanisms) whereas others can be considered as “soft” factors (building trust initiatives). Added to this, results show that factors affecting networking termination are not positive or negative in an absolute way, on the contrary, their effect is relative, in other words they can play a positive or negative role depending on the specific context they act in.

This paper contributes to the existing literature mainly focused on alliance termination, by providing a taxonomy of factors also relevant to interpret inter-firm networks ending. At the same time the study has managerial implications tied to the detection of potential risk factors and the consequent potential prevention of their transformation into negative outcomes.

Keywords: networks, alliances, inter-firm relationships, termination, network longevity

INTRODUCTION

Growing competitiveness, technological turbulence and the emergence of new markets have deeply affected the world business economic situation and the key value drivers of competitive advantage. Within this new and volatile environment, inter-organizational networking can be a key strategy by which to explore and exploit opportunities for growth and success (Gomes-Casseres, 1994). Inter-organizational relationships are driven by many needs, for example, improving production efficiency, sharing research and development skills, and gaining access to new resources and markets. Each of these aspects has become increasingly important, particularly for small to medium enterprises,
whose resources are often significantly constrained (Burt, 1997; Ahuja, 2000; Davies, 2009; Håkansson et al., 2009).

In this context, alliances and networks have been leading research topics for management scholars. Although a large number of studies have focused on creation (e.g., Gulati, 1995; Mitsuhashi & Greve, 2009), governance (e.g., Kale et al., 2002; Saxton, 1997), and performance of inter-firms organizations (Cantele & Vernizzi, 2015; Cantele & Vernizzi, 2016), only a few have investigated alliances and networks termination (e.g., Serapio & Cascio, 1996; Abodor & McMullen, 2002; Reuer & Zollo, 2004; McCutchen et al., 2008; Sadowski & Duysters, 2008; Pangarkar, 2009; Rooks et al., 2013; Cui 2013; Dan & Zondang 2015). In particular, the literature on termination is usually referred to strategic alliances (and thus mainly to dyadic relationships), while business networks have specific features that have not been extensively studied yet.

Nonetheless, a lot of scholars have pointed out that alliances and networks are often problematic and unstable (Das & Teng, 2000; Inkpen & Beamish, 1997; Reuer et al., 2002), an understanding of the drivers affecting inter-organisational relationship termination represent a crucial part of strategic alliances and networks’ knowledge.

Starting from this premise, the aim of this paper is to review the literature of strategic alliance termination in order to find common elements applicable to business networks. In particular, it explores the different factors found as leading to termination and classifies them in logical categories in order to get both theoretical and managerial benefits. Theoretical implications are tied to the deepening of termination factors applied to inter-firm networks, whereas managerial effects are linked to the goal of detecting such factors (i.e. potential risk factors) in order to prevent their transformation into negative outcomes.

The paper is structured as follows: in the next section, we briefly review the literature that frames our analysis of networking termination. Then we try to suggest a classification of the main factors at the origin of networking termination. Finally, concluding remarks and suggestions for future research will be provided.

Before moving ahead two methodological clarifications are necessary.

The articles we refer to figure out termination driving factors, refer mainly to strategic alliances and, in more general terms, to inter-organizational networking. This is motivated by the above-mentioned prevalence of studies on alliance termination (rather than networks), but also by the fact that our aim is to grasp threatening factors of inter-organizational networking without (for the moment) analysing factors affecting specific networks agreement types.
Added to this, the perspective we used is the network perspective and not the focal firm perspective. In other words we try to catch factors that can influence the longevity of the network itself regardless of some specific factors that could lead some focal firms out from the network (such as, for example, firm specific financial difficulties or M&A events).

**FACTORS AFFECTING ALLIANCE TERMINATION: LITERATURE HIGHLIGHTS**

Among the different issues stemming from the proliferation of networking arrangements, the analysis of the factors of networking termination represents a key question for academics, business managers, and policy makers.

Several scholars tried to analyse the sources of alliance instability unfolding different and not always convergent conclusions.

First of all, it is worth to mention how termination does not necessarily represents a negative outcome of alliances (i.e. a failure). On the contrary, as highlighted by Reuer & Zollo (2004), in some cases, termination is experienced as a physiologic step of inter-firm relationships, due for example, to the achievement of some specific goals. Added to this, alliance ending can also be experienced as a “neutral” outcome (neither positive nor negative) related to natural contract expiration or unilateral withdrawal by a partner due to change in specific strategic objectives.

As represented by the title of this article “When things go wrong”, this paper focuses on the negative side of the alliance termination, leaving apart the physiologic and neutral ending of inter-firms organizations.

Serapio & Cascio (1996) explore and support with real cases examples why international alliances end and how they end. More in details, the authors identify six different reasons of alliances termination, related to the outcomes of alliances, the inner difficulties of co-existence between partners and to contingent phenomena. As for the first category (alliances outcomes), the authors identify two main reasons of termination: (1) the alliance has met its goals (successful termination), (2) the alliance can’t achieve its goals (unsuccessful alliance). As for the second category of reasons (difficult of co-existence) the authors identify differences between partners (in terms of people incompatibilities, different management styles, disagreement over objectives) as one of the main causes of alliance termination (failure side). Moreover, they show three contingent phenomena that could lead alliance to an end (failure side): (1) the breach of the agreement, (2) the fact that the alliance no longer fits the goals/ strategies of a partner; (3) the exit of a partner because of financial difficulties or other specific
issues.

Abodor & McMullen (2002), focusing on e-commerce alliances, identify five steps / factors firms should take into account to better manage the alliance and to increase its longevity. The first element they identify is the partners protection against risk. More in details, authors highlight how in choosing and selecting the portfolio of alliances, firms should pay attention to the risk – return balance criterion. According to finance portfolio theory, when firms want to engage in multiple alliances they should choose partners that reflect a desirable mix of risk and return. The lack of this balance increases the risk of alliance termination. The second factor identified the structure of alliance. Informal alliances offer greater flexibility, but they are more likely to come to an end. Then, contractual agreement can bridge, at least in part, the weakness of informal alliances. In general, the formalization and implementation of contractual agreements can represent a form of protection of company interests making higher the propensity to continue the alliance. Contrary to prior research, the paper sheds light on the positive effect of short-term commitment. In details, the authors argue that in high –speed environment such as e-commerce are characterized by short time horizon firms are more oriented in focusing on short-term payoffs from e-alliances. In other words, the high speed nature of e-commerce technology means that in a short term the dependency relationship between a firm and its partners may change radically. Hence, short-term payoffs may be a positive driver of alliance longevity. Moreover, definition of clear goals make the alliance management easier and its continuity more likely. Further, trust is a key element of any alliance relationships, so firms must create a positive context of trust building. Furthermore, the definition of clear exit strategy (in terms of conditions under which partners can opt out of the deal, dispute resolution mechanisms, and so forth) may drive alliance continuity.

Among the authors tackling the alliance-ending topic, Reuer & Zollo, 2004 investigate the role of prior alliances experience. More in details, focusing on a survey administered to biotechnology and pharmaceutical firms engaged in inter-firm research collaboration, the authors find out that general alliance experience or prior alliances in the same technological area have no significant favourable consequences for alliance termination outcomes. As for experience, just the partner-specific experience has a positive effect on the favourability of termination outcomes and this effect is greater for non-equity alliances than for equity structured partnerships.

Moreover, based on survey responses from 85 parties in biopharmaceutical alliance McCutchen et al., (2008) show there are four main factors affecting an alliance stability.

The first element is task complexity defined as the level of difficulties in achieving alliance objectives. Task complexity can be influenced by a variety of elements such as the nature of the objectives, the
number of business functions involved, the products and market in the alliance and so forth. An alliance characterized by a high level of task complexity is more likely to experience conflict among partners and this explain the complexity-failure relationship.

The second factor identified is partners’ nationality, distinguishing between domestic alliances and international alliances, formed by partners of different countries. According to the authors, domestic alliances easily come to an end. Differences among international partners increase the probability to get complementary resources. When partners firms come from different countries, they are more likely to possess different technologies, know-how, connections, locations, capacities, and distribution channels. Thus, resource complementarity, or resource fit, which is desirable in any alliance formation and duration, is easier to achieve through international alliances. The third element is tied to strategic alliance experience. Through prior strategic alliances firms may develop expertise in identifying good partners, negotiating, inter-firm control, knowledge acquisition and many other crucial aspect of alliance’s management, developing the so called “collaborative know how” (Simonin, 1997). So, alliances characterized by limited prior strategic experiences are more likely to come to termination and have poor performance. Within the experience perspective, the authors identified the fourth element driving alliance termination, that is the strategic alliance experience disparity between partners. According to this view, if a firm is more effective in achieved specific objectives from the alliance (also because of it prior alliance experience) it will have less need for its partner. As such, asymmetric learning skews the level of interdependence in an alliance and may result in the weakening of the alliance.

Sadowski & Duysters (2008) explore the origins of alliance termination by examining 48 strategic technology alliances in different high-technology industries. According to the authors, the first element in influencing the longevity of alliance is negative prospects about future cooperation. Firms tend to be more loyal to partners once they expect future cooperation with the same partner. The probability that companies engage only in short-term cooperation can easily drive alliance to an end. The second element affecting alliance termination is tied to the negative perceptions about joint benefits. The perspective that both partners would not benefit from the strategic alliance also contributes to its termination. Partnering firms dissatisfied by their ability to receive benefits from the alliance would be more willing to terminate it prematurely. Furthermore, Sadowsky & Duyster (2008) suggest the lack of a win-win situation as the third factor leading alliances to an end. The so called win-win situation seems to be an essential requirement for a successful strategic alliance. Firms might therefore have to engage in extensive pre-alliance discussions in order to assess the viability and joint benefits about the future cooperation.
Pangarkar (2009) identifies a prior alliance termination experience as a key driver of alliance longevity. More in details, referring to a sample of 198 alliances (consisting of 99 terminations and 99 surviving) from the global biotechnology industry, the author argues that prior terminations experiences enables firms to design better alliances and adopt more appropriate alliance management strategies to avoid future terminations. Added to this, the author suggests how the termination experience mediates the relationship between alliance formation and likelihood of termination. The underline assumption is that since firms accumulate experience in undertaking organizational activities (such as termination management), they become more proficient at managing these activities and at preventing them. Moreover, results show that alliances between dissimilar firms are no more likely to come to an end than other alliances. On the contrary, higher cultural distance leads to lower likelihood of termination because of the value and uniqueness of resources coming from the partnership.

In order to understand the origin of alliances instability, Rooks et al., (2013) move from internal alliances factors (such as partners relationships) to factors related to the way in which a firm occupies a strategic position in the network being involved in many significant ties, i.e. centrality (Wasserman & Faust, 1994). Through the study of 1061 ICT-alliances set in the period 1975–1989 the authors found that differences in centrality increase alliance instability.

More in details, Rooks et al combined the centrality of a firm in a network with the resource fit concept (Das & Teng, 2000), deeply rooted in the resource based view field of study. Resource fit refers to the alignment between one organization’s resource need and another organization’s resource provisions. Defined in this way, resource fit is one of the main driver of any strategic alliance. The more the resource fit declines, and an alternative partner provides better resources, the more an organization is inclined to end the relation (Seabright, et al. 1992). According to the authors, resource fit is not independent from the position of firm within the network. More central firms are better positioned to acquire external resources. If less central partners are not able to keep up, then the resource fit declines, and the more central partners are more likely to switch partners. Consequently, differences between degree centralities of firms in an alliance decrease the resource fit and consequently shorten the alliance’s life span.

Cui (2013) analyses how the propensity of alliance’s termination is influenced by its resource relationships with other alliances of the firm. A lot of studies argue that dissimilar resources among partners positively affect the alliance continuity. Contrary to previous research, this study highlights how under some conditions, resource dissimilarity among partners may be less supportive of, or even detrimental to, the continuity of an alliance. More in details, the author identifies four conditional
factors that may affect the role of resource dissimilarity. First of all, relational connectedness, i.e. the focal partner's engagement in alliances with other partners, is found to strengthen the positive role of resources dissimilarity on alliance longevity. Vertical connectedness of alliance activities, i.e. the alliance with partners carrying out different value chain activities, decrease the positive effect of resources dissimilarity in alliance continuity. Further, the formation of substituting alliances by the focal partner and market uncertainty weaken the role of resources dissimilarity in alliance longevity.

Dan & Zondang (2015) explore how characteristics of the allying partners and of the market at the time of alliance formation act as predictors of alliance termination. Testing their hypothesis in the biopharmaceutical industry they shed light on four main factors. First of all, they show how an increase in perceived future value of the alliance is negatively associated with the propensity of alliance termination. In other words, the more the expectation for the co-creation value, i.e. the perceived future value of the alliance, (expressed in terms of level of financial resources committed to an alliance at its formation, investment in exploration and exploitation activities embedded in the alliance, and so forth) the less the propensity of alliance termination is. Added to that, results highlight the existence of an inverted U-shaped relationship between the focal company's product market diversity and propensity for alliance termination. More in details, when a potential alliance partner is active in a low number of product markets, the likelihood of termination of the alliance increases. However, as these same firms learn from their partners and from their different markets, they will also learn how to more efficiently manage relationships and new market entry increasing the chances of alliance survival. Therefore, the relationship between a company's product market diversity and the propensity for termination initially increases, and then decreases, presenting an inverted U-shaped relationship. Another factor increasing the propensity of alliance termination is a high level of technological intensity of the alliance partner. Firms that are less dependent on alliance partners for exploration and exploitation activities are expected to share less knowledge. Consequently, firms with higher technological intensity will find fewer benefits entering into and maintaining alliances. The alliances that these firms do enter into are expected to be more inherently unstable as these technologically intense firms will act more based on self-interest than for the benefit of the alliance (Das & Teng, 2000). Further, the propensity for alliance termination increases in high density markets than in less density ones. The complexity of the products, the regulatory environment and the higher competition make it difficult to become and remain a successful participant in these crowded product markets. Hence, alliances in high-density product markets are more likely to be terminated. Results confirm this hypothesis highlighting how the propensity for alliances to be terminated in markets for the treatment of cancer, neurological, and cardiovascular diseases (high density markets) are significantly higher than for alliances involved in markets for the treatment of blood, dermatological,
and gastrointestinal diseases (less density markets).

**INTER-FIRM NETWORKS TERMINATION: A TAXONOMY OF FACTORS**

Starting from the literature, mainly referred to alliances, we propose a taxonomy of the main factors driving alliance termination, applicable also to inter-firm networks.

First of all, after having identified the factors that, in different ways can affect alliances (and inter-firm network) termination, we classified them into six main groups.

1. **Prior experience**
2. **Goals definition**
3. **Partners compatibility / complementarity**
4. **Risk / return balance**
5. **Governance mechanisms**
6. **Soft items**

Each group is composed by several different factors that, depending on the specific context, can play positive or negative roles in networking longevity or termination (Table 1).

By positive factors we mean factors positively influencing the longevity of networking, whereas by negative factors we mean factors negatively affecting networking duration.

The first group, “prior experience” refers to factors tied to previous networking experience of firms belonging to the network. The “experience” can be declined in different terms: general previous networking experience, previous networking experience with the same partners and, even, previous experience in network termination.

“Goals definition” synthesizes factors related to the features of the goals posed by the networking cooperation (i.e. task complexity) and to the attitude of firms belonging to the network towards such goals (for example commitment).

The third group combines factors related to the “compatibility and complementarity” among partners, i.e. resources fit / dissimilarities, cultural differences.

The “risk / return balance” group refers to factors tied to the perception of the benefit / cost ratio of staying within the relationship.

“Governance mechanisms” refer to the set of tools that network managers can project and implement to make the network working efficiently towards goals achievement.

<th>Resources dissimilarity</th>
<th>Higher cultural distances</th>
<th>Difference between partners</th>
<th>Risk / Return balance perception</th>
<th>Risk return balance</th>
<th>Lack of formal alliance</th>
<th>Governance mechanisms</th>
<th>Lack of formal definition of contractual</th>
<th>Formalization of definition of exit</th>
<th>Trust-building initiatives</th>
</tr>
</thead>
</table>

Table 1. Factors affecting network termination
The last group represents the set of elements tied to “soft items” that, in different ways, can affect network longevity. Examples of these factors are trust, commitment, power and so forth.
As already mentioned we focus the analysis on the network perspective leaving apart the focal firm perspective within the network. This choice drives us to exclude from our taxonomy such factors that are strictly tied to one single firm such as firm specific financial difficulties or M&A events.
One important insight emerging from this taxonomy is that the identified factors emerge in different steps of networks evolution, some factors, such as experience or goals setting, take shape on the early stages of network formation, whereas others, such as trust, or resources fit take shape during the following phases of activities. In this sense, it would be very useful to combine the factors identified in this preliminary work with the different networks evolution phases in order to understand the way they act and to improve managerial implications.

CONCLUSION REMARKS AND FURTHER RESEARCH

Networks are motivated by, among other things, the need to improve production efficiency, share research and development skills and gain access to new markets. Each of these aspects has become increasingly important, especially for small to medium enterprises, whose resources are often significantly constrained (Ahuja 2000; Håkansson et al. 2009).
As showed in the literature concerning the antecedents of networks and strategic alliances (Cantele & Vernizzi, 2014, Cantele et al. 2016, Christoffersen 2013) to achieve these goals networking often relies on a broad set of different elements both structured and soft element such as commitment, trust and cooperation.
But not always things go in the better way, and often alliances and networking relationships go wrong and fail to achieve the goals they were built for and come to an end or, more often, come to an inertial status that does not bring any successful outcome. Understanding the factors that could affect networking termination can be useful to prevent them and to increase networking longevity.
The first significant element one can figure out from the existent literature is that there are a lot of different factors that in several ways can drive alliance failure. Some of them are “hard” factors such as (governance mechanisms) whereas others can be considered as “soft” factors (building trust initiatives).
Added to this, factors affecting networking termination are not positive or negative in an absolute way, on the contrary, their effect is relative, in other words they can play a positive or negative role depending on the specific context they act in. So, for example, short term commitment can play negative role in networks based on traditional industries firms, and a positive role with reference to industries characterized by short time horizon such as e-commerce based network.
Following this reasoning, all the factors can be considered as alerts to be monitored, that is to say, as risk factors that, if activated, could threat alliance/networking longevity.

This paper represents a preliminary study collecting suggestions from alliance literature in order to create a more comprehensive framework on business network termination; studies on networks are usually overlapping, as the term “network” is used in different context and this is the reason why the termination issue can only be depicted by doing a broad reference to different kind of inter-organisational relationships.

The analysis of termination factors synthesized in the paper is positioned in this research path with two main goals that will be focused by future research. First of all, further studies could try to match the termination factors with the different phases of network evolution. In this way it would be easier for network managers to monitor and prevent the negative effect of such factors, by facing them in the precise moment they usually appear. Added to this, consistently with prior studies on Italian business network contract agreement (Cantele & Vernizzi, 2014; 2015) further papers could test the identified risk factors with empirical observation, in order to confirm, rather than exclude or extend the supposed drivers of termination deducted from the literature taxonomy, and to match the specific evolution phase of the network with its specific longevity threats.

DIGITISATION AND BRANDING EVOLUTION: AN INTEGRATIVE CONCEPTUAL FRAMEWORK

Vernuccio, Maria

Department of Management, Sapienza University of Rome, Italy

ABSTRACT

By systematically analysing academic literature between 1960 and 2016 (July), this article aims to fill a significant gap in the existing literature, offering a broad interpretative framework of branding evolution in the long term. To this end, it establishes three key research perspectives for understanding the evolutionary dynamics of branding, i.e. conceptual, managerial and organisational. These research perspectives are used to interpret in an integrative manner, on the one hand, the different phases of branding evolution by defining five branding paradigms (i.e. sign, image, identity, relational and social paradigm) from a theoretical and managerial standpoint and, on the other hand, the main innovative aspects of branding that are more closely related to digitisation.

Keywords: Branding evolution, digitisation, branding paradigms, brand management, brand manager system, social engagement platform, hyper-connectivity, openness, systematic literature review, thematic content analysis.

INTRODUCTION

The digital revolution is leading to a paradigmatic shift in the way brands connect with people and in the how people connect among themselves. These connections are increasingly taking on the form of an interactive, fast and transparent network (many-to-many). Consequently, the traditional process of creating and managing brands is turning obsolete (Christodoulides, 2009). This process has always been based on linear and deterministic logic with a clear role distinction. On one hand, there is the company, the undisputed owner and sole creator of the brand narrative (Gensler et al., 2013). On the other hand, there are the stakeholders, regarded as the “biddable recipients” of brand value creation (Ramaswamy and Ozcan, 2016). Many are the recent studies focusing on the new dynamics of digital interaction between the brand and consumer/consumer groups (e.g. Gensler et al., 2013; Kozinets, 2014). At the same time, new branding constructs are being developed with the aim of better understanding the scope of participation and interaction (e.g. consumer-brand engagement).
Branding is a conceptual and managerial system that is very dynamic. It has undergone constant change for almost a century, driven both by internal company factors, such as new organisational structures or managerial styles, and external factors, such as changes to consumer values, diminished product life cycles, increase in the power of trade and technological innovations (Berthon et al., 2003; Louro and Vieira Cunha, 2001; Low and Fullerton, 1994). This system includes theoretical principles (i.e. the meaning of the brand and the sources of its value), as well as managerial and organisational aspects (i.e. players, resources, structures, tools, capabilities, relationships, strategic and tactical processes). Although academics generally agree that traditional branding is no longer suitable for the current “digitally empowered” world (Erdem et al., 2016), there are still two substantial gaps in the existing literature: 1) the lack of studies on long-term evolutionary dynamics of branding and its constituent elements, both theoretical and managerial (Laporte et al., 2016; Low and Fullerton, 1994); 2) the absence of wide-ranging analysis focusing on the impact of digitisation on branding. Therefore, we conducted a systematic literature review and a thematic content analysis in order to answer the following research questions:

RQ 1 – What are the main research perspectives for understanding the long-term evolutionary dynamics of branding from a conceptual, managerial and organisational point of view?

RQ 2 – In light of these perspectives, what are the different paradigmatic phases of branding evolution from a theoretical and managerial standpoint?

RQ 3 – What are the innovative aspects of branding, which are more closely associated with digitisation?

THEORETICAL BACKGROUND

The digital revolution represents a widespread process of a transfer of people, organisations, relational and production processes from an analogue world to a hybrid, liquid and network-based world (Bauman, 2013; Castells, 1996), which Floridi (2011) defines “infosphere”. This new world involves bits and atoms, with new technological, economic and socio-cultural forces at play. The main characteristics of digital marketing contexts may be summarised as follows: 1) hyper-connectivity (Vernuccio and Ceccotti, 2015), based on comprehensive networks (online and offline) and interactivity (as opposed to linearity, hierarchy and unidirectionality). All market players (brands included), constitute interactive nodes in a global network, each with a digital identity that could be termed “networked self” (Papacharissi, 2011) or “digital extended self” (Belk, 2013). 2) Openness, defined by Tapscott (2012) in terms of transparency, breaking down of the traditional boundaries and collaboration/co-working, all of which connote business models, strategies and identity values. Therefore, what has emerged is the phenomenon of consumer empowerment (e.g. Denegri-Knott et al.,...
2006; Kerr et al., 2012), which can be attributed to greater access to information and consumers’ ability
to control what they access, as well as the option of taking part in the brand discourse and co-creating
value with varying levels of engagement (Prahalad and Ramaswamy, 2004).

Researchers and brand managers are thereby forced to respond to these new challenges, questioning
the validity of orthodox branding concepts and practices. Since 2000, marketing scholars have
increased the efforts in investigating new ways of developing and managing brands. One should
consider, for example, the plethora of studies on: the role of brands in online communities (e.g. Muniz
and O’guinn, 2001), brand co-creation (e.g. Ramaswamy and Ozcan, 2016), brand management via
social media (e.g. Burmann, 2010), and the recent line of research on consumer-brand engagement
(e.g. Brodie et al., 2011; Graffigna and Gambetti, 2015). In light of these considerations, first it emerges
the need to undertake an analysis of the evolution of branding which encompasses a broader
spectrum even from the temporal point of view. It could then be possible to understand and
contextualise the innovative aspects of branding, which are more directly connected to digitisation.

METHODOLOGY

For the purposes of this paper, a systematic literature review has been conducted (Tranfield et al., 2003).
The following academic databases have been used at the first stage: Science Direct, Business Source
Complete, Scopus and Emerald Management. Papers of potential interest were identified through a
structured research in the article title, abstract and key words section of the aforementioned databases
based on a combination of different key words. The latter were selected according to the research
objectives and background outlined above: “brand manager”; “brand manager system”; “brand
management”; “brand strategy”; “brand building”; “brand evolution”; “internet & branding”; “brand
& digital”; “brand & social media”; “brand & co-creation”; “brand & engagement”; “consumer
empowerment”; “brand & community”. Only papers or books written in English (full text) and
published between 1960 and July 2016 (from Keith, 1960 to Ramaswamy and Ozcan, 2016) were
considered eligible. After duplicate studies were discarded, a database of 498 articles was created. Table
1 shows the criteria of this review protocol.

Table 1 – Inclusion and exclusion criteria in the first phase of the selection protocol.
In order to make the database more inclusive, a manual search of forward and backward citations was subsequently conducted (Webster and Watson, 2002), which meant that a further five books, 12 articles and one conference paper were also included. By reading through the abstracts and conclusions of the papers, the second selection phase involved assessing the relevance of these studies to our research objectives. At the end of this process, five books (11 book chapters) and 139 articles were selected (mostly from the Journal of Marketing and the Journal of Brand Management). Finally, the full-texts were thoroughly analysed using the thematic content analysis technique following an exploratory approach (Braun and Clarke, 2006).

**MAIN FINDINGS**

The content analysis yielded various inter-connected thematic areas, which represent key research perspectives on the evolution of branding from a conceptual, managerial and organisational point of view (RQ 1). Moreover, in light of these perspectives we identified the different paradigmatic phases of branding evolution (RQ 2) within a broad interpretative framework. Finally, we identified the innovative aspects of branding, which are more closely associated with digitisation (RQ 3). Hence, here follows a brief overview of the results.

**Conceptual perspective**

In this perspective, we have taken into account all the studies that contributed to establish what constitutes a brand and the source of its value, from the initial statistic concepts to more dynamic, open and recent ones. Five perspectives emerged: brand as sign, image, identity, relationship and social platform. The first phase (“brand as sign”) starts at the beginning of the twentieth century (1900-1930) with an objective perspective centred on the company. The brand is conceived as a set of distinguishing signs (a view still upheld by Kotler, 1991), with the purpose of merely simplifying the purchasing process (Copeland, 1923). The consumer is forced to play a passive role and the brand value is completely embedded within the product (Merz et al., 2009). The decades between the 1930s and the 1980s saw a lengthy period of research in the psycho-social domain (“brand as image”), shifting the perspective onto the consumer as an individual and viewing the brand as a mental representation and bearer of functional and symbolic benefit (Park et al., 1986). The image is the source of the brand value (Merz et al., 2009).

In the following period, which lasted only a decade (1990-2000), the attention was focused on the relationship between brand and consumer (Fournier, 1998), with an initial “emancipation” of the latter (Belk and Costa, 1998). There was a substantial increase of studies looking into the mental mechanisms involved in developing brand perceptions (Keller, 1993) and how such perceptions are at the heart of
brand equity generation (Aaker, 1996). At the same time, the brand took on anthropomorphic qualities, acquiring a personality (Aaker, 1997) and an internally-planned identity that was at the heart of the brand strategy (Kapferer, 1992; Aaker and Joachimsthaler, 2000). This decade, therefore, produced two perspectives: the brand as dyadic relationship and as identity, while the source of the brand value was the value as perceived by the individual, and was developed through to the consumer-brand relationship. Since the turn of the twenty-first century, a socio-cultural and experience-based approach has emerged, with the brand now being seen as a social process (Cayla and Arnould, 2008; Merz et al., 2009). The corporate brand has become increasingly significant (Balmer and Greyser, 2006), while relational perspectives are gradually branching out to the various stakeholders (Gregory, 2007). In the digitally empowered world, brands have become social platforms with which stakeholders can openly engage (Ramaswamy and Ozcan, 2016). Brand value is developed dynamically, through complex social interactions with and among stakeholders, following engagement dynamics and cultural negotiations within communities of fans or much more extensive networks (Brodie, 2009; Gregory, 2007; Ind and Bjerke, 2007; Mühlbacher and Hemetsberger, 2008).

Managerial perspective

The second theme to emerge from the analysis is the managerial perspective and is closely connected to the conceptual one described above. The managerial perspective involves the various brand management approaches, that are: product-based, adaptive, identity-centred and relational approach. In addition to these approaches previously posited by the literature, a final one is emerged: while not fully defined in the literature and albeit having developed with the digital revolution, this new approach is defined here as “open”. On the one hand, what distinguishes these approaches is the varying degree of brand management strategic orientation: low (tactical orientation) versus high degree (strategic orientation) (Louro and Vieira Cunha, 2001; Quinton, 2003). On the other hand, there is a spectrum of managerial approaches, ranging from greater internal emphasis (focus on the characteristics and actions of the organisation as key in the brand value creation) to more external emphasis (focus on market and customer). The first managerial approach, named “product-based”, is related to the brand conceived as a sign and centres on the product and the marketing mix (Kapferer, 1992; Kotler, 1991). The product-based approach is characterised by tactical management of the brand (as a legally protectable trademark), as well as by internal emphasis, whereas the consumer is considered a marginal and passive element. The second tactical approach, named “adaptive” (Louro and Vieira Cunha, 2001), is focused on the brand image with an external emphasis. The consumer is considered as a key player in forging brand meanings. In this case, brand management is a tactical process of cyclical adjustment to consumer perceptions (de Chernatony and Dall’Olmo, 1998).
Conversely, the third approach focuses on brand identity, is mainly internal and has a strategic orientation. In this case, brand management is accomplished by creating, developing and communicating the brand identity coherently (Aaker, 1996). The “relational approach” is also strategic, but places greater emphasis on external elements. It involves brand management based on the key role of the relationship between brand and consumer, within which co-creation of value is continually formed through communication of the brand identity (Louro and Vieira Cunha, 2001). The last approach, defined here as “open”, is the one that is most influenced by the digitisation. It combines strategic and tactical orientation with internal and external emphasis. While still fragmentary, the literature highlights the complexity of this brand management approach, illustrating the various aspects in terms of: social process (Mühlbacher and Hemetsberger, 2008); collaboration (Pitt et al., 2006; Gensler et al., 2013); co-creation (Hatch and Schultz, 2010; Ramaswamy and Ozcan, 2016); negotiation (Giesler, 2012); improvisation (Singh and Sonnenburgh, 2012); social engagement (Kozinets, 2014); risk management (Fournier and Avery, 2011); influence management (Bresciani and Ewing, 2014); variety of roles that digital media have in brand building (Aaker, 2015).

Organisational perspective

The third theme that emerges from the content analysis is the organisational perspective, and is closely linked to the above (Laporte et al., 2016; Louro and Vieira Cunha, 2001; Low and Fullerton, 1994). Two sub-themes have been identified in this area: organisational structures and key players. With regard to organisational structures, the analysis highlighted the prevalence of a more bureaucratic type of functional logic in the case of product/brand-centred and market-centred organisations. The “product/brand centred organisation” is connected to the managerial approaches of product and identity, while the “market-centred organisation” relates to the adaptive managerial approach (Louro & Vieira Cunha, 2001). Conversely, a more flexible and dynamic perspective prevails in “customer-centric organisations”, given the dependence on a managerial-relational approach. Finally, organisational structures linked to today digital revolution, yet largely unexplored by academic literature, should be much more flexible. In relation to these innovative organisational structures, De Swaan Arons (2014) recalls, above all, the necessary characteristic of agility: “Complex matrixed organisational structures [...] are giving way to networked organizations characterized by flexible roles, fluid responsibilities, and more relaxed sign-off processes designed for speed” (p. 61). With regard to the key players (second sub-theme), academic research ranges from an exclusive focus on the brand manager system (Low and Fullerton, 1994) to an explicit evaluation of the new roles of the consumer and other stakeholders in brand building activities (Ramaswamy and Ozcan, 2016; Vernuccio and Ceccotti, 2015), as well as the emerging specialised roles, such as the Chief of Marketing.
Technologist (Brinker and McLellan, 2014). Analysing how the brand manager system has developed since the 1960s until present, Laporte, Aimé, and Berger-Remy (2016) describe three fundamental brand manager profiles: 1) “the charismatic influencer” (1960s-1970s) who, despite little formal authority, boasts substantial influence-exerting capacity “thank to a legitimacy gained from recognized expertise but also from ‘personal attraction’” (p. 5); 2) “the good little soldier” (1980s-1990s) with less power and greater focus on internal planning; and 3) a hybrid figure inherited from the previous profiles, who should act as both “galvanic facilitator” and “absolute expert” (post 2000). This last profile coincides with the brand manager at the age of digital revolution. The brand manager should become a deeply renovated figure, equipped with both managerial and entrepreneurial mind-sets, as well as inside-out, outside-in (Day, 1994) and adaptive capabilities, in order to mobilise “dispersed and flexible partner resources” (Day, 2011, p. 188). He/she should play the role of “orchestrator” of both internal and external complementary capabilities: such as analytical, creative, relational and technical-executive (De Swaan Arons, 2014).

Figure 1 - Paradigmatic phases of branding evolution: An integrative conceptual framework.

In the light of the key research perspectives on the evolution of branding (e.g. conceptual, managerial and organisational) and based upon the aforementioned managerial dimensions of internal/external emphasis and strategic/tactical orientation, we developed a broad interpretative framework.
representing in an integrative manner the different paradigmatic phases of branding evolution (i.e. sign, image, identity, relational and social paradigm) from a theoretical and managerial standpoint (Figure 1).

Innovative branding aspects related to digitisation
